BROADCOM SOFTWARE

CA Service Management - 17.4

Table of Contents

Release Information **36**
- **CA Service Management 17.4 Release Notes** **36**
  - Fixed Issues - 17.4 37
  - Known Issues - 17.4 38
  - Supportability Matrix 43
  - Check out where we're going; attend a CA Product Roadmap Session 51
  - Defect Resolution Process 51
  - Product Accessibility Features 53
  - Product Names and Abbreviations 61
  - Third-Party License Acknowledgments 61
  - End User License Agreement (EULA) 145
  - Documentation for Older Releases 146
- **CA Service Management 17.4.5.0 Release Notes** **146**
  - Fixed Issues for 17.4.5.0 147
  - Troubleshooting for CASM 17.4.5.0 149
- **CA Service Management 17.4.4.0 Release Notes** **150**
- **CA Service Management 17.4.3.0 Release Notes** **153**
- **CA Service Management 17.4.2.0 Release Notes** **156**
- **CA Service Management 17.4.1.0 Release Notes** **160**

Getting Started **163**

Lift and Shift Cloud Migration **166**

CMDB Visualizer **167**
- **CMDB Visualizer Administration Interface** **167**
  - Configuration 168
  - Filters 169
- **CMDB Visualizer Interface** **171**
  - Visualizer Graphs 171
    - Layouts 173
    - Using the Visualizer Toolbar 174
  - Change Icons of CIs on Visualizer 176
- **Configuring CMDB Visualizer** **176**
  - CMDB Visualizer Resource Management and Performance Tuning 176
  - Security Configurations 178
  - Tomcat Logging 179
  - Troubleshooting CMDB Visualizer 180

Installing **182**

Installing CA Service Management 17.4.5.0 182
Install Prerequisites for CA Service Management 17.4.5.0 182
Install CA Service Management 17.4.5.0 (Windows) 184
Install CA Service Management 17.4.5.0 (Linux) 187
Validate CA Service Management 17.4.5.0 Installation 189
Post-Installation Tasks for CA Service Management 17.4.5.0 190
Post-Installation Tasks - CA SDM Advance Availability 17.4.5.0 200
Installing CA Service Management 17.4.4.0 205
Install Prerequisites for CA Service Management 17.4.4.0 205
Install CA Service Management 17.4.4.0 (Windows) 206
Install CA Service Management 17.4.4.0 (Linux) 209
Validate CA Service Management 17.4.4.0 Installation 210
Post-Installation Tasks for CA Service Management 17.4.4.0 212
Post-Installation Tasks - CA SDM Advance Availability 17.4.4.0 220
Uninstall CA Service Management 17.4.4.0 223
Installing CA Service Management 17.4.3.0 228
Install Prerequisites for CA Service Management 17.4.3.0 228
Install CA Service Management 17.4.3.0 (Windows) 230
Install CA Service Management 17.4.3.0 (Linux) 232
Validate CA Service Management 17.4.3.0 Installation 234
Post-Installation Tasks for CA Service Management 17.4.3.0 235
Post-Installation Tasks - CA SDM Advance Availability 17.4.3.0 243
Uninstall CA Service Management 17.4.3.0 245
Installing CA Service Management 17.4.2.0 250
Install Prerequisites for CA Service Management 17.4.2.0 250
Install CA Service Management 17.4.2.0 (Windows) 252
Install CA Service Management 17.4.2.0 (Linux) 254
Validate CA Service Management 17.4.2.0 Installation 256
Post-Installation Tasks for CA Service Management 17.4.2.0 257
Post-Installation Tasks - CA SDM Advance Availability 17.4.2.0 263
Uninstall CA Service Management 17.4.2.0 265
Installing CA Service Management 17.4.1.0 269
Install Prerequisites for CA Service Management 17.4.1.0 269
Install CA Service Management 17.4.1.0 (Windows) 270
Install CA Service Management 17.4.1.0 (Linux) 272
Validate CA Service Management 17.4.1.0 Installation 274
Post-Installation Tasks for CA Service Management 17.4.1.0 276
Post-Installation Tasks - CA SDM Advance Availability 17.4.1.0 281
Uninstall CA Service Management 17.4.1.0 282
CA Service Management 17.4 Solution Architecture 286

CA Asset Portfolio Management Product Architecture **287**
CA Service Catalog Product Architecture **287**
CA Service Desk Manager Product Architecture **291**
Installation Prerequisites **297**
Operating System Requirements 297
Server and Hardware Requirements 302
Software Requirements 307
Database Requirements 309
Supported Ports and Port Ranges 311
Supported Browser and Network Settings 313
Pre Installation Considerations **314**
CA Service Management Default User Information 314
CA Service Desk Manager Considerations 315
Considerations for Conventional Configuration 326
Considerations for Advanced Availability 328
xFlow Interface Considerations 339
CABI JasperReports Server (Insights) Considerations 339
CA Service Catalog Considerations 341
CA Asset Portfolio Manager Considerations 342
Oracle Real Application Clusters (RAC) Considerations 343
Installing CA Service Management 17.4 ..... **344**
Installing Common Components (CA EEM, Jaspersoft, and CA Process Automation) 345
Jaspersoft for CA Service Management 345
Install CA Process Automation for CA Service Management 434
Generating CASM Reports with APIs 436
Install CA EEM for CA Service Management 462
Enable and Configure Telemetry Services 464
Installing CA Service Desk Manager 465
CA SDM Advanced Availability Server Configuration Details 470
CA SDM Conventional Server Configuration Details 473
Search Server Configuration Details 476
xFlow Interface Configuration Details 478
Verify CA Service Desk Manager Installation 480
Securing CA SDM from Cross-Site Scripting Vulnerabilities 480
Installing Web Screen Painter 482
Installing CA Service Catalog 482
Installing CA Asset Portfolio Management 484
Post Installation Tasks **488**
CA Service Desk Manager Post Installation Tasks 488
Post-Installation Tasks After Installing CA SDM 17.4 488

Post-Installation Tasks After Installing CA SDM 17.4 on CA SDM 17.1 ... 494
Post-Installation Tasks After Installing CA SDM 17.4 on CA SDM 17.2 ... 500
Post-Installation Tasks After Installing CA SDM 17.4 on CA SDM 17.3 ... 505
CA Service Catalog Post Installation Tasks ... 511
After Installing CA Service Catalog 17.4 on 17.3.0.1 or later versions ... 511
After Upgrading to CA Service Catalog 17.4 from 17.1/17.2/17.3 ... 511
Integrate Pre-Installed Solution Components ... 515
CA Asset Portfolio Management Post Installation Tasks ... 516
Post-Installation Tasks After Installing CA APM on SQL Database ... 516
Post-Installation Tasks After Installing CA APM on Oracle Database ... 517
Additional Components Configuration ... 519
Apache Tomcat Configuration ... 523
(Optional) Configure Secure Network Communication ... 523
(Optional) Config File Changes in WCF Service to Address Security vulnerabilities ... 527

Upgrade Tools ... 554
Upgrade to CA Service Management 17.4 ... 556
Upgrading to CA Service Desk Manager 17.4 ... 557
Upgrade Prerequisites - CA SDM ... 558
Pre-Upgrade Tasks ... 559
How to Upgrade Oracle Database Client ... 564
Install and Configure Apache Tomcat ... 565
Tomcat Upgrade for CA Service Catalog using ANT ... 566
Upgrade Tomcat and JRE (CASM Admin) ... 567
Upgrade Tomcat and JRE (CAF ITAM) ... 568
Perform the CA SDM Post-Upgrade Tasks ... 568
Customization Upgrade Utility ... 569
Configure CA SDM Servers after Upgrade ... 572

Manually added NX variables need to be merged....572
Configure your Tickets....573
Enable Services in xFlow Interface....575
Modify the New Functional Access Areas Post-Migration....575
Review the CA SDM Email Mailbox Options....577
Upgrade Knowledge Management....579
Add Insights Functional Access to Existing Custom Roles....580
Set Active Status for Default Area....580
Upgrading to CA Service Catalog 17.4....581
Upgrade Prerequisites and Planning Consideration....581
Traditional and Migration Model Upgrades....585
Migrate the CA Service Catalog Data....586
Post-Upgrade Tasks - CA Service Catalog....588
Upgrading to CA Asset Portfolio Management 17.4....590
Post-Upgrade Tasks for CA APM 17.4....592
Upgrade Troubleshooting....593
Swing-Box Methods to Upgrade to CA Service Management 17.4....595
CA Service Desk Manager (SDM) - Swing Box Migration....595
CA SDM Swing-Box Migration Using Production Replica High Level Steps....598
CA SDM Swing-Box Migration using Intermittent Server - High Level Steps....604
CA Service Catalog - Swing Box Migration....610
CA Service Catalog Swing-Box Production Replica - High Level Steps....612
CA Service Catalog Swing Box Migration Intermittent Server - High Level Steps....617
Troubleshooting- Swing-Box Migration Issues....623
Use Case 1 - Swing-Box Migration to Upgrade CA Service Management 17.4....623
Install CA EEM (testqa-eem-new)....625
Install CA Process Automation 4.3.0.5 (testqa-pam-new)....626
Install CA Service Management 17.4....666
CA Service Management Solution Integration....723
Upgrade CA Service Management 17.1 to CA Service Management 17.4....765
Troubleshooting....767
Use Case 2 – CA Service Management 17.4 Swing Box Move from the Production to the Target Server....768
Administering....801
Administering CA Service Management....801
Administrative Service Offerings....803
Manage Tenants....803
Map Tenancy Structures across Products in the Solution....804
Manage Service Management Roles....806
Manage Users....809
Manage LDAP Servers....810

Configure Common Components ... 811
Manage Product Integrations ... 812
Business Value Dashboards ... 813
Know When the Business Value Dashboards are Available ... 813
Review the Business Value Dashboards Prerequisites ... 814
Determine the Business Value Dashboards User Permissions ... 815
Configure the Business Value Dashboard Reports ... 815
Learn How to Schedule the Business Value Dashboard Reports ... 816
Understand the Important Metrics ... 818
Offline Reporting through Microsoft SQL Server Database Replication ... 819
Verify the Prerequisites ... 823
Back up and restore the existing MDB instance ... 823
Implement Replication ... 825
Troubleshoot offline reporting ... 837
Convert a PFX Keystore to a Java Keystore ... 838
Transparent Data Encryption for CA Service Management ... 838
Enabling Transparent Data Encryption for Microsoft SQL Server Database ... 838
Enabling Transparent Data Encryption for Oracle Database ... 843
Configure Service Point ... 847
Implementing CA Service Management Virtual Analyst ... 847
Install Virtual Analyst ... 850
Offline Installation - CA Service Management Virtual Analyst ... 853
Train the NLU Server ... 854
RASA Clustering ... 855
Configure Virtual Analyst in Service Desk Manager ... 860
Define the User Context ... 869
Customizing Service Point appearance ... 869
Add Additional Information ... 870
Define the Default Categories ... 870
Manage Ticket Attributes ... 871
ServicePoint Request Approval Process ... 872
Manage Features ... 875
Set Up My Resources ... 877
Manage CA Service Catalog Featured Offerings ... 878
View Knowledge Base Articles from Service Point ... 879
Manage Smart Search ... 880
Enable the Guest Login ... 882
Configure the xFlow Interface ... 882
Configure Security Plugin to Access the Search Server ... 883
Enable Services for xFlow Interface ... 883

Configure Search Server Cluster....884
Configure Search Servers in CA SDM....885
Configure Event-Based Load....885
Perform Initial Load and Refresh Index and Data on the Search Server....886
View Configuration....890
Command Bar....892
Configure the xFlow Interface Server Services....895
Configure Suggested Experts Search....896
Configure Suggested Solution Search....896
Configure Multi-faceted Search....897
Heat....897
Ticket Attributes....900
Weather....901
Work Stream....903
Push Notification Service....903
Enable the Research Tool Extension....906
Configure the xFlow Interface Cache Size....907
Enable SAML Authentication for xFlow Interface....908
Configuration Changes for xFlow Interface....910
App Launcher - Apps Configuration and Role Switching....910
Manage Chat....915
Administer the xFlow Interface....917
Display the User Information....917
Customize the Branding....918
Modify Date and Time Format....920
Manage Attachments....921
Team Messages....922
Configure External Redirect URL on Logout....922
Configure SSO for xFlow Interface/Service Point....923
Rate Limiting in xFlow....923
Administer Insights....924
Insights Architecture Diagram....926
Transactional Reports....927
Add Custom Attributes to Reporting Domains....928
Editing Reporting Domains for Untenanted CA SDM....932
Configure JasperReports Whitelist for Transactional Reporting....932
Configure Multiple Domsrvr for Transactional Domain Reports....932
Aggregate Reports....933
Configure CA Service Desk Manager....939
Configuring CA SDM Servers....940

Changing the Server Configuration from Conventional to Advanced Availability....941
Changing the Server Configuration from Advanced Availability to Conventional Configuration....943
How to Configure Surveys....944
Create a Managed Survey....946
Create a Survey Template....949
How to Configure Notifications....952
Create a Notification Method....959
Create a Notification Rule....960
Create Message Templates....963
Create a Manual Notification....964
How to Set Up Notification for an Activity....966
Configure CA SDM and the Components....974
How to Move the Authentication Module to an External Server....976
Server Configuration Utility....980
Configure the CA SDM Environment....988
How to Configure the Employee and Guest Interface....989
How to Configure the Web Interface....990
How to Configure Integrated Windows Authentication for CA SDM....994
Search Engine Configuration....996
How to Enable Auto-Failover....998
Screen Reader Usage....999
Deploy the Health Servlet on the Application Server....999
Managing Servers....1001
How to Start the CA SDM Servers....1005
How to Stop the CA SDM Servers....1007
How to Configure Processes for CA SDM Servers....1009
How to Perform Rolling Maintenance on CA SDM Servers....1018
How to Configure SSL Authentication....1022
System Configurations....1027
Configure a Dedicated Domsrvr for SOAP Web Service - Advanced Availability....1030
Managing Your Database....1030
Database Backup....1030
Database Restore....1031
Database Table Replacement....1032
Data Dereferencing....1037
Use the Dbadmin Mode....1040
How to Use pdm_deref Example....1040
Database Loader....1042
Drop and Restore Constraints....1044
How to Create and Use an Input File....1044

How to Archive and Purge Historical Data....1045
Setting Up Multi-Tenancy....1051
How to Implement Multi-Tenancy....1052
Manage Multi-Tenancy....1059
How to Export and Import Tenant Data....1063
Utilities Used for Multi-Tenancy....1064
Setting Up Terms of Usage....1069
Handling the Open Redirect Vulnerability Issue in "LINK WITH BOPSID URL" Parameter....1071
Setting Up Security....1071
User Authentication....1075
Establishing Support Structure....1079
Setting Up Your CA SDM System....1079
Setting Up Category or Area....1114
Install Incident Tracking....1131
Related Ticket Activities....1132
Priority Calculation....1133
How to Set Up the Attachments Library....1145
Service Level Agreements (SLA)....1150
Automatic Closure of Tickets....1171
Search Attachments....1172
Create an Announcement....1172
File Types....1174
Auto Assignment....1174
How Auto Assignment Assigns Tickets....1179
How to Begin Implementing Auto Assignment....1193
Create a Stored Query....1200
Manage Roles....1201
Create Help Sets....1209
How to Manage Roles Using Menu Trees....1210
How Role-Based Navigation Works....1213
Create a Functional Access Area....1221
Role-Based Security....1224
Configuring User Accounts....1228
User Profile Picture Synchronization from LDAP Server....1229
Working with Special Handling Types....1230
Special Handling Types Options....1231
Contact Types....1233
How to integrate CA SDM with LDAP....1234
Create Contacts in Batch Mode Using LDAP Data....1244
Test Connections to LDAP Directories....1248

Error Messages for Failed Connections to LDAP Directories....1251
Configuration File Modification....1253
Creating the Business Structure....1261
CA SDM User Authentication....1268
Encrypt Session IDs to Address Vulnerability Issues....1271
Retry Mechanism for CA SDM and CA Process Automation Workflow Options....1272
Apache HTTP Load Balancer for CA SDM....1272
How to Configure the F5 Load Balancer for CA Service Desk Manager....1275
Prerequisites for configuring the F5 Load Balancer....1275
Create a Custom Health Monitor....1275
Create an F5 Pool for the CA Service Desk Manager Application Server....1276
Create an F5 Virtual Server or Node for CA Service Desk Manager....1277
Verify the F5 Load Balancer Configuration....1278
How to Configure the Mailbox to Handle Inbound Emails....1278
Choose a Notification Phrase....1283
Define a Mailbox....1287
How to Configure Email Replies....1303
How Does the Maileater Process Inbound Emails?....1307
How to Set Up the Data Partition....1307
Create an Access Type....1310
Data Partitions....1313
How to Perform Proactive Monitoring for CA SDM....1316
How to Configure Multiple CA SDM Web Engines on Application Servers?....1318
Administering CA Service Desk Manager....1319
Options Manager....1320
Add HTTP Headers in CA SDM Options Manager....1353
Install/Uninstall Options Manager Options....1354
Multi-Tenancy....1359
Service Provider....1359
How Multi-Tenancy Works....1360
User Interface Impact....1364
Knowledge Management Impact....1365
Create a Remote Reference....1366
Audit Log List....1367
Define Form Groups....1368
SOAP Web Services Policy....1368
Create a SOAP Web Services Error Type....1368
Create a SOAP Web Services Policy....1370
Manage Service Type and Service Type Events....1371
Create a Service Target Template....1374

Create Log Interval Configuration....1375
How to Manage Contact Groups....1376
CA SDM Environment Promotion....1380
CA SDM Configuration and Customization....1381

Release Information

Explore CA Service Management's latest enhancements, features, and cumulative patches.

- CA Service Management 17.4 Release Notes
- CA Service Management 17.4.5.0 Release Notes
- CA Service Management 17.4.4.0 Release Notes
- CA Service Management 17.4.3.0 Release Notes
- CA Service Management 17.4.2.0 Release Notes
- CA Service Management 17.4.1.0 Release Notes

CA Service Management 17.4 Release Notes

Learn about the new features, enhancements, and deprecated items with CA Service Management 17.4.

What's New

CA Service Management 17.4 includes the following new features:

- CA SDM and Jira Agile Management Integration
- CA Virtual Analyst Integration with MS Teams
- **Catalog Cache versioning for Service Point**: Service Point can now identify the availability of a new version of a file by using the unique file version identifier, saving business users' efforts to delete the browser cache whenever new roll-ups or T-fixes are applied.
- MS Graph API Support for OAuth 2.0: SDM Maileater supports IMAP/POP3 as one of the protocols for the inbound emails. This feature is to introduce MS Graph API as a protocol for the inbound emails processed by SDM Maileater.
- Lift and Shift cloud migration of CA Service Management. For more information, look into Lift and Shift Cloud Migration.

What's Deprecated?

The following items are deprecated and not supported on CA Service Management 17.4:

- Support Automation
- Service Catalog integration with CA Business Service Insight
- We recommend customers add CXF Web Services. Support for Axis-based web services would be dropped from June 30, 2025. For more information on CXF Usage, see the following topics:
  - Web Services Management
  - Tips for SOAP Web Services Clients
  - Contents of the Samples Directory

Quick CheckPoints

To install, upgrade, and configure Service Management, check out the following helpful URL links:

- Review the supported platform requirements, before you proceed with installing or upgrading CA Service Management 17.4. For more information, see Supportability Matrix.

Fixed Issues - 17.4

Learn about the Fixed Issues in CA Service Management 17.4.

The following issues were fixed and are included in CA Service Management 17.4:

xFlow Interface and Service Point

S. No	Fixed Issue ID	Description
1	Case #33359741	Service Point does not display KD images login when SP is installed on secondary server
2	Case #33381955	CV-GEN-INQUIRY_CATALOG_17.3_Xflow-When clicked 'Cancel Request' of a Request in S

CA Service Desk Manager

S. No.	Fixed Issue ID	Description
1	Case #33083350	Visualizer: Save map
2	Case #33319405	Export functionality stops working frequently
3	Case #33310522	SDM 17.3 RU18 - Failed to Copy SDM Ticket
4	Case #33358665	GRLoader removes line breaks
5	DE68660	Spell Check Not Working Correctly
6	Case #33374738	Assignee field empty after save Knowledge Document
7	DE68967	17.3 RU21 breaks SDM IIS Web Interface (exception in w3wp.exe)
8	Case #33433506	[SDM-Attachments] unable to upload attachments from employee interface
9	Case #33396607	Visualizer Tomcat fails to start
10	Case #33442176	SDM_17.3.22-33442176-A ""Knowledge Manager"" cannot create new ""Top"" Knowledge Categorie

CA Service Catalog

S.No	Fixed Issue ID	Description
1	DE68779	Service Catalog - news message - announcements
2	Case #33382286	Service Catalog - Form - Table Column widths

3	Case #33440375	CV-GEN-INQUIRY_CATALOG_17.3-The label text overlaps in Service Point

Jasper Reports Server 9.0.0

For the vulnerability of ***Log4j1 Removal*** in Datamart installed location, apply the patch with APAR No : 99112251

Known Issues - 17.4

This page talks about the Known Issues for the CA Service Management 17.4 release.

The CA Service Management 17.4 release includes the following known issues:

CA Service Management

Login Issue after installing CA EEM on Linux

Problem: Unable to log in into CA EEM application server after installing CA EEM on Linux (RH Linux or Suse) using the CA Service Management Common Installer 17.4.

Solution: Perform the following steps:

1. Uninstall existing CA EEM. Run the following command from where you have installed CA EEM:
   ```
   command eiamuninstall -DFORCE_UNINSTALL=true
   ```
2. Install CA EEM server (RH Linux or Suse) manually from CA Service Management DVD.
   For more information, see Install CA EEM.

CA Service Desk Manager

Post Installation task fails with pdm_webcache -H option

Problem: Post-Installation task fails with pdm_webcache -H option on SDM Application Server on a Slow network connection.

Solution: Workaround:

1. Extract the CA Service Desk Manager Installer DVD, remove pdm_webcache -H from SDM_patch.xml file from the installation folder location.
2. Retry the installation. SDM Application server is installed successfully.

Unable to establish connection with Microsoft Exchange SMTP server

Problem: Recent changes in JavaMail API has changed certain authentication defaults and the following authentication error message is displayed:

```
No authentication mechanisms supported by both server and client.
```

Workaround: This issue occurs when username and password are provided for the SMTP server which is configured with no authentication mechanism. To work around the issue, follow these steps:

1. Remove the existing mail server configuration.
2. Create a new one leaving **username** and **password** empty.
3. Restart the server.

Post Installation task fails with pdm_webcache -H option

Problem: Post-Installation task fails with pdm_webcache -H option on SDM Application Server on a Slow network connection.

Solution: Workaround:

1. Extract the CA Service Desk Manager Installer DVD, remove **pdm_webcache -H** from **SDM_patch.xml** file from the installation folder location.
2. Retry the installation. SDM Application server is installed successfully.

Unable to edit and save an email Address in EditList

Problem : The edit list functionality fails when attempting to edit a field using the **Edit in List Option.** The following error message is displayed: `error AHD04606: 0 records updated; n attempted update(s) failed - see message(s) below. AHD04605:Can't update - someone else has changed email_address`

Workaround: If you are applying the "**fmtFunc**" attribute to any field in the list htmpl files and have enabled the edit in list functionality for that list, ensure to add a name attribute to the anchor tag. The **fmtFunc** attribute converts the field into a hyperlink (wrapped inside HTML anchor tags): <a name='dis_lnk_in_listedit_<any_value>'

Here **<any_value>** must be replaced with a suitable value, such as field name.

Unable to establish connection with Microsoft Exchange SMTP server

Problem: Recent changes in JavaMail API has changed certain authentication defaults and the following authentication error message is displayed:

```
No authentication mechanisms supported by both server and client.
```

Workaround: This issue occurs when username and password are provided for the SMTP server which is configured with no authentication mechanism. To work around the issue, follow these steps:

1. Remove the existing mail server configuration.
2. Create a new one leaving **username** and **password** empty.
3. Restart the server.

After applying 17.4 GA domsrvr memory growth is observed

Problem: After applying 17.4 GA domsrvr memory growth is observed

Solution: Apply the required hotfix:

Windows APAR no : 99111862

Linux APAR no : 99111863

JasperReports® Server 8.1.1

Derived Tables are incompatible for Fields from Different Objects

Problem: When creating an ad-hoc view, you ideally select fields that belong to an object and derived tables that are linked to this same object. However, derived tables show incompatibility when fields from different objects that are not directly joined to the derived table are pulled in. For example, you can pull in fields belonging to "*chg*" object and derived table fields that are linked to "*chg*". However, you cannot pull "*chg*" fields with derived tables that are linked to "*nr*" object.

Workaround: Close and reopen the ad hoc view. Avoid any incompatible field.

Error message in the Insights log file

Problem: The following error message is displayed in the InsightMSs.log file: [*c.t.c.FreshnessCalculator] - calculateFreshnessFromExpires: HTTP date parsing failed Error.*

Solution: This does not affect the Insights functionality and hence no action is required.

CA Service Catalog

Any new or update to existing SRFs are not loading after upgrading the CA Service Catalog to 17.4.RU2

Problem: Any new or update to existing SRFs are not loading after upgrading the CA Service Catalog to 17.4.RU2

Steps to reproduce the problem:

1. Go to Administration > Events-Rules-Actions > Request/Subscription Item Create
2. Select an existing Rule or create a new Rule.
3. Click the Add button and this will bring you to the Add Action screen
4. In the Action Information Section select:
   a. Type: Process Automation
   b. Click the Magnifying glass next to the Start Request Form field
   c. Click an SRF (or the location of the offering you imported into ITPAM earlier.)
5. Start Request Form Field is populated but the popup window does not disappear.
6. Cursor is stuck as a circle.

Solution:

Download the fix for version 17.4 RU2 from here.

Cannot display charts in Data Views

Problem: Graph type Data Views cannot be rendered in the dashboards due to removed support for Applets.

Solution: As of now there is no workaround.

Case sensitivity for user name in Oracle database

Problem: The user name for CA Service Catalog is case-sensitive in Oracle database.

Solution: Enter the correct user name.

Form Designer style attribute is not supported for Dual List

Problem: Form Designer style attribute is not supported for Dual list.

Solution: There is no workaround available for this issue.

While configuring CA Service Catalog, if the database level collation is changed, the MDB task fails during installation

Problem: MDB database installation fails.

Workaround: Follow these steps:

1. After Configuration of CA Service Catalog - MDB task failure in the installer, navigate to USM_HOME\temp\mdb (for example: C:\Program Files\CA\Service Catalog\temp\mdb1.5\windows\Unicenter_Service_Management-1.0_mssql/DBTable) and modify the xml files for MDB tables as following:
   a. Search for the following: @COLLATE_SENSITIVE@
   b. Replace it with: @COLLATE_INSENSITIVE@
2. Retry upgrading or installing CA Service Management 17.4

Unable to execute CA EEM safex commands and ant commands like 'backup-eem-app' and 'restore-eem-app' in CA Service Catalog machine installed on Windows 2k22 operating system.

Problem: Unable to execute CA EEM safex commands and ant commands like 'backup-eem-app' and 'restore-eem-app' in CA Service Catalog machine that is installed on Windows 2k22 operating system.

Solution: Install Microsoft Visual C++ 2010 x64 Redistributable Package in CA Service Catalog installed machine which can be downloaded from here https://www.microsoft.com/en-us/download/details.aspx?id=26999

Submenu is missing under Catalog Tab with Administrator Privileged Role.

Problem: Submenu is missing under Catalog Tab with Administrator Privileged Role.

Solution: Follow these steps to resolve the issue:

1. Login to EEM using Eiamadmin super user account and select Service Catalog as an Application from the dropdown.
2. Click Manage Access Policies Tab - under Access Policies.
3. Click **Explicit Denies** Tab and click **Dashboard.**
   a. Edit and update filters value for “ACL_restrict_unwanted_Dashboards” access policy by adding “,17.4” to the list.
4. In **Explicit Denies** tab, click **Guinode**.
   a. Edit and update filters value for “ACL_restrict_unwanted_Guinodes” access policy by adding “,17.4” to the list.
   b. Edit and update filters value for “ACL_restrict_r11_Guinodes” access policy by adding “,17.4” to the list.
5. In Explicit Denies tab and click Launchpad.
   a. Edit and update filters value for “ACL_restrict_r11_Launchpads” access policy by adding “,17.4” to the list.
   b. Edit and update filters value for “ACL_restrict_unwanted_Launchpads” access policy by adding “,17.4” to the list.

      NOTE
      Ensure that there are no spaces between the values.

After Configuration of CA Service Catalog-MDB task failure

Problem: After Configuration of CA Service Catalog - MDB task failure in the installer, navigate.

- The following compilation errors occur after deploying the CustomJavaScript customization:
  a. Custom scripts of the customer can fail after jQuery upgrade.
  b. Administrators may have customizations in xsl files such as catalogbrowse.xsl, catalogbrowse_layout8.xsl, cataloggetchildren.xsl, and writing their scripts in custom_form_lib.js or by adding new files under filestore.
  c. Users write form scripts in the form designer page.

     NOTE

     - We recommend that administrators use OOTB Form APIs and JavaScript code.
     - jQuery has been upgraded to the latest version (from 1.6.4 to 3.6.2) as part of 17.4 release. If jQuery APIs that are being used are deprecated or deleted from the latest versions of jQuery, this may break their custom functionality.

Resolution: The customers must validate their custom code and ensure deprecated jQuery or removed APIs are not being used; if they are in use, resolve them by following the jQuery upgrade guidelines at https://jquery.com/upgrade-guide.

Mobile App

Ticket Details Not Displayed

Problem: Analysts cannot view the details of tickets in the mobile app.

Solution: For attributes to appear in the mobile app, administrators must configure and enable them.**Perform the following steps**

1. Configure mobile attributes. Follow Configure the Mobile Attributes for Tickets.
2. To enable the mobile attribute in the mobile app, navigate to **Administration** >**xFlow Interface** > **Object Attributes**.
   a. Select the mobile attribute.
   b. Click Edit.
   c. Select the **Show in Mobile Attributes** checkbox.
   d. Select Save.
3. Restart the CA xFlow Interface service.

CA Asset Portfolio Management

Unable to add cost to an asset in a localized environment

Problem: Unable to add cost to an asset with Data Importer in any localized environment.

Solution: There is no workaround available for this issue.

CA Asset Portfolio Management (APM) Installation Fails.

Problem: CA APM installation fails during the 'Preparing installation of CA APM' step, and the following error message is displayed: "**Exit code is non 0**".

Solution: This issue occurs when any other software is installed on the same server, that requires a system restart. Restart the server and install CA APM again.

Tenancy Management Page Does not Display on Google Chrome and Microsoft Edge

Problem: This is valid on all supported operating environments with Google Chrome and Microsoft Edge browsers.

Solution: Common Administration for Service Management (CASM) component provides multi-tenancy administration for CA APM. If you plan to perform Tenancy Management in CA APM, use a browser other than Google Chrome and Microsoft Edge.

CA Asset Portfolio Management shows incorrect version information

Problem: After CA Asset Portfolio Management is installed, the version information is displayed as 17.0.0.1034, instead of 17.4.

Solution: There is no workaround available for this issue.

Incorrect Microsoft SQL Server/ Oracle Database Version is Displayed

Problem: Login to CA APM. Navigate to **Administration**, **system configuration**, **Database**, MS SQL Server Microsoft SQL Server version is always displayed as '**MS SQL SERVER 2008'** instead of the correct installed Microsoft SQL Server versions (for example, 'MS SQL SERVER 2016/'MS SQL SERVER 2018)

Solution:

Perform the following steps for Microsoft SQL Server:

1. Launch the Microsoft SQL Developer tool to connect to MDB database,
2. Open a new SQL Worksheet and execute the following query:
   ```
   select * from AL_CDB_CONFIGURATIONPARAMETERS  where  CONFIGVALUE='MS SQL SERVER 2008' and
    componentkey='Database' and configkey='SqlServerVersionddl';
   ```
3. If the search result shows a record finding, run the following query.
   ```
   update AL_CDB_CONFIGURATIONPARAMETERS set  CONFIGVALUE='MS SQL SERVER 2016' where CONFIGVALUE='MS SQL
    SERVER 2008' and componentkey='Database' and configkey='SqlServerVersionddl';
   ```
4. In above query, locate **set CONFIGVALUE='MS SQL SERVER 2016'** replace it with **CONFIGVALUE='<MS SQL SERVER VERSION>'** as per the SQL Server version installed in your environment.
5. Perform an IISReset.

Perform the following steps for Oracle Server:

1. Launch the SQL Developer tool to connect to MDB database.
2. Open a new SQL Worksheet and execute the following query:
   ```
   select * from AL_CDB_CONFIGURATIONPARAMETERS  where  componentkey='Database' and
   configkey='SqlServerVersionddl';
   ```
3. If the search result shows a record finding, run the following query as per the Oracle version installed in your environment, for Oracle19c:-
   ```
   update AL_CDB_CONFIGURATIONPARAMETERS set  CONFIGVALUE='Oracle 19c' where componentkey='Database' and
    configkey='SqlServerVersionddl';
   commit;
   ```
   For 21c:

```
update AL_CDB_CONFIGURATIONPARAMETERS set  CONFIGVALUE='Oracle 21c' where componentkey='Database' and
 configkey='SqlServerVersionddl';
commit;
```

4. Perform an IISReset

Add attachments by cut/copy and paste in a ticket in xFlow and ServicePoint.

Problem: The copy/cut and paste of files does not work as expected on Firefox and Microsoft Edge browsers.

Solution: No solution

Supportability Matrix

The Supportability Matrix contains information related to the current release.

The CA Service Management 17.4 Supportability Matrix contains information that is related to the following:

NOTE

CA Service Management supports service packs and point releases not necessarily noted on this matrix as long as the problem reported is reproducible with versions that are listed on the support matrix. CA Technologies reserves the right to refuse support of new point releases should the reported problem require a major redesign to function properly. If the resolution to a problem is determined to be outside the realm of CA Support responsibilities, they may ask that you escalate your request for certification to your local account team.

NOTE
From 17.4.2.0 and later, the following versions are supported:

- JasperReports Server 9.0.0: Refer JasperReports Server
- JasperSoft Studio 9.0.0: Refer JasperSoft Studio

NOTE

From 17.4.2.0 to 17.4.4.0:

- EEM 12.6.7.0: Installers are available in 17.4 RU2 DVD ex: CASM_17.4.2.0\filestore\EEM, for more information refer EEM 12.6.7.
- ITPAM 04.4 CP03: Refer PAM 4.4 CP03.

From 17.4.5.0:

- If EEM is integrated with CASM, It is mandatory to upgrade to EEM 12.7.2.0 before installing CA Service Management 17.4 RU5. For more information refer EEM 12.7.2.0. Installers are available in CASM_17.4.5.0\filestore\EEM.
- From CA Service Management 17.4 RU5 onward, only CA PAM CP04 HF01 is supported. Refer CP04 - HF01. Installers are available in CASM_17.4.5.0\filestore\PAM_4.4_CP04_HF01.

Operating System

- The certified edition of the Microsoft Windows Server platform is Standard, Enterprise, and Data left.
- For configuration on a Linux or Unix server platform, we recommend that you install the database of the product on Linux or Unix platform and access the web client interface on the Windows platform.

Operating System - CA Service Management Solution

Operating System	Version	CA Service Desk Manager	CA Service Catalog	CA Asset Portfolio Management	xFlow / Service Point
Microsoft Windows Server	2022, 2019, 2016	Yes	Yes	Yes	Yes
RHEL 7.2, 8.6 (x86; 64-bit only)		Yes	No	No	Yes
RHEL 9.4 (64-bit only)		Yes (17.4 GA, and 17.4.5.0)	No	No	Yes (17.4 GA, and 17.4.5.0)
SUSE Linux Enterprise Server 12 SP2 (64-bit only)		Yes	No	No	Yes
SUSE Linux Enterprise Server 15.6 (64-bit only)		Yes (17.4 GA, and 17.4.3.0 and above.)	No	No	Yes (17.4 GA, and 17.4.3.0 and above.)

Operating System - Other Components

Operating System	CA EEM (12.6.6, 12.6.7, 12.7.2.0*)	CA Process Auto CP04, 4.4 CP04 H
Microsoft Windows Server 2022	No	Yes
Microsoft Windows Server 2019	Yes	Yes
Microsoft Windows Server 2016	Yes (12.6)	Yes
RHEL 8.1 (x86; 64-bit only)	Yes	Yes
RHEL 9.4	Yes (from 17.4 RU5)	Yes (from 17.4 RU
SUSE Linux Enterprise Server 12 SP2 (64-bit only)	Yes	No
SUSE Linux Enterprise Server 15.6 (64-bit only)	Yes	No

NOTE

- *EEM12.7.2.0 is supported from CASM17.4.5.0 and above.
- *CA PAM 4.4 CP 04 HF01 is supported from CASM17.4.5.0 and above.

Database

The following databases are certified on 64-bit:

IMPORTANT

To enable **SQL Always ON** with listener for Microsoft SQL Server, perform the below post-installation steps for CA Service Catalog ONLY:

1. After configuring the availability group listener, ensure to update the connection string to connect to the **Always On** availability group listener.
2. Open*USM_HOME\config.properties* and update the connection string of DBSource.url key with:

   ```
   ;MultiSubnetFailover=True
   ```

   Use semicolon as a separator in step 2.

   DB Source URL:

```
jdbc:sqlserver://
XX.XX.XXX.XXX:XXXX;instanceName=MSSQLSERVER;databaseName=mdb;SelectMethod=cursor;MultiSubnetFailover=True
```

3. Restart the Service Catalog services.

Database - CA Service Management Solution

Database	CA SDM	CA Service Catalog	CA APM	xFlow int
Microsoft SQL Server 2022	Yes	Yes	Yes	Yes
Microsoft SQL Server 2019	Yes	Yes	Yes	Yes
Microsoft SQL Server 2017	Yes	Yes	Yes	Yes
Microsoft SQL Server 2016	Yes	Yes	Yes	Yes
Oracle 21c	Yes	Yes	Yes*	Yes
Oracle 19c	Yes	Yes	Yes**	Yes
Oracle 19c RAC	Yes	Yes	Yes**	Yes

NOTE
Prerequisite for MS SQL Server 2022: Microsoft has removed the SQL Native Client 11 for out of the box SQL 2022. CA Service Management uses SQL Native Client 11, you must manually install it from the Microsoft website. Download the 64-bit SQL Native Client 11", named as Microsoft® SQL Server® 2012 Native Client from: https://www.microsoft.com/en-us/download/confirmation.aspx?id=50402

NOTE

- * CA APM - For installing CA APM on Oracle 21c database with Oracle 21c 32-bit client, add a new system environment variable "TNS_ADMIN" on the CA APM Web/Application servers. This variable value must point to the Oracle 21c client installed location. Set the variable value as <oracle_client_installed_location>\product \21.0.0\client_1\network\admin
- **CA APM uses Oracle 19c 32-bit client.

Database - Other Components

Database	CA Process Automation (4.3.5 CP08, 4.4, 4.4 CP02, 4.4 CP03, 4.4 CP04, 4.4 CP04 HF01)	JasperReports Server 9.0.0, 8.1.1/ Studio 9.0.0, 8.1.0

CA Spectrum Automation 25.04.1	Yes (From 17.4 RU5)	No	No
CA Service Operations Insight (SOI) 4.0 SP2	Yes	No	No
CA Configuration Automation (CCA) 12.9.0.54	Yes	No	No
CA Identity Manager 12.6.8	Yes	No	No
Microsoft SharePoint 2016	Yes	No	No

Interoperability

CA recommends upgrading all the Service Management capabilities in a customer environment using the common installer and common administration capabilities that are available with CA Service Management 17.4 solution. If you plan to upgrade product by product in a phased manner, the information in below tables can be used as a guideline to see the interoperability among the Service Management capabilities.

NOTE
Upgrade to EEM-12.6.6.0 and ITPAM-4.4 CP2 before upgrading to CASM 17.4 GA.

NOTE
If you have xFlow and CA Service Point installed in your environment, upgrade the 17.4 CA Service Catalog. Then upgrade CA SDM and its sub-components (i.e., xFlow/ CA Service Point and Search Server) concurrently.

Interoperability for CA Service Management

CA SDM	XFlow/ Service Point and Search Server	CA Catalog	ITAM
17.3 GA to 17.3 RU11	17.3 GA to 17.3 RU11	17.3 GA to 17.3 RU11	17.4 G
17.3 RU12 to RU23	17.3 RU12 to RU23	17.3 RU12 to RU23	17.4 G
17.3 GA to 17.3 RU11	17.3 GA to 17.3 RU11	17.4 GA	17.4 G
17.3 RU12 to RU23	17.3 RU12 to RU23	17.4 GA	17.4 G
17.4 GA	17.4 GA	17.4 GA	17.3 G
17.4 GA	17.4 GA	17.4 GA	17.3 R

17.4 RU5	17.4 RU5	17.4 RU5	17.4 R

Compliance

Compliance - CA Service Management Solution

Accessibility	CA SDM	CA Service Catalog	CA APM	xFlow/ Service Point
Section 508 Compliance	Yes	Yes *	Yes *	Yes *
Web Content Accessibility Guidelines (WCAG) 2.0 and 2.1	Yes	Yes *	Yes *	Yes *

F5 Networks	Yes	Yes	Yes
Microsoft NLB	No	No	Yes

Product Documentation

The CA Service Management solution documentation is available in the following languages. Some of the products in the solution support other languages such as Canadian French, Traditional Chinese, Danish, and so on, which are not supported by documentation. Refer to the English documentation for such languages.

Documentation - CASM Solution

- English
- French
- Spanish
- Brazilian Portuguese
- German

Internationalization and Localization

An Internationalized product (also referred to as a language-certified product) is an English-language product that runs on local language versions of the supported operating system and required third-party products.

Internationalized products support local language data for input and output, and also support the ability to specify local language conventions for date, time, currency, and number formats.

> **NOTE**
> CA Service Management 17.4 will support partial translations for German and Italian languages. New Features strings will not be translated in these languages and will appear in English.

The following must be considered:

- CA Business Intelligence JasperReports Server is supported only in English.
- The reports are localized in the following languages:
  - CA Service Desk Manager 17.4: French, German, Italian, Japanese, Spanish, and Brazilian Portuguese

Localized Versions of The Product Supported Based on Operating System

Language	Operating System
English	Windows and Linux
French	Windows and Linux
German	Windows and Linux
Spanish	Windows
Brazilian Portuguese	Windows

Internalization - CASM Solution

Check out where we're going; attend a CA Product Roadmap Session

Latest updates about CA Service Management.

We are always listening to our customers, and one of the most common requests we receive is for insight into our Product roadmap. You can now join your industry peers to hear directly from our product management team about the future direction of our products. By attending the product roadmap and feedback sessions, you will gain firsthand knowledge about upcoming product functionality and features along with architectural enhancements. At Broadcom, we strive to eliminate the barriers between your ideas and the business outcomes you seek.

Product management regularly hosts Office Hours, bimonthly on Thursdays . You can see the upcoming event on our community page.

Defect Resolution Process

A customer reported issue is characterized as a defect. This article outlines the process for defect triage, defect resolution, and the delivery cadence.

In CA Service Management, customer reported issue is characterized as a defect. This article outlines the process for defect triage, defect resolution, and the delivery cadence.

How to Report a Defect

CA Support is a one-point destination for reporting a product defect.

For other queries, ideas, tips, and feature enhancements, that do not fit the definition of a defect, can be submitted in the CA Service Management community. The community provides a unique opportunity to network and help you maximize your software investment by tapping into a community of expertise, open 24/7.

Defect Triage

Each defect is triaged and subsequently a technical severity is assigned to the defect, by the Customer Voice team (CV Team).

The technical severity mentioned above is different from the CA Support case assignment severity. The technical severity helps prioritize workload within the CV Team for the purpose of delivering solutions to reported defects.

NOTE

All defects that are triaged and determined to be an enhancement request should be submitted as idea for consideration in future releases. The idea must be submitted by the customer in the CA Service Management community.

Severity	Description	Criteria
S1	System-down or a product-inoperative condition impacting production environment, and an immediate workaround is not available.	• Causes downtime • Irrecoverable data corruption • Daily application crash • Critical security exploits • Blocks a critical business functionality.

S2	A high-impact business condition possibly endangering a production environment.	• Blocks a product functionality with no available workaround • Impacts but does not block a critical business functionality • Causes recoverable data corruption or loss • Pertains to significant performance degradation • Causes localization defects that make the functionality unusable • Causes application crash weekly or less frequently
S3	A low-impact business condition with most software functions still usable; however, some circumvention might be required to provide service.	• Impairs users ability to use full functionality set of the product • Might have a reasonable work-around • Insignificant performance degradation • Incomplete/Incorrect un-installation of the application • Incorrect error or log messages • Accessibility or usability defects causing minor inconvenience
S4	A minor problem or question that does not affect the software function.	• Causes confusion or inconvenience but does not result in loss of functionality • Low business impact • Low visibility or impacts small set of users

Defect Communication

All customer reported defects can be tracked through Broadcom Support Online. An update is provided when the triage is complete. The frequency of updates for an S1 is high. For lower severity defect, the updates are available based on the progress milestones.

Cadence for Delivery Method

Defect fixes are delivered quarterly through either a cumulative patch, a roll-up patch, or GA release.

TIP

- `We recommend that you review and meet the prerequisites before you install either a cumulative patch, a roll-up patch, or GA release.`
- Before applying either a cumulative patch, roll-up patch, or a release, we recommend that you verify them in a test environment that is a representative of your production environment in terms of the configuration and data volume.
- A cumulative patch, and roll-up patch is available for download from the Solutions and Patches page. The GA release is available through the CA Service Management Product Download page.
- Mobile App updates are made available through Google Play or Apple App Store.

A cumulative patch or the next release will contain fixes from the previous cumulative patches, roll-up patches, and test fixes (released, and unreleased). A cumulative patch ensures optimal performance and seamless system maintenance. Also, it reduces the overall patch level complexity and ensures that the collection of fixes are interoperable as they undergo a complete QA lifecycle.

A roll-up patch contains the fixes for S1, S2 defects since the last cumulative patch or roll-up patch. The roll-up patch undergoes QA testing that is limited to the following:

- Verification of the fix that is resolved in the patch.
- Regression and integration test coverage that is limited to the impacted product area.

Severity	Delivery Method	Additional Information
S1	Test fix*	A work-around or test fix is provided to the affected customers to support business continuity based on the latest cumulative patch or roll-up patch.
S2	Cumulative patch	Resolution for a S2 defect will be provided through the next available cumulative patch, roll-up patch, or product release. In critical cases, a test fix may be provided to the customer based on the latest cumulative/roll-up patch level.
S3	Cumulative patch or future release	Resolution of a S3 defect will be provided on a case-by-case basis either through a cumulative patch or a future release based on the complexity and risk.
S4	Selected defects in a cumulative patch or a future release	Low severity defects that affect several customers would be considered for resolution in a cumulative patch or a future release. Other S4 defects are closed.

* indicates Test fixes are not provided for xFlow Interface, CA ITAM, and Mobile App.

Product Accessibility Features

CA Technologies is committed to helping users with a wide range of abilities to use our products and supporting documentation to accomplish vital business tasks. This section outlines the accessibility features that are part of the CA Service Management product solution.

CA Technologies is committed to helping users with a wide range of abilities to use our products and supporting documentation to accomplish vital business tasks. This section outlines the accessibility features that are part of the CA Service Management product solution.

This section contains the following topics:

Product Enhancements

CA Service Management offers accessibility enhancements in the following areas:

- Display
- Sound
- Keyboard
- Mouse

NOTE

The following information applies to Windows-based and Macintosh-based applications. Java applications processed on many host operating systems, some of which already have assistive technologies available to

them. For these existing assistive technologies to provide access to programs written in JPL, they need a bridge between themselves in their native environments and the Java Accessibility support that is available from within the Java virtual machine (or Java VM). This bridge has one end in the Java VM and the other on the native operating environment, so it will be slightly different for each operating environment it bridges to. Sun is currently developing both the JPL and the Win32 sides of this bridge.

Display

To increase visibility on your computer display, you can adjust the following options:

Font style, color, and size of items

Lets you select font color, size, and other visual combinations.

Screen resolution

Lets you change the pixel count to enlarge objects on the screen.

Cursor width and blink rate

Lets you make the cursor easier to find or minimize blinking.

Icon size

Lets you make icons larger for visibility or smaller for increased screen space.

High contrast schemes

Lets you select color combinations that are easier to see.

Sound

Use sound as a visual alternative or to make computer sounds easier to hear or distinguish by adjusting the following options:

Volume

Lets you turn the computer sound up or down.

Text-to-Speech

Lets you hear command options and text read aloud.

Warnings

Lets you display visual warnings.

Notices

Gives you aural or visual cues when accessibility features are turned on or off.

Schemes

Lets you associate computer sounds with specific system events.

Captions

Lets you display captions for speech and sounds.

Keyboard

You can make the following keyboard adjustments:

Repeat Rate

Lets you set how quickly a character repeats when a key is struck.

Tones

Lets you hear tones when pressing certain keys.

Sticky Keys

Lets those who type with one hand or finger select alternative keyboard layouts.

Mouse

You can use the following options to make your mouse faster and easier to use:

Click Speed

Lets you select how fast to click the mouse button to make a selection.

Click Lock

Lets you highlight or drag without holding down the mouse button.

Reverse Action

Lets you reverse the functions controlled by the left and right mouse keys.

Blink Rate

Lets you select how fast the cursor blinks or if it blinks at all.

Pointer Options

Lets you complete the following tasks:

- Hide the pointer while typing
- Show the location of the pointer
- Set the speed that the pointer moves on the screen
- Select the pointer's size and color for increased visibility
- Move the pointer to a default location in a dialog box

Keyboard Shortcuts

The following table lists the supported keyboard shortcuts. These keyboard shortcuts are applicable to all CA Service Management products - CA Service Desk Manager, CA Service Catalog, and CA Asset Portfolio Management.

Keyboard	Description
Ctrl+X	Cut
Ctrl+C	Copy
Ctrl+K	Find Next
Ctrl+F	Find and Replace
Ctrl+V	Paste
Ctrl+S	Save
Ctrl+Shift+S	Save All
Ctrl+D	Delete Line
Ctrl+Right	Next Word
Ctrl+Down	Scroll Line Down
End	Line End

xFlow Interface Shortcuts	
Alt+m	Notification icon. Displays the Notification overlay with the focus on *Mark All As Read* option.
Alt+t	Brings the focus to Tickets in Streams.
Alt+s	Save stream. In the stream builder, when you create or edit a stream, click Alt+s to save the stream.
Alt+c	Cancel stream. In the stream builder, when you create or edit a stream, click Alt+c to cancel creating or editing the stream.
Alt+p	New Message button in Team Messages. When a new message is added while the Team Messages page is open, a pop-up appears displaying the New Messages button. Click on the button to display the latest messages.
xFlow Interface Calendar Shortcuts	
Left arrow	Focus on the previous date.
Right arrow	Focus on the next date.
Up arrow	Focus on the same day in the previous week.
Down arrow	Focus on the same day in the next week.
Page Up	Focus on the same date in the previous month.
Page Down	Focus on the same date in the next month.
Home	First date of the view
End	Last date of the view
Enter	Select the date
Space	Select the date
Esc	Close the calendar and focus on the input
CA Service Desk Manager Keyboard Shortcuts	
List Page	
Alt+C	Activates the List Edit Cancel button to cancel edit mode and discard all unsaved updates. Does nothing if not in List Edit mode.
Alt+E	Activates the Edit in List button to switch to List Edit mode.
Alt+G	Switches focus to the object type dropdown select in the Go button frame.
Alt+M	Switches focus to the first menu in the main menu bar (the File menu).
Alt+P	Switches focus to the first tab in the product toolbar (the Service Desk tab).
Alt+S	Activates the Search button to request a new search.

Alt+X	Switches focus to the top of the tree control in the left frame of the current page. There are left-frame tree controls on all tabs of the main page, the Knowledge Categories form, and the Knowledge Tree Designer. Alt+X has no effect if the current page does not include a left frame containing a tree control.
Ctrl+W	Closes the browser.
Detail Pages	
Alt+C	In edit mode, activates the Cancel button to return to read-only mode and discard all unsaved changes. Does nothing in read-only mode.
Alt+E	In read-only mode activates the Edit button to switch to edit mode.
Alt+G	Switches focus to the object type dropdown select in the Go button frame.
Alt+M	Switches focus to the first menu in the main menu bar (the File menu).
Alt+N	Switches focus to the first link on the index of the page's notebook (if present).
Alt+P	Switches focus to the first tab in the product toolbar (the Service Desk tab).
Alt+S	In edit mode, submits the form by activating the Save, Continue, OK, or Finished button. In read-only mode, activates the Search button on the first deferred tab containing a list page or does nothing if no exposed deferred tabs contain a list page.
Alt+number	Switches focus to the notebook index link for one of the ten tabs in the notebook. Alt+1 switches focus to the index link of the first tab; Alt+2 to that of second tab; and so on to Alt+0, which switches focus to the index link of the tenth tab. In Internet Explorer, you must activate the link by pressing Enter after the pressing the access key. In Mozilla, the link is automatically activated when you press the access key.
Alt+X	Switches focus to the top of the tree control in the left frame of the current page. There are left-frame tree controls on all tabs of the main page, the Knowledge Categories form, and the Knowledge Tree Designer. Alt+X has no effect if the current page does not include a left frame containing a tree control.

CA Service Catalog Accessibility

Note: Accessible Shortcut keys provided with the CA Service Catalog application may not work if your system or toolbar plugins are using a similar set of shortcut keys. Ensure to close such plugins before using the access keys provided with CA Service Catalog.

Note: The JAWS screen reader by design reads outs the first data column associated with a CA Service Catalog Form Designer table. When you focus on a checkbox associated with a form designer table, JAWS reads outs the data column associated with the checkbox. If you have customized the data columns and have added images, icons, or HTML values, JAWS will read these. Hence, it is recommended that you enter only plain text or numerical values in the table's first data column so that meaningful context is read out by JAWS.

Note: The JAWS Screen Reader while navigating through the CA Service Catalog Service Offering tree view may read out either '**Blank**' at the beginning of each service designer folder or may read out '**List End**' as you navigate to the next service level folder.

CA Service Catalog Keyboard Shortcuts	Description

Ctrl+Shift+Z	Reach the first service offering from the category tree in the browse widget.
v (small letter)	Open the popup window when you click the links in the list widget.
Ctrl+Shift+O	Reach the first button in button area when a request form is loaded and the focus is at any place in between the form.
Ctrl+Alt+A	Adds a form, folder, or service offering.
Ctrl+Shift+X	Cut a folder or a service offering
Ctrl+Shift+C	Copy a folder or a service offering
Ctrl+Shift+V	Paste a folder or a service offering
Ctrl + Enter	Opens the Attribute value editor popup window
Alt+S	To focus on the forms and folders search text field
Ctrl+Alt+V	Save
Ctrl+Alt+D	Delete
Ctrl+Alt+E	Rename
Ctrl+Alt+Z	Customize
Ctrl+Alt+H	Paste As Inherited
Ctrl+Alt+L	Opens the Localization Dialog.
Ctrl+Alt+J	Opens the Script dialog if a form is selected.
Ctrl+Alt+R	Restores the unsaved changes with the saved changes.
Ctrl+Alt+A	To add a Folder or add a service offering
CA Service Catalog Date (Calendar) Keyboard Shortcuts	Description
Left arrow	Move focus to the previous day.
Right arrow	Move focus to the next day.
Up arrow	Move focus to the same day of the previous week.
Down arrow	Move focus to the same day of the following week.
Page Up	Move focus to the same date of the previous month.
Page Down	Move focus to the same date of the following month.
Shift+Page Up	Move focus to the same date of the previous year.
Shift+Page Down	Move focus to the same date of the following year.
Home	Move to the first day of the month.
End	Move to the last day of the month
Tab	Navigate between calendar grid and other elements in the calendar.
Enter/Space	Select date if there is no time component in a calendar or else use the OK button to select a date.
Esc	Close the calendar and focus on the input
Note: The A, C, D, E, F, H, T, V, X, Z access keys are browser specific (IE and other browsers). Numeric keys 0, 1, 2, 3, 4, 5, 6, 7, 8, and 9 can also be used as Access Keys.	
Access or Hot Keys	**Button Name**

Alt + B	Back BI Launch Pad Change the Business Unit Browse Offerings
Alt + G	GO and Next Configure Define SOG
Alt + I	Edit Edit Tasks Edit account Edit-group Finish Define Dependencies Definition Search
Alt + J	Test Create Data Object Save & Test
Alt + K	• OK • Checkout • Tracking
Alt + L	• Delete • Delete Items • Delete Tasks
Alt + M	• Add • Add User • Add News Messages • Add Cart • Add Sub Unit • Email • Column Rules • Add Option • Add Sub Types • Resume link • CA CMDB Association
Alt + N	• Cancel • Close • Close Window
Alt + O	• Done • Set Folders • Organize options • Options • Hold link • Define offering Selection
Alt + P	• Set Permissions • Publish To Dashboard Delivery • Push Through Request
Alt + Q	• Request

Alt + R	• Refresh • Reset • Remove • Create • Erase All Rules • Search
Alt + S	• Save • Send • Share • Search • Create variable • Save Variable • Save Dependencies
Alt + U	• Submit • Save and Submit Cart • Launch • Feature • Update Configuration • Unshared • Upload • Update • Audit Trail
Alt + W	• Create Data view • View Scheduler system alerts • Preview
Alt + Y	• Copy • Modify • Modify Settings • Modify the account list • Save as Copy • CA EEM

Numeric Access Keys to Switch Tabs	**Tab Name**

Alt+Shift+Ctrl+L	Resize a Dialog Box to the Left
ESC	Close a Dialog Box
Ctrl+Shift+Down	View the Contents of a Drop-Down List

"Skip to Main Content" Navigation

The user interface has a **Skip to Main Content** link that allows users to quickly navigate to the first data field in the user interface without having to tab multiple times to get to the main content on the page.

In CA SDM, this link exists as **Skip Navigation**. This link allows the Screen Reader users to skip the in-between links and navigate to the main content page. This link is available by default for the Customer and Employee roles. For the Analyst role, the link is available only when the Screen Reader mode is enabled.

Product Names and Abbreviations

This page lists all the product names and abbreviations in CA Service Management.

This documentation references the following products and abbreviations:

- CA Service Desk Manager (CA SDM)
- CA Asset Portfolio Management (CA APM)
- CA Service Catalog (CA SC)
- CA Embedded Entitlements Manager (CA EEM)
- CA Process Automation (ITPAM)
- CA Business Intelligence (CABI JasperSoft Reports)
- CA Service Desk Manager Advanced Availability (AA)

Third-Party License Acknowledgments

This article contains all third-party software license agreements for applications that are included as part of CA Service Management 17.4. All third-party software has been used in accordance with the terms and conditions for use, reproduction, and distribution as defined by the applicable license agreements. Download the CA Service Management Third Party Licences to read the license agreements.

Table 1: Third-Party Software License Acknowledgements

S.No	Software Component Name	License Acknowledgement Legal Document Details
1.	Abdera 1.1.	Legal_Doc_00002556_8.pdf
2.	ActiveMQ 5.13.0	Legal_Doc_00001418_13.pdf
3.	Adaptive Communication Environment (ACE) 5.5.10	None

4.	Adaptive Communication Environment (ACE) 5.7.8	ACE 5.7.8 - This product includes Adaptive Communication Environment (ACE)5.7.8, which is distributed in accordance with the following terms: Copyright and Licensing Information for ACE(TM), TAO(TM), CIAO(TM), and CoSMIC(TM) [1]ACE(TM), [2]TAO(TM), [3]CIAO(TM), and [4]CoSMIC(TM) (henceforth referred to as "DOC software") are copyrighted by [5]Douglas C. Schmidt and his [6]research group at [7]Washington University, [8]University of California, Irvine, and [9]Vanderbilt University, Copyright (c) 1993-2010, all rights reserved. Since DOC software is open-source, freely available software, you are free to use, modify, copy, and distribute--perpetually and irrevocably--the DOC software source code and object code produced from the source, as well as copy and distribute modified versions of this software. You must, however, include this copyright statement along with any code built using DOC software that you release. No copyright statement needs to be provided if you just ship binary executables of your software products. You can use DOC software in commercial and/or binary software releases and are under no obligation to redistribute any of your source code that is built using DOC software. Note, however, that you may not do anything to the DOC software code, such as copyrighting it yourself or claiming authorship of the DOC software code, that will prevent DOC software from being distributed freely using an open-source development model. You needn't inform anyone that you're using DOC software in your software, though we encourage you to let [10]us know so we can promote your project in the [11]DOC software success stories. The [12]ACE, [13]TAO, [14]CIAO, and [15]CoSMIC web sites are maintained by the [16]DOC Group at the [17]Institute for Software Integrated Systems (ISIS) and the [18]Center for Distributed Object Computing of Washington University, St. Louis for the development of open-source software as part of the open-source software community. Submissions are provided by the submitter ``as is'' with no warranties whatsoever, including any warranty of merchantability, noninfringement of third party intellectual property, or fitness for any particular purpose. In no event shall the submitter be liable for any direct, indirect, special, exemplary, punitive, or consequential damages, including without limitation, lost profits, even if advised of the possibility of such damages. Likewise, DOC software is provided as is with no warranties of any kind, including the warranties of design, merchantability, and fitness for a particular purpose, noninfringement, or arising from a course of dealing, usage or trade practice. Washington University, UC Irvine, Vanderbilt University, their employees, and students shall have no liability with respect to the infringement of copyrights, trade secrets or any patents by DOC software or any part thereof. Moreover, in no event will Washington University, UC Irvine, or Vanderbilt University, their employees, or students be liable for any lost revenue or profits or other special, indirect and consequential damages. DOC software is provided with no support and without any obligation on the part of Washington University, UC Irvine, Vanderbilt University, their employees, or students to assist in its use, correction, modification, or enhancement. A [19]number of companies around the world provide commercial support for DOC software, however. DOC software is Y2K-compliant, as long as the underlying OS platform is Y2K-compliant. Likewise, DOC software is compliant with the new US daylight savings rule passed by Congress as "The Energy Policy Act of 2005," which established new daylight savings times (DST) rules for the United States that expand DST as of March 2007. Since DOC software obtains time/date and calendaring information from operating systems users will not be affected by the new DST rules as long as they upgrade their operating systems accordingly. The names ACE(TM), TAO(TM), CIAO(TM), CoSMIC(TM), Washington University, UC Irvine, and Vanderbilt University, may not be used to endorse or promote products or services derived from this source without express written permission from Washington University, UC Irvine, or Vanderbilt University. This license grants no permission to call products or services derived from this source ACE(TM), TAO(TM), CIAO(TM), or CoSMIC(TM), nor does it grant permission for the name Washington University, UC Irvine, or Vanderbilt University to appear in their names. If you have any suggestions, additions, comments, or questions, please let [20]me know. [21]Douglas C. Schmidt License URL: http://www.cs.wustl.edu/~schmidt/ACE-copying.html

5.	Adobe Flex SDK 3.4	Present the following in the Third Party Terms section of the CA EULA and the Acknowledgement section in the CA product user documentation, all in accordance with Tech Pub guidelines: ADOBE FLEX SDK 3.4 This CA product contains the above software, the use of which is governed by the following additional terms: 1. 54	Apache log4cxx 0.10.0	This product includes Apache log4cxx 0.10.0 and is distributed in accordance with the following license agreement (Apache License Version 2.0, January 2004 http://www.apache.org/licenses/ TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION 1. Definitions. "License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document. "Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License. "Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity. "You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License. "Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files. "Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types. "Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below). "Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof. "Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution." "Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work. 2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form. 3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed. 4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions: You must give any other recipients of the Work or Derivative Works a copy of this License; and You must cause any modified files to carry prominent notices stating that You changed the files; and You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and If the Work includes a "NOTICE" text file as part of its distribution,

55	Apache log4j 1.2.15	This product includes Apache log4j 1.2.15 and is distributed in accordance with the following license agreement:Apache License Version 2.0, January 2004 http://www.apache.org/ licenses/ TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION 1. Definitions. "License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document. "Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License. "Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity. "You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License. "Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files. "Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types. "Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below). "Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types. "Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below). "Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof. "Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution." "Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work. 2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form. 3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed. 4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions: (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and (b) You must cause any modified files to carry prominent notices stating that You changed the files; and (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of

Definitions. 'License' shall mean the terms and conditions for use, reproduction,and distribution as defined by Sections 1 through 9 of this document. 'Licensor' shall mean the copyright owner or entity authorized by the copyright owner that is granting the License. 'Legal Entity' shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, 'control' means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity. 'You' (or 'Your') shall mean an individual or Legal Entity exercising permissions granted by this License. 'Source' form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files. 'Object' form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and versions to other media types. 'Work' shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work(an example is provided in the Appendix below). 'Derivative Works' shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof. 'Contribution' shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, 'submitted' means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as 'Not a Contribution.' 'Contributor' shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work. 2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form. 3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s)with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed. 4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions: (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and (b) You must cause any modified files to carry prominent notices stating that You changed the files; and (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and (d) If the Work includes a 'NOTICE' text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part

89	Commons IO 1.3.2	This product includes Apache Jakarta Commons IO 1.3.2 which is distributed in accordance with the following license agreement:Apache License Version 2.0, January 2004 http://www.apache.org/licenses/ TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION 1. Definitions. "License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document. "Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License. "Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity. "You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License. "Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files. "Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types. "Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below). "Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof. "Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution." "Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work. 2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form. 3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed. 4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions: (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and (b) You must cause any modified files to carry prominent notices stating that You changed the files; and (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and (d)

For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity. "You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License. "Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files. "Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types. "Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below). "Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof. "Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution." "Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work. 2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form. 3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed. 4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions: (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and (b) You must cause any modified files to carry prominent notices stating that You changed the files; and (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and (d)

157	JAX-RPC 1.1	This product includes JAX RPC , which is distributed in accordance with the following license agreement: Apache License Version 2.0, January 2004 http://www.apache.org/ licenses/ TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION 1. Definitions. "License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document. "Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License. "Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity. "You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License. "Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files. "Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types. "Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below). "Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof. "Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution." "Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work. 2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form. 3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed. 4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions: (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and (b) You must cause any modified files to carry prominent notices stating that You changed the files; and (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and (d) If the Work includes a "NOTICE" text file as part of

171	json-simple 1.1.1	This product includes json-simple 1.0 which is distributed in accordance with the following license agreement: Apache License Version 2.0, January 2004 http://www.apache.org/ licenses/ TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION 1. Definitions. "License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document. "Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License. "Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity. "You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License. "Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files. "Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types. "Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below). "Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof. "Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution." "Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work. 2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form. 3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed. 4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions: (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and (b) You must cause any modified files to carry prominent notices stating that You changed the files; and (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and (d) If the Work includes a "NOTICE" text file as part of

Definitions. 'License' shall mean the terms and conditions for use, reproduction,and distribution as defined by Sections 1 through 9 of this document. 'Licensor' shall mean the copyright owner or entity authorized by the copyright owner that is granting the License. 'Legal Entity' shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, 'control' means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity. 'You' (or 'Your') shall mean an individual or Legal Entity exercising permissions granted by this License. 'Source' form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files. 'Object' form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and versions to other media types. 'Work' shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work(an example is provided in the Appendix below). 'Derivative Works' shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof. 'Contribution' shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, 'submitted' means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as 'Not a Contribution.' 'Contributor' shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work. 2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form. 3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s)with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed. 4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions: (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and (b) You must cause any modified files to carry prominent notices stating that You changed the files; and (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and (d) If the Work includes a 'NOTICE' text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part

189	Log4j 1.2.17	This product includes Apache Log4j 1.2.17 which is distributed in accordance with the following license agreement:Apache License Version 2.0, January 2004 http://www.apache.org/licenses/ TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION 1. 217	OpenSAML 1.1b	Portions of this product include software developed by the Apache Software Foundation. The Apache software is distributed in accordance with the following license agreement. TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION 1. Definitions. "License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document. "Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License. "Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity. "You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License. "Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files. "Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types. "Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below). "Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof. "Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution." "Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work. 2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form. 3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed. 4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions: You must give any other recipients of the Work or Derivative Works a copy of this License; and You must cause any modified files to carry prominent notices stating that You changed the files; and You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and If the Work includes a "NOTICE" text file as part of its distribution,

231	Oracle JDK (Java Development Kit) 1.6.0	This Product is distributed with Sun JDK 1.6.0 (JAVA SE DEVELOPMENT KIT (JDK), VERSION 6) (Sun JDK). The Sun JDK is distributed in accordance with the Sun Microsystems, Inc. (Sun) Binary Code License Agreement set forth below. As noted in Section G of the Supplemental License Terms of this license, Sun has provided additional copyright notices and license terms that may be applicable to portions of the Sun JDK in the THIRDPARTYLICENSEREADME.txt file that accompanies the Sun JDK. Sun Microsystems, Inc. Binary Code License Agreement for the JAVA SE DEVELOPMENT KIT (JDK), VERSION 6 SUN MICROSYSTEMS, INC. ("SUN") IS WILLING TO LICENSE THE SOFTWARE IDENTIFIED BELOW TO YOU ONLY UPON THE CONDITION THAT YOU ACCEPT ALL OF THE TERMS CONTAINED IN THIS BINARY CODE LICENSE AGREEMENT AND SUPPLEMENTAL LICENSE TERMS (COLLECTIVELY "AGREEMENT"). PLEASE READ THE AGREEMENT CAREFULLY. BY DOWNLOADING OR INSTALLING THIS SOFTWARE, YOU ACCEPT THE TERMS OF THE AGREEMENT. INDICATE ACCEPTANCE BY SELECTING THE "ACCEPT" BUTTON AT THE BOTTOM OF THE AGREEMENT. IF YOU ARE NOT WILLING TO BE BOUND BY ALL THE TERMS, SELECT THE "DECLINE" BUTTON AT THE BOTTOM OF THE AGREEMENT AND THE DOWNLOAD OR INSTALL PROCESS WILL NOT CONTINUE. 1. DEFINITIONS. "Software" means the identified above in binary form, any other machine readable materials (including, but not limited to, libraries, source files, header files, and data files), any updates or error corrections provided by Sun, and any user manuals, programming guides and other documentation provided to you by Sun under this Agreement. "Programs" mean Java applets and applications intended to run on the Java Platform, Standard Edition (Java SE) on Java-enabled general purpose desktop computers and servers. 2. LICENSE TO USE. Subject to the terms and conditions of this Agreement, including, but not limited to the Java Technology Restrictions of the Supplemental License Terms, Sun grants you a non-exclusive, non-transferable, limited license without license fees to reproduce and use internally Software complete and unmodified for the sole purpose of running Programs. Additional licenses for developers and/or publishers are granted in the Supplemental License Terms. 3. RESTRICTIONS. Software is confidential and copyrighted. Title to Software and all associated intellectual property rights is retained by Sun and/or its licensors. Unless enforcement is prohibited by applicable law, you may not modify, decompile, or reverse engineer Software. You acknowledge that Licensed Software is not designed or intended for use in the design, construction, operation or maintenance of any nuclear facility. Sun Microsystems, Inc. disclaims any express or implied warranty of fitness for such uses. No right, title or interest in or to any trademark, service mark, logo or trade name of Sun or its licensors is granted under this Agreement. Additional restrictions for developers and/or publishers licenses are set forth in the Supplemental License Terms. 4. LIMITED WARRANTY. Sun warrants to you that for a period of ninety (90) days from the date of purchase, as evidenced by a copy of the receipt, the media on which Software is furnished (if any) will be free of defects in materials and workmanship under normal use. Except for the foregoing, Software is provided "AS IS". Your exclusive remedy and Sun's entire liability under this limited warranty will be at Sun's option to replace Software media or refund the fee paid for Software. Any implied warranties on the Software are limited to 90 days. Some states do not allow limitations on duration of an implied warranty, so the above may not apply to you. This limited warranty gives you specific legal rights. You may have others, which vary from state to state. 5. DISCLAIMER OF WARRANTY. UNLESS SPECIFIED IN THIS AGREEMENT, ALL EXPRESS OR IMPLIED CONDITIONS, REPRESENTATIONS AND WARRANTIES, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT ARE DISCLAIMED, EXCEPT TO THE EXTENT THAT THESE DISCLAIMERS ARE HELD TO BE LEGALLY INVALID. 6. LIMITATION OF LIABILITY. TO THE EXTENT NOT PROHIBITED BY LAW, IN NO EVENT WILL SUN OR ITS LICENSORS BE LIABLE FOR ANY LOST REVENUE, PROFIT OR DATA, OR FOR SPECIAL, INDIRECT, CONSEQUENTIAL, INCIDENTAL OR PUNITIVE DAMAGES, HOWEVER CAUSED REGARDLESS OF THE THEORY OF LIABILITY, ARISING OUT OF OR RELATED TO THE USE OF OR INABILITY TO USE SOFTWARE, EVEN IF SUN HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. In no event will Sun's liability to you, whether in contract, tort (including negligence), or otherwise, exceed the amount paid by you for Software under this Agreement. The foregoing limitations will apply even if the above stated warranty fails of its essential purpose. Some states do not allow

"Software" means the identified above in binary form, any other machine readable materials (including, but not limited to, libraries, source files, header files, and data files), any updates or error corrections provided by Sun, and any user manuals, programming guides and other documentation provided to you by Sun under this Agreement. "Programs" mean Java applets and applications intended to run on the Java Platform, Standard Edition (Java SE) on Java-enabled general purpose desktop computers and servers. 2. LICENSE TO USE. Subject to the terms and conditions of this Agreement, including, but not limited to the Java Technology Restrictions of the Supplemental License Terms, Sun grants you a non-exclusive, non-transferable, limited license without license fees to reproduce and use internally Software complete and unmodified for the sole purpose of running Programs. Additional licenses for developers and/or publishers are granted in the Supplemental License Terms. 3. RESTRICTIONS. Software is confidential and copyrighted. Title to Software and all associated intellectual property rights is retained by Sun and/or its licensors. Unless enforcement is prohibited by applicable law, you may not modify, decompile, or reverse engineer Software.? You acknowledge that Licensed Software is not designed or intended for use in the design, construction, operation or maintenance of any nuclear facility. Sun Microsystems, Inc. disclaims any express or implied warranty of fitness for such uses. No right, title or interest in or to any trademark, service mark, logo or trade name of Sun or its licensors is granted under this Agreement. Additional restrictions for developers and/or publishers licenses are set forth in the Supplemental License Terms. 4. LIMITED WARRANTY.? Sun warrants to you that for a period of ninety (90) days from the date of purchase, as evidenced by a copy of the receipt, the media on which Software is furnished (if any) will be free of defects in materials and workmanship under normal use.? Except for the foregoing, Software is provided "AS IS".? Your exclusive remedy and Sun's entire liability under this limited warranty will be at Sun's option to replace Software media or refund the fee paid for Software. Any implied warranties on the Software are limited to 90 days. Some states do not allow limitations on duration of an implied warranty, so the above may not apply to you. This limited warranty gives you specific legal rights. You may have others, which vary from state to state. 5. DISCLAIMER OF WARRANTY.? UNLESS SPECIFIED IN THIS AGREEMENT, ALL EXPRESS OR IMPLIED CONDITIONS, REPRESENTATIONS AND WARRANTIES, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT ARE DISCLAIMED, EXCEPT TO THE EXTENT THAT THESE DISCLAIMERS ARE HELD TO BE LEGALLY INVALID. 6. LIMITATION OF LIABILITY.? TO THE EXTENT NOT PROHIBITED BY LAW, IN NO EVENT WILL SUN OR ITS LICENSORS BE LIABLE FOR ANY LOST REVENUE, PROFIT OR DATA, OR FOR SPECIAL, INDIRECT, CONSEQUENTIAL, INCIDENTAL OR PUNITIVE DAMAGES, HOWEVER CAUSED REGARDLESS OF THE THEORY OF LIABILITY, ARISING OUT OF OR RELATED TO THE USE OF OR INABILITY TO USE SOFTWARE, EVEN IF SUN HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.? In no event will Sun's liability to you, whether in contract, tort (including negligence), or otherwise, exceed the amount paid by you for Software under this Agreement.? The foregoing limitations will apply even if the above stated warranty fails of its essential purpose. Some states do not allow the exclusion of incidental or consequential damages, so some of the terms above may not be applicable to you. 7. TERMINATION.? This Agreement is effective until terminated.?

235	PCRE 4.4	Regular expression support is provided by the PCRE library package, which is open source software, written by Philip Hazel, and copyright by the University of Cambridge, England. Source can be found at ftp://ftp.csx.cam.ac.uk/pub/software/programming/pcre/. The University of Cambridgesoftware is distributed in accordance with the following license agreement. PCRE LICENCE ---------- PCRE is a library of functions to support regular expressions whose syntax and semantics are as close as possible to those of the Perl 5 language. Written by: Philip Hazel <ph10@cam.ac.uk> University of Cambridge Computing Service, Cambridge, England. Phone: +44 1223 334714. Copyright (c) 1997-2001 University of Cambridge Permission is granted to anyone to use this software for any purpose on any computer system, and to redistribute it freely, subject to the following restrictions: 1. This software is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. 2. The origin of this software must not be misrepresented, either by explicit claim or by omission. In practice, this means that if you use PCRE in software that you distribute to others, commercially or otherwise, you must put a sentence like this Regular expression support is provided by the PCRE library package, which is open source software, written by Philip Hazel, and copyright by the University of Cambridge, England. somewhere reasonably visible in your documentation and in any relevant files or online help data or similar. A reference to the ftp site for the source, that is, to ftp://ftp.csx.cam.ac.uk/pub/software/programming/pcre/ should also be given in the documentation. However, this condition is not intended to apply to whole chains of software. If package A includes PCRE, it must acknowledge it, but if package B is software that includes package A, the condition is not imposed on package B (unless it uses PCRE independently). 3. Altered versions must be plainly marked as such, and must not be misrepresented as being the original software. 4. If PCRE is embedded in any software that is released under the GNU General Purpose Licence (GPL), or Lesser General Purpose Licence (LGPL), then the terms of that licence shall supersede any condition above with which it is incompatible. The documentation for PCRE, supplied in the "doc" directory, is distributed under the same terms as the software itself.

236	PCRE 6.3	Portions of this product include software developed by Philip Hazel. 287	Struts 1.2.4	The Apache software is distributed in accordance with the following license agreement. Apache License Version 2.0, January 2004 http://www.apache.org/licenses/ TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION 1. Definitions. "License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document. "Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License. "Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity. "You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License. "Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files. "Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types. "Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below). "Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof. "Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution." "Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work. 2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form. 3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed. 4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions: (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and (b) You must cause any modified files to carry prominent notices stating that You changed the files; and (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and (d) If the Work includes a "NOTICE" text file as part of

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files. "Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types. "Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below). "Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof. "Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution." "Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work. 2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form. 3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed. 4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions: (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and (b) You must cause any modified files to carry prominent notices stating that You changed the files; and (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of

300	WSDL4J 1.6.2	This product contains WSDL4J 1.6.2 (Third Party Product) which is governed by the Common Public License v1.0 (CPL). Any provisions that differ from the Common Public License v1.0 are offered by CA alone and not by any other party. CA distributes the Third Party Product in unmodified, binary form, and makes the source code for WSDL4J 1.6.2 available under the terms of the CPL here: http://opensrcd.ca.com. Your use of WSDL4J 1.6.2 is governed by the following terms and conditions:Common Public License - v 1.0 THE ACCOMPANYING PROGRAM IS PROVIDED UNDER THE TERMS OF THIS COMMON PUBLIC LICENSE ("AGREEMENT"). ANY USE, REPRODUCTION OR DISTRIBUTION OF THE PROGRAM CONSTITUTES RECIPIENT'S ACCEPTANCE OF THIS AGREEMENT. 1. DEFINITIONS "Contribution" means: a) in the case of the initial Contributor, the initial code and documentation distributed under this Agreement, and b) in the case of each subsequent Contributor: i) changes to the Program, and ii) additions to the Program; where such changes and/or additions to the Program originate from and are distributed by that particular Contributor. A Contribution 'originates' from a Contributor if it was added to the Program by such Contributor itself or anyone acting on such Contributor's behalf. Contributions do not include additions to the Program which: (i) are separate modules of software distributed in conjunction with the Program under their own license agreement, and (ii) are not derivative works of the Program. "Contributor" means any person or entity that distributes the Program. "Licensed Patents " mean patent claims licensable by a Contributor which are necessarily infringed by the use or sale of its Contribution alone or when combined with the Program. "Program" means the Contributions distributed in accordance with this Agreement. "Recipient" means anyone who receives the Program under this Agreement, including all Contributors. 2. GRANT OF RIGHTS a) Subject to the terms of this Agreement, each Contributor hereby grants Recipient a non-exclusive, worldwide, royalty-free copyright license to reproduce, prepare derivative works of, publicly display, publicly perform, distribute and sublicense the Contribution of such Contributor, if any, and such derivative works, in source code and object code form. b) Subject to the terms of this Agreement, each Contributor hereby grants Recipient a non-exclusive, worldwide, royalty-free patent license under Licensed Patents to make, use, sell, offer to sell, import and otherwise transfer the Contribution of such Contributor, if any, in source code and object code form. This patent license shall apply to the combination of the Contribution and the Program if, at the time the Contribution is added by the Contributor, such addition of the Contribution causes such combination to be covered by the Licensed Patents. The patent license shall not apply to any other combinations which include the Contribution. No hardware per se is licensed hereunder. c) Recipient understands that although each Contributor grants the licenses to its Contributions set forth herein, no assurances are provided by any Contributor that the Program does not infringe the patent or other intellectual property rights of any other entity. Each Contributor disclaims any liability to Recipient for claims brought by any other entity based on infringement of intellectual property rights or otherwise. As a condition to exercising the rights and licenses granted hereunder, each Recipient hereby assumes sole responsibility to secure any other intellectual property rights needed, if any. For example, if a third party patent license is required to allow Recipient to distribute the Program, it is Recipient's responsibility to acquire that license before distributing the Program. d) Each Contributor represents that to its knowledge it has sufficient copyright rights in its Contribution, if any, to grant the copyright license set forth in this Agreement. 3. REQUIREMENTS A Contributor may choose to distribute the Program in object code form under its own license agreement, provided that: a) it complies with the terms and conditions of this Agreement; and b) its license agreement: i) effectively disclaims on behalf of all Contributors all warranties and conditions, express and implied, including warranties or conditions of title and non-infringement, and implied warranties or conditions of merchantability and fitness for a particular purpose; ii) effectively excludes on behalf of all Contributors all liability for damages, including direct, indirect, special, incidental and consequential damages, such as lost profits; iii) states that any provisions which differ from this Agreement are offered by that Contributor alone and not by any other party; and iv) states that source code for the Program is available from such Contributor, and informs licensees how to obtain it in a reasonable manner on or through a medium customarily used for software exchange. When the Program is made available in source code form: a) it must be made available under this Agreement; and b) a copy of this Agreement must be included with each copy of the Program. Contributors may not remove or alter any copyright notices contained within the Program. Each Contributor must identify itself as the originator

301	wss4j 1.6.9	wss4j 1.6.9 This product includes wss4j 1.6.9, which is distributed in accordance with the following license agreement: Apache License Version 2.0, January 2004 http://www.apache.org/licenses/ TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION 1. Definitions. "License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document. "Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License. "Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity. "You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License. "Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files. "Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types. "Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below). "Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof. "Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution." "Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work. 2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form. 3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed. 4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions: (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and (b) You must cause any modified files to carry prominent notices stating that You changed the files; and (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and (d)

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof. "Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution." "Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work. 2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form. 3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed. 4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions: (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and (b) You must cause any modified files to carry prominent notices stating that You changed the files; and (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and (d)

311	Xerces-C 3.2.2	00002556_6_doc_requirements.pdf

312	xercesImpl 2.11.0	This product includes xercesImpl v.2.11.0 which is distributed in accordance with the following license agreement: Apache License Version 2.0, January 2004 http://www.apache.org/ licenses/ TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION 1. Definitions. "License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document. "Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License. "Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity. "You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License. "Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files. "Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types. "Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below). "Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof. "Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution." "Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work. 2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form. 3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed. 4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions: (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and (b) You must cause any modified files to carry prominent notices stating that You changed the files; and (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and (d) If the Work includes a "NOTICE" text file as part of

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below). "Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof. "Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution." "Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work. 2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form. 3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed. 4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions: (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and (b) You must cause any modified files to carry prominent notices stating that You changed the files; and (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and (d)

CA Service Management 17.4.5.0 Release Notes

CA Service Management 17.4.5.0 is a cumulative patch for CA Service Management 17.4. For more information about the contents of previous cumulative patches, see Release Information.

This roll-up patch contains quality and security improvements, for more information review the Fixed Issues section.

Enhancements

- **Axis removal**:

  As announced in CA Service Management 17.4, the CASM suite of products now fully supports **CXF-based web services**, and **AXIS-based web services have been deprecated and are no longer supported**. For more information refer Axis to CXF Migration.
- **Improved Knowledge suggestions in xFlow**: Analysts can now view real-time knowledge and solution suggestions while typing the problem description on the xFlow ticket creation page. For more information refer, View Knowledge Base Documents from Search Results.
- **Direct Link/ Access to Catalog Services or Folders**: You can now access Catalog Services or Folders directly through bookmarked links, enabling faster navigation to frequently used requests or offerings. For more information refer, Bookmark Service Folders/ SDM Service Categories.
- **xFlow Rate Limiting Configuration**: You can now control the number of API requests allowed within a specific time frame using the Rate Limiter Filter. For more information, refer Enable Rate Limiting Configuration.
- **Announcements in xFlow**: This enhancement enables the rendering of announcements within xFlow, extending a feature previously available only in Classic Service Desk and Service Point.
- **Manual Notifications for xFlow**: The Manual Notify feature has been enhanced to provide a more intuitive and flexible notification experience. For more information, refer Manual Notifications for xFlow.
- **POST to GET conversion in CA SDM web interface:** Conversion or simulation of a POST operation using a GET operation is prohibited or strongly discouraged due to the critical security and data integrity risks. For more information, see Options Manager.
- A new FormDesigner JS API (ca_fdClearFieldValue) is now available in CA Service Catalog. This API clears any previously saved values in the DualList component and reloads the component.

  NOTE
  Key Considerations:

  - For CASM 17.4.5.0, you must install EEM 12.7.2.0 first, for installation you must follow the steps mentioned here. Installers are available in CASM_17.4.5.0\filestore\EEM. For more information, refer EEM 12.7.2.0.
  - **ITPAM 4.4 CP04 HF01** must be installed after EEM12.7.2.0 installers are available in ***CASM_17.4.5.0\filestore\PAM_4.4_CP04_HF01***. For installation, refer ITPAM CP04-HF01.
  - **Component Support:** From **CASM 17.4.5.0**, only **EEM 12.7.2.0** and **ITPAM CP04 HF01** are supported. These versions are **not compatible** with CASM 17.4 RU4 or earlier releases.
  - **Rollback Option:** Once upgraded to CASM 17.4.5.0, rollback to earlier versions is not supported. Ensure a full backup before upgrading.
  - **Interoperability**: Cross-version interoperability within CASM 17.4 is not supported. Upgrade all CA Service Management components to 17.4.5.0 to ensure compatibility.

NOTE

- To install CA Service Management 17.4.5.0, see Installing CA Service Management 17.4.5.0
- Uninstallation is not supported for CASM17.4.5.0.
- For troubleshooting of CASM 17.4.5.0, refer Troubleshooting for CASM 17.4.5.0

Certification

CA Service Management is now certified with:

- EEM 12.7.2.0
- ITPAM 4.4 CP04 HF01
- RHEL 9.4
- Siteminder 12.9
- CA Spectrum Automation 25.04.1

Fixed Issues

Fixed Issue ID	Description
Case #36119033	"POST" to "GET" Conversion -A5 - Security Misconfiguration
Case #36555258	Sanitization Tool gives out of memory issues, java.exe using 4.5 GB memory and then throw ""outofmemory"" exception. For more information refer, Admin insights for RTE.
Case #36456991	SDM 17.4.4_OpenJDK Multiple Vulnerabilities
Case #36448333	CASM 17.4.4 - SLCM - Searchserver synch
Case #36386604	In CA SDM, in the "Edit in List" view for workflows, the 'Assignee' and 'Group' fields are now linked. Selecting a group will now correctly filter the assignee list to only show members of that group and vice-versa.

For the complete list, go to Fixed Issues for 17.4.5.0

Fixed Issues for 17.4.5.0

Fixed Issues

Fixed Issue ID	Product	Description
Case #33679939	CA Service Desk Manager	CA SDM 17.3/17.4: Edit-in-List for Workflow Tasks
Case #36140819	CA Service Desk Manager	SDM - getListValues is returning more rows than stated in the documentation
Case #36172525	CA Service Desk Manager	SDM_17.4.03-36172525-incorrect parent child ticket relationship under edit-in-list
Case #36194886	CA Service Desk Manager	SDM - CACF Incident Template
Case #36198988	CA Service Desk Manager	Changing Incident ticket Category through WebServices generates ""Error setting attr 'category' on object '<TICKETPERSID>' to value '<PCAT ID>'
Case #36246397	xFlow/ ServicePoint	Issues in xFlow /ServicePoint functionalities

Fixed Issue ID	Product	Description
Case #36247637	CA Service Desk Manager	CV-GEN-INQUIRY_SDM_17.4 RU3-Ticket Web form is broken when a ticket is created by maileater
Case #36318942	CA Service Point	Certain service offerings not loading in Service Point
Case #36353822	CA Service Point	ServicePoint_17.4.4_Add to Cart and Check out buttons are missing for certain offerings option groups
Case #36374376	CA Service Desk Manager	Maileater does not import html-body to html_description
Case #36386604	xFlow	CASM 17.4.2 xFlow - Activity Feed - system-description missing. For more information, see Troubleshooting xFlow Interface.
Case #36448333	CA Service Desk Manager	CASM 17.4.4 - SLCM - Searchserver synch
Case #36456991	CA Service Desk Manager	SDM 17.4.4_OpenJDK Multiple Vulnerabilities
Case #36477139	CA Service Desk Manager	SDM_17.4.04-36477139-Cannot lock html description field
Case #36517730	CA Service Desk Manager	SDM_17.4.04-36517730-xFlow is not filtering for Affected Service CI's correctly
Case #36519372	xFlow	Lack of Rate Limiting on Sensitive Endpoints – CA Service Point. For more information refer Enable Rate Limiting Configuration.
Case #36555258	CA Service Desk Manager	Sanitization Tool gives out of memory issues, java.exe using 4.5 GB memory and then throw ""outofmemory"" exception. For more information refer, Admin insights for RTE.
Case #36400012	CA Service Desk Manager	The command pdm_replace -f input-file takes the input file from the NX_ROOT folder ONLY. The input file in any other location will lead a input file not found message.
Case #36119033	CA Service Desk Manager	"POST" to "GET" Conversion -A5 - Security Misconfiguration
Case #36422907	CA Service Desk Manager	Either in Incidents, Changes, and Problems, the words / Texts in pointed brackets <...> are deleted
Case #36601047	CA Service Desk Manager	Issue with Knowledge Attachments via WebService.
Case #36451946	ServicePoint	switchScope error in browser console (Service Point)
Case #36443867	ServicePoint	A date type field in Service Point is clearing the value after Chekout
Case #36443739	ServicePoint	Service Point shows This widget does not support CA Workflow based forms.
Case #36385532	ServicePoint	After creating a service request in Service Point the Offering tab disappears.
Case #36400880	ServicePoint	After clicking “Checkout” the request forms are not displayed.
Case #36285144	ServicePoint	setTimeout causing issues in dual list behavior in Service Point Catalog offerings
Case #36415118	ServicePoint	Expand the Comments field width under "Request Details" in Service Point when checking out offering
Case #36353824	ServicePoint	ServicePoint_17.4.4_Requests can not be checked out for certain offering options/forms
Case #36613252	ServicePoint	RU4_Virtual Analyst loses the chat icon reference

Troubleshooting for CASM 17.4.5.0

This page contains troubleshooting issues for CASM 17.4.5.0.

Troubleshooting

1. **Problem**:
   While upgrading to 17.4 RU5, the migration task to CXF endpoint fails in an SSL environment.
   Resolution:
   a. Login to ITPAM environment and navigate to SDM>> Configuration >> SDM Dataset
   b. Update the value of port from non- SSL to SSL port. (for example: from 8080 to 8443)
   c. Click **Retry Install** in the Common Installer.
2. **Problem**:
   The CA Asset Portfolio Management post-installation task (17.4.5.0) encounters a failure, with the following error: ***type=itam_sdm_cxf_integ.***
   Resolution:
   a. Start the CA SDM Services.
   b. Click **Retry Install** in the Common Installer.
3. **Problem**:
   When clicking the **Gold brick** icon on the CA Service Catalog request page, the ITAM URL opens using a non-SSL protocol, with the port number and the short hostname of the ITAM server.
   Resolution:
   Run the following query to update the ITAM URL to use the SSL protocol, FQDN, and SSL port:

   ```
   UPDATE ca_application_registration
   SET product_specific_data = '<SSL Protocol>://<ITAM FQDN>:<ITAM SSL Port>/ITAM'
   WHERE product_name = 'CA Asset Portfolio Management';
   ```

   For example:

   ```
   UPDATE ca_application_registration
   SET product_specific_data = 'https://test.itam.com:199/ITAM'
   WHERE product_name = 'CA Asset Portfolio Management';
   ```

4. **Problem**:
   CA Service Catalog Featured offerings are not accessible from **More** button/option in the ServicePoint application.
   Resolution:
   1. Access the USM_HOME folder of the CA Service Catalog computer and verify that the following certificate files exist:
      a. USMcertfile.key
      b. USMcertfile.pem
   2. Copy both the files and paste to this location **xFlow_Home\APPS\Services** location
   3. Restart xFlow Analyst Interface services.
5. **Problem**:
   An error occurs in the Viewlog file: "**Unable to find valid certification path to requested target**".
   Resolution:
   Open the command prompt, and enter the path:
   ```
   cd %USM_HOME%\embedded\jdk\bin
   ```

Now run the following command:

```
keytool -import -alias <alias_name> -file <certfile> -keystore %USM_HOME%\embedded\jdk\lib\security
\cacerts
```

For example:

```
keytool -import -alias server -file casmapp.cer -keystore "C:\Program Files\CA\Service Catalog\embedded
\jdk\lib\security\cacerts"
```

6. **Problem**:
   CA Service Desk Manager failed to connect to **Maileater**, **PAM**, or **Catalog** due to SSL configuration issues. The logs displayed the error *"Unable to find valid certification path to requested target."*
   Resolution:
   Follow this KB article.

CA Service Management 17.4.4.0 Release Notes

CA Service Management 17.4.4.0 is a cumulative patch for CA Service Management 17.4. For more information about the contents of previous cumulative patches, see Release Information.

This roll-up patch contains quality and security improvements, for more information review the Fixed Issues section.

Enhancements

- **Reporting API for Service Desk Manager**:
  Reporting is a crucial feature of CA SDM, enabling administrators, service owners, and service delivery managers to analyze service desk performance, ticket management, and workload trends. These reports are key for assessing performance and identifying areas for improvement. Previously, we integrated JasperSoft Reporting to provide visualizations, drill-down capabilities, and custom dashboards. However, as JasperSoft will no longer be supported, we are transitioning to a more flexible and extensible reporting solution based on APIs.
- Enable HTTP Strict Transport Security (HSTS) support across the solution.
- The SSL Configurator Utility Wizard for CA Service Management has been improved to enable secure configurations across the solution. Upgrading to 17.4RU4 will also maintain existing SSL settings across CA SDM, xFlow/ ServicePoint, and CA Service Catalog.
- When a Knowledge Document is accepted as a solution for an Request/Incident/Problem, a short resolution is displayed. For more information refer Post Installation page.
- xFlow Usability Enhancement: Add attachments by cut/copy and paste in a ticket, and attach a file using the drag and drop functionality or by clicking attach button and selecting the file.

NOTE
More Information

- To install CA Service Management 17.4.4.0, see Installing CA Service Management 17.4.4.0
- For updated information on uninstallation, see Uninstall CA Service Management 17.4.4.0

Certification

CA SDM 17.4.4.0 is now certified with CA ITPAM 04.4 CP 04.

Fixed Issues

CA Service Management 17.4.4.0 includes the following defect fixes.

Fixed Issue ID	Product	Description
Case #35797333	CA Service Desk Manager	Autosuggest doesn't work when searching for '%23' string in a lookup field.
Case #35938955	CA Service Desk Manager	The description field contains additional (unwanted) Linebreaks.
Case #36155888	CA Service Desk Manager	SOAP with CXF - When invoking the getGroupMemberListValues method, an exception is being generated, if the query does not return a result.
Case #33598936	CA Service Desk Manager	The PDM_D_MGR process is crashing on a single CA SDM APP server, about two or three times in a week.
Case #35791986	CA Service Catalog	Javascript functions are not populating the Category as expected for specific Service options.
Case #35994948	CA Service Desk Manager	CASM 17.4.2 – xFlow SAVE-Button does not come up.
Case #35974874	CA Service Desk Manager	Incident Impact should not be changed by Blackout Window.
Case #35994962	CA Service Desk Manager	In CASM 17.4.2 – xFlow Button solve (Lösung) does not work as expected.
Case #35924208	CA Service Desk Manager	In SDM 17.4 RU2 and RU3, the Spell-Checker and Knowledge-Search buttons are missing in the HTML Description.
Case #35973579	CA Service Desk Manager	When editing a knowledge document, links to other documents are created with an OpenDocumentViewer function, but saving the document removes this function, making the link non-functional.
Case #35957268	CA Service Desk Manager	When an Incident or Request is created in the Service Desk interface and the summary field is autofilled from the description field, it may contain blank spaces at the beginning and end.
Case #35845254	CA Service Desk Manager	REST API is not respecting category validation: REST generated requests are allowing non-request categories, and allowing the application to create tickets.
Case #35958350	CA Service Desk Manager	Cannot Create Incidents via WebServices: Axis Web Services method createRequest does not work when using type="crt:182".
Case #35842358	CA Service Desk Manager	No publish action in history when publishing knowledge document: When publishing a document, changing the Owner during the process doesn't create an entry in the document's history, whereas not changing the Owner does trigger an event entry in the history.
Case #35744820	CA Service Desk Manager	Issues with the new (CXF) Webservice logs.
Case #35721052	CA Service Desk Manager	Knowledge Is not showing Comments, Doc versions: Only one event is recorded in the history of a knowledge document in Service Desk Manager, whereas multiple events (like creation, publishing, and updates) are expected to be logged.

Fixed Issue ID	Product	Description
Case #35919217	CA Service Desk Manager	CASM 17.4 RU2 - maileater images in htm_description shown as empty frame: When maileater is importing an email containing the image in the body this image is shown as an empty frame in html_description.
Case #36046173	CA Service Desk Manager	GRLoader Model lookup doesn't work: If the model is specified as a lookup field in the input file for GRloader, it fails to update or create the CI with the corresponding model information.
Case #35892013	CA Service Desk Manager	HTML formatting issues in the Maileater email replies.
Case #35603597	CA Service Desk Manager	List-type property fields do not appear as expected in xFlow.
Case #35904750	CA Service Desk Manager	Issues with font colour change (font color and background font) in RTE.
Case #36122937	CA Service Desk Manager	Undesired Data partition messages.
Case #35911348	CA Service Desk Manager	Issue in CA SDM: Inactive Contacts with Email Addresses in CA Contacts - GRloader Assigns Configuration Items to Inactive Accounts.
Case #36149070	CA Service Desk Manager	Errors in the stdlog when using the REST APIs, from 17.4 RU3.
Case #35995195	CA Service Desk Manager	Temp files are not deleted from CATALINA_BASE_REST temp folder.
Case #35995597	CA Service Desk Manager	Login to Visualizer fails when accessed from the CI List by a domain user.
Case #36166062	CA Service Desk Manager	An error occurs when attempting to change the Virtual Analyst icon.
Case #35794772	CA Service Desk Manager	Vulnerabilities due to insufficient session ID entropy and cookies not being transmitted over SSL.
Case #35695195	CA Service Desk Manager	Vulnerability in attachment uploading with .exe in employee interface.
Case #35792488	CA Service Desk Manager	Issue in Appsec Point on servicedesk Uat for 2024-25
Case #36040543	CA Service Desk Manager	Path traversal vulnerability in file upload functionality: During the attachment upload process, the customer is modifying certain HTTP request parameters in the POST request related to the database update for attachment information.
Case #36049575	CA Service Desk Manager	Unrestricted file upload in CA SDM.
Case #36092728	CA Service Desk Manager	Issue with the size of the Change Order effort attribute.
Case #36012949	CA Service Desk Manager	In 17.4.2.0, xFlow - Description Field is no longer resizable.
Case #36075295	CA Service Desk Manager	Unable to log in to NTLM Xflow.
Case #36062739/ 36246286/ 36272268	CA Service Desk Manager	Search of areas and offerings does not work after upgrade to 17.4 GA. ServicePoint not searching keywords.
Case #36096506	CA Service Desk Manager	PAM 4.4 - Error - Policy Limit Exceeded
Case #35549332	CA Service Desk Manager	Email notification issues in CA SDM: Post upgrade from 4.3 SP5 Process Automaton Manager (PAM) to 4.4 CP2 Process Automation Manager, our notifications changed.

Fixed Issue ID	Product	Description
Case #35835937	CA Service Catalog	Cannot read properties of undefined (reading '$select') - ca_fdFetchSelectData
Case #35959770	CA Service Catalog	In CASM 17.4 RU3, report id does not display the values as expected: In CA Service Catalog, the select type fields that contain a report id do not display the values from the list.
Case #35972087	CA Service Catalog	Approval emails to Groups are not delivered to members for certain/most groups in in EEM/Catalog.
Case #35943312	CA Service Catalog	Grant all access roles permissions does not apply to all option groups items.
Case #36123023	CA Service Catalog	In 17.4 RU3, the table label appears in front of the date picker, causing a visibility issue.
Case #36117563	CA ServicePoint	No data partition message is displayed for employee workflow task.
Case #35728701	CA ServicePoint	Insights - repository loading
Case #36117553	CA xFlow/ ServicePoint	While switching between xFlow and ServicePoint, user is unable to access the reports and other objects while using insights.
Case #35898007	CA APM	Import SAM data into ITAM.

Hot Fix

1. For 17.4 RU2 and later, integrated with the JasperReports 9.0.0 environment, apply Hotfix T5UG596.caz with APAR No: 99112519 to resolve a performance issue in ad-hoc views when adding additional fields to crosstab rows.
2. JasperReports Server Directory/Path Traversal Vulnerability: A directory traversal vulnerability has been identified that potentially allows unauthenticated users to access sensitive information on the host system. An attacker could send a specially-crafted URL request to view files on the server.
   This fix should be applied on the 17.4 RU4 and above, integrated with JasperReports 9.0.0 environment.
   To eliminate the CVE-2024-3325, apply the hotfix T5UG584.caz with APAR No : 99112426.

Known Issues

1. **Issue**: With some mail clients, Maileater fails to generate the description using HTML content when the email body contains only HTML and does not include a Maileater tag.
   Solution: To resolve the issue, apply patch T5UG591 (for Windows with APAR No: 99112469) or T5UG592 (for Linux with APAR No: 99112470) on top of RU4.

For a list of existing issues, see Known Issues.

CA Service Management 17.4.3.0 Release Notes

CA Service Management 17.4.3.0 is a cumulative patch for CA Service Management 17.4. For more information about the contents of previous cumulative patches, see Release Information.

This roll-up patch contains bug fixes, for more information review the Fixed Issues mentioned below.

Enhancements

CA SDM

- **Enhancements to Change Calendar and Change Order Details**

- **Non-Global Windows Added**: The Change Calendar now displays both global and non-global change windows for a complete view.
- **Description Field Included**: The description field from the Change Window detail page is now visible in the Change Calendar.
- **Detailed Blackout Alerts**: The Change Order detail page now shows which blackout windows apply, including their names and total count.

These updates improve visibility and clarity for users managing change schedules. For more information, refer to Change Window Management.

CA ITAM

- ITAM now supports both SDM AXIS and CXF web services, for more information please refer CA Service Catalog CXF webservices for CA APM

Certification

CA SDM 17.4.3.0 is now certified with SUSE Enterprise Linux 15.6.

Fixed Issues

CA Service Management 17.4.3.0 includes the following defect fixes. For more information, see Steps to reproduce document.

Fixed Issue ID	Product	Description
Case #35618464	CA Service Desk Manager	The Description field is not coming through on the Change Orders created by Employees.
Case #35587746	CA Service Desk Manager	Unable to change the template of Manual Notify after the CA Service Desk 17.4.2.0 Rich Text-/HTML implementation.
Case #35581473	CA Service Desk Manager	Issues arise while creating a new CMDB model.
Case #35546587	CA Service Desk Manager	Personalized reply does not work in the “Manual Notify” activity.
Case #35540546	CA Service Desk Manager	Scratch Pad information does not transfer to the Incident Detail - Description.
Case #35532769	CA Service Desk Manager	Service Management v17.4.2.0 Upgrade installer is overwriting an existing option record.
Case #35490287	CA Service Desk Manager	If a CI's Status is set to inactive, the IP-address (alarm_id) should be released.
Case #35489449	CA Service Desk Manager	After applying RU2 in the body of maileater, new lines of text are not copied to description.
Case #35470183	CA Service Desk Manager	After installing 17.4 RU2, in the Incident Detail report the Manual Notify act log displays html code instead of plain text.
Case #35375329	CA Service Desk Manager	After applying RU2 in the mailbox Email Type GRAPH is displaying as DIAGRAMM in German install.
Case #35448547	CA Service Desk Manager	After applying RU2 the maileater is processing plain text emails incorrectly.
Case #35348496 and 35332768	CA Service Desk Manager	Issues in maileater and email templates in 17.4.2.0.
Case #35333039	CA Service Desk Manager	Manual Notify not showing in HTMPL format in Activates Log.

Fixed Issue ID	Product	Description
Case #35326026	CA Service Desk Manager	In the Employee Interface, an incident ticket is not create after searching for knowledge.
Case #35318053	CA Service Desk Manager	When you run the pdm_pki command utility, it does not log error/info messages anywhere.
Case #35230272	CA Service Desk Manager	Line break issues in Description text.
Case #35170567	CA Service Desk Manager	SDM Sanitation does not replace \n by
Case #35047759	CA Service Desk Manager	Configuration in CA SDM Advanced Availability fails.
Case #35044812	CA Service Desk Manager	When the Type field is empty, the ticket is created as a Request, even when the Category does not allow the creation of Request ticket type.
Case #35020216	CA Service Desk Manager	Cannot read properties of undefined (reading 'value') at copy_field_val.
Case #33723379	CA Service Desk Manager	In REST Tomcat Appsec Vulnerability - HTTP “OPTIONS” Method Enabled.
Case #33723368	CA Service Desk Manager	Stored cross-site scripting in CA SDM.
Case #33723330	CA Service Desk Manager	After upgrading to 17.4 RU2 from RU1, SDM IIS SSL URL does not load.
Case #33722876	CA Service Desk Manager	Vulnerability: Java script library.
Case #33701408	CA Service Desk Manager	In SDM_17.3RU22_Error message Alias for session was not indexed.
Case #33684723	CA Service Desk Manager	SDM_17.2RU1_Editing OOTB and running reports leave suspended querys.
Case #33643149	CA Service Desk Manager	Attached events continue to fire even after they are set to be inactive.
Case #33598973	CA Service Desk Manager	Service Catalog integration with SDM fields goes empty.
Case #35332786	CA Service Desk Manager	Maileater is updating tickets with wrong data.
Case #35485998	CA Service Desk Manager	Jasper 7.9 error in CA SDM.
Case #35499329	CA Service Desk Manager	When hovering over the Manual Notification in the Activity Log, it displays HTMPL code.
Case #35461689	CA Service Desk Manager	After applying RU2 newlines in the HTML-Part of the notification-template are no longer in the received email.
Case #33665082	CA Service Desk Manager	Vulnerabilities in SDM.
Case #33643260 and #35083411	CA Service Desk Manager	Vulnerabilities in datamart log4j.
Case #33593356	CA Service Desk Manager	CA SDM attachment issue.
Case #35124582	CA Service Desk Manager	RASA and Python vulnerabilities.
Case #35157933	CA XFlow	After upgrading CASM 17.4.1 to 17.4.2 xFlow no longer allows to work with Tickets.
Case #33638949	CA Service Catalog	One Service Offering is not displayed in the Service Catalog.
Case #33729964	CA Service Catalog	USS integration error occurs while upgrading Swingbox from 17.1 to 17.4.

Fixed Issue ID	Product	Description
Case #33712946	CA Service Catalog	Table header disappears in request form table component.
Case #33708646	CA Service Catalog	Changes in table behavior after upgrading to 17.4.1.0
Case #33705519	CA Service Catalog	CV-CONFIRM-DEFECT_Catalog_17.4RU1-Datasource ODBC connection does not work.
Case #33689588	CA Service Catalog	Issue with listing subscriptions on certain BUs.
Case #33622749	CA Service Catalog	End users are facing problem to see their pending request, assigned to their respective groups.
Case #35614393	CA ServicePoint	The lookup for Requester is not working in ServicePoint for the Catalog Offering.
Case #35627952	CA ServicePoint	In the ServicePoint, the Catalog forms are taking longer to refresh.
Case #35617982	CA ServicePoint	Service Point mouse over/hover and complete ticket activity frame does not line break after 17.4.2.
Case #35406022	CA ServicePoint	Default value for the custom object attribute not working.
Case #35535085	CA ServicePoint	Issues in Service Point "My Approvals" functionality.
Case #35358525	CA ServicePoint	You can create tickets in Service Portal with inactive categories if the link is bookmarked.
Case #33630542	CA ServicePoint	Large logo size for Catalog service offerings in ServicePoint.
Case #33710557	CABI	On SDM and Jasper integrated environment, unable to run the Adhoc views when locale is set to en_ZA.
Case #33701429	CA APM	Field Label Changes on Location Configuration won't Save (Legal Document -->Cost -->Payment).
Case #33602808	CA APM	Asset family and Class field are not always populated.
Case #33586589	CA APM	The Stored Procedure blocks DB tables for several seconds.

Known Issues

For a list of existing issues, see Known Issues.

NOTE
More Information

- To install CA Service Management 17.4.1.0, see Installing CA Service Management 17.4.3.0.
- For updated information on uninstallation, see Uninstall CA Service Management 17.4.3.0

CA Service Management 17.4.2.0 Release Notes

Release Notes for CA Service Management 17.4.2.0

CA Service Management 17.4.2.0 is a cumulative patch for CA Service Management 17.4. For more information about the contents of previous cumulative patches, see Release Information.

This roll-up patch contains bug fixes, for more information review the Fixed Issues mentioned below.

What's new?

CA Service Desk Manager

- We have made capturing details of a ticket (incident/request/problem/change order/issue) easier by including support for rich text in the description for ticket types. For further information, refer to Rich Text Editor Capability in CA SDM.

CA ServicePoint

- Supports classic workflow approval process. For further information, refer to ServicePoint Workflow Approval Process for CA SDM.
- Now supports browsing through the list of Service Desk Manager Categories. For more information, refer to Ability to Browse SDM Categories.
- Virtual Analyst - The RASA installation process has been automated for Windows. For more information, refer to Automated Installation of Virtual Analyst for Windows.

CA Service Catalog

From 17.4 RU2, CA Service Catalog supports CXF based webservices, which helps the product to move away from AXIS based web services. AXIS based webservices are deprecated and they will eventually get removed in the future versions of CA Service Catalog. For more information, have a look at the Axis to CXF Migration guide.

CA APM

ITAM now supports both SDM AXIS and CXF web services, for more information please refer SDM CXF support for CA APM.

Certifications

- CA Service Desk Manager is now certified with TIBCO Jaspersoft 9.0.0 (Jaspersoft® Studio 9.0.0 and JasperReports® Server 9.0.0). For more information, refer to For more information refer Jaspersoft Studio and JasperReports Server.
- Embedded Entitlements Manager (EEM) 12.6.7.0. For more information, refer to CA EEM 12.6.7.0.
- IT Process Automation Manager 4.4 CP03. For further information, refer to CA IT PAM 4.4 CP03.

Fixed Issues

CA Service Management 17.4.2.0 includes the following defect fixes. For more information, see Steps to reproduce document.

Fixed Issue ID	Product	Description
Case #33416126	CA Service Desk Manager	"Unknown value for status" error is received in Spectrum while trying to create a ticket in SDM.
Case #33544230	CA Service Desk Manager	Knowledge Management Custom Approval Process does not populate Assignee.
Case #33546477	CA Service Desk Manager	The specified error message in the Pre-Update DP does not show in Service Point.
Case #33557830	CA Service Catalog	Offering is stuck in Approved state.
Case #33562159	CA Service Desk Manager	17.3.23-SOAP Call provides ambiguous fault message without additional tracing
Case #33586849	CA Service Desk Manager	When multiple files are attached to the same ticket, the attachments are not being written to correct locations.
Case #33590312	CA Service Desk Manager	Few HSTS vulnerabilities were reported.
Case #33592625	CA Service Desk Manager	German localization
Case #33593356	CA Service Desk Manager	Intermittently the upload and download of attachments are not working.

Fixed Issue ID	Product	Description
Case #33595872	CA Service Desk Manager	In a multi-tenanted environment, Activity Notifications are sent indiscriminately to all members of a named Contact Type in the Activity Notification configuration.
Case #33596447	CA Service Desk Manager	If a user accesses the URL with Category, the displayed ticket creation screen does not have the specified Category. However, the created ticket had the expected Category.
Case #33606408	CA Service Desk Manager	pdm_cgireport.exe on IIS exposes the hidden arguments, which present vulnerability that unexpected parties can use to access SDM data.
Case #33609483	CA Service Desk Manager	Reported by vulnerability tool.
Case #33627232	CA Service Catalog	End users are facing problem to see their pending requests assigned to their respective groups.
Case #33639815	CA Service Desk Manager	ACAS Nessus scan found a few vulnerabilities on the SDM 17.4.1 server.
Case #33654916	CA Service Desk Manager	Creating an Incident with a Request category is not enforced in SOAP webservices.
Case #33660564	CA Service Desk Manager	Issues in the Announcement Page HTML on Employee Interface.
Case #33666776	CA Service Catalog	After upgrading to 17.4 RU1 from 17.3 RU1, there were discrepancies in fetching the report data.
Case #33681660	CA Service Catalog	In CMDB CI Association window, the remove button next to each CI does not match the CI UUID in Service Catalog CI association.
Case #33684464	CA Service Desk Manager	In USRD table in CA SDM the tenant is not auto-populated when it is a lookup field.
Case #33701831	CA Service Desk Manager	The SDM upgrade script always resets the repository paths back to defaults.
Case #33668407	CA Service Desk Manager	Page loads without the ServicePoint log.

Mandatory Cumulative Test fixes after applying 17.4 RU2

NOTE
Install all the patches mentioned below. To install the patches, follow the steps mentioned in the respective ReadMe files.

Support Site Links

Windows

Fix	File type	Solution Description
99112110	CAZ	WIN-xFlow\BUI Activity log entries not showing in HTML format.
99112111	CAZ	WIN-Activity log entries not showing in HTML format.
99112220	CAZ	WIN-Personalized Responses in Manual Notify

Linux

Fix	File type	Solution Description
99112110	tar.Z	LNX-xFlow\BUI Activity log entries not showing in HTML format.
99112112	tar.Z	LNX-Activity log entries not showing in HTML format.
99112221	tar.Z	LNX-Personalized Responses in Manual Notify

Fixed Issues

After installing the CA Servicement Management 17.4 RU2, a few issues were present. The following are a list of test fixes. For more information see Steps to reproduce document.

Fixed Issue ID	Product	Description
Case #35170567	CA Service Desk Manager	CA SDM Sanitation does not replace \n by
Case #35230272	CA Service Desk Manager	The description text no longer breaks the lines properly. It looks like the text is on one line. The issue only occurs with old tickets from before 17.4 RU2.
Case #35348496	CA Service Desk Manager	Issues with Maileater and email templates.
Case #35448547	CA Service Desk Manager	Maileater does not read text-emails correctly.
Case #35470183	CA Service Desk Manager	The incident detail report's Manual Notify act log has html code instead of the plain text.
Case #35461689	CA Service Desk Manager	Empty lines in an email notification are missing, and everything is displayed as a single line.
Case #35187945	CA Service Desk Manager	Manual notification displays html tags instead of html content in Activity log.
Case #35532769	CA Service Desk Manager	Service Management v17.4.2.0 Upgrade installer is overwriting an existing option record.
Case #35546587	CA Service Desk Manager	Personalized reply does not work in the “Manual Notify” activity.

JasperReports Server 9.0.0 TFix

In JasperReports Server 9.0.0 DVD integrated environment, the ***Allow.jar*** file is visible in the UI. To eliminate the CVE-2024-3325, apply the hotfix T5UG571.caz with APAR No : 99112250.

Known Issues

1. **Issue:**
   Start Request Form is not loading in Service Catalog-17.4 RU2
   Solution:
   Refer the KB Article and follow the steps.

For a list of existing issues, see Known Issues.

NOTE
More Information

- To install CA Service Management 17.4.2.0, see Installing CA Service Management 17.4.2.0.
- For updated information on uninstallation, see Uninstall CA Service Management 17.4.2.0

CA Service Management 17.4.1.0 Release Notes

Release Notes of 17.4.1.0

CA Service Management 17.4.1.0 is a cumulative patch for CA Service Management 17.4. For more information about the contents of previous cumulative patches, see Release Information.

This roll-up patch contains bug fixes, for more information review Fixed Issues mentioned below.

Security Vulnerability

Addressed the security vulnerability Apache ActiveMQ CVE-2023-46604. Upgraded Apache ActiveMQ version from 5.15.15 to 5.15.16

Fixed Issues

CA Service Management 17.4.1.0 includes the following defect fixes. For more information, see Steps to reproduce document.

Fixed Issue ID	Product	Description
DE574567	CA Service Desk Manager	The -m option for the maileater does not work as expected.
DE574845	CA Service Desk Manager	Same search query for knowledge documents search is giving different search results in SDM/xFlow/ServicePoint.
DE574831	CA Service Desk Manager	When we transfer a ticket to a new group and contact who is not in the new group, a log is generated saying the transfer is made.
DE574918	CA Service Desk Manager	Unable to sync LDAP status of a user with the SDM user.
DE576471	CA Service Desk Manager	GRLoader removes line breaks, and the description fields display text in a single line.
DE575776	CA Service Desk Manager	SAML login fails if username has special characters.
DE575200	CA Service Desk Manager	The html injection given in the scratch pad is running the command.
DE575768	CA Service Desk Manager	Cross site scripting fails.
DE575770	CA Service Desk Manager	DB Connections remain in open state and sleeping, until DB Server runs on errors and CA Application Server Environment (Advanced Availability) crashes.
DE576682	CA Service Desk Manager	WebServices and GRLoader do not work after upgrading to 17.3 RU 22.
DE577420	CA Service Desk Manager	A few related tables are not getting archived along with the SDM tickets, and when they are manually added to itil_arcpur_cfg.xml, the other tables are archived twice.
DE580333	CA Service Desk Manager	Maileater is stuck trying to process the given mail and it remains in the Inbox.
DE575766	CA Service Desk Manager	High memory utilization of Domsrvr.

Fixed Issue ID	Product	Description
DE579182	CA Service Desk Manager	When creating a CI via a script or the GUI, a usp_owned_resource record is created but not a ca_owned_resource record.
DE579622	CA Service Desk Manager	When emails are sent with the new pdm_mail_assembly.jar file provided, the original Unicode encoding is lost (Serbian Latin encoding).
DE576743	CA Service Desk Manager	Performance issues related to usp_lock_release_multiple SP
DE580441	CA Service Desk Manager	Unable to export incident list after the upgrade in 17.4.
DE576481	CA Service Point	Search on ticket confirmation screen does not work.
DE576467	CA Service Point	Cross-Site Scripting (XSS) vulnerabilities occur in CA Service Point when using CA Catalog offerings.
DE576461	CA Service Point	The label text overlaps in Service Point, if a Box Label of a checkbox has long text in a form.
DE576456	CA Service Point	In 17.3 RU22, when the subject of the ticket is more than 90 characters, the label overlaps the link for reopening the ticket. If the status of the ticket has more than 28 characters, the label covers the last modifed date. Both occur on the Service Point home page.
DE576455	CA Service Point	The "Close Ticket Status" message in Aria Chatbot is incorrectly displayed as NONE instead of “Closed”.
DE575198	CA Service Catalog	For a notification to be sent from Catalog, a new field "Related Ticket" details is added.
DE576465	CA Service Catalog	Procedures and scripts to archive or delete data do not work and throws errors.
DE576720	CABI	Ad Hoc views using fields like "Duration Resolve to Close in Days" error out with "already closed" error.
DE575194	CABI	Reports which query a Double type field from CA SDM's object schema displays incorrect values.
DE576459	CA APM	In ITAM_17.3_the admin_password field from al_process_account table is created with a space at the end.

Mobile App Fixed Issues

CA ServicePoint Mobile app 1.7.2 includes the following defect fixes.

Fixed Issue ID	Product	Description
DE581035	Service Point Mobile App	Service Point Mobile Attribute is not showing custom fields in the drop-down.

Resolved Known Issues

Fixed Issue ID	Product	Description
DE583305	CA Service Management	CA service Management now supports SiteMinder 12.8.7 integration.

Known Issues

For a list of existing issues, see Known Issues.

NOTE
The issue- "Siteminder integration with XFlow/Servicepoint is not working if we configure SSOArtifactType as "header"" is now fixed in CA Service Management 17.4.1.0

NOTE
More Information

- To install CA Service Management 17.4.1.0, see Installing CA Service Management 17.4.1.0.
- For updated information on uninstallation, see Uninstall CA Service Management 17.4.1.0

Getting Started

An overview of features and basic use of CA Service Management.

This section includes information about CA Service Management architecture, capabilities, and benefits. Review the information in this section before you implement the solution.

Service Desk Manager

CA Service Desk Manager offers a comprehensive set of customizable services to suit the needs of the organization. CA SDM integrates all stages and elements of service desk operations into a single platform, including service requests, incident, change, knowledge and configuration management.

CA SDM is designed to improve service levels provided to end users and efficiency of the overall department, and also includes reporting and advanced dashboard features, that facilitate better decisions and lower operational costs.

Following are the benefits of Service Desk Manager:

- Multi-tenant architecture that supports service desk consolidation for global enterprises.
- Empowers service desk analysts to be more efficient and effective.
- Minimize service disruptions and risks resulting from unforeseen changes thus, improving the day-to-day operations of the organization.

xFlow Interface

In today's world, IT organizations must adapt and adopt changes to meet the growing business demands, unfortunately, the tools available to service desk analyst typically fall short and mostly use ticketing based solutions developed decades ago. Thus, business users are disconnected and a service desk analyst lacks the knowledge and context to make the right decision.

xFlow Interface provides comprehensive and intelligence-based views that analysts, teams, and the service desk to provide first-class customer service.

For a service desk analyst, the xFlow Interface empowers to stay connected, provides a clear-and-contextual view of the work.

Following are the benefits of xFlow Interface:

- Prioritize workload.
- Understand the state of the IT environment.
- Get the context of issues.
- Quickly triage and resolve issues.

Service Point

Service Point for CA Service Management provides a self-service experience with embedded assistive intelligence for business-users. Service Point uses Natural Language Processing (NLP) that provides business users with context-based solutions and suggestions.

Business users can perform the following actions using Service Point:

- Access knowledge
- Create, view, and modify tickets
- Contextually collaborate on tickets using live chat
- View allocated resources
- Manage ticket notifications

With a business-centric focus, Service Point helps an organization achieve the following:

- Broad adoption of services
- Context-based solutions
- Improved productivity
- Reduced costs
- Improved collaboration and knowledge sharing
- Elevated perception of IT organization

CA Service Management Virtual Analyst

Few quick checkpoints are listed below for CA Service Management Administrators to get started with the implementation and deployment of Virtual Analyst in their organization.

1. Install Virtual Analyst and RASA Server. RASA is the NLU engine used in CA Service Management Virtual Analyst. For more information, see Install Virtual Analyst. In case, if you do not have internet connectivity, you do have the option to install the virtual analyst in an offline mode. For more information, see Offline Installation - CA Service Management Virtual Analyst.
2. After successful installation, training the NLU server is mandatory for the Virtual Analyst to be up and running. Train the NLU server to train the virtual analyst with out-of-the-box (OOTB) data. For more information, see Train the NLU Server
3. RASA server configuration details must be updated in CA Service Desk Manager (CA SDM) to enable the Virtual Analyst services. Perform this step in CA Service Desk Manager Interface. For more information, see Configure Virtual Analyst in Service Desk Manager
4. Enable the Virtual Analyst capabilities via the CA Service Desk Manager Interface. Login to CA SDM, navigate to **Administration**, **xFlow Interface**, **Service Point** configurations. For more information, see Manage Features
5. Administrators can configure and create tickets via the Virtual Analyst through template-based ticket creation or through auto-categorization. For more information, see Manage Features.
6. If you have custom attributes in your tickets, and want these to be a part of Virtual Analyst ticket creation process, see Custom Attributes for Ticket Creation.
7. Administrators can customize the Virtual Analyst responses to suit implementation requirements. For more information, see Virtual Analyst Intents.
8. Customize the look and feel of the Virtual Analyst through Manage Features. CA SDM Administrators can update the Virtual Analyst Name, Logo, Launch Text via the Manage Features capability in Service Point.

Insights

Insights (CABI JasperReports 6.4.3) is built on TIBCO Jaspersoft Business Intelligence (BI) Technology and is a light-weight embeddable BI tech stack. It supports Out-of-the-Box Reports, creation of complex reports and dashboards for Aggregate and Transactional Reports. Supports Multi-tenant architecture with easy to use self-service BI. CA SDM along with xFlow Interface/Service Point provides access to your reports via the Insights App and CA SDM Interface.

Insights enable decision-makers with self-service analysis capability to understand and analyze the key metrics and historical trends from CA SDM operational data. The interactive reports and dashboards allow to view all the key metrics of the IT environment in one place and perform adhoc analysis of relevant metrics.

Following are the benefits of Insights:

- Self-service analysis of KPIs for decision makers.
- Easy monitoring and access.
- Data driven decisions.
- Measure the effectiveness of your IT process.
- View all the key metrics in one place.

To help you with compatibility related information, see Supportability Matrix.

To help you with pre-installation steps, see CABI JasperReports Server (Insights) Considerations.

For step-by-step instructions to Install and configure CABI JasperReports for CA Service Management, see JasperReports Server.

To administer, see Administer Insights.

For using, see Using Insights.

For troubleshooting issues, see Troubleshooting Insights (CABI JasperReports)

Service Catalog

CA Service Catalog helps create a one-stop storefront experience to manage and automate the entire request lifecycle, including the initial request, approval, and fulfillment of services. Behind the scenes, workflow automates and manages fulfillment and related processes, simplifying power user tasks and increasing the productivity of all the involved users.

Following are the benefits of Service Catalog:

- Define service offerings with complete cost transparency and associated SLAs.
- Reduce the cost and effort of delivering services.
- Automate time-consuming, manual, and scripted tasks.

Asset Portfolio Management

CA Asset Portfolio Management enables you to holistically manage your company's IT assets and determine what assets are available and in use, improve the organizational distribution of those assets, and increase productivity around license reporting and audit responses.

Following are the benefits of Asset Portfolio Management:

- Deliver business value.
- Reduce risks and costs.
- Maximize the value of IT assets.
- Increase software compliance.

To help you with install planning of CA Service Management, see CA Service Management 17.4 Release Notes.

For step-by-step install instructions, see Installing.

To help you with upgrade planning of CA Service Management, see CA Service Management 17.4 Release Notes.

For step-by-step upgrade on upgrading CA Service Management, see Upgrading.

Lift and Shift Cloud Migration

Lift and Shift for CA Service Management on AWS, Azure, GCP.

The lift and shift migration approach involves migrating your application and associated data to the cloud with minimal or no changes, effectively "lifting" applications from their existing environments and "shifting" them as-is to a new hosting premises, typically in the cloud.

Typically no significant changes are made to the application architecture, data flow, or authentication mechanisms.

Key considerations in a lift and shift migration include the application's compute, storage, and network requirements, which should be mapped from the current infrastructure to equivalent resources in the cloud. This strategy takes the path of least resistance, allowing you to "re-host" your existing workload without modifying the application.

> **NOTE**
> CA Service Management is certified for Oracle database on Google cloud platform.

For more information refer Moving the CA MDB Data from the Source to the Target Systems.

For steps on cloud migration, refer Moving the CA MDB Database on Microsoft SQL Server.

CMDB Visualizer

CA CMDB Visualizer updates.

Check out the CMDB Visualizer updates in this article.

- CMDB Visualizer Administration Interface
- CMDB Visualizer Interface
- Configuring CMDB Visualizer

CMDB Visualizer Administration Interface

This article describes the CA CMDB Visualizer Administration Interface optimizations from an end-user perspective.

Use the CMDB Visualizer administration interface to perform the following functions:

> **NOTE**
> For Oracle 21c, set the **isClusterEnv** setting to "true" in the application.conf file of CMDB viz and restart the CA SDM Services.:
>
> - For Windows: <SDM installed location>\bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\WEB-INF\classes\application.conf)
> - For LINUX: <SDM installed location>/bopcfg/www/CATALINA_BASE_VIZ/webapps/CMDBVisualizer/WEB-INF/classes/application.conf).

> **NOTE**
> The functions described in this article are only available to roles with administrative privileges.

> **IMPORTANT**
> To access CA CMDB Visualizer, ensure that the URL name is consistent for all CA Service Management products (including FQDN, if any) as '**vizserver**' value in **casm.conf.js** (NX_ROOT\bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\viz-ux\conf\casm.conf.js).

1. Install and configure the Visualizer server.
2. Modify the display of CI status and relationships.
3. Create and manage administrative filters.
4. Create and manage Visualizer CI graphics.

> **NOTE**
> In case of CA SDM secondary servers, the Database (SQL Server or Oracle) Client software must be installed. A local domsrvr must be used for the **sdm.domsrvr.viz** setting in **application.conf** and ensure that you have opened the database port for CMDB Visualizer. Visualizer uses the database connection for initial cache loading and performance improvement. If you do not want to expose the database connection to an external network, it is recommended that you plan to have the CA SDM secondary server in a DMZ network.

The Visualizer Web App comes with a configuration file called **application.conf**. The following settings can be configured by an Administrator:

- **sessionTimeout - User session timeout**, in minutes. **Default value = 60**
- **expirationCheckInterval - Interval time**, in minutes, to check for expired sessions. Expired sessions are not removed at the exact time but instead when the expiration check finds it. **Default value = 5**

NOTE
The color is not changed on the hue or color sliding bar in graph, you must select the color in the large palette above the hue slider bar. This is an expected behavior with the slider when the initial color is #000000 or #ffffff (grey scale colors). This is a limitation with the angular component.

CMDB Visualizer Administration Interface provides the following functions:

Find CIs by Assets and Attributes

NOTE
To disable CIs and Asset search, disable the **Enable Asset Search** toggle option on the Visualizer administrative interface.

You can search for CI (and asset) attributes to locate and manage CIs in your database. It mainly consists of the following: Perform the following steps:

1. Type the search criteria in "**Find CIs**" Search pane on the top right pane of Visualizer graph.
   The Search Results tab displays all CIs/Assets that match your search criteria.

- **Primary**:
  Primary fields focus your search that is based on the following basic CI attributes.
- **Network**:
  Network fields search on the following common CI attributes for network addressing.
- **Assets**:
  Asset fields search on the following basic CI/asset attributes.
- **Maintenance**:
  Maintenance fields provide searching on CI attributes for the following maintenance tasks.

For more information, see the following topics.

- Configuration
- Filters

Configuration

This article talks about the configuration of CA CMDB Visualizer.

The CMDB Visualizer Configuration tab allows for modifying server settings and displaying Configuration Items (CIs). Login to CA CMDB. Select the **Configuration** option from the Left Menu tree to configure the following options in a graph:

1. **Display Settings**: Provides the following options to set CI labels in a graph:
   a. **Number of Lines to Display for CI Labels**:
      Based on the specified number, the CI Label displays in the graph. Example: If 3 is specified, the label displays in three lines in a graph.
   b. **Characters per Line for CI Labels**: Specify the Characters for CI labels in a graph. For example: If 10 is specified, after 10 characters, the label will display in a new line.
   c. **Display Relationship Label**: Enable or disable this option as per your requirement. If you disable this option, CI relationships are not displayed in a graph.
   d. **Relationship Label Length**: Specify the CI relationship label length - maximum number of characters in which a graph relationship label will be displayed.
   e. **CI Relationships to (Default value)**: Used to specify the default number of levels with which the graph will be displayed.
   f. **Enable Asset Search**: If enabled, you can search for assets or CIs.

Relationship Style
Use this option to define relationship characteristics in a graph.
Select the Relationship from the list. Select the option to differentiate a relationship in a graph via **line color** and **line thickness**. Use **Preview** to visualize how the graph will be displayed in real time with the specified options.

CI Status

Use this option to define CI graphical characteristics.

The user can select CI configuration Status Image along with Image color. User can **Preview** CI configuration status with selected color and category.

Filters

This article describes how built-in filters work in CA CMDB Visualizer.

CA CMDB Visualizer provides built-in analysis filters, and an ability to create filters.
Filters support CI families, relationship types, and other attributes. Admin and Non-Admin Filters are supported. However, in administrator mode, only admin filters are shown, while all other filters are shown in non-admin mode.

> **NOTE**
> While rendering a filter with "**populate from graph**" peer attributes is shown only when there is a peer relationship among nodes. To apply peer relationship on a selected graph, uncheck "**populate from graph**" and add the peer attributes and apply it on a graph. The graph is displayed with peer relations.
>
> **IMPORTANT**
> CMDB Visualizer supports both **JSON** and **FormData** for creating and editing filters. By default, **JSON** is used. If administrators have a requirement to switch to **FormData**, set the **isFilterObjJsonTyp** value to **false**. By default, it is set to **true** in the **casm.conf** file in <NX_ROOT>*bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\viz-ux\conf\casm.conf.js* .

Admin and Non-Admin Filters

Admin and Non-Admin filters support the following:

- Create Filters
- View Filters
- Edit Filters
- Delete Filters

Non-Admin Supported Filters
Non-Admin Filters are of the following types:

- Load Filter Options from Graph
- Apply Saved Filter on Graph

Filters support the following attributes:

- Family
- Classes
- Status
- Location
- Provider Relationships
- Dependent Relationships
- Peer Relationships
- Other Relationship
- Model
- Manufacturer
- Maintenance Vendor

Create Filters

CA CMDB Visualizer provides built-in analysis filters, and you can create filters for your business needs.

NOTE
Users can create a maximum of 200 filters in the filter pane. Even if you create more than 200 filters, the filter popup shows only 200 filters. The additional filters cannot be accessed.

NOTE
The color is not changed on the hue or color sliding bar, you must select the color in the large palette above the hue slider bar. This is an expected behavior with the slider when the initial color is #000000 or #fffff (gray scale colors). This is a limitation with the angular component.

Follow these steps:

1. Click the New Filter button.
   The Filter Wizard launches.
2. Name the filter and select one of the following filter types:
   a. **Browse**
      Displays the unfiltered display of all related CIs.
   b. **Impact Analysis**
      With the focal CI as provider, shows the CIs that are affected when any change occurs to the focal CI.
   c. **Root Cause**
      With the focal CI as dependent, shows the CIs that could be the root cause for the focal CI to go down or can affect the focal CI's behavior.
   d. **Cause and Effect CIs**
      Combination of Root Cause and Impact Analysis. From the focal CI, shows all the CIs that could be the root cause. Or shows the CIs that could be affected when a change occurs to the focal CI.
   e. **Trace Relation**
      Displays all possible relationships among focal CIs, based on the Levels setting. If the graph has only one focal CI, applying this filter displays only the focal CI.
   f. **Shortest Path**
      Displays the shortest chain of relationships among focal CIs, based on the Levels setting. If the graph has only one focal CI, applying this filter displays only the focal CI.

      NOTE
      In addition to the predefined filters, any available administrator-defined and user-defined filters display.
3. Click Save & Finish.
   The filter is created.

CMDB Visualizer Interface

This article describes the CA CMDB Visualizer Interface optimizations from an end-user perspective.

CA CMDB Visualizer provides a graphical interface with toolbars and a graphical canvas. You can click the button on the left side of the canvas to display the retractable Search pane.

> **NOTE**
> Visualizer uses the space bar to select or confirm an operation. For example, if the focus is on a button, then instead of pressing Enter, press the space bar.

Graphical Interface

CDMB Visualizer Graphical interface provides the following capabilities:

1. A way to create, manage and apply analysis filters.
2. Change the graphical layout and number of CI levels to be displayed.
3. Select CIs for graphical viewing and right-click to provide various functions, including the ability to view and modify CI properties.
4. Use the Toolbar icons to provide various functions.
5. Zoom in to view areas of interest, or zoom out to see the larger context.
6. Use the Full Screen Mode to display a larger work area.

   > **NOTE**
   > When you enable Full-Screen mode, you cannot use the keyboard functionality. Search for CIs by Attributes.

For more information, see the following topics:

- Visualizer Graphs
- Change Icons of CIs on Visualizer

Visualizer Graphs

This article gives an overview on how to use Graphs in CA CMDB Visualizer.

This article contains the following topics:

Open Graph

1. Click Open Graph on the toolbar.
   The Open Graph list displays graphs with saved metadata.
2. From the list, complete one of the following actions:
   - Double-click a graph item.
   - Select a graph and click Open.

   The graph is rebuilt based on its saved metadata and its current CMDB data.

Follow these steps:

1. Click Open Graph on the toolbar.
   The Open Graph list displays graphs with saved metadata.
2. Select the graph from the Open Graph list.
3. Click Delete.
   The graph is deleted.

Invert Graph

By default, Visualizer displays Provider CIs at the top and Dependent CIs at the bottom, relative to the Focal CI.

Follow these steps:

1. Click the Invert Graph button to reverse this arrangement to a vertical axis.
   You can view the data from a different perspective.

Find CIs on the Graph

You can find specific CIs to display as nodes on the graphical display. Use the Find CIs button to open a new window over the graph to prompt for what string to match. The Find string is matched using graphical node attributes such as the CI name and family. Find shows the count of CIs which matched the users input criteria. The count is displayed in the bottom left corner.

Follow these steps:

1. Select the nodes to use from the Find CI results.
2. Click Select On Graph.
   The selected CIs display.

For more information about finding CIs by Assets and Attributes, see CMDB Visualizer Interface.

Show Graph for a Single CI

Follow these steps:

1. On the Visualizer graph, select a CI to serve as the focus of the analysis.
2. Right-click the CIs menu and select Make Focal CI.
   The selected CI becomes the *Focal CI* in the Visualizer. Its associated relations display, including the configured number of levels.

Add Multiple CIs to Graph

Follow these steps:

Make Focal CI, Add to Graph, or drag-and-drop CIs from the following sources:

- Search Results
- Scratchpad
- Saved graphs
- Hidden CI list

> **NOTE**
> Users can add maximum of 10 focal CIs or 10 graphs.

Create Relationships

CMDB Visualizer now provides the ability to define Relationship between existing CIs via the CMDB application without the need to be taken away from the context to define relationships from the CA SDM Interface. The established/defined relationship is reflected immediately in the graphical interface without reloading the graph. For more information, see Working with CIs in Visualizer
Perform the following steps:

1. Select one or multiple (only two) CIs that are displayed on the graph, right click the context menu and select Create Relationships to define relationships between CIs.
2. From the New Configuration Item Relationship dialog box, fill in the following: For example: Relationship Type: deploys between the selected two CIs.
3. Click Save.
   Relationship is created between two CIs.

Filters - Adhoc Analysis
CMDB visualizer now provides the ability to preview and perform Adhoc analysis of graphs. Users can now filter the graph on multiple attributes of a CI and view a preview of the graph with the applied filter. This capability enables users to filter large graphs and perform Adhoc analysis without being forced to save the filter.

- Open a CI in Visualizer or search for CI and drag it on to the graph.
- Click **Filter** to select the attributes that are needed for your analysis. By default, the attributes are populated from the underlying graph. You can unselect the option to view all the attribute values.
- Click **Preview** to view a graph based on the selected attribute values.
- To modify your selection, click **Filter** again and preview the changes.
- To reset the selections to the default state, click **Reset**.
- To save a filter, click filter and provide the name of the filter and click **Save and Apply**.

> **NOTE**
> Actions like addition of CIs to a graph, display levels change, switching of the view can be done while the filter is still not saved. Visualizer provides alerts for unsaved filters.

Layouts

This article talks about

Layout

The Layout drop-down list lets you switch your CI display between two different layout options, depending on your analysis needs. The following types of layouts are available:

- Hierarchical
- Circular

Hierarchical Layout

Use a hierarchical layout when you want to view related CIs that can be logically distant from the focal CI.

Circular Layout

You use a circular layout when you want to emphasize all relationships closest to a focal CI.

Change Levels

You can change the number of levels of CIs that are displayed relative to the focal CI. The maximum number of levels that are allowed is nine. The default value is two levels, which you can modify by using the Administration interface.

Follow these steps:

1. Click the Levels drop-down list.
   The numbered levels appear.
2. Select the number of levels that you want.
   The graph adjusts to reflect the new setting.

Change the Number of Levels of CIs
You can change the number of levels of CIs that are displayed relative to the focal CI. The maximum number of levels that are allowed is nine. The default value is two levels, which you can modify by using the Administration interface.
For more information about how to create Filers, see Filters.

Using the Visualizer Toolbar

This article contains the following topics:

The topic describes the Visualizer toolbar features that are available when the CA SDM server with Visualizer is running.

> **NOTE**
> Select **Overview** to zoom in on a certain area of the graph. Overview section helps users to focus and highlight particular CI/CIs from rest of the CIs on a graph when graphs have multiple CIs (ranging from 2 to 2000 or more).

Launch Visualizer in CI Context

Follow these steps:

1. In the CA SDM web interface, navigate to a CI List, or Search for the CIs to analyze.
   The CI List displays.
2. Click a CI of interest.
   The CI Detail page is displayed and the Visualizer button is available. If CA CMDB Visualizer was not installed, the Visualizer button is inactive.
3. Click Visualizer.
   Visualizer starts and the relationships for the focal CI display.
   Default: Cause and Effect CIs

Launch Visualizer with Applied Filter

Follow these steps:

1. Navigate to the CI List, or search for the CIs you want to analyze.
   The CI List displays.
2. Click a CI of interest.
   The Configuration Item Detail page displays.
3. On the Filters list, select a filter.
4. Click Visualizer.
   Visualizer starts and the graphical relationships for the focal CI display according to the selected filter. If CA CMDB Visualizer was not installed, the Visualizer button is inactive.

Trace Relation with Focal CIs

You can trace all relationships between the selected CI and any focal CIs on the graph.

Follow these steps:

1. Select a CI on the graph.
2. Right-click and select Trace Relations with Focal CIs.
   Any relationships are displayed.

> **NOTE**
> If the selected CI is also the only focal CI, only that CI is displayed.

Launch MDRs

Follow these steps:

1. Right-click a CI on the Visualizer graphical display.
   A pop-up menu displays.
2. Select the Launch MDR option on the pop-up menu.

All external data providers that are associated with the CI appear.

3. Select an application name and click it to start the associated application.
   Visualizer launches the external MDR application as it is defined in the CMDB.

   NOTE
   Visualizer does not validate the external MDR applications credentials and URLs.

Hide/Display CIs

To promote clearer viewing, you can hide and then redisplay graphed CIs. Hidden CIs are available only for the current graph. When a new graph is generated, or when a Focal CI is set, the Hidden CIs List is cleared.

Follow these steps:

1. To select a CI, click it.
2. Right-click the CI and select Hide from the drop-down list.
   The graph updates so that the CI is hidden.

Follow these steps:

1. Click Hidden CIs on the toolbar or status bar.
   The Hidden CIs list displays.
2. Select one or more hidden CIs from the list and perform one of the following actions:
   - Click Unhide.
   - Drag to the graph canvas.
   - Right-click and select Unhide.

   The graph updates so that the CIs display.

View Change History for a CI

Follow these steps:

1. Select the CI you want to view.
2. Click Properties.
   CA CMDB is launched in context, displaying the CI Detail page.
3. Select the Versioning tab and click Show Log.
   The tab displays the details of the changes that were made to the CI.

Apply a Filter

Follow these steps:

1. Build the desired graphical display.
2. Click the Filter drop-down list.
   The Filter list is displayed.
3. Select a filter from the list.
   The filter is applied to the graph, which reorients to display the new perspective.

Use the Scratchpad

To view the Scratchpad, click the Scratchpad button on the Visualizer toolbar.

The Scratchpad displays.

Follow these steps:

1. Select one or more CIs on the Scratchpad.

2. Complete one of the following actions:
   – Click the Make Focal CI button on the Scratchpad toolbar.
   – Drag and drop one or more CIs from the Scratchpad to the graph.
   – Right-click on a CI and select Make Focal CI.

Follow these steps:

1. Select one or more CIs on the Scratchpad.
2. Complete one of the following actions:
   – Click the Add to Graph button on the Scratchpad toolbar.
   – Right-click on the CI and select Add To Graph.

Follow these steps:

1. Select one or more CIs to delete.
2. Click the Remove button on the Scratchpad toolbar.
   The CI is deleted from Scratchpad.

To synchronize the Scratchpad to the Database, click Refresh. The Scratchpad removes all the CIs that were deleted from the database.

To save a CI on the Scratchpad, right-click the CI and select Add to Scratchpad.

The CI is added to the Scratchpad.

Change Icons of CIs on Visualizer

You can change the icon of a CI on the Visualizer. Complete the following:

Follow these steps:

1. Navigate to $NX_ROOT \bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\viz-ux\assets
2. Open the serverjpegfamilyimagemap_OOTB.properties file and comment out the line (with a #) that corresponds to the family you would like to change the icon.
3. Navigate to $NX_ROOT \bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\viz-ux\assets
4. Open the serverjpegfamilyimagemap.properties file and add the family class and image name (300002=new_hardware_server.jpg).
5. Add new Image under $NX_ROOT \bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\viz-ux\assets \images\viz_icons.
6. Restart the CA Service Desk Manager service.
   You have successfully changed the icon of a CI on the Visualizer.

Configuring CMDB Visualizer

Configure CMDB Visualizer by performing the following:

- CMDB Visualizer Resource Management and Performance Tuning
- Security Configurations
- Tomcat Logging
- Troubleshooting CMDB Visualizer

CMDB Visualizer Resource Management and Performance Tuning

This article describes how CA SDM Administrators can manage CMDB resources for optimizing the performance of CMDB.

This article describes how CA SDM Administrators can manage CMDB resources (like database connection, user-sessions, nodes, data retrieval, configurations and so on) and thereby optimizing the performance of CMDB. To change the default configurations, open the application.conf file from where you have installed CMDB: Web-INF/classes/ application.conf .

Few of these attributes that Administrators can change in the **application.conf** file are explained below:

1. **app**:
   a. **name** = "CMDB Visualizer"
   Specifies the name of the application in log file. for example, CMDB Visualizer.

   NOTE
   This string only shows up in the log files and is not intended for Customization.

   b. **sessionTimeout = 60 (in minutes)**:
   Specifies the user idle time for logged-in user in the visualizer app before the session times out. Session timeout is specified in minutes.
   c. **expirationCheckInterval** = 5
   Interval time (in minutes) to check for expired sessions. Expired sessions will not be logged out at the exact time but instead when the expiration check interval is reached.

   IMPORTANT
   The recommended value is **5** minutes. Anything less than this value impact system performance, so this value must be changed judiciously. This value will add up with the timeout value (max time lag).
2. **Graph Node Configurations**: This is a Configuration Item (CI). Specifies the following values to be applied to a CMDB Graph Node.
   a. **filter = "inactive=0"**
   Specifies the filter to be applied while fetching the nodes and is applied only during initial loading when index-based loading is disabled.
   When system starts up we preload some CMDB graph nodes data into cache and this is a filter condition to filter out what nodes will be part of pre-load data. If '**indexBasedLoading**' is '**on**', this value is ignored.
   b. **maxFetchSize = 1000**
   Specifies maximum number of records in a single query during initial load. During system startup, the database query is split for node initial load based on this value.
   c. **indexBasedLoading = off**
   To persist the most used Nodes data, so that system restart can pre-load these nodes.

   NOTE
   This requires the **indexFilePath** value to be configured by Administrators. Ensure that the file exists.
   d. **Index File Path**: Complete path must be provided, relative path does not work. For example: indexFilePath = "C:\ \Program Files (x86)\\CA\\Service Desk Manager\\site\\nodes.index". To be configured by administrators and they must make sure that the file exists.
   e. **maxIndexEntries = 100000**
   Maximum number of nodes in the index file '. The maximum number of nodes that will be persisted to thendexFilePath' file
   f. **indexFileWriteInterval = 30**
   Specifies the interval to write the cached ID values to index file (in Minutes). It is frequency of writing the nodes data to the 'indexFilePath' file.
   g. **maxNodeLoadOnStartUp = 100000**
   Specifies the maximum number of nodes to load into cache on system startup. if 'indexBasedLoading' is 'on' then this value will be ignored.
3. **sdm.domsrvr.viz = domsrvr**
   Specifies the domsrvr list to connect to Visualizer. If the number of active visualizer users are more than the specified supported user count per domsrvr, then multiple domsrvrs must be used.

For example: If a single domsrvr supports 75 Visualizer Analysts, you get a better response when the number of users are under 75. If you plan to use more than 150 Visualizer Analysts, then you need two domsrvrs (specified with comma separated values).

NOTE
Domsrvr configured in this variable must be local to that machine. For all SDM servers "domsrvr" is local except in case of secondary servers.

4. **sdm.log4jRefreshInterval = 300000 (in milliseconds)**
   Specifies the time interval value to check for log level changes for Slump logging. Value is specified in seconds.
5. **db**: Contains database details.
   a. **defaultDB = "default"**

CAUTION
Do not change this value, else system will fail to start.

   b. **maxFetchSize = 100000**
      Maximum number of records that can be fetched from the database in a single query. It can be fine tuned as appropriate. **However, It is not recommended to change this value**.
   c. **inClausePlaceHonderCount = 1000**
      Maximum number of items to be part of **IN CLAUSE** when fetching data from a database.
   d. **initialPoolSize = 8**
      Number of active database connections to be used by Visualizer during system startup.
   e. **maxPoolSize = 12**
      Maximum number of active database connections to be used by Visualizer (can be increased or decreased based on data load requirements).
   f. **cleanupSchedulerInterval = 15 (minutes)**
      Frequency to check for idle database connections for cleanup.Value is specified in minutes.

Security Configurations

This article describes configuring and mitigating the cross-site request forgery for CMDB visualiser.

This article describes how to configure "X-XSS-Protection" header,"X-Content-Type-Options" header, "Content-Security-Policy" header and to mitigate Cross-Site Request Forgery for CMDB Visualizer.
Perform the following steps:

1. Navigate to <NX_ROOT>\bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\WEB-INF.
2. Open the **web.xml** file in a text editor.
3. Search for the filter name **httpHeaderSecurity**, uncomment the below lines:
   Example:

```
<filter>
         <filter-name>httpHeaderSecurity</filter-name>
         <filter-class>org.apache.catalina.filters.HttpHeaderSecurityFilter</filter-class>
         <async-supported>true</async-supported>
    </filter>
```

4. Search for filter-mapping of **httpHeaderSecurity**,uncomment the below lines:
   Example:

```
<filter-mapping>
        <filter-name>httpHeaderSecurity</filter-name>
        <url-pattern>/*</url-pattern>
        <dispatcher>REQUEST</dispatcher>
    </filter-mapping>
```

5. Search for the filter name, **CrossSiteSecurityFilter** and uncomment the below section:
   Example:

```
<filter>
   <filter-name>CrossSiteSecurityFilter</filter-name>
  <filter-class>com.broadcom.visualizer.rest.security.filters.CrossSiteSecurityFilter</filter-class>
  <async-supported>true</async-supported>
<init-param>
<param-name>contentSecurityPolicy</param-name>
<param-value>default-src 'self' 'unsafe-inline' 'unsafe-eval'; font-src 'self'; style-src 'self' 'unsafe-
inline'; img-src 'self' data:</param-value>
          </init-param>
<init-param>
  <param-name>refererValidation</param-name>
  <param-value>true</param-value>
          </init-param>
<init-param>
 <param-name>isCSPEnable</param-name>
  <param-value>true</param-value>
   </init-param>
   </filter>
```

6. Search for filter-mapping of **CrossSiteSecurityFilter**, uncomment the below lines:
   Example:

```
  <filter-mapping>
        <filter-name>CrossSiteSecurityFilter</filter-name>
        <url-pattern>/*</url-pattern>
    </filter-mapping>
```

7. Restart the CA Service Desk Manager server.

Tomcat Logging

Tomcat Logging for CA Service Desk Manager.

CA SDM uses a separate **log4j.properties** file for its web components such as Servlets and PDM_RPC. Support Automation, CMDB Visualizer, and REST also have a separate l**og4j.properties** file. Starting or stopping the Tomcat logging does not require you to recycle the Tomcat daemons.

The following list describes how the **log4j.properties** and **log4j2.properties** file for CA SDM components differ:

- CA SDM monitors the **log4j2.properties** in the NX_ROOT\site\cfg and in the NX_ROOT\bopcfg\www \CATALINA_BASE\webapps\CAisd\WEB-INF for changes.
- REST monitors the rest.log4j2.properties in the NX_ROOT\site\cfg.

Use the pdm_log4j_config utility for changing variables in the log4j2.properties, logback.properties, and rest.log42j.properties files. You cannot use the pdm_log4j_config utility to modify the polling interval. CA SDM checks the log4j2.properties file for any changes periodically using the monitorInterval attribute.

Servlet Defaults

The following servlets log Info level messages to the **jsrvr.log** file by default:

- **PDMweb**: Log entry from operations on the user interface.
- **UploadServlet**: Log entry generated when you attach files to a ticket.
- **PDMExport**: Log entry generated when you click Export on list forms.
- **PDMReport**: Log entry generated when you click the Report menu on list forms.
- **Page_cache**: Log entry that is generated from operations on the user interface.

Enable Additional Logging for Visualizer

To enable additional logging for Visualizer, follow these steps:

1. Increase the log level for visualizer_slump.log and visualizer_bop.log under the NX_ROOT\bopcfg\www \CATALINA_BASE_VIZ\logs directory. directory.
   a. Edit the NX_ROOT\bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\WEB-INF\classes \log4j2.properties file.
   b. For rootLogger.level, change from INFO to DEBUG and for logger.bop_logging.level, change from INFO to DEBUG
      NOTE
      Example: rootLogger.level=DEBUG logger.bop_logging.level=DEBUG
   c. You can also increase the log level for the slump package and bop package by changing the level to debug for logger.slump.name and logger.bop.name packages.
      NOTE
      Example: logger.slump.level=DEBUG logger.bop.level = INFO
2. Increase the log level for VisualizerMS_debug.log under NX_ROOT\log directory
   a. Edit the `NX_ROOT\bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\WEB-INF\classes \logback.properties` file.
   b. For **rootLogger.level**, change from INFO to DEBUG. For example:

      ```
      rootLogger.level=DEBUG
      ```

   c. Save the changes and restart the Visualizer tomcat using following commands:

      ```
      pdm_tomcat_nxd -c stop -t VIZ
      pdm_tomcat_nxd -c start -t V
      ```

Troubleshooting CMDB Visualizer

This article describes troubleshooting steps for CMDB Visualizer issues.

This page contains:

- Unable to login to CMDB Visualizer
- CMDB Visualizer Interface may fail to launch with HTTP 404 Error

Unable to login to CMDB Visualizer

Problem: Unable login into CMDB Visualizer Interface URL with valid credentials when value of “vizserver” is not in the same format in the casm.conf file: <NX_ROOT>\bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\viz-ux \conf\casm.conf.js.

NOTE
Before accessing the CMDB URL, ensure to cross verify the CMDB entries specified in **casm.conf** and **nx.env**.

Perform the following steps:

1. Login to CA Service Desk Manager (SDM) browser Interface and access the URL: https://<hostname>:<portnumber> CA SDM is accessed successfully with a valid login role/user (Example: ServiceDesk).
2. Now, try to access the CMDB URL: http://<hostname>:<portnumber>/CMDBVisualizer

3. CMDB Visualizer Interface is launched but login access is denied even to valid users/role like ServiceDesk.

Solution: To resolve this issue, verify the value of "**vizserver**" and access the URL interface with the same format as specified in **casm.conf** file.

CMDB Visualizer Interface may fail to launch with HTTP 404 Error

Problem: Visualizer does not launch from the CA Service Desk Manager Web Interface and shows HTTP 404 error.

Solution: Update the **context.xml** file in <NX_ROOT>\bopcfg\www\CATALINA_BASE_VIZ\conf\context.XML. Update the following in the beginning or topmost portion of this file:

```
<Valve className="org.apache.catalina.valves.rewrite.RewriteValve" />
```

For example, after adding the above lines, the **context.xml** file is updated as shown below:

```
<Valve className="org.apache.catalina.valves.rewrite.RewriteValve" />
    <WatchedResource>WEB-INF/web.xml/<WatchedResource>
    <WatchedResource>${catalina.base}/conf/web.xml/<WatchedResource>
```

Installing

Learn how to plan, and install the product.

CA Service Management products have different prerequisites, pre-installation considerations, installation procedures and post installation configurations.

> **NOTE**
> Always create a new directory to place the CA Service Management 17.4 installers at the directory location that does not contain any spaces. For more information, refer to the KB Article.
> **Example:** E:\ProgramFiles(x86)\CA\ServiceDeskManager

To successfully install the CA Service Management solution review the following.

- CA Service Management 17.4 Solution Architecture
- CA Asset Portfolio Management Product Architecture
- CA Service Catalog Product Architecture
- CA Service Desk Manager Product Architecture
- Pre-Installation Considerations
- Installation Prerequisites
- Installing CA Service Management 17.4
- Post Installation Tasks
- CA Service Management Solution Integration

Patches

The following cumulative patches are available for CA Service Management 17.4.

- Installing CA Service Management 17.4.5.0
- Installing CA Service Management 17.4.4.0
- Installing CA Service Management 17.4.3.0
- Installing CA Service Management 17.4.2.0
- Installing CA Service Management 17.4.1.0

Installing CA Service Management 17.4.5.0

Based on your CA Service Management implementation, review the following topics for a successful installation.

- Install Prerequisites for CA Service Management 17.4.5.0
- Install CA Service Management 17.4.5.0 (Windows)
- Install CA Service Management 17.4.5.0 (Linux)
- Validate CA Service Management 17.4.5.0 Installation
- Post-Installation Tasks for CA Service Management 17.4.5.0
- Post-Installation Tasks - CA SDM Advance Availability 17.4.5.0
- Uninstallation is no longer supported from CASM 17.4.5.0

Install Prerequisites for CA Service Management 17.4.5.0

Installation prerequisites for CASM 17.4.5.0

Verify and complete the following prerequisites before installation of CA Service Desk Manager, CA Service Catalog, and CA Asset Portfolio Management.

NOTE

CA Service Management (CASM) solution is a distributed environment, follow the order mentioned for a seamless installation:

1. CA Embedded Entitlements Manager 12.7.2.0
2. CA Process Automation 4.4CP4+Hotfix
3. 17.4.5.0 CA Service Catalog
4. 17.4.5.0 CA SDM and its sub-components.
5. 17.4.5.0 CA Asset Portfolio Management.

NOTE
Pre-Upgrade Recommendation:
Take a snapshot or image of all CASM components (CA SDM, CA Service Catalog, ITAM, CA PAM, and EEM) and back up the mdb before installing CASM 17.4.5.0 , as rollback to earlier versions is not supported.

NOTE

- If EEM is integrated with CASM, It is mandatory to upgrade to EEM 12.7.2.0, before installing CA Service Management 17.4.5.0.
  Installers are available in CASM_17.4.5.0\filestore\EEM.
  Before upgrading EEM to 12.7.2.0, ensure you follow the **mandatory** steps mentioned here.
- From CA Service Management 17.4.5.0 onward, only ITPAM CP04 HF01 is supported. Refer ITPAM CP04 - HF01.
  Installers are available in CASM_17.4.5.0\filestore\PAM_4.4_CP04_HF01.

Installation Prerequisites for CA Service Desk Manager

Review the following CA SDM installation prerequisites before you start the installation process:

NOTE
We recommend that you place the installer in a shorter directory path, containing no spaces, to avoid errors when running the setup file. For example, unzip the file at: C:\WIN_17_4_5_0.

- Ensure that CA SDM and xFlow Interface 17.4 is installed in your environment.
- Back up the system database (MDB). The system database (MDB) backup is mandatory and ensures safe data recovery if any problems are encountered during the installation process.
- Do not invoke ApplyPTF manually in your system while running the CA Service Management CA Service Management 17.4.5.0 installer.
- In the case of, CA Service Desk Manager - Conventional configuration, if the Primary and Secondary servers are on separate nodes, and the xFlow Interface is deployed on the Secondary Server, then the Database Client (Microsoft SQL Native Client or Oracle Database Client) is required on the Secondary Server for a successful installation.
- CA SDM must be installed for deploying the xFlow Interface. In the conventional configuration, it1s recommended to install the xFlow Interface server on a secondary server. Advanced Availability users can install the xFlow Interface only on an application server.

IMPORTANT
After upgrading to CA Service Management 17.4.5.0, Maileater does not work with POP4 on a non-TLS port with Clear Text as a security level. This is a limitation of the upgraded Javamail (Third-party jar) used in connection to the mail server. Users are required to use **LOGIN** as a security level.

(Optional) Backing up the CR_Stored_Queries Table

CA Service Management provides a fix to address a vulnerability related to SQL injection. As part of this fix, **Cr_Stored_Queries** table is updated. If you have made customizations or changes to the Out-of-the-box (OOTB) stored queries, perform the below steps to take a backup before applying the CA Service Management patch:

1. Open a command prompt window and navigate to *$NX_ROOT\patches.* and create a folder **Backup_Data**. Navigate to this folder and take the Backup of the Cr_Stored_Queries table by running the following command:
   ```
   pdm_extract Cr_Stored_Queries> Cr_Stored_Queries_17.4_backup.dat
   ```
2. Verify that the **Cr_Stored_Queries_17.4_backup.dat** file is successfully created.
3. Now, proceed with CA Service Management 17.4.5.0 installation.
4. After applying the patch, if required based on your customizations, you can update the database files created in **Step 1**. Navigate to $NX_ROOT\patches\Backup_Data location and run the following command:

   ```
   pdm_load -f Cr_Stored_Queries_17.4_backup.dat
   ```

Installation Prerequisites for CA Service Catalog

Verify and complete the following prerequisites before proceeding with CA Service Catalog 17.4.5.0 installation:

- Ensure that CA Service Catalog 17.4 is installed in your environment.
- Back up the system database (MDB). The system database (MDB) backup is mandatory and ensures safe data recovery if any problems are encountered during the installation process.

Installation Prerequisites for CA Asset Portfolio Management

Consider the following prerequisites:

> **WARNING**
> CA Asset Portfolio Management (CA APM) architecture is highly database-driven and has no rollback mechanism for database-related changes. Hence, the uninstallation of the CA APM patch is not recommended and is not supported. The only way to revert the database changes, if required, is by restoring the database backup which can lead to data loss.

Verify and complete the following prerequisites before proceeding with the CA Asset Portfolio Management installation:

- Ensure that CA Asset Portfolio Management 17.4 is installed in your environment.
- Back up the system database (MDB). The system database (MDB) backup is mandatory and ensures safe data recovery if any problems are encountered during the installation process.

Install CA Service Management 17.4.5.0 (Windows)

> **NOTE**
> **Pre-Upgrade Recommendation:**
>
> - Take a snapshot or image of all CASM components (CA SDM, CA Service Catalog, ITAM, CA PAM, and EEM) and back up the mdb before installing CASM 17.4 RU5, as rollback to earlier versions is not supported.
> - If the EEM certificate key length was not updated to 2048-bit key length before upgrading to EEM 12.7.2.0, update it now before installing CASM 17.4 RU5. For related commands refer here.

CA Service Management 17.4.5.0 installer performs prerequisite checks and mandatory validations before installing the patch.

NOTE

- We recommend that you place the installer in a **shorter directory path**, containing no spaces, to avoid errors when running the setup file. For example, unzip the file at: C:\WIN_17_4_5_0
- In CA Service Desk Manager (SDM) Availability mode, the xFlow Interface can only be installed on an Application Server. If you have converted CA SDM conventional configuration to advanced availability configuration, and you have a previously installed version of xFlow Interface, ensure that you uninstall xFlow Interface and then, reinstall xFlow Interface on an Application server.

Perform the following steps to install 17.4.5.0 on Windows:

1. From the Broadcom Support portal, download the **WIN_17_4_5_0.zip** file.
   NOTE
   CA Service Management 17.4.5.0 (Windows) installer is provided as a ZIP file and not as a CAZ file. Extract/unzip the content of the ZIP file to your local folder.
2. Copy **WIN_17_4_5_0.zip** on all servers in your environment.
3. Extract the contents of the ZIP file to the folder named WIN_17_4_5_0.
   NOTE
   In the extracted folder, CA EEM 12.7.2.0.0.0 installer is available in *CASM_17.4.5.0\filestore\EEM\Windows\12.7.2.0.0.0*
4. In CA SDM conventional configuration, stop CA SDM services in your environment. In the case of Advance Availability configuration, stop CA SDM services only on the server on which CA SDM will be installed.
5. Log in to the server as a local admin to install the patch.
6. Navigate to **WIN_17_4_5_0** folder. Right-click **Setup.exe** and select **run as administrator**.
7. Review and Accept the License Agreement Information.
8. Select **Microsoft SQL Server** or **Oracle** as the database type in the Database Configuration screen.
   For Windows Microsoft SQL Server database, *mdbadmin* is the default user.
9. Provide the database details:
   a. If you have selected **Microsoft SQL Server**, provide the following field information:
      - **Database Server**: Enter the hostname of the database server.
        If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
      - **Database Name**: Enter the Database name (MDB), the name of the target DBMS. The default value is mdb.
      - **Database Port**: Provide the port identifier for the target DBMS.
      - **Database Server Instance**: The database instance name. Leave this field blank if you are using the default instance.
        If you are using the SQL named instance and a non-default port number, the **Database Server Instance** field should look like this: ***<database instance name>,<non-default port number>***
        For example:
        ```
        sdmcasmqa,10555
        ```
      - **Database Admin User**: For Microsoft SQL Server, **sa** is the default value.
        The **sa** user is the admin user with permission to create a user and schema.
      - **Database Admin Password**: Enter the database password of the user specified by a database admin user. No default value is assigned to this parameter.
      - **mdbadmin Password**: Enter the password for the user specified for the MDB admin user.
      - **Confirm mdbadmin Password**: Confirm the password.
   b. If you have selected **Oracle** database, provide the following field information:
      - **Database Server**: Enter the hostname of the Oracle database server.
        If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
      - **Oracle Service Name**: Enter the Oracle Service name.
      - **Listener Port**: Enter the listener port for the database.
      - **Net Service Name**: Enter the Net Service Name of the Oracle database where the database resides.

If the database is remote, use the Net Service Name that is defined in the Oracle client on the local computer. CA SDM has access to the database through a local installation of the Oracle client.

- **DBA User Name**: Provide the name of an Oracle user with DBA access. The default value for DBA user is **SYS**.
- **DBA User Password**: Enter the password for the DBA user.
- **mdbadmin Password**: Enter the password for MDB admin.
- **Confirm mdbadmin Password**: Confirm the password.
- **Tablespace Path (on DB Server)**: Provide the tablespace path on the database server.
- **Oracle Home Path**: Provide the Oracle Client 64-bit path. Provide Oracle client 42-bit path. For CA Asset Portfolio Management, provide the Oracle 42-bit client.
- **Data Tablespace Name**: Provide the name of the data tablespace. The default value is MDB_DATA.
- **Index Tablespace Name**: Provide the index Tablespace Name: The default value is MDB_INDEX.

Click **Next**.

10. On **Select the Products and Integrations** page, patch list is displayed. Select the required patch to install.

    WARNING

    CA Service Management does not support the uninstallation of the CA Asset Portfolio Management patch. Uninstalling the CA APM patch does not uninstall the MDB patch, as there is no rollback mechanism for the same. For more information, see Installation Prerequisites.

    a. **CA Service Desk Manager**
       - CA Service Desk Manager Patch
       - xFlow Interface Patch
       - Search Server Patch: Search server patch must be installed on a Server where an earlier version from previous releases is already installed.

    b. **CA Service Catalog**
       - CA Service Catalog Patch

    c. **CA Asset Portfolio Management**
       - CA Asset Portfolio Management Patch

    Click **Next**.

11. Review the Pre-Installation Configuration page. Click **Next**.

    NOTE

    Select the option to perform the automated post-install steps for CA SDM. If this option is not selected, you must manually perform the post-install steps for CA SDM. Note that for CA Service Catalog and CA Asset Portfolio Management, you need to perform the manual post-install steps.

    NOTE
    From 17.4 RU5, when ITPAM is integrated with any CASM product, a new alert (*Out of the box CA Process Automation Sample data willbe automatically re-imported*") pops-up in the common installer.

12. Click **Install** to proceed with the installation. Review the Installation progress and when the installation is complete, click **Next.**

    NOTE
    From 17.4 RU5, a new task, **Migrating Solution Products to use CXF endpoints** is created, when any of the CASM products are integrated.

    NOTE
    If Migration Task to CXF endpoints ***fails*** in an SSL environment during RU5 upgrade, follow these steps:

    1. Login to ITPAM environment and open SDM Dataset located at /SDM/Configuration/
    2. Update the value of port from <non ssl port of SDM tomcate> to <ssl port of SDM tomcate> example:- 8080 to 8443.
    3. Click Retry Install in the Common Installer.

NOTE
If "Performing CA Asset Portfolio Management Post install steps: 17.4.5.0" task fails with "type=itam_sdm_cxf_integ", follow these steps:

1. Start the CA SDM Services.
2. Click Retry Install in the Common Installer.

13. To review the installation logs, navigate to the path shown in the installation summary screen.
14. Click **Finish** to exit the installer
15. After installing the Key definition for "xflow" not found in the DITA map., start the **CA Key definition for "xflow" not found in the DITA map.** service from Windows Services (**Control Panel, Administrative Tools, Services**) as this service is not started by default.
16. After installing the search server, if the **Search Server** service is not started by default or if it stops, start the services from **Control Panel, Administrative Tools, Services.**
17. Validate the Installation.
18. Complete the Post-Installation Tasks.

After installing the Key definition for "xflow" not found in the DITA map. and Search Server, you can configure the cache size for Key definition for "xflow" not found in the DITA map.. For more information about how to configure cache size, see Perform initial load and refresh index on the search server.

Install CA Service Management 17.4.5.0 (Linux)

Installing CASM 17.4.5.0 on Linux.

NOTE
Pre-Upgrade Recommendation:

- Take a snapshot or image of all CASM components (CA SDM, CA Service Catalog, ITAM, CA PAM, and EEM) and back up the mdb before installing CASM 17.4 RU5, as rollback to earlier versions is not supported.
- If the EEM certificate key length was not updated to key length 2048-bit key length before upgrading to EEM 12.7.2.0, update it now before installing CASM 17.4 RU5. For related commands refer here.

NOTE
In CA SDM Advanced Availability mode, the xFlow Interface can only be installed on an Application Server. If you have converted CA SDM conventional configuration to advanced availability configuration, and you have a previously installed version of xFlow Interface, ensure that you uninstall xFlow Interface and then reinstall xFlow Interface on an Application server.

CA Service Management 17.4.5.0 installer performs prerequisite checks and mandatory validations before installing the patch.

IMPORTANT
We recommend that you place the installer in a **shorter directory path**, containing no spaces, to avoid errors when running the setup file. For example, unzip the file at: *<root>\casm_dvd.x86Linux\<installer_file>*

Perform the following steps to install 17.4.5.0 on Linux:

1. From the Broadcom Support portal, download the **LNX_17_4_5_0.tar.gz** file.
2. To extract the LNX_17_4_5_0.tar.gz, run the following command:

```
tar -xvzf LNX_17_4_5_0.tar.gz
```

NOTE
In the extracted folder, CA EEM 12.7.2.0.0.0 installer is available in CASM_17.4.5.0\filestore\EEM\Linux \12.7.2.0.0.0

3. Set CA SDM bin and library environment variables.
   For example:

```
export PATH=/opt/CA/ServiceDeskManager/bin:$PATH
export LD_LIBRARY_PATH=/opt/CA/ServiceDeskManager/lib:$LD_LIBRARY_PATH
```

4. In SDM conventional configuration, stop CA SDM services in your environment. In the case of Advance Availability, stop CA SDM services only on the server on which CA SDM will be installed.
5. Run the setup file from the casm_dvd.x86Linux folder to install the application(s) using the following command:
   ```
   ./setup.sh
   ```
6. Review and accept the license agreement terms.
7. In Database Configuration, select **Oracle** as the database type. Ensure that you have installed the Oracle database client in your system.
   Provide the following Oracle database configuration details:
   - **Database Server**: Enter the hostname of the Oracle database server.
     If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
   - **Oracle Service Name**: Enter the Oracle Service name.
   - **Listener Port**: Enter the listener port for the database.
   - **Net Service Name**: Enter the Net Service Name of the Oracle database where the database resides.
     If the database is remote, use the Net Service Name that is defined in the Oracle client on the local computer. CA SDM has access to the database through a local installation of the Oracle client.
   - **DBA User Name**: Authenticates the name of the user with DBA access. The default value for DBA user is **SYS.**
   - **DBA User Password**: Authenticates the password for DBA user.
   - **mdbadmin Password**: Specify the password for the mdbadmin user.
   - **Confirm mdbadmin Password**: Confirm the mdbadmin user password.
   - **Tablespace Path (on DB Server)**: Enter the tablespace directory on the database server.
   - **Oracle Home Path**: Provide the Oracle Client 64-bit path. Provide Oracle client 42-bit path for fresh installation
   - **Data Tablespace Name**: Enter the tablespace name. The default value is **MDB_DATA**.
   - **Index Tablespace Name**: Enter the index tablespace name: The default value is **MDB_INDEX**.
8. Click **Next.**
9. On **Select the Products and Integrations** page, patch list is displayed. Select the required patch to install.
   a. **CA Service Desk Manager**
      - CA Service Desk Manager Patch
      - xFlow Interface Patch
      - Search Server Patch: A search server patch must be installed on a server where an earlier version from previous releases is already installed.
10. Click **Next**.
11. Review the Pre-Installation Summary page. Click **Next.**

    NOTE
    From 17.4 RU5, when ITPAM is integrated with any CASM product, a new alert (*Out of the box CA Process Automation Sample data willbe automatically re-imported*") pops-up in the common installer.
12. Click **Install** to proceed with the installation. Review the Installation progress and when the installation is complete, click **Next.**

    NOTE
    From 17.4 RU5, a new task, **Migrating Solution Products to use CXF endpoints** is created, when any of the CASM products are integrated.

    NOTE
    If Migration Task to CXF endpoints ***fails*** in an SSL environment during RU5 upgrade, follow these steps:

    1. Login to ITPAM environment and open SDM Dataset located at /SDM/Configuration/
    2. Update the value of port from <non ssl port of SDM tomcate> to <ssl port of SDM tomcate> example:- 8080 to 8443.

3. Click Retry Install in the Common Installer.

13. To review the installation logs, navigate to the path shown in the installation summary screen.
14. Click **Finish** to exit the installer.
    If patch installation fails for a product, retry the installation by using the **Retry** option in the wizard where it fails. If retry does not work, exit the installer and relaunch it. If the problem persists, contact Broadcom Support.
15. After installing XFlow Interface, start the **CA XFlow Interface** service. Navigate to /opt/CA/xFlow/Apps and run the following command from a command prompt window:
    ```
    ./xFlowServer start
    ```
    To stop the server, run the following command:
    ```
    ./xFlowServer Stop.sh
    ```
16. Navigate to /opt/CA/SC/SearchServer/elasticsearch/bin and run the following command from the command prompt window:
    ```
    ./ServicesStart.sh
    ```
    NOTE
    If you get the below message while restarting the search server service, ignore it and continue:
    ```
    groupadd: group 1elasticsearch1 already exists
    useradd: user 1elasticuser1 already exists
    runuser: warning: cannot change directory to /home/elasticuser: No such file or directory
    OpenJDK 64-Bit Server VM warning: Option UseConcMarkSweepGC was deprecated in version 9.0 and
     will likely be removed in a future release.
    ```
    To stop the server, run the following command:
    ```
    /ServicesStop.sh
    ```
17. Validate the Installation.
18. Complete the Post-Installation Tasks.

After installing the XFlow Interface and Search Server, you can configure the cache size for XFlow Interface. For more information about how to configure cache size, see Perform initial load and refresh index on the search server.

Validate CA Service Management 17.4.5.0 Installation

Validate the CASM 17.4.5.0 installation

To verify the successful installation of CA Service Management 17.4.5.0, validate the installation for the corresponding applications in the following location. You can also navigate to the root folder where you have locally installed the application and select the "env.info" file for validating your installation:

- **CA ITAM:**
  NOTE
  CORA version: 17.4.0.57
  - C:\Program Files (x86)\CA\ITAM\env.info
  - product=ITAM
  - major=17
  - minor=4
  - cum=5
  - roll-up=0

  NOTE
  CA CASM uses Apache Tomcat version 9.0.108.
- **CA Service Catalog:**

  - %USM_HOME%*CA_SLCM_<hostname>.his* file
  - %USM_HOME%\view\webapps\usm\locale\about_info.xml
  - %USM_HOME%\build.xml
  - %USM_HOME%\env.info
- **xFlow Interface:**
  - *C:\Program Files\CA\xFlow\<hostname>.his* file
  - NX_ROOT\env.info
  - NX_ROOT\version.xml
- **CA SDM:**
  - *C:\Program Files (x86)\CA\Service Desk Manager\<hostname>.his* file
  - NX_ROOT\pdmconf\version
  - NX_ROOT\env.info
  - HELP, ABOUT

NOTE
For CA SDM, the Binary and Language Combo patches are installed irrespective of the environment. The language patch for the corresponding CA SDM environment is installed.

To validate the successful installation of the patches, follow these steps:

1. Open the <sdm_installation>\<hostname>.his file in a text editor.
2. Search for the instances of "gol-351". In a successful install, you should come across these three entries (Binary, Language Combo, and corresponding language patch).

Application	Windows	Linux
CA Asset Portfolio Management	T6EE1745.CAZ	NA
CA Service Catalog	T6D91745.CAZ	NA
CA Service Desk Manager - Binary	gol-351_cum_C	gol-351_x86_64Linux_cum_C
CA Service Desk Manager - Languag504e Comb	gol-351_langcombo	gol-351_langcombo
CA Service Desk Manager - English	gol-351_en_US	gol-351_x86_64Linux_en_US
CA Service Desk Manager - German	gol-351_de_DE	gol-351_x86_64Linux_en_DE
CA Service Desk Manager - Spanish	gol-351_es_ES	NA
CA Service Desk Manager - French	gol-351_fr_FR	gol-351_x86_64Linux_fr_FR
CA Service Desk Manager - Italian	gol-351_it_IT	NA
CA Service Desk Manager - Japanese	gol-351_ja_JP	gol-351_x86_64Linux_ja_JP
CA Service Desk Manager - Brazilian Portuguese	gol-351_pt_BR	NA

Post-Installation Tasks for CA Service Management 17.4.5.0

Post-installation steps and checklist for CASM 17.4.5.0

After successful installation of CA Service Management 17.4.5.0, perform the following post-installation steps.

CA Service Desk Manager

Manual Steps required for Automated Post-Installation

CA Service Management provides an option in the installer to automate the post-install tasks.

If you have selected **Yes** to automate the post-installation steps while running the CA Service Management Installer Wizard, you are not required to perform any manual post-install steps for CA Service Desk Manager (SDM).

If you have selected **No** for automating the post-install steps while running the CA Service Management Installer wizard, perform the below manual post-install tasks as per your deployment requirements:

Manual Post-Install Tasks After Installing CA Service Desk Manager (SDM) 17.4.5.0 on CA SDM 17.4.4.0

Perform the following steps:

1. Stop CA SDM services.
2. Navigate to NX_ROOT/site/config.properties file and ensure the value of resources.created parameter is set to 0.
3. Open a command prompt window and run the following command:
   ```
   pdm_configure
   ```
4. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_05_insert.dat
   pdm_load -u -f r17_4_05_update.dat
   ```

Manual Post-Install Tasks After Installing CA Service Desk Manager (SDM) 17.4.5.0 on CA SDM 17.4.3.0
Perform the following steps:

1. Stop CA SDM services.
2. Navigate to NX_ROOT/site/config.properties file and ensure the value of resources.created parameter is set to 0.
3. Open a command prompt window and run the following command:
   ```
   pdm_configure
   ```
4. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_04_insert.dat
   pdm_load -u -f r17_4_04_update.dat
   pdm_load -f r17_4_05_insert.dat
     pdm_load -u -f r17_4_05_update.dat
   ```

Manual Post-Install Tasks After Installing CA Service Desk Manager (SDM) 17.4.5.0 on CA SDM 17.4.2.0
Perform the following steps:

1. Stop CA SDM services.
2. Navigate to NX_ROOT/site/config.properties file and ensure the value of resources.created parameter is set to 0.
3. Open a command prompt window and run the following command:
   ```
   pdm_configure
   ```
4. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_03_insert.dat

   pdm_load -u -f r17_4_03_update.dat
   pdm_load -f r17_4_04_insert.dat
   pdm_load -u -f r17_4_04_update.dat
    pdm_load -f r17_4_05_insert.dat
    pdm_load -u -f r17_4_05_update.dat
   ```
5. Notification message template is modified to update the existing email templates with the html_description field. **Tool location**: NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate This has to be executed one time when the SDM service is up and running. **For e.g:**
   Windows
   ```
   NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate.bat
   ```
   Linux

```
NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate.sh
```

Manual Post-Install Tasks After Installing CA Service Desk Manager (SDM) 17.4.5.0 on CA SDM 17.4 or CA SDM 17.4.1.0

Perform the following steps:

1. Stop CA SDM services.
2. Navigate to NX_ROOT/site/config.properties file and ensure the value of resources.created parameter is set to 0.
3. Open a command prompt window and run the following command:
   ```
   pdm_configure
   ```
4. Change the directory to NX_ROOT/data, and execute the following command:

   ```
   pdm_load -f r17_4_02_insert.dat
   pdm_load -u -f r17_4_02_update.dat
   pdm_load -f r17_4_03_insert.dat
   pdm_load -u -f r17_4_03_update.dat
   pdm_load -f r17_4_04_insert.dat
   pdm_load -u -f r17_4_04_update.dat
   pdm_load -f r17_4_05_insert.dat
   pdm_load -u -f r17_4_05_update.dat
   ```

5. Notification message template is modified to update the existing email templates with the html_description field.
   Tool location: NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate This has to be executed one time when the SDM service is up and running. **For e.g:**
   Windows
   ```
   NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate.bat
   ```
   Linux
   ```
   NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate.sh
   ```

Manual Post-Installation Task for CMDB

> **NOTE**
> For Oracle 21c, set the **isClusterEnv** setting to "true" in the application.conf file of CMDB viz and restart the CA SDM Services:
>
> - For Windows: <SDM installed location>\bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\WEB-INF\classes\application.conf)
> - For LINUX: <SDM installed location>/bopcfg/www/CATALINA_BASE_VIZ/webapps/CMDBVisualizer/WEB-INF/classes/application.conf).

If you are applying CA Service Management 17.4.4.0 in an SSL environment, CA SDM Administrators must perform the following post-installation steps for CMDB Visualizer Interface to open using the **HTTPS** protocol when launching from CA SDM UI:

1. In the NX.env file, change the **NX_CMDB_VISUALIZER** entry to provide **HTTPS protocol** and **HTTPS port**.
   For example: @NX_CMDB_VISUALIZER=https://sdmurl:<VIZ_SSL_PORT>/CMDBVisualizer
2. In **casm.conf.js** file from NX_root\bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\viz-ux\conf, provide the HTTPS as protocol and HTTP port.
   For example:

   ```
   sdm: {

   vizserver: 'https://sdmurl:<VIZ_SSL_PORT>/CMDBVisualizer/viz',
   ```

```
server: 'https:// sdmurl:<SDM_SSL_PORT>/CAisd/pdmweb.exe'
}
```

Manual Post-Installation Task for OAuth 2.0 (Maileater/ Mailer)

After generating an access token for OAuth 2.0 to connect to a mail server, perform the mandatory post-install tasks on all servers in your environment:

1. Create a backup of web.xml from NX_ROOT\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF in your local directory to perform backout if required.
2. Open the web.xml file from NX_ROOT\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF.
3. Search for the following statement:
   ```
   <!--USD servlet mappings start-->
   ```
4. Copy and paste the following configuration under the statement:

   ```
   <servlet>
   <servlet-name>OAuthProcessor</servlet-name>
   <servlet-class>com.broadcom.oAuth.OAuthProcessor</servlet-class>
   </servlet>
   ```
5. Copy and paste the following configuration after any <servlet-mapping>:

   ```
   <servlet-mapping>
   <servlet-name>OAuthProcessor</servlet-name>
   <url-pattern>/OAuthProcessor</url-pattern>
   </servlet-mapping>
   ```
6. Save and close the web.xml file.
7. For OAuth servlet preservation in a primary and secondary environment, the secondary server must also have the OAuth processor entries in the following file: *<NX_ROOT>\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF\web.xml.last*.
8. Repeat Steps 1-8 to update **web.xml.tpl** file in the NX_ROOT\samples\pdmconf\web.xml.tpl folder to avoid losing these changes when pdm_configure is run at a later point of time.
9. Run the following command:
   ```
   pdm_tomcat_nxd -c STOP command
   ```
10. Wait for some time (a minute or so) and run the following command:
    ```
    pdm_tomcat_nxd -c START command
    ```

For more information, see Define a mailbox.

Manual Post-Installation Task for Excel file (.xlsx) export*

1. Execute the following command:
   ```
   pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst
   ```
2. Execute the following command to add the new NX variable to NX.env.tpl file.
   ```
   pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst -t
   ```
3. Restart CA SDM services.

HTML Tags Sanitization

NOTE
This step is mandatory when you are updating from 17.GA or 17.4.1.0 to 17.4.5.0. For information, refer Admin Insights for RTE.

The sanitization tool can be run any number of times. Administrators can choose if they wish to run the tool for each ticket type separately or for all ticket types at one go.

Before running the Sanitization tool ensure you take a backup of all the ticket objects using the following commands or by taking a backup of the sdm databse :

```
"Call_Req": pdm_extract Call_Req > cr_backup.txt
"Issue": pdm_extract Issue > Issue_backup.txt
"Change Orders": pdm_extract Change_Request >change_orders_backup.txt.
```

Both active and archived tickets can be sanitized.
For Windows:

```
NX_ROOT\samples\sdk\SanitizationTool\sanitizeTool.bat
```

For Linux:

```
NX_ROOT\samples\sdk\SanitizationTool\sanitizeTool.sh
```

NOTE
We recommend executing the sanitization during slack time on any Service Desk Manager server.

After executing the sanitization tool, execute the following command to update domsrvr memory cache:

```
pdm_cache_refresh -t Call_Req
pdm_cache_refresh -t Issue
pdm_cache_refresh -t Change_Request
```

(Optional) Enable HTML content for Ticket Description in the Activity log

NOTE

- This step is mandatory when you are updating from 17.GA or 17.4.1.0 to 17.4.5.0.
- A new Field Update activity association (**HTML Description** has been introduced)
- Either **HTML Description** or **Description** activity association has to be enbaled. Do not enable both the options.
- Out of the box Description Field Update activity association is enabled in the activity log for all ticket types (Incident,Request,Problem,ChangeOrder and Issue).

Enabling HTML content for Description in the Activity Log:

1. Login into CA SDM with Administrator access type.
2. Administration --> Notifications --> Activity Associations.
3. Click **Show Filter**.
4. Enter "HTML Description" in the Symbol text box in the Activity Association List page.
5. Click **Search**
6. For every **HTML Description Field Update association**, click **Edit** and check the **Log Me** checkbox, then save the changes made.

Disabling plain text for Description in the Activity log:

1. Click **Show Filter** in the Activity Association List page.
2. Enter "Description" in the Symbol text box and Select Object Type as "Request/Incident/Problem" and click **Search**.
3. Now see the one row and click the Description link in the Activity Association List page.
4. Unselect the **Log Me** check box and save the page.
5. For Change Order and Issue repeat the steps from 1 to 4.

(Optional) Manual Post-Installation Task for Knowledge Document export with German fields

If you are exporting Knowledge Document with German Fields (included in the export field list), then perform the below post-install steps for successful export of knowledge documents:

1. Take the backup of NX_ROOT\NX.env file (NX_ROOT is the installation directory for CA Service Desk Manager).
2. Open NX_ROOT\pdmconf\NX.env_nt.tpl file using any text editor and take the value of NX variable @NX_KEIT_AVAILABLE_FIELDS which is COPIED_DATA and update Nx.env in NX_ROOT by executing below command:
   ```
   pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <COPIED_DATA>  -a  pdm_option.inst
   ```
   Where COPIED_DATA is the value copied from NX.env_nt.tpl (step 2).
   For example, " pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <provide the exact string here> -a pdm_option.inst "
   Note to avoid losing the updated changes when you run pdm_configure, execute the above command with the '-t' flag as follows:
   ```
   pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <COPIED_DATA> -a pdm_option.inst -t
   ```

(Optional) Handle HTML Mails that contains Tables in MailEater

Java based Maileater already has the ability to process the emails that were sent in plain format or HTML format, to support the processing of emails that contain Tables in the HTML body. But the format in which the email was sent is lost when received by Maileater.

1. Run the following commands from NX_ROOT/bin from the command prompt/ terminal:
   ```
   pdm_options_mgr -c -s NX_ENFORCE_HTML_EMAIL_PARSING -v "Yes" -a pdm_option.inst
   pdm_options_mgr -c -s NX_ENFORCE_HTML_EMAIL_PARSING -v "Yes" -a pdm_option.inst -t
   ```
2. Restart CA SDM and XFlow applications.

(Optional) Comments are not allowed when a Data Partition (O_COMMENTS) is created with Customer, Employee and ServiceDesk Analyst

To disable comments:

1. Login to SDM and navigate to Administration -> Security and Role Management-> Data partition-> Data Partition List.
2. In Data Partition List, create a constraint (O_COMMENTS with the condition id=0) and link it to Customer, Employee and ServiceDesk Analyst data partitions.
3. Run the following commands from NX_ROOT/bin from the command prompt/ terminal:
   ```
   pdm_options_mgr -c -s KT_COMMENT_USE_SUPERUSER -v 0 -a pdm_option.inst
   pdm_options_mgr -c -s KT_COMMENT_USE_SUPERUSER -v 0 -a pdm_option.inst -t
   ```
4. Restart CA SDM and XFlow applications.

(Optional) POST to GET conversion in CA SDM web interface

Conversion or simulation of a POST operation using a GET operation is prohibited or strongly discouraged due to the critical security and data integrity risks.

To enable the OP codes, follow these steps:

1. Login to CA SDM with the Administrator user type.
2. Navigate to Administration >> Options Manager >> Web >> block_opcodes_for_get.
3. Click *block_opcodes_for_get* link.
4. In *block_opcodes_for_get Options Details* window, click **Edit >> Install.**

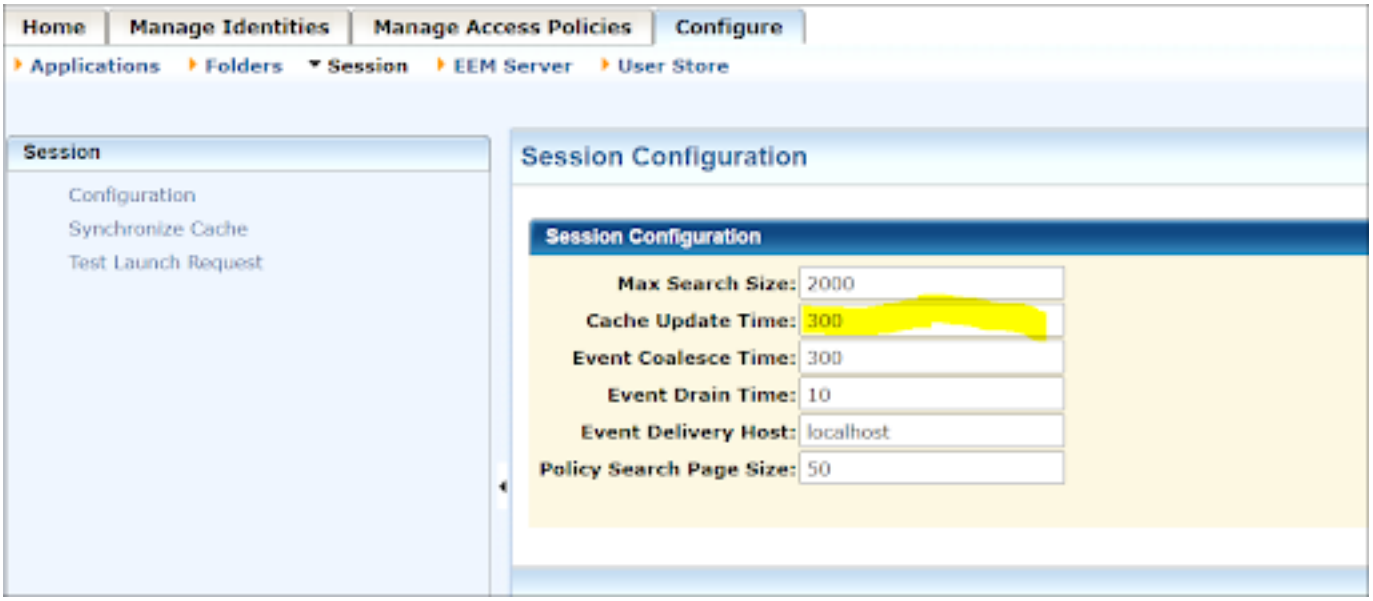
   NOTE
   The default values are:
   ```
   ACCUMULATE,ACCUMULATE_ALL,ATTACH_STYPE_EVENT,CLOSE_ALL_CHILD,KT_ES_SAVE_TREE,KT_SAVE_REPORT_CARD,LOGIN,LogA
   ```
5. Now restart CA SDM service.

(Optional) Manual Post-Installation Task for EEM Cache Timeout Configuration Update

You may face issues while logging in to EEM or SDM using the EEM user accounts due to a session cache timeout mismatch between EEM and SDM.

You can update the EEM cache timeout configuration by adding a new NX variable, "NX_EEM_CACHE_UPDATE_TIME" in SDM.

Keep the value the same as the EEM cache timeout configuration value mentioned in the following screenshot.



To set the EEM cache update time to 300 seconds, perform the following steps:

To add the variable in the **nx.env** file, run the following command:

```
pdm_options_mgr -c -s  EEM_CACHE_UPDATE_TIME  -v 300 -a pdm_option.inst
```

To add the variable in the **nxenv_nt.tpl** file, run the following command:

```
pdm_options_mgr -c -s  EEM_CACHE_UPDATE_TIME  -v 300 -a pdm_option.inst -t
```

(Optional)casc_impersnate_user

Once both CA SDM and CA Service Catalog are integrated, do the following:

1. Login to CA SDM with the Administrator user type.
2. Navigate to Administration >> Options Manager >> CA Service Catalog >> in the Options List, install casc_impersnate_user
3. Restart the SDM service.

(Optional)Incident/Request/Problem Solution should display Short Resolution

To display a short solution for tickets, do the following:

1. Login to CA SDM with the Administrator user type.
2. Navigate to Administration >> Options Manager >> Knowledge >> use_resolution_short_for_soln.
3. In the use_resolution_short_for_soln window displayed, click **Edit,** and click **Install**.
4. Restart CA SDM.

xFlow

(Optional)Enable Rate Limiting Configuration

Each incoming request to the backend passes through multiple filters before being fulfilled. To protect against potential misuse or malicious activity, a Rate Limiter Filter has been introduced. The Rate Limiter Filter is a comprehensive API protection mechanism that safeguards against API abuse by enforcing configurable request limits. It supports both token-based and IP-based identification strategies to ensure secure and controlled access.

To enable the rate- limiting functionality:

- Locate the file ***application.conf*** at the default location. (Default location: ***C:\Program Files\CA\xFlow\APPS\Services\incidentmicroservice-17.0.479\conf***).
- After updating the below configurations, restart xFlow service.

Configuration	Description
ratelimit.enabled = true	Enables the rate limiting for API endpoints.
ratelimit.defaultPerUserLimit = 50	Number of requests allowed per API endpoint per X-Access Token within the defined time window. Applies individually to each API Example: 50 for /api/tickets, 50 for /api/emailtemplate.
ratelimit.timeWindowMinutes = 1	Duration of the rate-limiting time window (in minutes). Users can make the configured number of requests within this window. The cleanup interval is automatically calculated as max(2 * timeWindow, 5 minutes)
ratelimit.customIpHeader = ""	Specifies a custom header for extracting the client IP address for rate limiting. If configured, this header is checked before standard headers (X-Forwarded-For, X-Real-IP, Remote-Addr). Example: ratelimit.customIpHeader = "X-Custom-Client-IP"

Service Point

After successful installation of Service Point, refresh index and data on the Search Server.

NOTE
In case of Linux Search Server environment, ensure to run the following commands on the terminal:

```
sysctl -w vm.max_map_count=262144
ulimit -Hn 65535
```

(Optional) Manual Post-Installation Task for Rebuild Index

NOTE
This step is mandatory when you are updating from 17.GA or 17.4.1.0 to 17.4.5.0.

If you have upgraded or are planning to install CA EEM 12.6 with Service Point and CA Service Catalog, ensure that you rebuild the CA Service Catalog index after completing the CA EEM upgrade/installation process. For more information, see Perform Initial Load and Refresh Index Data on Search Server.
Run the following command to rebuild the index:

```
$ES_HOME/search/bin/pdm_es_rebuild_index.bat index=catalog_index
```

CA Service Catalog

Perform the following CA Service Catalog post-installation steps as per your environment requirements:

- Post-Installation Tasks after installing CA Service Catalog 17.4.3.0 on CA Service Catalog 17.4 or later
- gMSA Authentication

Post-Install Tasks After Installing CA Service Catalog 17.4.3.0 on CA Service Catalog 17.4 or later

Review and perform the post-installation steps based on your deployment requirements.

NOTE
If any SSL certificate(s) chain was imported to the Oracle Java's JAVA_HOME\lib\security\cacerts Keystore, those certificate(s) chain again need to be exported explicitly and imported properly into the new AdoptOpenJDK's %USM_HOME%\embedded\jdk\lib\security\cacerts Keystore.

Follow these steps

- (Optional) If Service Catalog is accessed from applications like Service Point, SharePoint and so on, then you must perform this step. Open the "**web.xml**" file located in *USM_HOME%\view\webapps\usm\WEB-INF* and update the respective parameter values for the parameter name "cors.allowed.origins" and "cors.support.credentials". For example, if you are using Catalog Widgets in Service Point
- (Optional) Unable to approve any workflow requests through email. The email sent for approvals is corrupted with special characters. Follow the KB article steps.

(Optional) Approve workflow requests through email

The workflow email sent for approvals is corrupted with special characters. To approve any workflow requests through email, follow the KB article steps.

gMSA Authentication Post-Install Steps for CA Service Catalog (Automated steps)

CA Service Catalog provides automated post-installation steps for gMSA Authentication. Review the following before you proceed:

- Prerequisites and Considerations
- How to Automate gMSA Post-Installation Steps
- Unconfigure gMSA

Prerequisites and Considerations:

Ensure that you have taken care of the below considerations on all nodes of CA Service Catalog where you want to automate the gMSA post-installation procedure.

1. If the accounting service is available, perform the automated post-install steps by updating serviceName to ServiceAccounting and providing the appropriate gMSA account name in the **gmsa.properties** file.
2. If the filestore path is external to the server from where the **GMSAPostInstall.bat** is running, ensure to provide appropriate access to the server for setting the gMSA account permissions.
3. While preparing the properties file, check for any copy/paste issues, special characters, spaces, and so on.

How to Automate gMSA Post-Installation Steps

Perform the following steps to enable the batch file **GMSAPostInstall.bat** and to automate the gMSA post-installation steps:

1. Create a gMSA account for CA Service Catalog.
2. Ensure that appropriate DB (database) permission is given to the newly created account(s).
3. Enter the below values in the **gmsa.properties** file and save it.

   NOTE
   A template file (**gmsa.properties**) is added in the common installer in *"\filestore\SLCM\gMSAProperties"* . Optionally. use this file as a template file to fill gmsa properties. This can be copied to "USM_HOME/scripts/GMSA" where Catalog is installed.

   NOTE
   All values are mandatory. Make sure that there are no leading or trialing spaces while providing these values.

   a. **serviceName**: Application service name to enable GMSA. In the case of Catalog, it will be ServiceCatalog and for accounting, it will be ServiceAccounting.

b. **folderName**: Absolute path of the application installation directory.
c. **gMSAName**: Name of the GMSA service account (domain\accountName$).
d. **filestorePath**: Shared network path (\\Server_name\filestore) or local filestore path

4. Navigate to %USM_HOME% and launch **usm.cmd**
5. Navigate to %USM_HOME%/scripts/GMSA/ folder and run the "GMSAPostInstall.bat" in command prompt.

NOTE
If the command executes without any error, "Post-installation steps for GMSA executed successfully" message is displayed with exit code 0.
If there are errors, the error message is shown with a non-zero exit code. Correct the error to continue and perform step **5** again.

Unconfigure gMSA for CA Service Catalog

To disable or unconfigure gMSA for CA Service Catalog, follow the steps below:

1. Replace **config.properties** file from*%USM_HOME%*\ folder.
2. Revert back all the folder permissions which were assigned to domain users.
3. Start Catalog and Accounting Services with the local system account.

NOTE
In the case of load balancers, repeat steps 1-3 to unconfigure gMSA on all Catalog servers.

CA Asset Portfolio Management

Manual Post-Installation Task for Removing jQuery, log4net, and log4j Vulnerabilities

After installing 17.4.5.0, delete jquery-1.3.2.min.js, jquery-ui-1.7.2.custom.min.js , log4net.dll, and log4j from their respective installed folders.

NOTE
Perform the below steps if you have not done this earlier.

Perform the following steps:

1. Log on to CA APM Web Server, navigate to the <ITAM_install_dir>\ITAM\Web Server\castylesr5\javascript.
   Example: C:\Program Files (x86)\CA\ITAM\Web Server\castylesr5\javascript
   Locate and delete the jquery-1.3.2.min.js and jquery-ui-1.7.2.custom.min.js files from the directory.
2. Navigate to the ITAM_install_dir\CA\ITAM\Data Importer.
   Locate and delete the log4net.dll file from the directory.
3. Navigate to the C:\Program Files (x86)\CA\SC\CORA.
   Locate and delete the log4j-1.2.15.jar, log4j.properties, and ojdbc6.jar files from the directory.
4. Navigate to the ITAM_install_dir\CA\ITAM.
   Backup the following folders and manually delete them:
   - CDB
   - MDB
   - jre8

   NOTE
   jre8 folder has to be deleted manually for every RU installation.
5. Perform an IISRESET and delete the browser's cache to load the upgraded files.

For ITAM installation on French Operating System

Following the successful installation of version 17.4.3.0 on a French Windows operating system with the browser set to French, we are unable to log in to ITAM.

An error message is displayed: ***Une valeur Request.Form potentiellement dangereuse a été détectée à partir du client (_UPLOAD_NON_TXT_CSV_DATA_FILE_="...ectionné n'est pas de type...").***

To overcome this, follow these steps:

1. Navigate to *C:\Program Files (x86)\CA\ITAM\Web Server, edit web.config*, and search for *<pages enableEventValidation="false" viewStateEncryptionMode="Never" controlRenderingCompatibilityVersion="4.0" clientIDMode="AutoID">* , then add *validateRequest="false"* to it.
2. After adding, it looks like this:
   <pages enableEventValidation="false" viewStateEncryptionMode="Never" controlRenderingCompatibilityVersion="4.0" clientIDMode="AutoID" validateRequest="false">
3. Do an IISRESET.
4. You can now successfully login to ITAM.

Post-Installation Tasks - CA SDM Advance Availability 17.4.5.0

The installer wizard provides an option in the installer to automate the post-install tasks. Perform the following post-installation tasks for CA SDM Advanced Availability Configuration. For the Advanced Availability configuration, the following host names are considered as an example:

- The background server hostname is sdmcahost1.
- The standby server hostname is sdmcahost2.
- The application server hostname is sdmcahost3.

Manual Steps required for Automated Post-Installation

If you have selected **Yes** for automating the post-install steps while running the installer wizard, then perform manually the following post-install tasks:

Manual Post-Install Tasks - After Installing CA Service Desk Manager (SDM) 17.4.5.0 on CA SDM 17.4.4.0

1. Ensure that the patch is applied on the standby server (sdmcahost2).
2. Start the CA SDM service on the standby server (sdmcahost2). Open the command prompt and run the following command:
   ```
   pdm_server_control -b
   ```
3. Ensure that the patch is applied on the original background server (sdmcahost1) which is now a standby server.
4. Start the CA SDM service on the standby server (sdmcahost1). Run the following command:
   ```
   pdm_server_control -b
   ```
5. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_05_insert.dat
   pdm_load -u -f r17_4_05_update.dat
   ```
6. Clear the browser cache by the following command:
   ```
   pdm_webcache -H
   ```
7. Ensure that the patch is applied on all the application servers and the remaining standby servers if any. If you selected YES to automate the post-install steps, then there are no more manual post-install steps to be performed.

Manual Post-Install Tasks - After Installing CA Service Desk Manager (SDM) 17.4.5.0 on CA SDM 17.4.3.0

1. Ensure that the patch is applied on the standby server (sdmcahost2).
2. Start the CA SDM service on the standby server (sdmcahost2). Open the command prompt and run the following command:
   ```
   pdm_server_control -b
   ```
3. Ensure that the patch is applied on the original background server (sdmcahost1) which is now a standby server.

4. Start the CA SDM service on the standby server (sdmcahost1). Run the following command:
   ```
   pdm_server_control -b
   ```
5. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_04_insert.dat
   pdm_load -u -f r17_4_04_update.dat
   pdm_load -f r17_4_05_insert.dat
   pdm_load -u -f r17_4_05_update.dat
   ```
6. Clear the browser cache by the following command:
   ```
   pdm_webcache -H
   ```
7. Ensure that the patch is applied on all the application servers and the remaining standby servers if any. If you selected YES to automate the post-install steps, then there are no more manual post-install steps to be performed.

Manual Post-Install Tasks - After Installing CA Service Desk Manager (SDM) 17.4.5.0 on CA SDM 17.4.2.0

1. Ensure that the patch is applied on the standby server (sdmcahost2).
2. Start the CA SDM service on the standby server (sdmcahost2). Open the command prompt and run the following command:
   ```
   pdm_server_control -b
   ```
3. Ensure that the patch is applied on the original background server (sdmcahost1) which is now a standby server.
4. Start the CA SDM service on the standby server (sdmcahost1). Run the following command:
   ```
   pdm_server_control -b
   ```
5. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_03_insert.dat
   pdm_load -u -f r17_4_03_update.dat
              pdm_load -f r17_4_04_insert.dat
   pdm_load -u -f r17_4_04_update.dat
   pdm_load -f r17_4_05_insert.dat
   pdm_load -u -f r17_4_05_update.dat
   ```
6. Clear the browser cache by the following command:
   ```
   pdm_webcache -H
   ```
7. Ensure that the patch is applied on all the application servers and the remaining standby servers if any. If you selected YES to automate the post-install steps, then there are no more manual post-install steps to be performed.

Manual Post-Install Tasks - After Installing CA Service Desk Manager (SDM) 17.4.5.0 on CA SDM 17.4 GA or CA SDM 17.4.1.0

1. Ensure that the patch is applied on the standby server (sdmcahost2).
2. Start the CA SDM service on the standby server (sdmcahost2). Open the command prompt and run the following command:
   ```
   pdm_server_control -b
   ```
3. Ensure that the patch is applied on the original background server (sdmcahost1) which is now a standby server.
4. Start the CA SDM service on the standby server (sdmcahost1). Run the following command:
   ```
   pdm_server_control -b
   ```
5. Change the directory to NX_ROOT/data, and execute the following command:

   ```
   pdm_load -f r17_4_02_insert.dat
       pdm_load -u -f r17_4_02_update.dat
       pdm_load -f r17_4_03_insert.dat
       pdm_load -u -f r17_4_03_update.dat
     pdm_load -f r17_4_04_insert.dat
   ```

```
  pdm_load -u -f r17_4_04_update.dat
pdm_load -f r17_4_05_insert.dat
pdm_load -u -f r17_4_05_update.dat
```

6. Clear the browser cache by the following command:
   ```
   pdm_webcache -H
   ```
7. Ensure that the patch is applied on all the application servers and the remaining standby servers if any. If you selected YES to automate the post-install steps, then there are no more manual post-install steps to be performed.

Manual Steps required for Non-Automated Post-Installation

If you have selected **No** for automating the post-install steps while running the CA Service Management installer wizard, perform manually the appropriate post-install after this task as per your deployment requirements.

Post-Install Tasks After Installing CA SDM 17.4.5.0 on CA SDM 17.4.4.0 for Advanced Availability Configuration

1. Ensure that the patch is applied on the standby server (sdmcahost2).
2. Navigate to NX_ROOT/site/config.properties file and ensure the value of resources.created parameter is set to 0. Open a command prompt and run the following command:
   ```
   pdm_configure
   ```
   On the installer configuration page, before clicking Finish, uncheck the Start service when completed checkbox. Failure to uncheck the box may result in the loss of custom schema changes and configurations that were changed on the server.
3. Promote the standby server as the new background server by performing the following steps. To suppress version control on the standby server and later on the background server, run the following command on each server:
   ```
   pdm_server_control -v
   ```
4. Start SDM service on the standby server. Run the following command:
   ```
   pdm_server_control -b
   ```
5. Ensure that the patch is applied on the original background server (sdmcahost1) which is now a standby server, and perform the following steps. Navigate to NX_ROOT/site/config.properties file and ensure that the value of resources.created parameter is set to 0. Run the following command:
   ```
   pdm_configure
   ```
6. Start the CA SDM service on the standby server (sdmcahost1). Run the following command:
   ```
   pdm_server_control -b
   ```
7. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_05_insert.dat
   pdm_load -u -f r17_4_05_update.dat
   ```
8. Ensure that the patch is applied on all application servers and the remaining standby server if any. Perform the following steps on all application servers and standby servers.
9. Navigate to NX_ROOT/site/config.properties file and ensure that the value of resources.created parameter is set to 0. Run the following command:
   ```
   pdm_configure
   ```
10. Clear the browser cache by running the following command:
    ```
    pdm_webcache -H
    ```

Post-Install Tasks After Installing CA SDM 17.4.5.0 on CA SDM 17.4.3.0 for Advanced Availability Configuration

1. Ensure that the patch is applied on the standby server (sdmcahost2).

2. Navigate to NX_ROOT/site/config.properties file and ensure the value of resources.created parameter is set to 0. Open a command prompt and run the following command:
   ```
   pdm_configure
   ```
   On the installer configuration page, before clicking Finish, uncheck the Start service when completed checkbox. Failure to uncheck the box may result in the loss of custom schema changes and configurations that were changed on the server.
3. Promote the standby server as the new background server by performing the following steps. To suppress version control on the standby server and later on the background server, run the following command on each server:
   ```
   pdm_server_control -v
   ```
4. Start SDM service on the standby server. Run the following command:
   ```
   pdm_server_control -b
   ```
5. Ensure that the patch is applied on the original background server (sdmcahost1) which is now a standby server, and perform the following steps. Navigate to NX_ROOT/site/config.properties file and ensure that the value of resources.created parameter is set to 0. Run the following command:
   ```
   pdm_configure
   ```
6. Start the CA SDM service on the standby server (sdmcahost1). Run the following command:
   ```
   pdm_server_control -b
   ```
7. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_04_insert.dat
   pdm_load -u -f r17_4_04_update.dat
   pdm_load -f r17_4_05_insert.dat
   pdm_load -u -f r17_4_05_update.dat
   ```
8. Ensure that the patch is applied on all application servers and the remaining standby server if any. Perform the following steps on all application servers and standby servers.
9. Navigate to NX_ROOT/site/config.properties file and ensure that the value of resources.created parameter is set to 0. Run the following command:
   ```
   pdm_configure
   ```
10. Clear the browser cache by running the following command:
    ```
    pdm_webcache -H
    ```

Post-Install Tasks After Installing CA SDM 17.4.5.0 on CA SDM 17.4.2.0 for Advanced Availability Configuration

1. Ensure that the patch is applied on the standby server (sdmcahost2).
2. Navigate to NX_ROOT/site/config.properties file and ensure the value of resources.created parameter is set to 0. Open a command prompt and run the following command:
   ```
   pdm_configure
   ```
   On the installer configuration page, before clicking Finish, uncheck the Start service when completed checkbox. Failure to uncheck the box may result in the loss of custom schema changes and configurations that were changed on the server.
3. Promote the standby server as the new background server by performing the following steps. To suppress version control on the standby server and later on the background server, run the following command on each server:
   ```
   pdm_server_control -v
   ```
4. Start SDM service on the standby server. Run the following command:
   ```
   pdm_server_control -b
   ```
5. Ensure that the patch is applied on the original background server (sdmcahost1) which is now a standby server, and perform the following steps. Navigate to NX_ROOT/site/config.properties file and ensure that the value of resources.created parameter is set to 0. Run the following command:
   ```
   pdm_configure
   ```
6. Start the CA SDM service on the standby server (sdmcahost1). Run the following command:
   ```
   pdm_server_control -b
   ```

7. Change the directory to NX_ROOT/data, and execute the following command:

```
pdm_load -f r17_4_03_insert.dat
pdm_load -u -f r17_4_03_update.dat
                    pdm_load -f r17_4_04_insert.dat
pdm_load -u -f r17_4_04_update.dat
             pdm_load -f r17_4_05_insert.dat
pdm_load -u -f r17_4_05_update.dat
```

8. Ensure that the patch is applied on all application servers and the remaining standby server if any. Perform the following steps on all application servers and standby servers.
9. Navigate to NX_ROOT/site/config.properties file and ensure that the value of resources.created parameter is set to 0. Run the following command:

```
pdm_configure
```

10. Clear the browser cache by running the following command:

```
pdm_webcache -H
```

Post-Install Tasks After Installing CA SDM 17.4.5.0 on CA SDM 17.4 GA or CA SDM 17.4.1.0 for Advanced Availability Configuration

1. Ensure that the patch is applied on the standby server (sdmcahost2).
2. Navigate to NX_ROOT/site/config.properties file and ensure the value of resources.created parameter is set to 0. Open a command prompt and run the following command:

```
pdm_configure
```

   On the installer configuration page, before clicking Finish, uncheck the Start service when completed checkbox. Failure to uncheck the box may result in the loss of custom schema changes and configurations that were changed on the server.
3. Promote the standby server as the new background server by performing the following steps. To suppress version control on the standby server and later on the background server, run the following command on each server:

```
pdm_server_control -v
```

4. Start SDM service on the standby server. Run the following command:

```
pdm_server_control -b
```

5. Ensure that the patch is applied on the original background server (sdmcahost1) which is now a standby server, and perform the following steps. Navigate to NX_ROOT/site/config.properties file and ensure that the value of resources.created parameter is set to 0. Run the following command:

```
pdm_configure
```

6. Start the CA SDM service on the standby server (sdmcahost1). Run the following command:

```
pdm_server_control -b
```

7. Change the directory to NX_ROOT/data, and execute the following command:

```
pdm_load -f r17_4_02_insert.dat
pdm_load -u -f r17_4_02_update.dat
pdm_load -f r17_4_03_insert.dat
pdm_load -u -f r17_4_03_update.dat
                   pdm_load -f r17_4_04_insert.dat
pdm_load -u -f r17_4_04_update.dat
                 pdm_load -f r17_4_05_insert.dat
pdm_load -u -f r17_4_05_update.dat
```

8. Notification message template is modified to update the existing email templates with the html_description field. **Tool location**: NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate This has to be executed one time when the SDM service is up and running. **For e.g:**
   Windows

```
NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate.bat
```

   Linux

```
NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate.sh
```

9. Ensure that the patch is applied on all application servers and the remaining standby server if any. Perform the following steps on all application servers and standby servers.
10. Navigate to NX_ROOT/site/config.properties file and ensure that the value of resources.created parameter is set to 0. Run the following command:
    ```
    pdm_configure
    ```
11. Clear the browser cache by running the following command:
    ```
    pdm_webcache -H
    ```
12. Execute the following command.
    ```
    pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst
    ```
13. Execute the following command to add the new NX variable to NX.env.tpl file.
    ```
    pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst -t
    ```
14. Restart CA SDM Services.

Installing CA Service Management 17.4.4.0

Based on your CA Service Management implementation, review the following topics for a successful installation.

- Install Prerequisites for CA Service Management 17.4.4.0
- Install CA Service Management 17.4.4.0 (Windows)
- Install CA Service Management 17.4.4.0 (Linux)
- Validate CA Service Management 17.4.4.0 Installation
- Post-Installation Tasks for CA Service Management 17.4.4.0
- Post-Installation Tasks - CA SDM Advance Availability 17.4.4.0
- Uninstall CA Service Management 17.4.4.0

Install Prerequisites for CA Service Management 17.4.4.0

Installation prerequisites for patch 17.4.4.0

Verify and complete the following prerequisites before installation of CA Service Desk Manager, CA Service Catalog, and CA Asset Portfolio Management.

Installation Prerequisites for CA Service Desk Manager

Review the following CA SDM installation prerequisites before you start the installation process:

> **NOTE**
> We recommend that you place the installer in a shorter directory path, containing no spaces, to avoid errors when running the setup file. For example, unzip the file at: C:\WIN_17_4_4_0.

- Ensure that CA SDM and xFlow Interface 17.4 is installed in your environment.
- Back up the system database (MDB). The system database (MDB) backup is mandatory and ensures safe data recovery if any problems are encountered during the installation process.
- Do not invoke ApplyPTF manually in your system while running the CA Service Management CA Service Management 17.4.4.0 installer.
- In the case of, CA Service Desk Manager - Conventional configuration, if the Primary and Secondary servers are on separate nodes, and the xFlow Interface is deployed on the Secondary Server, then the Database Client (Microsoft SQL Native Client or Oracle Database Client) is required on the Secondary Server for a successful installation.
- CA SDM must be installed for deploying the xFlow Interface. In the conventional configuration, it1s recommended to install the xFlow Interface server on a secondary server. Advanced Availability users can install the xFlow Interface only on an application server.

IMPORTANT
After upgrading to CA Service Management 17.4.4.0, Maileater does not work with POP4 on a non-TLS port with Clear Text as a security level. This is a limitation of the upgraded Javamail (Third-party jar) used in connection to the mail server. Users are required to use **LOGIN** as a security level.

(Optional) Backing up the CR_Stored_Queries Table

CA Service Management provides a fix to address a vulnerability related to SQL injection. As part of this fix, **Cr_Stored_Queries** table is updated. If you have made customizations or changes to the Out-of-the-box (OOTB) stored queries, perform the below steps to take a backup before applying the CA Service Management patch:

1. Open a command prompt window and navigate to *$NX_ROOT\patches.* and create a folder **Backup_Data**. Navigate to this folder and take the Backup of the Cr_Stored_Queries table by running the following command:
   ```
   pdm_extract Cr_Stored_Queries> Cr_Stored_Queries_17.4_backup.dat
   ```
2. Verify that the **Cr_Stored_Queries_17.4_backup.dat** file is successfully created.
3. Now, proceed with CA Service Management 17.4.4.0 installation.
4. After applying the patch, if required based on your customizations, you can update the database files created in **Step 1**. Navigate to $NX_ROOT\patches\Backup_Data location and run the following command:

   ```
   pdm_load -f Cr_Stored_Queries_17.4_backup.dat
   ```

Installation Prerequisites for CA Service Catalog
Verify and complete the following prerequisites before proceeding with CA Service Catalog 17.4.4.0 installation:

- Ensure that CA Service Catalog 17.4 is installed in your environment.
- Back up the system database (MDB). The system database (MDB) backup is mandatory and ensures safe data recovery if any problems are encountered during the installation process.

Installation Prerequisites for CA Asset Portfolio Management
Consider the following prerequisites:

WARNING
CA Asset Portfolio Management (CA APM) architecture is highly database-driven and has no rollback mechanism for database-related changes. Hence, the uninstallation of the CA APM patch is not recommended and is not supported. The only way to revert the database changes, if required, is by restoring the database backup which can lead to data loss.

Verify and complete the following prerequisites before proceeding with the CA Asset Portfolio Management installation:

- Ensure that CA Asset Portfolio Management 17.4 is installed in your environment.
- Back up the system database (MDB). The system database (MDB) backup is mandatory and ensures safe data recovery if any problems are encountered during the installation process.

Install CA Service Management 17.4.4.0 (Windows)

CA Service Management 17.4.4.0 installer performs prerequisite checks and mandatory validations before installing the patch.

NOTE

- We recommend that you place the installer in a **shorter directory path**, containing no spaces, to avoid errors when running the setup file. For example, unzip the file at: C:\WIN_17_4_4_0
- In CA Service Desk Manager (SDM) Availability mode, the xFlow Interface can only be installed on an Application Server. If you have converted CA SDM conventional configuration to advanced availability

configuration, and you have a previously installed version of xFlow Interface, ensure that you uninstall xFlow Interface and then, reinstall xFlow Interface on an Application server.

Perform the following steps to install 17.4.4.0 on Windows:

1. From the Broadcom Support portal, download the **WIN_17_4_4_0.zip** file.
   NOTE
   CA Service Management 17.4.4.0 (Windows) installer is provided as a ZIP file and not as a CAZ file. Extract/unzip the content of the ZIP file to your local folder.
2. Copy **WIN_17_4_4_0.zip** on all servers in your environment.
3. Extract the contents of the ZIP file to the folder named WIN_17_4_4_0.
   NOTE
   In the extracted folder, CA EEM 12.6.7.0 installer is available in *CASM_17.4.4.0\filestore\EEM\Windows\12.6.7.0*
4. In CA SDM conventional configuration, stop CA SDM services in your environment. In the case of Advance Availability configuration, stop CA SDM services only on the server on which CA SDM will be installed.
5. Log in to the server as a local admin to install the patch.
6. Navigate to **WIN_17_4_4_0** folder. Right-click **Setup.exe** and select **run as administrator**.
7. Review and Accept the License Agreement Information.
8. Select **Microsoft SQL Server** or **Oracle** as the database type in the Database Configuration screen.
   For Windows Microsoft SQL Server database, *mdbadmin* is the default user.
9. Provide the database details:
   a. If you have selected **Microsoft SQL Server**, provide the following field information:
      - **Database Server**: Enter the hostname of the database server.
        If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
      - **Database Name**: Enter the Database name (MDB), the name of the target DBMS. The default value is mdb.
      - **Database Port**: Provide the port identifier for the target DBMS.
      - **Database Server Instance**: The database instance name. Leave this field blank if you are using the default instance.
        If you are using the SQL named instance and a non-default port number, the **Database Server Instance** field should look like this: ***<database instance name>,<non-default port number>***
        For example:
        ```
        sdmcasmqa,10555
        ```
      - **Database Admin User**: For Microsoft SQL Server, **sa** is the default value.
        The **sa** user is the admin user with permission to create a user and schema.
      - **Database Admin Password**: Enter the database password of the user specified by a database admin user. No default value is assigned to this parameter.
      - **mdbadmin Password**: Enter the password for the user specified for the MDB admin user.
      - **Confirm mdbadmin Password**: Confirm the password.
   b. If you have selected **Oracle** database, provide the following field information:
      - **Database Server**: Enter the hostname of the Oracle database server.
        If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
      - **Oracle Service Name**: Enter the Oracle Service name.
      - **Listener Port**: Enter the listener port for the database.
      - **Net Service Name**: Enter the Net Service Name of the Oracle database where the database resides.

If the database is remote, use the Net Service Name that is defined in the Oracle client on the local computer. CA SDM has access to the database through a local installation of the Oracle client.

- **DBA User Name**: Provide the name of an Oracle user with DBA access. The default value for DBA user is **SYS**.
- **DBA User Password**: Enter the password for the DBA user.
- **mdbadmin Password**: Enter the password for MDB admin.
- **Confirm mdbadmin Password**: Confirm the password.
- **Tablespace Path (on DB Server)**: Provide the tablespace path on the database server.
- **Oracle Home Path**: Provide the Oracle Client 64-bit path. Provide Oracle client 42-bit path. For CA Asset Portfolio Management, provide the Oracle 42-bit client.
- **Data Tablespace Name**: Provide the name of the data tablespace. The default value is MDB_DATA.
- **Index Tablespace Name**: Provide the index Tablespace Name: The default value is MDB_INDEX.

Click **Next**.

10. On **Select the Products and Integrations** page, patch list is displayed. Select the required patch to install.

    WARNING

    CA Service Management does not support the uninstallation of the CA Asset Portfolio Management patch. Uninstalling the CA APM patch does not uninstall the MDB patch, as there is no rollback mechanism for the same. For more information, see Installation Prerequisites.

    a. **CA Service Desk Manager**
       - CA Service Desk Manager Patch
       - xFlow Interface Patch
       - Search Server Patch: Search server patch must be installed on a Server where an earlier version from previous releases is already installed.

    b. **CA Service Catalog**
       - CA Service Catalog Patch

    c. **CA Asset Portfolio Management**
       - CA Asset Portfolio Management Patch

    Click **Next**.

11. Review the Pre-Installation Configuration page. Click **Next**.

    NOTE

    Select the option to perform the automated post-install steps for CA SDM. If this option is not selected, you must manually perform the post-install steps for CA SDM. Note that for CA Service Catalog and CA Asset Portfolio Management, you need to perform the manual post-install steps.

12. Click **Install** to proceed with the installation. Review the Installation progress and when the installation is complete, click **Next.**
13. To review the installation logs, navigate to the path shown in the installation summary screen.
14. Click **Finish** to exit the installer
15. After installing the Key definition for "xflow" not found in the DITA map., start the **CA Key definition for "xflow" not found in the DITA map.** service from Windows Services (**Control Panel, Administrative Tools, Services**) as this service is not started by default.
16. After installing the search server, if the **Search Server** service is not started by default or if it stops, start the services from **Control Panel, Administrative Tools, Services.**
17. Validate the Installation.
18. Complete the Post-Installation Tasks.

After installing the Key definition for "xflow" not found in the DITA map. and Search Server, you can configure the cache size for Key definition for "xflow" not found in the DITA map.. For more information about how to configure cache size, see Perform initial load and refresh index on the search server.

Install CA Service Management 17.4.4.0 (Linux)

Installing CASM 17.4.4.0 on Linux.

> **NOTE**
> In CA SDM Advanced Availability mode, the xFlow Interface can only be installed on an Application Server. If you have converted CA SDM conventional configuration to advanced availability configuration, and you have a previously installed version of xFlow Interface, ensure that you uninstall xFlow Interface and then reinstall xFlow Interface on an Application server.

CA Service Management 17.4.4.0 installer performs prerequisite checks and mandatory validations before installing the patch.

> **IMPORTANT**
> We recommend that you place the installer in a **shorter directory path**, containing no spaces, to avoid errors when running the setup file. For example, unzip the file at: *<root>\casm_dvd.x86Linux\<installer_file>*

Perform the following steps to install 17.4.4.0 on Linux:

1. From the Broadcom Support portal, download the **LNX_17_4_4_0.tar.gz** file.
2. To extract the LNX_17_4_4_0.tar.gz, run the following command:
   ```
   tar -xvzf LNX_17_4_4_0.tar.gz
   ```
   > **NOTE**
   > In the extracted folder, CA EEM 12.6.7.0 installer is available in CASM_17.4.4.0\filestore\EEM\Linux\12.6.7.0
3. Set CA SDM bin and library environment variables.
   For example:
   ```
   export PATH=/opt/CA/ServiceDeskManager/bin:$PATH
   export LD_LIBRARY_PATH=/opt/CA/ServiceDeskManager/lib:$LD_LIBRARY_PATH
   ```
4. In SDM conventional configuration, stop CA SDM services in your environment. In the case of Advance Availability, stop CA SDM services only on the server on which CA SDM will be installed.
5. Run the setup file from the casm_dvd.x86Linux folder to install the application(s) using the following command:
   ```
   ./setup.sh
   ```
6. Review and accept the license agreement terms.
7. In Database Configuration, select **Oracle** as the database type. Ensure that you have installed the Oracle database client in your system.
   Provide the following Oracle database configuration details:
   - **Database Server**: Enter the hostname of the Oracle database server.
     If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
   - **Oracle Service Name**: Enter the Oracle Service name.
   - **Listener Port**: Enter the listener port for the database.
   - **Net Service Name**: Enter the Net Service Name of the Oracle database where the database resides.
     If the database is remote, use the Net Service Name that is defined in the Oracle client on the local computer. CA SDM has access to the database through a local installation of the Oracle client.
   - **DBA User Name**: Authenticates the name of the user with DBA access. The default value for DBA user is **SYS.**
   - **DBA User Password**: Authenticates the password for DBA user.
   - **mdbadmin Password**: Specify the password for the mdbadmin user.
   - **Confirm mdbadmin Password**: Confirm the mdbadmin user password.
   - **Tablespace Path (on DB Server)**: Enter the tablespace directory on the database server.
   - **Oracle Home Path**: Provide the Oracle Client 64-bit path. Provide Oracle client 42-bit path for fresh installation
   - **Data Tablespace Name**: Enter the tablespace name. The default value is **MDB_DATA**.
   - **Index Tablespace Name**: Enter the index tablespace name: The default value is **MDB_INDEX**.
8. Click **Next.**

9. On **Select the Products and Integrations** page, patch list is displayed. Select the required patch to install.
   a. **CA Service Desk Manager**
      - CA Service Desk Manager Patch
      - xFlow Interface Patch
      - Search Server Patch: A search server patch must be installed on a server where an earlier version from previous releases is already installed.
10. Click **Next**.
11. Review the Pre-Installation Summary page. Click **Next.**
12. Click **Install** to proceed with the installation. Review the Installation progress and when the installation is complete, click **Next.**
13. To review the installation logs, navigate to the path shown in the installation summary screen.
14. Click **Finish** to exit the installer.
    If patch installation fails for a product, retry the installation by using the **Retry** option in the wizard where it fails. If retry does not work, exit the installer and relaunch it. If the problem persists, contact Broadcom Support.
15. After installing XFlow Interface, start the**CA XFlow Interface**service. Navigate to /opt/CA/xFlow/Apps and run the following command from a command prompt window:
    ```
    ./xFlowServer start
    ```
    To stop the server, run the following command:
    ```
    ./xFlowServer Stop.sh
    ```
16. Navigate to /opt/CA/SC/SearchServer/elasticsearch/bin and run the following command from the command prompt window:
    ```
    ./ServicesStart.sh
    ```
    NOTE
    If you get the below message while restarting the search server service, ignore it and continue:
    ```
    groupadd: group 1elasticsearch1 already exists
    useradd: user 1elasticuser1 already exists
    runuser: warning: cannot change directory to /home/elasticuser: No such file or directory
    OpenJDK 64-Bit Server VM warning: Option UseConcMarkSweepGC was deprecated in version 9.0 and
     will likely be removed in a future release.
    ```
    To stop the server, run the following command:
    ```
    /ServicesStop.sh
    ```
17. Validate the Installation.
18. Complete the Post-Installation Tasks.

After installing the XFlow Interface and Search Server, you can configure the cache size for XFlow Interface. For more information about how to configure cache size, see Perform initial load and refresh index on the search server.

Validate CA Service Management 17.4.4.0 Installation

Validate CASM 17.4.4.0 installation

To verify the successful installation of CA Service Management 17.4.4.0, validate the installation for the corresponding applications in the following location. You can also navigate to the root folder where you have locally installed the application and select the "env.info" file for validating your installation:

- **CA ITAM:**
  NOTE
  CORA version: 17.4.0.57

  - C:\Program Files (x86)\CA\ITAM\env.info
  - product=ITAM
  - major=17
  - minor=4
  - cum=4
  - roll-up=0

    NOTE
    CA CASM uses Apache Tomcat version 9.0.102.
- **CA Service Catalog:**
  - %USM_HOME%*CA_SLCM_<hostname>.his* file
  - %USM_HOME%\view\webapps\usm\locale\about_info.xml
  - %USM_HOME%\build.xml
  - %USM_HOME%\env.info
- **xFlow Interface:**
  - *C:\Program Files\CA\xFlow\<hostname>.his* file
  - NX_ROOT\env.info
  - NX_ROOT\version.xml
- **CA SDM:**
  - *C:\Program Files (x86)\CA\Service Desk Manager\<hostname>.his* file
  - NX_ROOT\pdmconf\version
  - NX_ROOT\env.info
  - HELP, ABOUT

    NOTE
    For CA SDM, the Binary and Language Combo patches are installed irrespective of the environment. The language patch for the corresponding CA SDM environment is installed.

    To validate the successful installation of the patches, follow these steps:

    1. Open the <sdm_installation>\<hostname>.his file in a text editor.
    2. Search for the instances of "gol-310". In a successful install, you should come across these three entries (Binary, Language Combo, and corresponding language patch).

Application	Windows	Linux
CA Asset Portfolio Management	T6EE1744	NA
CA Service Catalog	T6D91744	NA
CA Service Desk Manager - Binary	gol-310_cum_C	gol-310_x86_64Linux_cum_C
CA Service Desk Manager - Languag504e Comb	gol-310_langcombo	gol-310_langcombo
CA Service Desk Manager - English	gol-310_en_US	gol-310_x86_64Linux_en_US
CA Service Desk Manager - German	gol-310_de_DE	gol-310_x86_64Linux_en_DE
CA Service Desk Manager - Spanish	gol-310_es_ES	NA
CA Service Desk Manager - French	gol-310_fr_FR	gol-310_x86_64Linux_fr_FR
CA Service Desk Manager - Italian	gol-310_it_IT	NA
CA Service Desk Manager - Japanese	gol-310_ja_JP	gol-310_x86_64Linux_ja_JP
CA Service Desk Manager - Brazilian Portuguese	gol-310_pt_BR	NA

Post-Installation Tasks for CA Service Management 17.4.4.0

After successful installation of CA Service Management 17.4.4.0, perform the following post-installation steps.

CA Service Desk Manager

Manual Steps required for Automated Post-Installation

CA Service Management provides an option in the installer to automate the post-install tasks.
If you have selected **Yes** to automate the post-installation steps while running the CA Service Management Installer Wizard, you are not required to perform any manual post-install steps for CA Service Desk Manager (SDM).

If you have selected **No** for automating the post-install steps while running the CA Service Management Installer wizard, perform the below manual post-install tasks as per your deployment requirements:

Manual Post-Install Tasks After Installing CA Service Desk Manager (SDM) 17.4.4.0 on CA SDM 17.4.3.0
Perform the following steps:

1. Stop CA SDM services.
2. Navigate to NX_ROOT/site/config.properties file and ensure the value of resources.created parameter is set to 0.
3. Open a command prompt window and run the following command:
   ```
   pdm_configure
   ```
4. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_04_insert.dat
   pdm_load -u -f r17_4_04_update.dat
   ```

Manual Post-Install Tasks After Installing CA Service Desk Manager (SDM) 17.4.4.0 on CA SDM 17.4.2.0
Perform the following steps:

1. Stop CA SDM services.
2. Navigate to NX_ROOT/site/config.properties file and ensure the value of resources.created parameter is set to 0.
3. Open a command prompt window and run the following command:
   ```
   pdm_configure
   ```
4. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_03_insert.dat
   pdm_load -u -f r17_4_03_update.dat                                                    pdm_load -f
   r17_4_04_insert.dat
   pdm_load -u -f r17_4_04_update.dat
   ```
5. Notification message template is modified to update the existing email templates with the html_description field.
   Tool location: NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate This has to be executed one time when the SDM service is up and running. **For e.g:**
   Windows
   ```
   NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate.bat
   ```
   Linux
   ```
   NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate.sh
   ```

Manual Post-Install Tasks After Installing CA Service Desk Manager (SDM) 17.4.4.0 on CA SDM 17.4 or CA SDM 17.4.1.0

Perform the following steps:

1. Stop CA SDM services.
2. Navigate to NX_ROOT/site/config.properties file and ensure the value of resources.created parameter is set to 0.

3. Open a command prompt window and run the following command:
   ```
   pdm_configure
   ```
4. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_02_insert.dat
   pdm_load -u -f r17_4_02_update.dat
   pdm_load -f r17_4_03_insert.dat
   pdm_load -u -f r17_4_03_update.dat                                                    pdm_load -f
   r17_4_04_insert.dat
   pdm_load -u -f r17_4_04_update.dat
   ```
5. Notification message template is modified to update the existing email templates with the html_description field.
   Tool location: NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate This has to be executed one time when the SDM service is up and running. **For e.g:**
   Windows
   ```
   NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate.bat
   ```
   Linux
   ```
   NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate.sh
   ```

Manual Post-Installation Task for CMDB

> **NOTE**
> For Oracle 21c, set the **isClusterEnv** setting to "true" in the application.conf file of CMDB viz and restart the CA SDM Services.:
>
> - For Windows: <SDM installed location>\bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\WEB-INF\classes\application.conf)
> - For LINUX: <SDM installed location>/bopcfg/www/CATALINA_BASE_VIZ/webapps/CMDBVisualizer/WEB-INF/classes/application.conf).

If you are applying CA Service Management 17.4.4.0 in an SSL environment, CA SDM Administrators must perform the following post-installation steps for CMDB Visualizer Interface to open using the **HTTPS** protocol when launching from CA SDM UI:

1. In the NX.env file, change the **NX_CMDB_VISUALIZER** entry to provide **HTTPS protocol** and **HTTPS port**.
   For example: @NX_CMDB_VISUALIZER=https://sdmurl:<VIZ_SSL_PORT>/CMDBVisualizer
2. In **casm.conf.js** file from NX_root\bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\viz-ux\conf, provide the HTTPS as protocol and HTTP port.
   For example:

```
sdm: {

     vizserver: 'https://sdmurl:<VIZ_SSL_PORT>/CMDBVisualizer/viz',
     server: 'https:// sdmurl:<SDM_SSL_PORT>/CAisd/pdmweb.exe'
   }
```

Manual Post-Installation Task for OAuth 2.0 (Maileater/ Mailer)

After generating an access token for OAuth 2.0 to connect to a mail server, perform the mandatory post-install tasks on all servers in your environment:

1. Create a backup of web.xml from NX_ROOT\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF in your local directory to perform backout if required.
2. Open the web.xml file from NX_ROOT\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF.
3. Search for the following statement:

```
<!--USD servlet mappings start-->
```

4. Copy and paste the following configuration under the statement:

```
<servlet>
  <servlet-name>OAuthProcessor</servlet-name>
  <servlet-class>com.broadcom.oAuth.OAuthProcessor</servlet-class>
 </servlet>
```

5. Copy and paste the following configuration after any <servlet-mapping>:

```
<servlet-mapping>
  <servlet-name>OAuthProcessor</servlet-name>
  <url-pattern>/OAuthProcessor</url-pattern>
</servlet-mapping>
```

6. Save and close the web.xml file.
7. For OAuth servlet preservation in a primary and secondary environment, the secondary server must also have the OAuth processor entries in the following file: *<NX_ROOT>\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF\web.xml.last*.
8. Repeat Steps 1-8 to update **web.xml.tpl** file in the NX_ROOT\samples\pdmconf\web.xml.tpl folder to avoid losing these changes when pdm_configure is run at a later point of time.
9. Run the following command:
   ```
   pdm_tomcat_nxd -c STOP command
   ```
10. Wait for some time (a minute or so) and run the following command:
    ```
    pdm_tomcat_nxd -c START command
    ```

For more information, see Define a mailbox.

Manual Post-Installation Task for Excel file (.xlsx) export*

1. Execute the following command:
   ```
   pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst
   ```
2. Execute the following command to add the new NX variable to NX.env.tpl file.
   ```
   pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst -t
   ```
3. Restart CA SDM services.

HTML Tags Sanitization

The sanitization tool can be run any number of times. Administrators can choose if they wish to run the tool for each ticket type separately or for all ticket types at one go.

Before running the Sanitization tool ensure you take a backup of all the ticket objects using the following commands or by taking a backup of the sdm databse :

```
"Call_Req": pdm_extract Call_Req > cr_backup.txt
"Issue": pdm_extract Issue > Issue_backup.txt
"Change Orders": pdm_extract Change_Request >change_orders_backup.txt.
```

Both active and archived tickets can be sanitized.
For Windows:

```
NX_ROOT\samples\sdk\SanitizationTool\sanitizeTool.bat
```

For Linux:

```
NX_ROOT\samples\sdk\SanitizationTool\sanitizeTool.sh
```

NOTE
We recommend executing the sanitization during slack time on any Service Desk Manager server.

After executing the sanitization tool, execute the following command to update domsrvr memory cache:

```
pdm_cache_refresh -t Call_Req
pdm_cache_refresh -t Issue
pdm_cache_refresh -t Change_Request
```

(Optional) Enable HTML content for Ticket Description in the Activity log

NOTE

- A new Field Update activity association (**HTML Description** has been introduced)
- Either **HTML Description** or **Description** activity association has to be enbaled. Do not enable both the options.
- Out of the box Description Field Update activity association is enabled in the activity log for all ticket types (Incident,Request,Problem,ChangeOrder and Issue).

Enabling HTML content for Description in the Activity Log:

1. Login into CA SDM with Administrator access type.
2. Administration --> Notifications --> Activity Associations.
3. Click **Show Filter**.
4. Enter "HTML Description" in the Symbol text box in the Activity Association List page.
5. Click **Search**
6. For every **HTML Description Field Update association**, click **Edit** and check the **Log Me** checkbox, then save the changes made.

Disabling plain text for Description in the Activity log:

1. Click **Show Filter** in the Activity Association List page.
2. Enter "Description" in the Symbol text box and Select Object Type as "Request/Incident/Problem" and click **Search**.
3. Now see the one row and click the Description link in the Activity Association List page.
4. Unselect the **Log Me** check box and save the page.
5. For Change Order and Issue repeat the steps from 1 to 4.

(Optional) Manual Post-Installation Task for Knowledge Document export with German fields

If you are exporting Knowledge Document with German Fields (included in the export field list), then perform the below post-install steps for successful export of knowledge documents:

1. Take the backup of NX_ROOT\NX.env file (NX_ROOT is the installation directory for CA Service Desk Manager).
2. Open NX_ROOT\pdmconf\NX.env_nt.tpl file using any text editor and take the value of NX variable @NX_KEIT_AVAILABLE_FIELDS which is COPIED_DATA and update Nx.env in NX_ROOT by executing below command:

   ```
   pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <COPIED_DATA>  -a  pdm_option.inst
   ```

   Where COPIED_DATA is the value copied from NX.env_nt.tpl (step 2).
   For example, " pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <provide the exact string here> -a pdm_option.inst "
   Note to avoid losing the updated changes when you run pdm_configure, execute the above command with the '-t' flag as follows:

   ```
   pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <COPIED_DATA> -a pdm_option.inst -t
   ```

(Optional) Handle HTML Mails that contains Tables in MailEater

Java based Maileater already has the ability to process the emails that were sent in plain format or HTML format, to support the processing of emails that contain Tables in the HTML body. But the format in which the email was sent is lost when received by Maileater.

1. Run the following commands from NX_ROOT/bin from the command prompt/ terminal:
   ```
   pdm_options_mgr -c -s NX_ENFORCE_HTML_EMAIL_PARSING -v "Yes" -a pdm_option.inst
   pdm_options_mgr -c -s NX_ENFORCE_HTML_EMAIL_PARSING -v "Yes" -a pdm_option.inst -t
   ```
2. Restart CA SDM and XFlow applications.

(Optional) Comments are not allowed when a Data Partition (O_COMMENTS) is created with Customer, Employee and ServiceDesk Analyst

To disable comments:

1. Login to SDM and navigate to Administration -> Security and Role Management-> Data partition-> Data Partition List.
2. In Data Partition List, create a constraint (O_COMMENTS with the condition id=0) and link it to Customer, Employee and ServiceDesk Analyst data partitions.
3. Run the following commands from NX_ROOT/bin from the command prompt/ terminal:
   ```
   pdm_options_mgr -c -s KT_COMMENT_USE_SUPERUSER -v 0 -a pdm_option.inst
   pdm_options_mgr -c -s KT_COMMENT_USE_SUPERUSER -v 0 -a pdm_option.inst -t
   ```
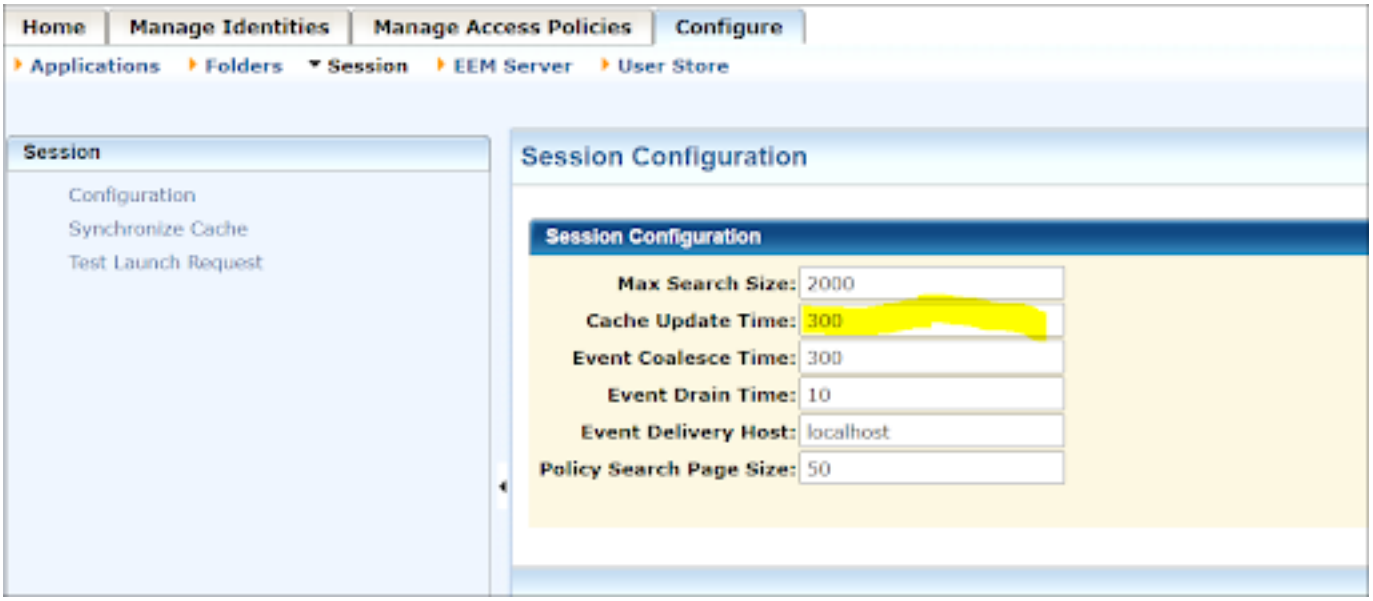
4. Restart CA SDM and XFlow applications.

(Optional) Manual Post-Installation Task for EEM Cache Timeout Configuration Update

You may face issues while logging in to EEM or SDM using the EEM user accounts due to a session cache timeout mismatch between EEM and SDM.

You can update the EEM cache timeout configuration by adding a new NX variable, "NX_EEM_CACHE_UPDATE_TIME" in SDM.

Keep the value the same as the EEM cache timeout configuration value mentioned in the following screenshot.



To set the EEM cache update time to 300 seconds, perform the following steps:

To add the variable in the **nx.env** file, run the following command:

```
pdm_options_mgr -c -s  EEM_CACHE_UPDATE_TIME  -v 300 -a pdm_option.inst
```

To add the variable in the **nxenv_nt.tpl** file, run the following command:

```
pdm_options_mgr -c -s  EEM_CACHE_UPDATE_TIME  -v 300 -a pdm_option.inst -t
```

(Optional)casc_impersnate_user

Once both CA SDM and CA Service Catalog are integrated, do the following:

1. Login to CA SDM with the Administrator user type.
2. Navigate to Administration >> Options Manager >> CA Service Catalog >> in the Options List, install casc_impersnate_user
3. Restart the SDM service.

(Optional)Incident/Request/Problem Solution should display Short Resolution

To display a short solution for tickets, do the following:

1. Login to CA SDM with the Administrator user type.
2. Navigate to Administration >> Options Manager >> Knowledge >> use_resolution_short_for_soln.
3. In the use_resolution_short_for_soln window displayed, click **Edit,** and click **Install**.
4. Restart CA SDM.

(Optional)Logging SOAP Calls

Service Point

After successful installation of Service Point, refresh index and data on the Search Server.

> **NOTE**
> In case of Linux Search Server environment, ensure to run the following commands on the terminal:
>
> ```
> sysctl -w vm.max_map_count=262144
> ulimit -Hn 65535
> ```

(Optional) Manual Post-Installation Task for Rebuild Index

If you have upgraded or are planning to install CA EEM 12.6 with Service Point and CA Service Catalog, ensure that you rebuild the CA Service Catalog index after completing the CA EEM upgrade/installation process. For more information, see Perform Initial Load and Refresh Index Data on Search Server.
Run the following command to rebuild the index:

```
$ES_HOME/search/bin/pdm_es_rebuild_index.bat index=catalog_index
```

CA Service Catalog

Perform the following CA Service Catalog post-installation steps as per your environment requirements:

- Post-Installation Tasks after installing CA Service Catalog 17.4.3.0 on CA Service Catalog 17.4 or later
- gMSA Authentication

Post-Install Tasks After Installing CA Service Catalog 17.4.3.0 on CA Service Catalog 17.4 or later

Review and perform the post-installation steps based on your deployment requirements.

> **NOTE**
> If any SSL certificate(s) chain was imported to the Oracle Java's JAVA_HOME\lib\security\cacerts Keystore, those certificate(s) chain again need to be exported explicitly and imported properly into the new AdoptOpenJDK's %USM_HOME%\embedded\jdk\lib\security\cacerts Keystore.
>
> **NOTE**
> While upgrading from 17.4.2.0 to 17.4.3.0, re-run the removal_axis.bat file, if already ran it on 17.4.2.0.

Follow these steps

- (Optional) If Service Catalog is accessed from applications like Service Point, SharePoint and so on, then you must perform this step. Open the "**web.xml**" file located in *USM_HOME%\view\webapps\usm\WEB-INF* and update the respective parameter values for the parameter name "cors.allowed.origins" and "cors.support.credentials". For example, if you are using Catalog Widgets in Service Point
- (Optional) Unable to approve any workflow requests through email. The email sent for approvals is corrupted with special characters. Follow the KB article steps.

(Optional) Approve workflow requests through email

The workflow email sent for approvals is corrupted with special characters. To approve any workflow requests through email, follow the KB article steps.

gMSA Authentication Post-Install Steps for CA Service Catalog (Automated steps)

CA Service Catalog provides automated post-installation steps for gMSA Authentication. Review the following before you proceed:

- Prerequisites and Considerations
- How to Automate gMSA Post-Installation Steps
- Unconfigure gMSA

Prerequisites and Considerations:

Ensure that you have taken care of the below considerations on all nodes of CA Service Catalog where you want to automate the gMSA post-installation procedure.

1. If the accounting service is available, perform the automated post-install steps by updating serviceName to ServiceAccounting and providing the appropriate gMSA account name in the **gmsa.properties** file.
2. If the filestore path is external to the server from where the **GMSAPostInstall.bat** is running, ensure to provide appropriate access to the server for setting the gMSA account permissions.
3. While preparing the properties file, check for any copy/paste issues, special characters, spaces, and so on.

How to Automate gMSA Post-Installation Steps

Perform the following steps to enable the batch file **GMSAPostInstall.bat** and to automate the gMSA post-installation steps:

1. Create a gMSA account for CA Service Catalog.
2. Ensure that appropriate DB (database) permission is given to the newly created account(s).
3. Enter the below values in the **gmsa.properties** file and save it.

   NOTE
   A template file (**gmsa.properties**) is added in the common installer in *"\filestore\SLCM\gMSAProperties"* . Optionally. use this file as a template file to fill gmsa properties. This can be copied to "USM_HOME/scripts/GMSA" where Catalog is installed.

   NOTE
   All values are mandatory. Make sure that there are no leading or trialing spaces while providing these values.

   a. **serviceName**: Application service name to enable GMSA. In the case of Catalog, it will be ServiceCatalog and for accounting, it will be ServiceAccounting.
   b. **folderName**: Absolute path of the application installation directory.
   c. **gMSAName**: Name of the GMSA service account (domain\accountName$).
   d. **filestorePath**: Shared network path (\\Server_name\filestore) or local filestore path
4. Navigate to %USM_HOME% and launch **usm.cmd**
5. Navigate to %USM_HOME%/scripts/GMSA/ folder and run the "GMSAPostInstall.bat" in command prompt.

NOTE
If the command executes without any error, "Post-installation steps for GMSA executed successfully" message is displayed with exit code 0.
If there are errors, the error message is shown with a non-zero exit code. Correct the error to continue and perform step **5** again.

Unconfigure gMSA for CA Service Catalog

To disable or unconfigure gMSA for CA Service Catalog, follow the steps below:

1. Replace **config.properties** file from*%USM_HOME%*\ folder.
2. Revert back all the folder permissions which were assigned to domain users.
3. Start Catalog and Accounting Services with the local system account.

NOTE
In the case of load balancers, repeat steps 1-3 to unconfigure gMSA on all Catalog servers.

CA Asset Portfolio Management

Manual Post-Installation Task for Removing jQuery, log4net, and log4j Vulnerabilities

After installing 17.4.4.0, delete jquery-1.3.2.min.js, jquery-ui-1.7.2.custom.min.js , log4net.dll, and log4j from their respective installed folders.

NOTE
Perform the below steps if you have not done this earlier.

Perform the following steps:

1. Log on to CA APM Web Server, navigate to the <ITAM_install_dir>\ITAM\Web Server\castylesr5\javascript.
   Example: C:\Program Files (x86)\CA\ITAM\Web Server\castylesr5\javascript
   Locate and delete the jquery-1.3.2.min.js and jquery-ui-1.7.2.custom.min.js files from the directory.
2. Navigate to the ITAM_install_dir\CA\ITAM\Data Importer.
   Locate and delete the log4net.dll file from the directory.
3. Navigate to the C:\Program Files (x86)\CA\SC\CORA.
   Locate and delete the log4j-1.2.15.jar, log4j.properties, and ojdbc6.jar files from the directory.
4. Navigate to the ITAM_install_dir\CA\ITAM.
   Backup the following folders and manually delete them:
   - CDB
   - MDB
   - jre8

   NOTE
   jre8 folder has to be deleted manually for every RU installation.
5. Perform an IISRESET and delete the browser's cache to load the upgraded files.

For ITAM installation on French Operating System

Following the successful installation of version 17.4.3.0 on a French Windows operating system with the browser set to French, we are unable to log in to ITAM.

An error message is displayed: ***Une valeur Request.Form potentiellement dangereuse a été détectée à partir du client (_UPLOAD_NON_TXT_CSV_DATA_FILE_="...ectionné n'est pas de type...").***

To overcome this, follow these steps:

1. Navigate to *C:\Program Files (x86)\CA\ITAM\Web Server, edit web.config*, and search for *<pages enableEventValidation="false" viewStateEncryptionMode="Never" controlRenderingCompatibilityVersion="4.0" clientIDMode="AutoID">* , then add *validateRequest="false"* to it.

2. After adding, it looks like this:
   <pages enableEventValidation="false" viewStateEncryptionMode="Never" controlRenderingCompatibilityVersion="4.0" clientIDMode="AutoID" validateRequest="false">
3. Do an IISRESET.
4. You can now successfully login to ITAM.

Post-Installation Tasks - CA SDM Advance Availability 17.4.4.0

The installer wizard provides an option in the installer to automate the post-install tasks. Perform the following post-installation tasks for CA SDM Advanced Availability Configuration. For the Advanced Availability configuration, the following host names are considered as an example:

- The background server hostname is sdmcahost1.
- The standby server hostname is sdmcahost2.
- The application server hostname is sdmcahost3.

Manual Steps required for Automated Post-Installation

If you have selected **Yes** for automating the post-install steps while running the installer wizard, then perform manually the following post-install tasks:

Manual Post-Install Tasks - After Installing CA Service Desk Manager (SDM) 17.4.4.0 on CA SDM 17.4.3.0

1. Ensure that the patch is applied on the standby server (sdmcahost2).
2. Start the CA SDM service on the standby server (sdmcahost2). Open the command prompt and run the following command:
   ```
   pdm_server_control -b
   ```
3. Ensure that the patch is applied on the original background server (sdmcahost1) which is now a standby server.
4. Start the CA SDM service on the standby server (sdmcahost1). Run the following command:
   ```
   pdm_server_control -b
   ```
5. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_04_insert.dat
   pdm_load -u -f r17_4_04_update.dat
   ```
6. Clear the browser cache by the following command:
   ```
   pdm_webcache -H
   ```
7. Ensure that the patch is applied on all the application servers and the remaining standby servers if any. If you selected YES to automate the post-install steps, then there are no more manual post-install steps to be performed.

Manual Post-Install Tasks - After Installing CA Service Desk Manager (SDM) 17.4.4.0 on CA SDM 17.4.2.0

1. Ensure that the patch is applied on the standby server (sdmcahost2).
2. Start the CA SDM service on the standby server (sdmcahost2). Open the command prompt and run the following command:
   ```
   pdm_server_control -b
   ```
3. Ensure that the patch is applied on the original background server (sdmcahost1) which is now a standby server.
4. Start the CA SDM service on the standby server (sdmcahost1). Run the following command:
   ```
   pdm_server_control -b
   ```
5. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_03_insert.dat
   pdm_load -u -f r17_4_03_update.dat                                                    pdm_load -
   f r17_4_04_insert.dat
   pdm_load -u -f r17_4_04_update.dat
   ```

6. Clear the browser cache by the following command:
   ```
   pdm_webcache -H
   ```
7. Ensure that the patch is applied on all the application servers and the remaining standby servers if any. If you selected YES to automate the post-install steps, then there are no more manual post-install steps to be performed.

Manual Post-Install Tasks - After Installing CA Service Desk Manager (SDM) 17.4.4.0 on CA SDM 17.4 GA or CA SDM 17.4.1.0

1. Ensure that the patch is applied on the standby server (sdmcahost2).
2. Start the CA SDM service on the standby server (sdmcahost2). Open the command prompt and run the following command:
   ```
   pdm_server_control -b
   ```
3. Ensure that the patch is applied on the original background server (sdmcahost1) which is now a standby server.
4. Start the CA SDM service on the standby server (sdmcahost1). Run the following command:
   ```
   pdm_server_control -b
   ```
5. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_02_insert.dat
   pdm_load -u -f r17_4_02_update.dat
   pdm_load -f r17_4_03_insert.dat
   pdm_load -u -f r17_4_03_update.dat                                                    pdm_load -
   f r17_4_04_insert.dat
   pdm_load -u -f r17_4_04_update.dat
   ```
6. Clear the browser cache by the following command:
   ```
   pdm_webcache -H
   ```
7. Ensure that the patch is applied on all the application servers and the remaining standby servers if any. If you selected YES to automate the post-install steps, then there are no more manual post-install steps to be performed.

Manual Steps required for Non-Automated Post-Installation

If you have selected **No** for automating the post-install steps while running the CA Service Management installer wizard, perform manually the appropriate post-install after this task as per your deployment requirements.

Post-Install Tasks After Installing CA SDM 17.4.4.0 on CA SDM 17.4.3.0 for Advanced Availability Configuration

1. Ensure that the patch is applied on the standby server (sdmcahost2).
2. Navigate to NX_ROOT/site/config.properties file and ensure the value of resources.created parameter is set to 0. Open a command prompt and run the following command:
   ```
   pdm_configure
   ```
   On the installer configuration page, before clicking Finish, uncheck the Start service when completed checkbox. Failure to uncheck the box may result in the loss of custom schema changes and configurations that were changed on the server.
3. Promote the standby server as the new background server by performing the following steps. To suppress version control on the standby server and later on the background server, run the following command on each server:
   ```
   pdm_server_control -v
   ```
4. Start SDM service on the standby server. Run the following command:
   ```
   pdm_server_control -b
   ```
5. Ensure that the patch is applied on the original background server (sdmcahost1) which is now a standby server, and perform the following steps. Navigate to NX_ROOT/site/config.properties file and ensure that the value of resources.created parameter is set to 0. Run the following command:
   ```
   pdm_configure
   ```
6. Start the CA SDM service on the standby server (sdmcahost1). Run the following command:

```
pdm_server_control –b
```

7. Change the directory to NX_ROOT/data, and execute the following command:

```
pdm_load –f r17_4_04_insert.dat
pdm_load –u –f r17_4_04_update.dat
```

8. Ensure that the patch is applied on all application servers and the remaining standby server if any. Perform the following steps on all application servers and standby servers.
9. Navigate to NX_ROOT/site/config.properties file and ensure that the value of resources.created parameter is set to 0. Run the following command:

```
pdm_configure
```

10. Clear the browser cache by running the following command:

```
pdm_webcache –H
```

Post-Install Tasks After Installing CA SDM 17.4.4.0 on CA SDM 17.4.2.0 for Advanced Availability Configuration

1. Ensure that the patch is applied on the standby server (sdmcahost2).
2. Navigate to NX_ROOT/site/config.properties file and ensure the value of resources.created parameter is set to 0. Open a command prompt and run the following command:

```
pdm_configure
```

   On the installer configuration page, before clicking Finish, uncheck the Start service when completed checkbox. Failure to uncheck the box may result in the loss of custom schema changes and configurations that were changed on the server.
3. Promote the standby server as the new background server by performing the following steps. To suppress version control on the standby server and later on the background server, run the following command on each server:

```
pdm_server_control –v
```

4. Start SDM service on the standby server. Run the following command:

```
pdm_server_control –b
```

5. Ensure that the patch is applied on the original background server (sdmcahost1) which is now a standby server, and perform the following steps. Navigate to NX_ROOT/site/config.properties file and ensure that the value of resources.created parameter is set to 0. Run the following command:

```
pdm_configure
```

6. Start the CA SDM service on the standby server (sdmcahost1). Run the following command:

```
pdm_server_control –b
```

7. Change the directory to NX_ROOT/data, and execute the following command:

```
pdm_load –f r17_4_03_insert.dat
pdm_load –u –f r17_4_03_update.dat                                                    pdm_load –
f r17_4_04_insert.dat
pdm_load –u –f r17_4_04_update.dat
```

8. Ensure that the patch is applied on all application servers and the remaining standby server if any. Perform the following steps on all application servers and standby servers.
9. Navigate to NX_ROOT/site/config.properties file and ensure that the value of resources.created parameter is set to 0. Run the following command:

```
pdm_configure
```

10. Clear the browser cache by running the following command:

```
pdm_webcache –H
```

Post-Install Tasks After Installing CA SDM 17.4.4.0 on CA SDM 17.4 GA or CA SDM 17.4.1.0 for Advanced Availability Configuration

1. Ensure that the patch is applied on the standby server (sdmcahost2).
2. Navigate to NX_ROOT/site/config.properties file and ensure the value of resources.created parameter is set to 0. Open a command prompt and run the following command:

```
pdm_configure
```

On the installer configuration page, before clicking Finish, uncheck the Start service when completed checkbox. Failure to uncheck the box may result in the loss of custom schema changes and configurations that were changed on the server.

3. Promote the standby server as the new background server by performing the following steps. To suppress version control on the standby server and later on the background server, run the following command on each server:
   ```
   pdm_server_control -v
   ```
4. Start SDM service on the standby server. Run the following command:
   ```
   pdm_server_control -b
   ```
5. Ensure that the patch is applied on the original background server (sdmcahost1) which is now a standby server, and perform the following steps. Navigate to NX_ROOT/site/config.properties file and ensure that the value of resources.created parameter is set to 0. Run the following command:
   ```
   pdm_configure
   ```
6. Start the CA SDM service on the standby server (sdmcahost1). Run the following command:
   ```
   pdm_server_control -b
   ```
7. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_02_insert.dat
   pdm_load -u -f r17_4_02_update.dat
   pdm_load -f r17_4_03_insert.dat
   pdm_load -u -f r17_4_03_update.dat                                                    pdm_load -f
   r17_4_04_insert.dat
   pdm_load -u -f r17_4_04_update.dat
   ```
8. Notification message template is modified to update the existing email templates with the html_description field. **Tool location**: NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate This has to be executed one time when the SDM service is up and running. **For e.g:**
   Windows
   ```
   NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate.bat
   ```
   Linux
   ```
   NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate.sh
   ```
9. Ensure that the patch is applied on all application servers and the remaining standby server if any. Perform the following steps on all application servers and standby servers.
10. Navigate to NX_ROOT/site/config.properties file and ensure that the value of resources.created parameter is set to 0. Run the following command:
    ```
    pdm_configure
    ```
11. Clear the browser cache by running the following command:
    ```
    pdm_webcache -H
    ```
12. Execute the following command.
    ```
    pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst
    ```
13. Execute the following command to add the new NX variable to NX.env.tpl file.
    ```
    pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst -t
    ```
14. Restart CA SDM Services.

Uninstall CA Service Management 17.4.4.0

Review the following topics to uninstall CA Service Management 17.4.4.0:

- Uninstall CA SDM 17.4.4.0 (Windows)
- Uninstall CA SDM 17.4.4.0 (Linux)
- Restore Visualizer Files (Windows)
- Restore Visualizer Files (Linux)
- Uninstall the XFlow Interface 17.4.4.0 (Windows)
- Uninstall the XFlow Interface 17.4.4.0 (Linux)
- Uninstall CA Service Catalog 17.4.4.0
- Uninstall CA Asset Portfolio Management
- Run the Database Cleanup Utility for CA Service Management 17.4.4.0

NOTE

Uninstalling CA Service Management 17.4.4.0 will revert to CA Service Management 17.4 version on which 17.4.3.0 is installed.

Example: If CA Service Management 17.4.4.0 is installed on 17.4, uninstalling 17.4.4.0 will revert to CA Service Management 17.4.

Uninstall CA SDM 17.4.4.0 (Windows)

Perform the following steps to uninstall CA SDM 17.4.4.0 on Windows:

1. Log in to CA SDM as an Administrator.
2. Shut down CA Service Desk Manager Server.
3. Navigate to **<NX_ROOT>\bin** and run the following command to backup the unsupported jars from the older versions.
   ```
   pdm_perl pdm_restore_files.pl gol-310_tool ..\PATCHES\DELIVERABLES_REMOVAL.TXT
   ```
4. Navigate to the location *where you have extracted the CA Service Management Installer zip package*.
5. Locate *CASM-17.4.4.0-CommonPatchInstaller-Win\filestore\utils\ApplyPTF* folder.
6. Run the **APPLYPTF.exe**.
7. Select **Backout PTF** from the local or remote node option.
8. Click **Next**.
9. Enter the patch number for the language that is installed in your environment:
   - **Binary**: gol-310_cum_C
   - **Language Master**: gol-310_langcombo
   - **English**: gol-310_en_US
   - **French**: gol-310_fr_FR
   - **German**: gol-310_de_DE
   - **Spanish**: gol-310_es_ES
   - **Italian:** gol-310_it_IT
   - **Japanese**: gol-310_ja_JP
   - **Brazilian Portuguese**: gol-310_pt_BR
10. Click **Next** to continue backing out the specific patch.
11. Repeat steps 6-9, to back out the language English (gol-310_en_US) patch.
12. Repeat steps 6-9 to back out the language master (gol-310-langcombo) patch.
13. Repeat steps 6-9 to back out the binary (gol-310_cum_C) patch.
14. Reboot the server.
15. Repeat steps **6-12** on all standby, application, or secondary servers in your environment.
16. Restore the MDB database to the database backup that you took before applying the patch.
17. Take the backup of the 5.40.0 folder and then delete the folder from <NX_ROOT>\bin\perllib.
18. Copy the 5.36.0 folder from <NX_ROOT>\REPLACED\perl_old and place the folder to <NX_ROOT>\bin\perllib.

19. Navigate to ***<NX_ROOT>\site\config.properties*** file and ensure that the value of ***resources.created*** parameter is set to **0.** This must display as ***resources.created=0*** in the file.
20. Open a command prompt and run the following command:
    ```
    pdm_configure
    ```
21. If you roll-back from 17.4.4.0 to the base version, copyright text year will not change. To change the year:
    a. Add @NX_COPYRIGHT_YEAR=2023 into NX.env file located under CA SDM install directory (NX_ROOT).
    b. To preserve the value even after pdm_configure, update the value of "genfact.gx_copyright_year in install.properties under NX_ROOT\site genfact.gx_copyright_year=2023

Uninstall CA SDM 17.4.4.0 (Linux)

Perform the following steps to uninstall CA SDM 17.4.4.0 on Linux:

1. Login to CA SDM as the root user.
2. Shut down the CA Service Desk Manager Server.
3. Navigate to **<NX_ROOT>/bin** and run the following command to backup the unsupported jars from the older versions.
   ```
   ./pdm_perl pdm_restore_files.pl ../replaced/gol-310_tool ../patches/deliverables_removal.txt
   ```
4. Navigate to the location where you have extracted the CA SDM Installer **tar.gz** package.
5. Navigate to the *casm_dvd.x86Linux \filestore\utils\ApplyPTF* folder.
6. The following binary/language-independent and language-dependent patches are supported:
   - Binary name: gol-310_x86_64Linux_cum_C
   - Language Master: gol-310_langcombo
   - English: gol-310_x86_64Linux_en_US
   - German: gol-310_x86_64Linux_de_DE
   - French: gol-310_x86_64Linux_fr_FR
   - Japanese: gol-310_x86_64Linux_ja_JP
7. Execute the following command to remove the binaries or the language-dependent patches. Replace the <patch_name> with the binary or language-dependent patch name:
   ```
   ./applyptf.<platform> -b <patch_name>  -e <NX_ROOT>
   ```
   Here, <platform> specifies the operating system and <NX_ROOT> specifies the CA SDM installed location.
   For example:
   ```
   ./applyptf.linux -b gol-310_x86_64Linux_cum_C  -e /opt/CA/ServiceDeskManager
   ```
8. Repeat step 6 to back out the language English (gol-310_x86_64Linux_en_US) patch.
9. Repeat step 6 to back out the binary (gol-310_x86_64Linux_cum_C) patch.

   NOTE

   During uninstallation, if you get any errors, ensure that the following steps are performed:

   1. Copy the subfolders from <NX_ROOT>/replaced/<gol-310_x86_64Linux_cum_C> and place it into the <NX_ROOT> folder.
   2. Copy the subfolders from <NX_ROOT>/replaced/<gol-310_x86_64Linux_en_US> and place it into the <NX_ROOT> folder.
   3. Open **.his** file under the <NX_ROOT> folder and delete the entries related to the current patch and save it.
10. To restore MDB database, revert to database backup that you took before applying the patch.
11. Take the backup of the 5.40.0 folder and then delete the folder from <NX_ROOT>\bin\perllib.
12. Copy the 5.36.0 folder from <NX_ROOT>\REPLACED\perl_old and place the folder to <NX_ROOT>\bin\perllib.
13. Navigate to ***<NX_ROOT>/site/config.properties*** file and ensure that the value of ***resources.created*** parameter is set to **0.** This must display as ***resources.created=0*** in the file.

14. Open a command prompt and run the following command:
    ```
    pdm_configure
    ```

15. If you roll-back from 17.4.4.0 to the base version, copyright text year will not change. To change the year:
    a. Add @NX_COPYRIGHT_YEAR=2023 into NX.env file located under CA SDM install directory (NX_ROOT).
    b. To preserve the value even after pdm_configure, update the value of "genfact.gx_copyright_year in install.properties under NX_ROOT\site genfact.gx_copyright_year=2023

       NOTE
       If you are unable to access the SDM URL, follow these steps:

       1. Stop the SDM Services.
       2. Navigate to the <NX_ROOT>/bopcfg/www/CATALINA_BASE folder and delete the work folder.
       3. Start the SDM Services.

Restore Visualizer Files (Windows)

NOTE
After uninstalling CA SDM, CMDB Visualizer does not function automatically as the uninstallation process will not restore the previous visualizer files . To restore, perform the below steps manually:

1. Navigate to the where you have installed Visualizer: <NX_ROOT>\bopcfg\www\CATALINA_BASE_VIZ\webapps.
2. Remove the CMDBVisualizer folder.
3. Copy the **Visualizer_17.4.3.0.OLD** folder from<NX_ROOT>*REPLACED* and paste it in <NX_ROOT>*bopcfg**www* *CATALINA_BASE_VIZ**webapps*. Now, rename the **Visualizer_17.4.3.0.OLD** to **CMDBVisualizer**.
4. Start the SDM Service.

CMDB Visualizer works as expected.

Restore Visualizer Files (Linux)

NOTE
After uninstalling CA SDM, CMDB Visualizer does not function automatically as the uninstallation process will not restore the previous visualizer files. To restore the files, perform the below steps manually:

1. Navigate to the where you have installed Visualizer: <NX_ROOT>/bopcfg/www/CATALINA_BASE_VIZ/webapps.
2. Remove the CMDBVisualizer folder.
3. Copy the **Visualizer_17.4.4.0.OLD** folder from <NX_ROOT>*/replaced* and paste it into <NX_ROOT>*bopcfg**www* *CATALINA_BASE_VIZ**webapps*. Now, rename the **Visualizer_17.4.4.0.OLD** to **CMDBVisualizer**.
4. Start the SDM Service.

CMDB Visualizer works as expected.

Uninstall the XFlow Interface 17.4.4.0 (Windows)

Perform the following steps to uninstall the xFlow Interface (Windows):

1. Click **Start**, **Control Panel**, **Uninstall a Program** to uninstall xFlow Interface 17.4.4.0.
   Or
2. Navigate to where you have installed the xFlow Interface (for example, <NX_ROOT>*/CA/xFlow)*.
3. Select xFlow Interface **17.4.4.0_installation** and click **Change xFlow Interface 17.4.4.0 Installation.exe** to complete the uninstallation process.
4. If you are using Microsoft SQL Server Database, run the following query:
   ```
   update ofProperty set propValue='select c.access_token from casm_active_sessions c WHERE
    UPPER(CONVERT(varchar(32), c.contact_uuid ,2)) = UPPER(?)' where name = 'jdbcAuthProvider.passwordSQL'
   ```

5. If you are using Oracle Database, run the following query;

```
update ofProperty set propValue='select c.access_token from casm_active_sessions c WHERE
 UPPER(CAST( c.contact_uuid AS varchar2(32))) = UPPER(?)' where name = 'jdbcAuthProvider.passwordSQL'
```

Uninstall the XFlow Interface 17.4.4.0 (Linux)

To uninstall the XFlow Interface, complete the following steps on Linux :

1. Navigate to where you have installed the xFlow Interface server.
   For example:
   /opt/CA/_xFlow Interface_installation
2. Execute the following command to uninstall the xFlow Interface 17.4.4.0:

```
./Change xFlow_Interface 17.4.4.0 Installation
```

3. Click **Finish** to complete the uninstallation process.
4. Run the following query for Oracle Database:

```
update ofProperty set propValue='select c.access_token from casm_active_sessions c WHERE
 UPPER(CAST( c.contact_uuid AS varchar2(32))) = UPPER(?)' where name = 'jdbcAuthProvider.passwordSQL'
```

Uninstall CA Service Catalog 17.4.4.0

To uninstall CA Service Catalog, perform the following steps:

1. Click **Control Panel**, **Programs and Features**.
2. Double-click the CA Service Catalog 17.4.4.0 and follow the uninstallation wizard instructions.

Uninstall CA Asset Portfolio Management

CA Asset Portfolio Management (CA APM) architecture is highly database-driven and has no rollback mechanism for database-related changes. Hence, the uninstallation of the CA APM patch is not recommended and is not supported. The only way to revert the database changes, if required, is by restoring the database backup which can lead to data loss.

Run the Database Cleanup Utility for CA Service Management 17.4.4.0

During the installation of CA Service Management products, each of the installed product is registered in a common mdb table that is reflected in the deployment summary of the selected environment. These entries must be cleared in the following cases:

- Uninstallation of any CA Service Management products
- Moving Database or migration from one server to another

Run the CA Service Management database cleanup utility on a Windows or a Non-Windows environment. The database cleanup utility removes the entries and adds to the following tables:

Table Name from where the entries are removed	Table Name to which the removed entries are added
al_cdb_componentinstallstate	al_cdb_comp_installstate_bkup
al_cdb_configurationparameters	al_cdb_config_params_backup

NOTE

On a Non-Windows Platform, before running the **DBCleanup.sh** Utility, you must export the Oracle Environment variables on the terminal.

Perform the following steps:

1. Navigate to *DVD1\DBCleanupUtility* directory.
2. For Windows, double-click the **DBCleanupUtility.bat** to launch the DBCleanup utility.
   On a Non-Windows platform, you must run the **DBCleanupUtility.sh** file.
3. Enter the following details:
   a. **Database Server Type**: Specify the type of server. Microsoft SQL or Oracle.
   b. **Database Host Name:** Enter the host name of the server where the database resides.
   c. **Database User Name**:
      - **SQL Server**: Enter the privileged user detail that has permission to create and modify the schema.
      - **Oracle**: Provide the mdbadmin user name.
   d. **Database Password**:
      - **MS SQL**: Enter the database password used by the database admin user.
      - **Oracle**: Enter the password for the Oracle database user.
   e. **Database Port Number:** Provide the database port number.
   f. **Enter Database Name :** Enter the database name. For example, mdb.
   g. **System Name**: Provide the hostname of the system from where you want to uninstall the CA Service Management product or products.
4. Select any of the following products that you want to uninstall:
   – **SDM -** CA Service Desk Manager
   – **SLCM-** CA Service Catalog
   – **xFlow Interface**
   – **ProductUpdates**
   Enter product name to be uninstalled: **ProductUpdates**
5. Enter product to clean up updates: (sdm,slcm,xflow,chatserver,searchserver): For example, slcm
6. Enter update version to clean up: 17.4.4.0
7. The utility cleans up the database and removes the entries of the selected product installed on the server.

Installing CA Service Management 17.4.3.0

Based on your CA Service Management implementation, review the following topics for a successful installation.

- Install Prerequisites for CA Service Management 17.4.3.0
- Install CA Service Management 17.4.3.0 (Windows)
- Install CA Service Management 17.4.3.0 (Linux)
- Validate CA Service Management 17.4.3.0 Installation
- Post-Installation Tasks for CA Service Management 17.4.3.0
- Post-Installation Tasks - CA SDM Advance Availability 17.4.3.0
- Uninstall CA Service Management 17.4.3.0

Install Prerequisites for CA Service Management 17.4.3.0

Installation prerequisites for patch 17.4.3.0

Verify and complete the following prerequisites before installation of CA Service Desk Manager, CA Service Catalog, and CA Asset Portfolio Management.

Installation Prerequisites for CA Service Desk Manager

Review the following CA SDM installation prerequisites before you start the installation process:

> **NOTE**
> We recommend that you place the installer in a shorter directory path, containing no spaces, to avoid errors when running the setup file. For example, unzip the file at: C:\WIN_17_4_3_0.

- Ensure that CA SDM and xFlow Interface 17.4 is installed in your environment.
- Back up the system database (MDB). The system database (MDB) backup is mandatory and ensures safe data recovery if any problems are encountered during the installation process.
- Do not invoke ApplyPTF manually in your system while running the CA Service Management CA Service Management 17.4.3.0 installer.
- In the case of, CA Service Desk Manager - Conventional configuration, if the Primary and Secondary servers are on separate nodes, and the xFlow Interface is deployed on the Secondary Server, then the Database Client (Microsoft SQL Native Client or Oracle Database Client) is required on the Secondary Server for a successful installation.
- CA SDM must be installed for deploying the xFlow Interface. In the conventional configuration, it's recommended to install the xFlow Interface server on a secondary server. Advanced Availability users can install the xFlow Interface only on an application server.

> **IMPORTANT**
> After upgrading to CA Service Management 17.4.3.0, Maileater does not work with POP3 on a non-TLS port with Clear Text as a security level. This is a limitation of the upgraded Javamail (Third-party jar) used in connection to the mail server. Users are required to use **LOGIN** as a security level.

(Optional) Backing up the CR_Stored_Queries Table

CA Service Management provides a fix to address a vulnerability related to SQL injection. As part of this fix, **Cr_Stored_Queries** table is updated. If you have made customizations or changes to the Out-of-the-box (OOTB) stored queries, perform the below steps to take a backup before applying the CA Service Management patch:

1. Open a command prompt window and navigate to *$NX_ROOT\patches.* and create a folder **Backup_Data**. Navigate to this folder and take the Backup of the Cr_Stored_Queries table by running the following command:
   ```
   pdm_extract Cr_Stored_Queries> Cr_Stored_Queries_17.4_backup.dat
   ```
2. Verify that the **Cr_Stored_Queries_17.4_backup.dat** file is successfully created.
3. Now, proceed with CA Service Management 17.4.3.0 installation.
4. After applying the patch, if required based on your customizations, you can update the database files created in **Step 1**. Navigate to $NX_ROOT\patches\Backup_Data location and run the following command:

   ```
   pdm_load -f Cr_Stored_Queries_17.4_backup.dat
   ```

Installation Prerequisites for CA Service Catalog

Verify and complete the following prerequisites before proceeding with CA Service Catalog 17.4.3.0 installation:

- Ensure that CA Service Catalog 17.4 is installed in your environment.
- Back up the system database (MDB). The system database (MDB) backup is mandatory and ensures safe data recovery if any problems are encountered during the installation process.

Installation Prerequisites for CA Asset Portfolio Management

Consider the following prerequisites:

WARNING
CA Asset Portfolio Management (CA APM) architecture is highly database-driven and has no rollback mechanism for database-related changes. Hence, the uninstallation of the CA APM patch is not recommended and is not supported. The only way to revert the database changes, if required, is by restoring the database backup which can lead to data loss.

Verify and complete the following prerequisites before proceeding with the CA Asset Portfolio Management installation:

- Ensure that CA Asset Portfolio Management 17.4 is installed in your environment.
- Back up the system database (MDB). The system database (MDB) backup is mandatory and ensures safe data recovery if any problems are encountered during the installation process.

Install CA Service Management 17.4.3.0 (Windows)

Installing CASM 17.4.3.0 on Windows

CA Service Management 17.4.3.0 installer performs prerequisite checks and mandatory validations before installing the patch.

NOTE

- We recommend that you place the installer in a **shorter directory path**, containing no spaces, to avoid errors when running the setup file. For example, unzip the file at: C:\WIN_17_4_3_0
- In CA Service Desk Manager (SDM) Availability mode, the xFlow Interface can only be installed on an Application Server. If you have converted CA SDM conventional configuration to advanced availability configuration, and you have a previously installed version of xFlow Interface, ensure that you uninstall xFlow Interface and then, reinstall xFlow Interface on an Application server.

Perform the following steps to install 17.4.3.0 on Windows:

1. From the Broadcom Support portal, download the **WIN_17_4_3_0.zip** file.
   NOTE
   CA Service Management 17.4.3.0 (Windows) installer is provided as a ZIP file and not as a CAZ file. Extract/unzip the content of the ZIP file to your local folder.
2. Copy **WIN_17_4_3_0.zip** on all servers in your environment.
3. Extract the contents of the ZIP file to the folder named WIN_17_4_3_0.
   NOTE
   In the extracted folder, CA EEM 12.6.7.0 installer is available in *CASM_17.4.3.0\filestore\EEM\Windows\12.6.7.0*
4. In CA SDM conventional configuration, stop CA SDM services in your environment. In the case of Advance Availability configuration, stop CA SDM services only on the server on which CA SDM will be installed.
5. Log in to the server as a local admin to install the patch.
6. Navigate to **WIN_17_4_3_0** folder. Right-click **Setup.exe** and select **run as administrator**.
7. Review and Accept the License Agreement Information.
8. Select **Microsoft SQL Server** or **Oracle** as the database type in the Database Configuration screen.
   For Windows Microsoft SQL Server database, *mdbadmin* is the default user.
9. Provide the database details:
   a. If you have selected **Microsoft SQL Server**, provide the following field information:
      - **Database Server**: Enter the hostname of the database server.
        If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
      - **Database Name**: Enter the Database name (MDB), the name of the target DBMS. The default value is mdb.
      - **Database Port**: Provide the port identifier for the target DBMS.
      - **Database Server Instance**: The database instance name. Leave this field blank if you are using the default instance.

If you are using the SQL named instance and a non-default port number, the **Database Server Instance** field should look like this: ***<database instance name>,<non-default port number>***
For example:

```
sdmcasmqa,10555
```

- **Database Admin User**: For Microsoft SQL Server, **sa** is the default value.
  The **sa** user is the admin user with permission to create a user and schema.
- **Database Admin Password**: Enter the database password of the user specified by a database admin user. No default value is assigned to this parameter.
- **mdbadmin Password**: Enter the password for the user specified for the MDB admin user.
- **Confirm mdbadmin Password**: Confirm the password.

b. If you have selected **Oracle** database, provide the following field information:
- **Database Server**: Enter the hostname of the Oracle database server.
  If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
- **Oracle Service Name**: Enter the Oracle Service name.
- **Listener Port**: Enter the listener port for the database.
- **Net Service Name**: Enter the Net Service Name of the Oracle database where the database resides.
  If the database is remote, use the Net Service Name that is defined in the Oracle client on the local computer. CA SDM has access to the database through a local installation of the Oracle client.
- **DBA User Name**: Provide the name of an Oracle user with DBA access. The default value for DBA user is **SYS**.
- **DBA User Password**: Enter the password for the DBA user.
- **mdbadmin Password**: Enter the password for MDB admin.
- **Confirm mdbadmin Password**: Confirm the password.
- **Tablespace Path (on DB Server)**: Provide the tablespace path on the database server.
- **Oracle Home Path**: Provide the Oracle Client 64-bit path. Provide Oracle client 32-bit path. For CA Asset Portfolio Management, provide the Oracle 32-bit client.
- **Data Tablespace Name**: Provide the name of the data tablespace. The default value is MDB_DATA.
- **Index Tablespace Name**: Provide the index Tablespace Name: The default value is MDB_INDEX.

Click **Next**.

10. On **Select the Products and Integrations** page, patch list is displayed. Select the required patch to install.

    WARNING

    CA Service Management does not support the uninstallation of the CA Asset Portfolio Management patch. Uninstalling the CA APM patch does not uninstall the MDB patch, as there is no rollback mechanism for the same. For more information, see Installation Prerequisites.

a. **CA Service Desk Manager**
- CA Service Desk Manager Patch
- xFlow Interface Patch
- Search Server Patch: Search server patch must be installed on a Server where an earlier version from previous releases is already installed.

b. **CA Service Catalog**
- CA Service Catalog Patch

c. **CA Asset Portfolio Management**
- CA Asset Portfolio Management Patch

Click **Next**.

11. Review the Pre-Installation Configuration page. Click **Next**.

NOTE

Select the option to perform the automated post-install steps for CA SDM. If this option is not selected, you must manually perform the post-install steps for CA SDM. Note that for CA Service Catalog and CA Asset Portfolio Management, you need to perform the manual post-install steps.

12. Click **Install** to proceed with the installation. Review the Installation progress and when the installation is complete, click **Next.**
13. To review the installation logs, navigate to the path shown in the installation summary screen.
14. Click **Finish** to exit the installer
15. After installing the Key definition for "xflow" not found in the DITA map., start the **CA Key definition for "xflow" not found in the DITA map.** service from Windows Services (**Control Panel, Administrative Tools, Services**) as this service is not started by default.
16. After installing the search server, if the **Search Server** service is not started by default or if it stops, start the services from **Control Panel, Administrative Tools, Services.**
17. Validate the Installation.
18. Complete the Post-Installation Tasks.

After installing the Key definition for "xflow" not found in the DITA map. and Search Server, you can configure the cache size for Key definition for "xflow" not found in the DITA map.. For more information about how to configure cache size, see Perform initial load and refresh index on the search server.

Install CA Service Management 17.4.3.0 (Linux)

Installing CASM 17.4.3.0 on Linux

NOTE
In CA SDM Advanced Availability mode, the xFlow Interface can only be installed on an Application Server. If you have converted CA SDM conventional configuration to advanced availability configuration, and you have a previously installed version of xFlow Interface, ensure that you uninstall xFlow Interface and then reinstall xFlow Interface on an Application server.

CA Service Management 17.4.3.0 installer performs prerequisite checks and mandatory validations before installing the patch.

IMPORTANT
We recommend that you place the installer in a **shorter directory path**, containing no spaces, to avoid errors when running the setup file. For example, unzip the file at: *<root>\casm_dvd.x86Linux\<installer_file>*

Perform the following steps to install 17.4.3.0 on Linux:

1. From the Broadcom Support portal, download the **LNX_17_4_3_0.tar.gz** file.
2. To extract the LNX_17_4_3_0.tar.gz, run the following command:
   ```
   tar -xvzf LNX_17_4_3_0.tar.gz
   ```
   NOTE
   In the extracted folder, CA EEM 12.6.7.0 installer is available in CASM_17.4.3.0\filestore\EEM\Linux\12.6.7.0
3. Set CA SDM bin and library environment variables.
   For example:
   ```
   export PATH=/opt/CA/ServiceDeskManager/bin:$PATH
   export LD_LIBRARY_PATH=/opt/CA/ServiceDeskManager/lib:$LD_LIBRARY_PATH
   ```
4. In SDM conventional configuration, stop CA SDM services in your environment. In the case of Advance Availability, stop CA SDM services only on the server on which CA SDM will be installed.
5. Run the setup file from the casm_dvd.x86Linux folder to install the application(s) using the following command:
   ```
   ./setup.sh
   ```
6. Review and accept the license agreement terms.

7. In Database Configuration, select **Oracle** as the database type. Ensure that you have installed the Oracle database client in your system.
   Provide the following Oracle database configuration details:
   - **Database Server**: Enter the hostname of the Oracle database server.
     If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
   - **Oracle Service Name**: Enter the Oracle Service name.
   - **Listener Port**: Enter the listener port for the database.
   - **Net Service Name**: Enter the Net Service Name of the Oracle database where the database resides.
     If the database is remote, use the Net Service Name that is defined in the Oracle client on the local computer. CA SDM has access to the database through a local installation of the Oracle client.
   - **DBA User Name**: Authenticates the name of the user with DBA access. The default value for DBA user is **SYS.**
   - **DBA User Password**: Authenticates the password for DBA user.
   - **mdbadmin Password**: Specify the password for the mdbadmin user.
   - **Confirm mdbadmin Password**: Confirm the mdbadmin user password.
   - **Tablespace Path (on DB Server)**: Enter the tablespace directory on the database server.
   - **Oracle Home Path**: Provide the Oracle Client 64-bit path. Provide Oracle client 32-bit path for fresh installation
   - **Data Tablespace Name**: Enter the tablespace name. The default value is **MDB_DATA**.
   - **Index Tablespace Name**: Enter the index tablespace name: The default value is **MDB_INDEX**.
8. Click **Next.**
9. On **Select the Products and Integrations** page, patch list is displayed. Select the required patch to install.
   a. **CA Service Desk Manager**
      - CA Service Desk Manager Patch
      - xFlow Interface Patch
      - Search Server Patch: A search server patch must be installed on a server where an earlier version from previous releases is already installed.
10. Click **Next**.
11. Review the Pre-Installation Summary page. Click **Next.**
12. Click **Install** to proceed with the installation. Review the Installation progress and when the installation is complete, click **Next.**
13. To review the installation logs, navigate to the path shown in the installation summary screen.
14. Click **Finish** to exit the installer.
    If patch installation fails for a product, retry the installation by using the **Retry** option in the wizard where it fails. If retry does not work, exit the installer and relaunch it. If the problem persists, contact Broadcom Support.
15. After installing XFlow Interface, start the**CA XFlow Interface**service. Navigate to /opt/CA/xFlow/Apps and run the following command from a command prompt window:
    ```
    ./xFlowServer start
    ```
    To stop the server, run the following command:
    ```
    ./xFlowServer Stop.sh
    ```
16. Navigate to /opt/CA/SC/SearchServer/elasticsearch/bin and run the following command from the command prompt window:
    ```
    ./ServicesStart.sh
    ```
    NOTE
    If you get the below message while restarting the search server service, ignore it and continue:
    ```
    groupadd: group 'elasticsearch' already exists
    useradd: user 'elasticuser' already exists
    runuser: warning: cannot change directory to /home/elasticuser: No such file or directory
    OpenJDK 64-Bit Server VM warning: Option UseConcMarkSweepGC was deprecated in version 9.0 and
     will likely be removed in a future release.
    ```

To stop the server, run the following command:

```
/ServicesStop.sh
```

17. Validate the Installation.
18. Complete the Post-Installation Tasks.

After installing the XFlow Interface and Search Server, you can configure the cache size for XFlow Interface. For more information about how to configure cache size, see Perform initial load and refresh index on the search server.

Validate CA Service Management 17.4.3.0 Installation

Validate CASM 17.4.3.0 installation

To verify the successful installation of CA Service Management 17.4.3.0, validate the installation for the corresponding applications in the following location. You can also navigate to the root folder where you have locally installed the application and select the "env.info" file for validating your installation:

- **CA ITAM:**

  NOTE
  CORA version: 17.4.0.57

  – C:\Program Files (x86)\CA\ITAM\env.info
  – product=ITAM
  – major=17
  – minor=4
  – cum=3
  – roll-up=0

  NOTE
  CA CASM uses Apache Tomcat version 9.0.86.
- **CA Service Catalog:**
  – %USM_HOME%*CA_SLCM_<hostname>.his* file
  – %USM_HOME%\view\webapps\usm\locale\about_info.xml
  – %USM_HOME%\build.xml
  – %USM_HOME%\env.info
- **xFlow Interface:**
  – *C:\Program Files\CA\xFlow\<hostname>.his* file
  – NX_ROOT\env.info
  – NX_ROOT\version.xml
- **CA SDM:**
  – *C:\Program Files (x86)\CA\Service Desk Manager\<hostname>.his* file
  – NX_ROOT\pdmconf\version
  – NX_ROOT\env.info
  – HELP, ABOUT

  NOTE
  For CA SDM, the Binary and Language Combo patches are installed irrespective of the environment. The language patch for the corresponding CA SDM environment is installed.

  To validate the successful installation of the patches, follow these steps:

  1. Open the <sdm_installation>\<hostname>.his file in a text editor.

2. Search for the instances of "gol-230". In a successful install, you should come across these three entries (Binary, Language Combo, and corresponding language patch).

Application	Windows	Linux
CA Asset Portfolio Management	T6EE1743	NA
CA Service Catalog	T6D91743	NA
CA Service Desk Manager - Binary	gol-230_cum_C	gol-230_x86_64Linux_cum_C
CA Service Desk Manager - Languag504e Comb	gol-230_langcombo	gol-230_langcombo
CA Service Desk Manager - English	gol-230_en_US	gol-230_x86_64Linux_en_US
CA Service Desk Manager - German	gol-230_de_DE	gol-230_x86_64Linux_en_DE
CA Service Desk Manager - Spanish	gol-230_es_ES	NA
CA Service Desk Manager - French	gol-230_fr_FR	gol-230_x86_64Linux_fr_FR
CA Service Desk Manager - Italian	gol-230_it_IT	NA
CA Service Desk Manager - Japanese	gol-230_ja_JP	gol-230_x86_64Linux_ja_JP
CA Service Desk Manager - Brazilian Portuguese	gol-230_pt_BR	NA

Post-Installation Tasks for CA Service Management 17.4.3.0

After successful installation of CA Service Management 17.4.3.0, perform the following post-installation steps.

CA Service Desk Manager

Manual Steps required for Automated Post-Installation

CA Service Management provides an option in the installer to automate the post-install tasks.
If you have selected **Yes** to automate the post-installation steps while running the CA Service Management Installer Wizard, you are not required to perform any manual post-install steps for CA Service Desk Manager (SDM).

If you have selected **No** for automating the post-install steps while running the CA Service Management Installer wizard, perform the below manual post-install tasks as per your deployment requirements:

Manual Post-Install Tasks After Installing CA Service Desk Manager (SDM) 17.4.3.0 on CA SDM 17.4.2.0
Perform the following steps:

1. Stop CA SDM services.
2. Navigate to NX_ROOT/site/config.properties file and ensure the value of resources.created parameter is set to 0.
3. Open a command prompt window and run the following command:
   ```
   pdm_configure
   ```
4. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_03_insert.dat
   pdm_load -u -f r17_4_03_update.dat
   ```
5. Notification message template is modified to update the existing email templates with the html_description field.
   Tool location: NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate This has to be executed one time when the SDM service is up and running. **For e.g:**
   Windows
   ```
   NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate.bat
   ```
   Linux

```
NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate.sh
```

Manual Post-Install Tasks After Installing CA Service Desk Manager (SDM) 17.4.3.0 on CA SDM 17.4 or CA SDM 17.4.1.0

Perform the following steps:

1. Stop CA SDM services.
2. Navigate to NX_ROOT/site/config.properties file and ensure the value of resources.created parameter is set to 0.
3. Open a command prompt window and run the following command:
   ```
   pdm_configure
   ```
4. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_02_insert.dat
   pdm_load -u -f r17_4_02_update.dat
   pdm_load -f r17_4_03_insert.dat
   pdm_load -u -f r17_4_03_update.dat
   ```
5. Notification message template is modified to update the existing email templates with the html_description field.
   Tool location: NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate This has to be executed one time when the SDM service is up and running. **For e.g:**
   Windows
   ```
   NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate.bat
   ```
   Linux
   ```
   NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate.sh
   ```

Manual Post-Installation Task for CMDB

> **NOTE**
> For Oracle 21c, set the **isClusterEnv** setting to "true" in the application.conf file of CMDB viz and restart the CA SDM Services.:
>
> - For Windows: <SDM installed location>\bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\WEB-INF\classes\application.conf)
> - For LINUX: <SDM installed location>/bopcfg/www/CATALINA_BASE_VIZ/webapps/CMDBVisualizer/WEB-INF/classes/application.conf).

If you are applying CA Service Management 17.4.3.0 in an SSL environment, CA SDM Administrators must perform the following post-installation steps for CMDB Visualizer Interface to open using the **HTTPS** protocol when launching from CA SDM UI:

1. In the NX.env file, change the **NX_CMDB_VISUALIZER** entry to provide **HTTPS protocol** and **HTTPS port**.
   For example: @NX_CMDB_VISUALIZER=https://sdmurl:<VIZ_SSL_PORT>/CMDBVisualizer
2. In **casm.conf.js** file from NX_root\bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\viz-ux\conf, provide the HTTPS as protocol and HTTP port.
   For example:

```
sdm: {

      vizserver: 'https://sdmurl:<VIZ_SSL_PORT>/CMDBVisualizer/viz',
      server: 'https:// sdmurl:<SDM_SSL_PORT>/CAisd/pdmweb.exe'
    }
```

Manual Post-Installation Task for OAuth 2.0 (Maileater/ Mailer)

After generating an access token for OAuth 2.0 to connect to a mail server, perform the mandatory post-install tasks on all servers in your environment:

1. Create a backup of web.xml from NX_ROOT\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF in your local directory to perform backout if required.
2. Open the web.xml file from NX_ROOT\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF.
3. Search for the following statement:
   ```
   <!--USD servlet mappings start-->
   ```
4. Copy and paste the following configuration under the statement:

   ```
   <servlet>
     <servlet-name>OAuthProcessor</servlet-name>
     <servlet-class>com.broadcom.oAuth.OAuthProcessor</servlet-class>
    </servlet>
   ```
5. Copy and paste the following configuration after any <servlet-mapping>:

   ```
    <servlet-mapping>
      <servlet-name>OAuthProcessor</servlet-name>
      <url-pattern>/OAuthProcessor</url-pattern>
    </servlet-mapping>
   ```
6. Save and close the web.xml file.
7. For OAuth servlet preservation in a primary and secondary environment, the secondary server must also have the OAuth processor entries in the following file: *<NX_ROOT>\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF\web.xml.last*.
8. Repeat Steps 1-8 to update **web.xml.tpl** file in the NX_ROOT\samples\pdmconf\web.xml.tpl folder to avoid losing these changes when pdm_configure is run at a later point of time.
9. Run the following command:
   ```
   pdm_tomcat_nxd -c STOP command
   ```
10. Wait for some time (a minute or so) and run the following command:
    ```
    pdm_tomcat_nxd -c START command
    ```

For more information, see Define a mailbox.

Manual Post-Installation Task for Excel file (.xlsx) export*

1. Execute the following command:
   ```
   pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst
   ```
2. Execute the following command to add the new NX variable to NX.env.tpl file.
   ```
   pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst -t
   ```
3. Restart CA SDM services.

HTML Tags Sanitization

The sanitization tool can be run any number of times. Administrators can choose if they wish to run the tool for each ticket type separately or for all ticket types at one go.

Before running the Sanitization tool ensure you take a backup of all the ticket objects using the following commands or by taking a backup of the sdm databse :

```
"Call_Req": pdm_extract Call_Req > cr_backup.txt
"Issue": pdm_extract Issue > Issue_backup.txt
"Change Orders": pdm_extract Change_Request >change_orders_backup.txt.
```

Both active and archived tickets can be sanitized.
For Windows:

```
NX_ROOT\samples\sdk\SanitizationTool\sanitizeTool.bat
```

For Linux:

```
NX_ROOT\samples\sdk\SanitizationTool\sanitizeTool.sh
```

NOTE
We recommend executing the sanitization during slack time on any Service Desk Manager server.

After executing the sanitization tool, execute the following command to update domsrvr memory cache:

```
pdm_cache_refresh -t Call_Req
pdm_cache_refresh -t Issue
pdm_cache_refresh -t Change_Request
```

(Optional) Enable HTML content for Ticket Description in the Activity log

NOTE

- A new Field Update activity association (**HTML Description** has been introduced)
- Either **HTML Description** or **Description** activity association has to be enbaled. Do not enable both the options.
- Out of the box Description Field Update activity association is enabled in the activity log for all ticket types (Incident,Request,Problem,ChangeOrder and Issue).

Enabling HTML content for Description in the Activity Log:

1. Login into CA SDM with Administrator access type.
2. Administration --> Notifications --> Activity Associations.
3. Click **Show Filter**.
4. Enter "HTML Description" in the Symbol text box in the Activity Association List page.
5. Click **Search**
6. For every **HTML Description Field Update association**, click **Edit** and check the **Log Me** checkbox, then save the changes made.

Disabling plain text for Description in the Activity log:

1. Click **Show Filter** in the Activity Association List page.
2. Enter "Description" in the Symbol text box and Select Object Type as "Request/Incident/Problem" and click **Search**.
3. Now see the one row and click the Description link in the Activity Association List page.
4. Unselect the **Log Me** check box and save the page.
5. For Change Order and Issue repeat the steps from 1 to 4.

(Optional) Manual Post-Installation Task for Knowledge Document export with German fields

If you are exporting Knowledge Document with German Fields (included in the export field list), then perform the below post-install steps for successful export of knowledge documents:

1. Take the backup of NX_ROOT\NX.env file (NX_ROOT is the installation directory for CA Service Desk Manager).
2. Open NX_ROOT\pdmconf\NX.env_nt.tpl file using any text editor and take the value of NX variable @NX_KEIT_AVAILABLE_FIELDS which is COPIED_DATA and update Nx.env in NX_ROOT by executing below command:

   ```
   pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <COPIED_DATA>  -a  pdm_option.inst
   ```

   Where COPIED_DATA is the value copied from NX.env_nt.tpl (step 2).
   For example, " pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <provide the exact string here> -a pdm_option.inst "

Note to avoid losing the updated changes when you run pdm_configure, execute the above command with the '-t' flag as follows:

```
pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <COPIED_DATA> -a pdm_option.inst -t
```

(Optional) Handle HTML Mails that contains Tables in MailEater

Java based Maileater already has the ability to process the emails that were sent in plain format or HTML format, to support the processing of emails that contain Tables in the HTML body. But the format in which the email was sent is lost when received by Maileater.

1. Run the following commands from NX_ROOT/bin from the command prompt/ terminal:

```
pdm_options_mgr -c -s NX_ENFORCE_HTML_EMAIL_PARSING -v "Yes" -a pdm_option.inst
pdm_options_mgr -c -s NX_ENFORCE_HTML_EMAIL_PARSING -v "Yes" -a pdm_option.inst -t
```

2. Restart CA SDM and XFlow applications.

(Optional) Comments are not allowed when a Data Partition (O_COMMENTS) is created with Customer, Employee and ServiceDesk Analyst

To disable comments:

1. Login to SDM and navigate to Administration -> Security and Role Management-> Data partition-> Data Partition List.
2. In Data Partition List, create a constraint (O_COMMENTS with the condition id=0) and link it to Customer, Employee and ServiceDesk Analyst data partitions.
3. Run the following commands from NX_ROOT/bin from the command prompt/ terminal:

```
pdm_options_mgr -c -s KT_COMMENT_USE_SUPERUSER -v 0 -a pdm_option.inst
pdm_options_mgr -c -s KT_COMMENT_USE_SUPERUSER -v 0 -a pdm_option.inst -t
```

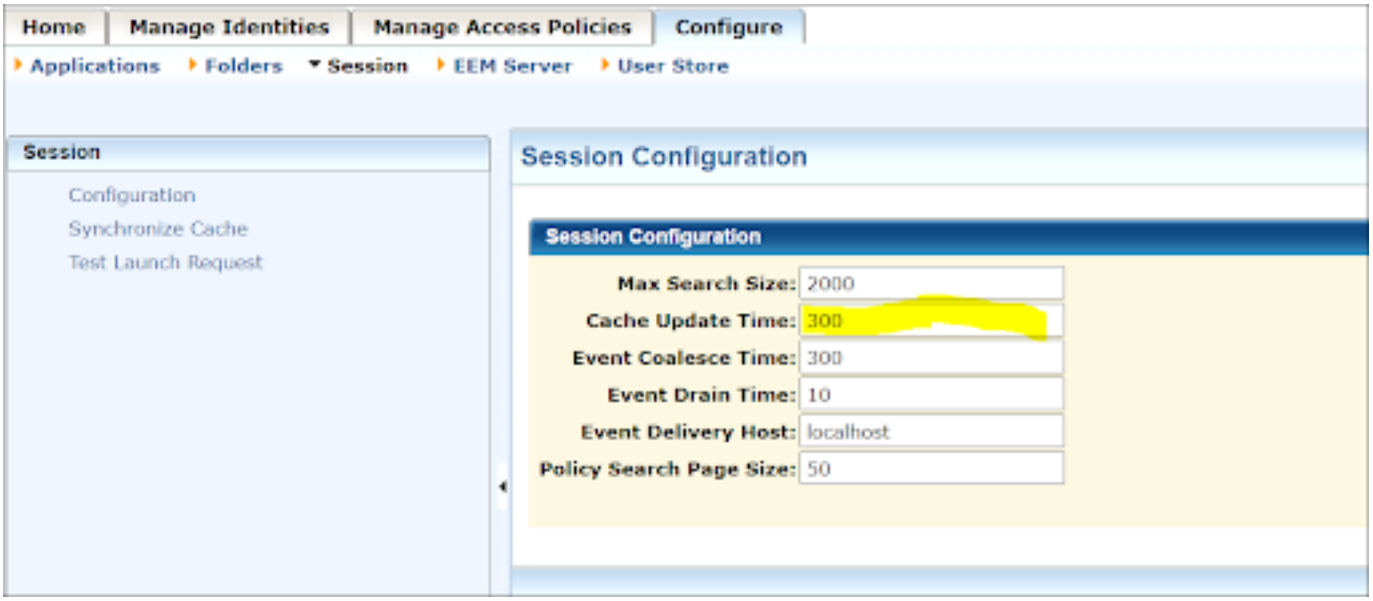
4. Restart CA SDM and XFlow applications.

(Optional) Manual Post-Installation Task for EEM Cache Timeout Configuration Update

You may face issues while logging in to EEM or SDM using the EEM user accounts due to a session cache timeout mismatch between EEM and SDM.

You can update the EEM cache timeout configuration by adding a new NX variable, "NX_EEM_CACHE_UPDATE_TIME" in SDM.

Keep the value the same as the EEM cache timeout configuration value mentioned in the following screenshot.



To set the EEM cache update time to 300 seconds, perform the following steps:

To add the variable in the **nx.env** file, run the following command:

```
pdm_options_mgr -c -s  EEM_CACHE_UPDATE_TIME  -v 300 -a pdm_option.inst
```

To add the variable in the **nxenv_nt.tpl** file, run the following command:

```
pdm_options_mgr -c -s  EEM_CACHE_UPDATE_TIME  -v 300 -a pdm_option.inst -t
```

(Optional)casc_impersnate_user

Once both CA SDM and CA Service Catalog are integrated, do the following:

1. Login to CA SDM with the Administrator user type.
2. Navigate to Administration >> Options Manager >> CA Service Catalog >> in the Options List, install casc_impersnate_user
3. Restart the SDM service.

Service Point

After successful installation of Service Point, refresh index and data on the Search Server.

> **NOTE**
> In case of Linux Search Server environment, ensure to run the following commands on the terminal:
>
> ```
> sysctl -w vm.max_map_count=262144
> ulimit -Hn 65535
> ```

(Optional) Manual Post-Installation Task for Rebuild Index

If you have upgraded or are planning to install CA EEM 12.6 with Service Point and CA Service Catalog, ensure that you rebuild the CA Service Catalog index after completing the CA EEM upgrade/installation process. For more information, see Perform Initial Load and Refresh Index Data on Search Server.
Run the following command to rebuild the index:

```
$ES_HOME/search/bin/pdm_es_rebuild_index.bat index=catalog_index
```

CA Service Catalog

Perform the following CA Service Catalog post-installation steps as per your environment requirements:

- Post-Installation Tasks after installing CA Service Catalog 17.4.3.0 on CA Service Catalog 17.4 or later
- gMSA Authentication

Post-Install Tasks After Installing CA Service Catalog 17.4.3.0 on CA Service Catalog 17.4 or later

Review and perform the post-installation steps based on your deployment requirements.

> **NOTE**
> If any SSL certificate(s) chain was imported to the Oracle Java's JAVA_HOME\lib\security\cacerts Keystore, those certificate(s) chain again need to be exported explicitly and imported properly into the new AdoptOpenJDK's %USM_HOME%\embedded\jdk\lib\security\cacerts Keystore.

> **NOTE**
> While upgrading from 17.4.2.0 to 17.4.3.0, re-run the removal_axis.bat file, if already ran it on 17.4.2.0.

Follow these steps

- (Optional) If Service Catalog is accessed from applications like Service Point, SharePoint and so on, then you must perform this step. Open the "**web.xml**" file located in *USM_HOME%\view\webapps\usm\WEB-INF* and update the

respective parameter values for the parameter name "cors.allowed.origins" and "cors.support.credentials". For example, if you are using Catalog Widgets in Service Point

- (Optional) Unable to approve any workflow requests through email. The email sent for approvals is corrupted with special characters. Follow the KB article steps.

(Optional) Approve workflow requests through email

The workflow email sent for approvals is corrupted with special characters. To approve any workflow requests through email, follow the KB article steps.

gMSA Authentication Post-Install Steps for CA Service Catalog (Automated steps)

CA Service Catalog provides automated post-installation steps for gMSA Authentication. Review the following before you proceed:

- Prerequisites and Considerations
- How to Automate gMSA Post-Installation Steps
- Unconfigure gMSA

Prerequisites and Considerations:

Ensure that you have taken care of the below considerations on all nodes of CA Service Catalog where you want to automate the gMSA post-installation procedure.

1. If the accounting service is available, perform the automated post-install steps by updating serviceName to ServiceAccounting and providing the appropriate gMSA account name in the **gmsa.properties** file.
2. If the filestore path is external to the server from where the **GMSAPostInstall.bat** is running, ensure to provide appropriate access to the server for setting the gMSA account permissions.
3. While preparing the properties file, check for any copy/paste issues, special characters, spaces, and so on.

How to Automate gMSA Post-Installation Steps

Perform the following steps to enable the batch file **GMSAPostInstall.bat** and to automate the gMSA post-installation steps:

1. Create a gMSA account for CA Service Catalog.
2. Ensure that appropriate DB (database) permission is given to the newly created account(s).
3. Enter the below values in the **gmsa.properties** file and save it.

   NOTE
   A template file (**gmsa.properties**) is added in the common installer in *"\filestore\SLCM\gMSAProperties"* . Optionally. use this file as a template file to fill gmsa properties. This can be copied to "USM_HOME/scripts/GMSA" where Catalog is installed.

   NOTE
   All values are mandatory. Make sure that there are no leading or trialing spaces while providing these values.

   a. **serviceName**: Application service name to enable GMSA. In the case of Catalog, it will be ServiceCatalog and for accounting, it will be ServiceAccounting.
   b. **folderName**: Absolute path of the application installation directory.
   c. **gMSAName**: Name of the GMSA service account (domain\accountName$).
   d. **filestorePath**: Shared network path (\\Server_name\filestore) or local filestore path
4. Navigate to %USM_HOME% and launch **usm.cmd**
5. Navigate to %USM_HOME%/scripts/GMSA/ folder and run the "GMSAPostInstall.bat" in command prompt.

   NOTE
   If the command executes without any error, "Post-installation steps for GMSA executed successfully" message is displayed with exit code 0.

If there are errors, the error message is shown with a non-zero exit code. Correct the error to continue and perform step **5** again.

Unconfigure gMSA for CA Service Catalog

To disable or unconfigure gMSA for CA Service Catalog, follow the steps below:

1. Replace **config.properties** file from*%USM_HOME%*\ folder.
2. Revert back all the folder permissions which were assigned to domain users.
3. Start Catalog and Accounting Services with the local system account.

NOTE
In the case of load balancers, repeat steps 1-3 to unconfigure gMSA on all Catalog servers.

CA Asset Portfolio Management

Manual Post-Installation Task for Removing jQuery, log4net, and log4j Vulnerabilities

After installing 17.4.3.0, delete jquery-1.3.2.min.js, jquery-ui-1.7.2.custom.min.js , log4net.dll, and log4j from their respective installed folders.

NOTE
Perform the below steps if you have not done this earlier.

Perform the following steps:

1. Log on to CA APM Web Server, navigate to the <ITAM_install_dir>\ITAM\Web Server\castylesr5\javascript.
   Example: C:\Program Files (x86)\CA\ITAM\Web Server\castylesr5\javascript
   Locate and delete the jquery-1.3.2.min.js and jquery-ui-1.7.2.custom.min.js files from the directory.
2. Navigate to the ITAM_install_dir\CA\ITAM\Data Importer.
   Locate and delete the log4net.dll file from the directory.
3. Navigate to the C:\Program Files (x86)\CA\SC\CORA.
   Locate and delete the log4j-1.2.15.jar, log4j.properties, and ojdbc6.jar files from the directory.
4. Navigate to the ITAM_install_dir\CA\ITAM.
   Backup the following folders and manually delete them:
   - CDB
   - MDB
   - jre8

   NOTE
   jre8 folder has to be deleted manually for every RU installation.
5. Perform an IISRESET and delete the browser's cache to load the upgraded files.

For ITAM installation on French Operating System

Following the successful installation of version 17.4.3.0 on a French Windows operating system with the browser set to French, we are unable to log in to ITAM.

An error message is displayed: ***Une valeur Request.Form potentiellement dangereuse a été détectée à partir du client (_UPLOAD_NON_TXT_CSV_DATA_FILE_="...ectionné n'est pas de type...").***

To overcome this, follow these steps:

1. Navigate to *C:\Program Files (x86)\CA\ITAM\Web Server, edit web.config*, and search for *<pages enableEventValidation="false" viewStateEncryptionMode="Never" controlRenderingCompatibilityVersion="4.0" clientIDMode="AutoID">* , then add *validateRequest="false"* to it.
2. After adding, it looks like this:
   <pages enableEventValidation="false" viewStateEncryptionMode="Never" controlRenderingCompatibilityVersion="4.0" clientIDMode="AutoID" validateRequest="false">

3. Do an IISRESET.
4. You can now successfully login to ITAM.

Post-Installation Tasks - CA SDM Advance Availability 17.4.3.0

The installer wizard provides an option in the installer to automate the post-install tasks. Perform the following post-installation tasks for CA SDM Advanced Availability Configuration. For the Advanced Availability configuration, the following host names are considered as an example:

- The background server hostname is sdmcahost1.
- The standby server hostname is sdmcahost2.
- The application server hostname is sdmcahost3.

Manual Steps required for Automated Post-Installation

If you have selected **Yes** for automating the post-install steps while running the installer wizard, then perform manually the following post-install tasks:

Manual Post-Install Tasks - After Installing CA Service Desk Manager (SDM) 17.4.3.0 on CA SDM 17.4.2.0

1. Ensure that the patch is applied on the standby server (sdmcahost2).
2. Start the CA SDM service on the standby server (sdmcahost2). Open the command prompt and run the following command:
   ```
   pdm_server_control -b
   ```
3. Ensure that the patch is applied on the original background server (sdmcahost1) which is now a standby server.
4. Start the CA SDM service on the standby server (sdmcahost1). Run the following command:
   ```
   pdm_server_control -b
   ```
5. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_03_insert.dat
   pdm_load -u -f r17_4_03_update.dat
   ```
6. Clear the browser cache by the following command:
   ```
   pdm_webcache -H
   ```
7. Ensure that the patch is applied on all the application servers and the remaining standby servers if any. If you selected YES to automate the post-install steps, then there are no more manual post-install steps to be performed.

Manual Post-Install Tasks - After Installing CA Service Desk Manager (SDM) 17.4.3.0 on CA SDM 17.4 GA or CA SDM 17.4.1.0

1. Ensure that the patch is applied on the standby server (sdmcahost2).
2. Start the CA SDM service on the standby server (sdmcahost2). Open the command prompt and run the following command:
   ```
   pdm_server_control -b
   ```
3. Ensure that the patch is applied on the original background server (sdmcahost1) which is now a standby server.
4. Start the CA SDM service on the standby server (sdmcahost1). Run the following command:
   ```
   pdm_server_control -b
   ```
5. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_02_insert.dat
   pdm_load -u -f r17_4_02_update.dat
   pdm_load -f r17_4_03_insert.dat
   pdm_load -u -f r17_4_03_update.dat
   ```
6. Clear the browser cache by the following command:

```
pdm_webcache -H
```

7. Ensure that the patch is applied on all the application servers and the remaining standby servers if any. If you selected YES to automate the post-install steps, then there are no more manual post-install steps to be performed.

Manual Steps required for Non-Automated Post-Installation

If you have selected **No** for automating the post-install steps while running the CA Service Management installer wizard, perform manually the appropriate post-install after this task as per your deployment requirements.

Post-Install Tasks After Installing CA SDM 17.4.3.0 on CA SDM 17.4.2.0 for Advanced Availability Configuration

1. Ensure that the patch is applied on the standby server (sdmcahost2).
2. Navigate to NX_ROOT/site/config.properties file and ensure the value of resources.created parameter is set to 0. Open a command prompt and run the following command:
   ```
   pdm_configure
   ```
   On the installer configuration page, before clicking Finish, uncheck the Start service when completed checkbox. Failure to uncheck the box may result in the loss of custom schema changes and configurations that were changed on the server.
3. Promote the standby server as the new background server by performing the following steps. To suppress version control on the standby server and later on the background server, run the following command on each server:
   ```
   pdm_server_control -v
   ```
4. Start SDM service on the standby server. Run the following command:
   ```
   pdm_server_control -b
   ```
5. Ensure that the patch is applied on the original background server (sdmcahost1) which is now a standby server, and perform the following steps. Navigate to NX_ROOT/site/config.properties file and ensure that the value of resources.created parameter is set to 0. Run the following command:
   ```
   pdm_configure
   ```
6. Start the CA SDM service on the standby server (sdmcahost1). Run the following command:
   ```
   pdm_server_control -b
   ```
7. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_03_insert.dat
   pdm_load -u -f r17_4_03_update.dat
   ```
8. Ensure that the patch is applied on all application servers and the remaining standby server if any. Perform the following steps on all application servers and standby servers.
9. Navigate to NX_ROOT/site/config.properties file and ensure that the value of resources.created parameter is set to 0. Run the following command:
   ```
   pdm_configure
   ```
10. Clear the browser cache by running the following command:
    ```
    pdm_webcache -H
    ```

Post-Install Tasks After Installing CA SDM 17.4.3.0 on CA SDM 17.4 GA or CA SDM 17.4.1.0 for Advanced Availability Configuration

1. Ensure that the patch is applied on the standby server (sdmcahost2).
2. Navigate to NX_ROOT/site/config.properties file and ensure the value of resources.created parameter is set to 0. Open a command prompt and run the following command:
   ```
   pdm_configure
   ```
   On the installer configuration page, before clicking Finish, uncheck the Start service when completed checkbox. Failure to uncheck the box may result in the loss of custom schema changes and configurations that were changed on the server.

3. Promote the standby server as the new background server by performing the following steps. To suppress version control on the standby server and later on the background server, run the following command on each server:
   ```
   pdm_server_control -v
   ```
4. Start SDM service on the standby server. Run the following command:
   ```
   pdm_server_control -b
   ```
5. Ensure that the patch is applied on the original background server (sdmcahost1) which is now a standby server, and perform the following steps. Navigate to NX_ROOT/site/config.properties file and ensure that the value of resources.created parameter is set to 0. Run the following command:
   ```
   pdm_configure
   ```
6. Start the CA SDM service on the standby server (sdmcahost1). Run the following command:
   ```
   pdm_server_control -b
   ```
7. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_02_insert.dat
   pdm_load -u -f r17_4_02_update.dat
   pdm_load -f r17_4_03_insert.dat
   pdm_load -u -f r17_4_03_update.dat
   ```
8. Notification message template is modified to update the existing email templates with the html_description field. **Tool location**: NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate This has to be executed one time when the SDM service is up and running. **For e.g:**
   Windows
   ```
   NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate.bat
   ```
   Linux
   ```
   NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate.sh
   ```
9. Ensure that the patch is applied on all application servers and the remaining standby server if any. Perform the following steps on all application servers and standby servers.
10. Navigate to NX_ROOT/site/config.properties file and ensure that the value of resources.created parameter is set to 0. Run the following command:
    ```
    pdm_configure
    ```
11. Clear the browser cache by running the following command:
    ```
    pdm_webcache -H
    ```
12. Execute the following command.
    ```
    pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst
    ```
13. Execute the following command to add the new NX variable to NX.env.tpl file.
    ```
    pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst -t
    ```
14. Restart CA SDM Services.

Uninstall CA Service Management 17.4.3.0

Review the following topics to uninstall CA Service Management 17.4.3.0:

- Uninstall CA SDM 17.4.3.0 (Windows)
- Uninstall CA SDM 17.4.3.0 (Linux)
- Restore Visualizer Files (Windows)
- Restore Visualizer Files (Linux)
- Uninstall the XFlow Interface 17.4.3.0 (Windows)
- Uninstall the XFlow Interface 17.4.3.0 (Linux)
- Uninstall CA Service Catalog 17.4.3.0
- Uninstall CA Asset Portfolio Management
- Run the Database Cleanup Utility for CA Service Management 17.4.3.0

NOTE

Uninstalling CA Service Management 17.4.3.0 will revert to CA Service Management 17.4 version on which 17.4.3.0 is installed.

Example: If CA Service Management 17.4.3.0 is installed on 17.4, uninstalling 17.4.3.0 will revert to CA Service Management 17.4.

Uninstall CA SDM 17.4.3.0 (Windows)

Perform the following steps to uninstall CA SDM 17.4.3.0 on Windows:

1. Log in to CA SDM as an Administrator.
2. Shut down CA Service Desk Manager Server.
3. Navigate to **<NX_ROOT>\bin** and run the following command to backup the unsupported jars from the older versions.
   ```
   pdm_perl pdm_restore_files.pl gol-230_tool ..\PATCHES\DELIVERABLES_REMOVAL.TXT
   ```
4. Navigate to the location *where you have extracted the CA Service Management Installer zip package*.
5. Locate *CASM-17.4.3.0-CommonPatchInstaller-Win\filestore\utils\ApplyPTF* folder.
6. Run the **APPLYPTF.exe**.
7. Select **Backout PTF** from the local or remote node option.
8. Click **Next**.
9. Enter the patch number for the language that is installed in your environment:
   - **Binary**: gol-230_cum_C
   - **Language Master**: gol-230_langcombo
   - **English**: gol-230_en_US
   - **French**: gol-230_fr_FR
   - **German**: gol-230_de_DE
   - **Spanish**: gol-230_es_ES
   - **Italian:** gol-230_it_IT
   - **Japanese**: gol-230_ja_JP
   - **Brazilian Portuguese**: gol-230_pt_BR
10. Click **Next** to continue backing out the specific patch.
11. Repeat steps 6-9, to back out the language English (gol-230_en_US) patch.
12. Repeat steps 6-9 to back out the language master (gol-230-langcombo) patch.
13. Repeat steps 6-9 to back out the binary (gol-230_cum_C) patch.
14. Reboot the server.
15. Repeat steps **6-12** on all standby, application, or secondary servers in your environment.
16. Restore the MDB database to the database backup that you took before applying the patch.
17. Take the backup of the 5.40.0 folder and then delete the folder from <NX_ROOT>\bin\perllib.
18. Copy the 5.36.0 folder from <NX_ROOT>\REPLACED\perl_old and place the folder to <NX_ROOT>\bin\perllib.

19. Navigate to ***<NX_ROOT>\site\config.properties*** file and ensure that the value of ***resources.created*** parameter is set to **0.** This must display as ***resources.created=0*** in the file.
20. Open a command prompt and run the following command:
    ```
    pdm_configure
    ```
21. If you roll-back from 17.4.3.0 to the base version, copyright text year will not change. To change the year:
    a. Add @NX_COPYRIGHT_YEAR=2023 into NX.env file located under CA SDM install directory (NX_ROOT).
    b. To preserve the value even after pdm_configure, update the value of "genfact.gx_copyright_year in install.properties under NX_ROOT\site genfact.gx_copyright_year=2023

Uninstall CA SDM 17.4.3.0 (Linux)

Perform the following steps to uninstall CA SDM 17.4.3.0 on Linux:

1. Login to CA SDM as the root user.
2. Shut down the CA Service Desk Manager Server.
3. Navigate to **<NX_ROOT>/bin** and run the following command to backup the unsupported jars from the older versions.
   ```
   ./pdm_perl pdm_restore_files.pl ../replaced/gol-230_tool ../patches/deliverables_removal.txt
   ```
4. Navigate to the location where you have extracted the CA SDM Installer **tar.gz** package.
5. Navigate to the *casm_dvd.x86Linux \filestore\utils\ApplyPTF* folder.
6. The following binary/language-independent and language-dependent patches are supported:
   - Binary name: gol-230_x86_64Linux_cum_C
   - Language Master: gol-230_langcombo
   - English: gol-230_x86_64Linux_en_US
   - German: gol-230_x86_64Linux_de_DE
   - French: gol-230_x86_64Linux_fr_FR
   - Japanese: gol-230_x86_64Linux_ja_JP
7. Execute the following command to remove the binaries or the language-dependent patches. Replace the <patch_name> with the binary or language-dependent patch name:
   ```
   ./applyptf.<platform> -b <patch_name>  -e <NX_ROOT>
   ```
   Here, <platform> specifies the operating system and <NX_ROOT> specifies the CA SDM installed location.
   For example:
   ```
   ./applyptf.linux -b gol-230_x86_64Linux_cum_C  -e /opt/CA/ServiceDeskManager
   ```
8. Repeat step 6 to back out the language English (gol-230_x86_64Linux_en_US) patch.
9. Repeat step 6 to back out the binary (gol-230_x86_64Linux_cum_C) patch.

   NOTE
   During uninstallation, if you get any errors, ensure that the following steps are performed:

   1. Copy the subfolders from <NX_ROOT>/replaced/<gol-230_x86_64Linux_cum_C> and place it into the <NX_ROOT> folder.
   2. Copy the subfolders from <NX_ROOT>/replaced/<gol-230_x86_64Linux_en_US> and place it into the <NX_ROOT> folder.
   3. Open **.his** file under the <NX_ROOT> folder and delete the entries related to the current patch and save it.
10. To restore MDB database, revert to database backup that you took before applying the patch.
11. Take the backup of the 5.40.0 folder and then delete the folder from <NX_ROOT>\bin\perllib.
12. Copy the 5.36.0 folder from <NX_ROOT>\REPLACED\perl_old and place the folder to <NX_ROOT>\bin\perllib.
13. Navigate to ***<NX_ROOT>/site/config.properties*** file and ensure that the value of ***resources.created*** parameter is set to **0.** This must display as ***resources.created=0*** in the file.
14. Open a command prompt and run the following command:
    ```
    pdm_configure
    ```

15. If you roll-back from 17.4.3.0 to the base version, copyright text year will not change. To change the year:
    a. Add @NX_COPYRIGHT_YEAR=2023 into NX.env file located under CA SDM install directory (NX_ROOT).
    b. To preserve the value even after pdm_configure, update the value of "genfact.gx_copyright_year in install.properties under NX_ROOT\site genfact.gx_copyright_year=2023

NOTE
If you are unable to access the SDM URL, follow these steps:

1. Stop the SDM Services.
2. Navigate to the <NX_ROOT>/bopcfg/www/CATALINA_BASE folder and delete the work folder.
3. Start the SDM Services.

Restore Visualizer Files (Windows)

NOTE
After uninstalling CA SDM, CMDB Visualizer does not function automatically as the uninstallation process will not restore the previous visualizer files . To restore, perform the below steps manually:

1. Navigate to the where you have installed Visualizer: <NX_ROOT>\bopcfg\www\CATALINA_BASE_VIZ\webapps.
2. Remove the CMDBVisualizer folder.
3. Copy the **Visualizer_17.4.3.0.OLD** folder from<NX_ROOT>*REPLACED* and paste it in <NX_ROOT>*bopcfg**www* *CATALINA_BASE_VIZ**webapps*. Now, rename the **Visualizer_17.4.3.0.OLD** to **CMDBVisualizer**.
4. Start the SDM Service.

CMDB Visualizer works as expected.

Restore Visualizer Files (Linux)

NOTE
After uninstalling CA SDM, CMDB Visualizer does not function automatically as the uninstallation process will not restore the previous visualizer files. To restore the files, perform the below steps manually:

1. Navigate to the where you have installed Visualizer: <NX_ROOT>/bopcfg/www/CATALINA_BASE_VIZ/webapps.
2. Remove the CMDBVisualizer folder.
3. Copy the **Visualizer_17.4.3.0.OLD** folder from <NX_ROOT>*/replaced* and paste it into <NX_ROOT>*bopcfg**www* *CATALINA_BASE_VIZ**webapps*. Now, rename the **Visualizer_17.4.3.0.OLD** to **CMDBVisualizer**.
4. Start the SDM Service.

CMDB Visualizer works as expected.

Uninstall the XFlow Interface 17.4.3.0 (Windows)

Perform the following steps to uninstall the xFlow Interface (Windows):

1. Click **Start**, **Control Panel**, **Uninstall a Program** to uninstall xFlow Interface 17.4.3.0.
   Or
2. Navigate to where you have installed the xFlow Interface (for example, <NX_ROOT>*/CA/xFlow)*.
3. Select xFlow Interface **17.4.3.0_installation** and click **Change xFlow Interface 17.4.3.0 Installation.exe** to complete the uninstallation process.
4. If you are using Microsoft SQL Server Database, run the following query:

```
update ofProperty set propValue='select c.access_token from casm_active_sessions c WHERE
 UPPER(CONVERT(varchar(32), c.contact_uuid ,2)) = UPPER(?)' where name = 'jdbcAuthProvider.passwordSQL'
```

5. If you are using Oracle Database, run the following query;

```
update ofProperty set propValue='select c.access_token from casm_active_sessions c WHERE
 UPPER(CAST( c.contact_uuid AS varchar2(32))) = UPPER(?)' where name = 'jdbcAuthProvider.passwordSQL'
```

Uninstall the XFlow Interface 17.4.3.0 (Linux)

To uninstall the XFlow Interface, complete the following steps on Linux :

1. Navigate to where you have installed the xFlow Interface server.
   For example:
   /opt/CA/_xFlow Interface_installation
2. Execute the following command to uninstall the xFlow Interface 17.4.3.0:
   ```
   ./Change xFlow_Interface 17.4.3.0 Installation
   ```
3. Click **Finish** to complete the uninstallation process.
4. Run the following query for Oracle Database:
   ```
   update ofProperty set propValue='select c.access_token from casm_active_sessions c WHERE
    UPPER(CAST( c.contact_uuid AS varchar2(32))) = UPPER(?)' where name = 'jdbcAuthProvider.passwordSQL'
   ```

Uninstall CA Service Catalog 17.4.3.0

To uninstall CA Service Catalog, perform the following steps:

1. Click **Control Panel**, **Programs and Features**.
2. Double-click the CA Service Catalog 17.4.3.0 and follow the uninstallation wizard instructions.

Uninstall CA Asset Portfolio Management

CA Asset Portfolio Management (CA APM) architecture is highly database-driven and has no rollback mechanism for database-related changes. Hence, the uninstallation of the CA APM patch is not recommended and is not supported. The only way to revert the database changes, if required, is by restoring the database backup which can lead to data loss.

Run the Database Cleanup Utility for CA Service Management 17.4.3.0

During the installation of CA Service Management products, each of the installed product is registered in a common mdb table that is reflected in the deployment summary of the selected environment. These entries must be cleared in the following cases:

- Uninstallation of any CA Service Management products
- Moving Database or migration from one server to another

Run the CA Service Management database cleanup utility on a Windows or a Non-Windows environment. The database cleanup utility removes the entries and adds to the following tables:

Table Name from where the entries are removed	Table Name to which the removed entries are added
al_cdb_componentinstallstate	al_cdb_comp_installstate_bkup
al_cdb_configurationparameters	al_cdb_config_params_backup

NOTE

On a Non-Windows Platform, before running the **DBCleanup.sh** Utility, you must export the Oracle Environment variables on the terminal.

Perform the following steps:

1. Navigate to *DVD1\DBCleanupUtility* directory.
2. For Windows, double-click the **DBCleanupUtility.bat** to launch the DBCleanup utility.
   On a Non-Windows platform, you must run the **DBCleanupUtility.sh** file.
3. Enter the following details:
   a. **Database Server Type**: Specify the type of server. Microsoft SQL or Oracle.

b. **Database Host Name:** Enter the host name of the server where the database resides.
c. **Database User Name**:
   - **SQL Server**: Enter the privileged user detail that has permission to create and modify the schema.
   - **Oracle**: Provide the mdbadmin user name.
d. **Database Password**:
   - **MS SQL**: Enter the database password used by the database admin user.
   - **Oracle**: Enter the password for the Oracle database user.
e. **Database Port Number:** Provide the database port number.
f. **Enter Database Name :** Enter the database name. For example, mdb.
g. **System Name**: Provide the hostname of the system from where you want to uninstall the CA Service Management product or products.

4. Select any of the following products that you want to uninstall:
   – **SDM -** CA Service Desk Manager
   – **SLCM-** CA Service Catalog
   – **xFlow Interface**
   – **ProductUpdates**
   Enter product name to be uninstalled: **ProductUpdates**
5. Enter product to clean up updates: (sdm,slcm,xflow,chatserver,searchserver): For example, slcm
6. Enter update version to clean up: 17.4.3.0
7. The utility cleans up the database and removes the entries of the selected product installed on the server.

Installing CA Service Management 17.4.2.0

Based on your CA Service Management implementation, review the following topics for a successful installation.

- Install Prerequisites for CA Service Management 17.4.2.0
- Install CA Service Management 17.4.2.0 (Windows)
- Install CA Service Management 17.4.2.0 (Linux)
- Validate CA Service Management 17.4.2.0 Installation
- Post-Installation Tasks for CA Service Management 17.4.2.0
- Post-Installation Tasks - CA SDM Advance Availability 17.4.2.0
- Uninstall CA Service Management 17.4.2.0

Install Prerequisites for CA Service Management 17.4.2.0

Installation prerequisites for patch 17.4.2.0

Verify and complete the following prerequisites before installation of CA Service Desk Manager, CA Service Catalog, and CA Asset Portfolio Management.

Installation Prerequisites for CA Service Desk Manager
Review the following CA SDM installation prerequisites before you start the installation process:

> **NOTE**
> We recommend that you place the installer in a shorter directory path, containing no spaces, to avoid errors when running the setup file. For example, unzip the file at: C:\WIN_17_4_2_0.

- Ensure that CA SDM and xFlow Interface 17.4 is installed in your environment.
- Back up the system database (MDB). The system database (MDB) backup is mandatory and ensures safe data recovery if any problems are encountered during the installation process.
- Do not invoke ApplyPTF manually in your system while running the CA Service Management CA Service Management 17.4.2.0 installer.
- In the case of, CA Service Desk Manager - Conventional configuration, if the Primary and Secondary servers are on separate nodes, and the xFlow Interface is deployed on the Secondary Server, then the Database Client (Microsoft SQL Native Client or Oracle Database Client) is required on the Secondary Server for a successful installation.
- CA SDM must be installed for deploying the xFlow Interface. In the conventional configuration, it's recommended to install the xFlow Interface server on a secondary server. Advanced Availability users can install the xFlow Interface only on an application server.

  IMPORTANT
  After upgrading to CA Service Management 17.4.2.0, Maileater does not work with POP3 on a non-TLS port with Clear Text as a security level. This is a limitation of the upgraded Javamail (Third-party jar) used in connection to the mail server. Users are required to use **LOGIN** as a security level.

(Optional) Backing up the CR_Stored_Queries Table

CA Service Management provides a fix to address a vulnerability related to SQL injection. As part of this fix, **Cr_Stored_Queries** table is updated. If you have made customizations or changes to the Out-of-the-box (OOTB) stored queries, perform the below steps to take a backup before applying the CA Service Management patch:

1. Open a command prompt window and navigate to *$NX_ROOT\patches.* and create a folder **Backup_Data**. Navigate to this folder and take the Backup of the Cr_Stored_Queries table by running the following command:
   ```
   pdm_extract Cr_Stored_Queries> Cr_Stored_Queries_17.4_backup.dat
   ```
2. Verify that the **Cr_Stored_Queries_17.4_backup.dat** file is successfully created.
3. Now, proceed with CA Service Management 17.4.2.0 installation.
4. After applying the patch, if required based on your customizations, you can update the database files created in **Step 1**. Navigate to $NX_ROOT\patches\Backup_Data location and run the following command:

   ```
   pdm_load -f Cr_Stored_Queries_17.4_backup.dat
   ```

Installation Prerequisites for CA Service Catalog

Verify and complete the following prerequisites before proceeding with CA Service Catalog 17.4.2.0 installation:

- Ensure that CA Service Catalog 17.4 is installed in your environment.
- Back up the system database (MDB). The system database (MDB) backup is mandatory and ensures safe data recovery if any problems are encountered during the installation process.

Installation Prerequisites for CA Asset Portfolio Management

Consider the following prerequisites:

WARNING
CA Asset Portfolio Management (CA APM) architecture is highly database-driven and has no rollback mechanism for database-related changes. Hence, the uninstallation of the CA APM patch is not recommended and is not supported. The only way to revert the database changes, if required, is by restoring the database backup which can lead to data loss.

Verify and complete the following prerequisites before proceeding with the CA Asset Portfolio Management installation:

- Ensure that CA Asset Portfolio Management 17.4 is installed in your environment.
- Back up the system database (MDB). The system database (MDB) backup is mandatory and ensures safe data recovery if any problems are encountered during the installation process.

Install CA Service Management 17.4.2.0 (Windows)

Installing CASM 17.4.2.0 on Windows

CA Service Management 17.4.2.0 installer performs prerequisite checks and mandatory validations before installing the patch.

NOTE

- We recommend that you place the installer in a **shorter directory path**, containing no spaces, to avoid errors when running the setup file. For example, unzip the file at: C:\WIN_17_4_2_0
- In CA Service Desk Manager (SDM) Availability mode, the xFlow Interface can only be installed on an Application Server. If you have converted CA SDM conventional configuration to advanced availability configuration, and you have a previously installed version of xFlow Interface, ensure that you uninstall xFlow Interface and then, reinstall xFlow Interface on an Application server.

Perform the following steps to install 17.4.2.0 on Windows:

1. From the Broadcom Support portal, download the **WIN_17_4_2_0.zip** file.
   NOTE
   CA Service Management 17.4.2.0 (Windows) installer is provided as a ZIP file and not as a CAZ file. Extract/unzip the content of the ZIP file to your local folder.
2. Copy **WIN_17_4_2_0.zip** on all servers in your environment.
3. Extract the contents of the ZIP file to the folder named WIN_17_4_2_0.
   NOTE
   In the extracted folder, CA EEM 12.6.7.0 installer is available in *CASM_17.4.2.0\filestore\EEM\Windows\12.6.7.0*
4. In CA SDM conventional configuration, stop CA SDM services in your environment. In the case of Advance Availability configuration, stop CA SDM services only on the server on which CA SDM will be installed.
5. Log in to the server as a local admin to install the patch.
6. Navigate to **WIN_17_4_2_0** folder. Right-click **Setup.exe** and select **run as administrator**.
7. Review and Accept the License Agreement Information.
8. Select **Microsoft SQL Server** or **Oracle** as the database type in the Database Configuration screen.
   For Windows Microsoft SQL Server database, *mdbadmin* is the default user.
9. Provide the database details:
   a. If you have selected **Microsoft SQL Server**, provide the following field information:
      - **Database Server**: Enter the hostname of the database server.
        If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
      - **Database Name**: Enter the Database name (MDB), the name of the target DBMS. The default value is mdb.
      - **Database Port**: Provide the port identifier for the target DBMS.
      - **Database Server Instance**: The database instance name. Leave this field blank if you are using the default instance.
        If you are using the SQL named instance and a non-default port number, the **Database Server Instance** field should look like this: ***<database instance name>,<non-default port number>***
        For example:
        ```
        sdmcasmqa,10555
        ```
      - **Database Admin User**: For Microsoft SQL Server, **sa** is the default value.

The **sa** user is the admin user with permission to create a user and schema.

- **Database Admin Password**: Enter the database password of the user specified by a database admin user. No default value is assigned to this parameter.
- **mdbadmin Password**: Enter the password for the user specified for the MDB admin user.
- **Confirm mdbadmin Password**: Confirm the password.

b. If you have selected **Oracle** database, provide the following field information:

- **Database Server**: Enter the hostname of the Oracle database server.
  If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
- **Oracle Service Name**: Enter the Oracle Service name.
- **Listener Port**: Enter the listener port for the database.
- **Net Service Name**: Enter the Net Service Name of the Oracle database where the database resides.
  If the database is remote, use the Net Service Name that is defined in the Oracle client on the local computer. CA SDM has access to the database through a local installation of the Oracle client.
- **DBA User Name**: Provide the name of an Oracle user with DBA access. The default value for DBA user is **SYS**.
- **DBA User Password**: Enter the password for the DBA user.
- **mdbadmin Password**: Enter the password for MDB admin.
- **Confirm mdbadmin Password**: Confirm the password.
- **Tablespace Path (on DB Server)**: Provide the tablespace path on the database server.
- **Oracle Home Path**: Provide the Oracle Client 64-bit path. Provide Oracle client 32-bit path. For CA Asset Portfolio Management, provide the Oracle 32-bit client.
- **Data Tablespace Name**: Provide the name of the data tablespace. The default value is MDB_DATA.
- **Index Tablespace Name**: Provide the index Tablespace Name: The default value is MDB_INDEX.

Click **Next**.

10. On **Select the Products and Integrations** page, patch list is displayed. Select the required patch to install.

    WARNING

    CA Service Management does not support the uninstallation of the CA Asset Portfolio Management patch. Uninstalling the CA APM patch does not uninstall the MDB patch, as there is no rollback mechanism for the same. For more information, see Installation Prerequisites.

    a. **CA Service Desk Manager**
    - CA Service Desk Manager Patch
    - xFlow Interface Patch
    - Search Server Patch: Search server patch must be installed on a Server where an earlier version from previous releases is already installed.

    b. **CA Service Catalog**
    - CA Service Catalog Patch

    c. **CA Asset Portfolio Management**
    - CA Asset Portfolio Management Patch

    Click **Next**.

11. Review the Pre-Installation Configuration page. Click **Next**.

    NOTE

    Select the option to perform the automated post-install steps for CA SDM. If this option is not selected, you must manually perform the post-install steps for CA SDM. Note that for CA Service Catalog and CA Asset Portfolio Management, you need to perform the manual post-install steps.

12. Click **Install** to proceed with the installation. Review the Installation progress and when the installation is complete, click **Next.**
13. To review the installation logs, navigate to the path shown in the installation summary screen.
14. Click **Finish** to exit the installer

15. After installing the Key definition for "xflow" not found in the DITA map., start the **CA Key definition for "xflow" not found in the DITA map.** service from Windows Services (**Control Panel, Administrative Tools, Services**) as this service is not started by default.
16. After installing the search server, if the **Search Server** service is not started by default or if it stops, start the services from **Control Panel, Administrative Tools, Services.**
17. Validate the Installation.
18. Complete the Post-Installation Tasks.

After installing the Key definition for "xflow" not found in the DITA map. and Search Server, you can configure the cache size for Key definition for "xflow" not found in the DITA map.. For more information about how to configure cache size, see Perform initial load and refresh index on the search server.

Install CA Service Management 17.4.2.0 (Linux)

Installing CASM 17.4.2.0 on Linux

> **NOTE**
> In CA SDM Advanced Availability mode, the xFlow Interface can only be installed on an Application Server. If you have converted CA SDM conventional configuration to advanced availability configuration, and you have a previously installed version of xFlow Interface, ensure that you uninstall xFlow Interface and then reinstall xFlow Interface on an Application server.

CA Service Management 17.4.2.0 installer performs prerequisite checks and mandatory validations before installing the patch.

> **IMPORTANT**
> We recommend that you place the installer in a **shorter directory path**, containing no spaces, to avoid errors when running the setup file. For example, unzip the file at: *<root>\casm_dvd.x86Linux\<installer_file>*

Perform the following steps to install 17.4.2.0 on Linux:

1. From the Broadcom Support portal, download the **LNX_17_4_2_0.tar.gz** file.
2. To extract the LNX_17_4_2_0.tar.gz, run the following command:
   ```
   tar -xvzf LNX_17_4_2_0.tar.gz
   ```
   > **NOTE**
   > In the extracted folder, CA EEM 12.6.7.0 installer is available in CASM_17.4.2.0\filestore\EEM\Linux\12.6.7.0
3. Set CA SDM bin and library environment variables.
   For example:
   ```
   export PATH=/opt/CA/ServiceDeskManager/bin:$PATH
   export LD_LIBRARY_PATH=/opt/CA/ServiceDeskManager/lib:$LD_LIBRARY_PATH
   ```
4. In SDM conventional configuration, stop CA SDM services in your environment. In the case of Advance Availability, stop CA SDM services only on the server on which CA SDM will be installed.
5. Run the setup file from the casm_dvd.x86Linux folder to install the application(s) using the following command:
   ```
   ./setup.sh
   ```
6. Review and accept the license agreement terms.
7. In Database Configuration, select **Oracle** as the database type. Ensure that you have installed the Oracle database client in your system.
   Provide the following Oracle database configuration details:
   - **Database Server**: Enter the hostname of the Oracle database server.
     If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
   - **Oracle Service Name**: Enter the Oracle Service name.
   - **Listener Port**: Enter the listener port for the database.
   - **Net Service Name**: Enter the Net Service Name of the Oracle database where the database resides.

If the database is remote, use the Net Service Name that is defined in the Oracle client on the local computer. CA SDM has access to the database through a local installation of the Oracle client.
- **DBA User Name**: Authenticates the name of the user with DBA access. The default value for DBA user is **SYS.**
- **DBA User Password**: Authenticates the password for DBA user.
- **mdbadmin Password**: Specify the password for the mdbadmin user.
- **Confirm mdbadmin Password**: Confirm the mdbadmin user password.
- **Tablespace Path (on DB Server)**: Enter the tablespace directory on the database server.
- **Oracle Home Path**: Provide the Oracle Client 64-bit path. Provide Oracle client 32-bit path for fresh installation
- **Data Tablespace Name**: Enter the tablespace name. The default value is **MDB_DATA**.
- **Index Tablespace Name**: Enter the index tablespace name: The default value is **MDB_INDEX**.

8. Click **Next.**
9. On **Select the Products and Integrations** page, patch list is displayed. Select the required patch to install.
   a. **CA Service Desk Manager**
      - CA Service Desk Manager Patch
      - xFlow Interface Patch
      - Search Server Patch: A search server patch must be installed on a server where an earlier version from previous releases is already installed.
10. Click **Next**.
11. Review the Pre-Installation Summary page. Click **Next.**
12. Click **Install** to proceed with the installation. Review the Installation progress and when the installation is complete, click **Next.**
13. To review the installation logs, navigate to the path shown in the installation summary screen.
14. Click **Finish** to exit the installer.
    If patch installation fails for a product, retry the installation by using the **Retry** option in the wizard where it fails. If retry does not work, exit the installer and relaunch it. If the problem persists, contact Broadcom Support.
15. After installing XFlow Interface, start the**CA XFlow Interface**service. Navigate to /opt/CA/xFlow/Apps and run the following command from a command prompt window:
    ```
    ./xFlowServer start
    ```
    To stop the server, run the following command:
    ```
    ./xFlowServer Stop.sh
    ```
16. Navigate to /opt/CA/SC/SearchServer/elasticsearch/bin and run the following command from the command prompt window:
    ```
    ./ServicesStart.sh
    ```
    NOTE
    If you get the below message while restarting the search server service, ignore it and continue:
    ```
    groupadd: group 'elasticsearch' already exists
    useradd: user 'elasticuser' already exists
    runuser: warning: cannot change directory to /home/elasticuser: No such file or directory
    OpenJDK 64-Bit Server VM warning: Option UseConcMarkSweepGC was deprecated in version 9.0 and
     will likely be removed in a future release.
    ```
    To stop the server, run the following command:
    ```
    /ServicesStop.sh
    ```
17. Validate the Installation.
18. Complete the Post-Installation Tasks.

After installing the XFlow Interface and Search Server, you can configure the cache size for XFlow Interface. For more information about how to configure cache size, see Perform initial load and refresh index on the search server.

Validate CA Service Management 17.4.2.0 Installation

Validate CASM 17.4.2.0 installation

To verify the successful installation of CA Service Management 17.4.2.0, validate the installation for the corresponding applications in the following location. You can also navigate to the root folder where you have locally installed the application and select the "env.info" file for validating your installation:

- **CA ITAM:**

  NOTE
  CORA version: 17.4.0.57

  – C:\Program Files (x86)\CA\ITAM\env.info
  – product=ITAM
  – major=17
  – minor=4
  – cum=2
  – roll-up=0

  NOTE
  CA CASM uses Apache Tomcat version 9.0.86.
- **CA Service Catalog:**
  – %USM_HOME%*CA_SLCM_<hostname>.his* file
  – %USM_HOME%\view\webapps\usm\locale\about_info.xml
  – %USM_HOME%\build.xml
  – %USM_HOME%\env.info
- **xFlow Interface:**
  – *C:\Program Files\CA\xFlow\<hostname>.his* file
  – NX_ROOT\env.info
  – NX_ROOT\version.xml
- **CA SDM:**
  – *C:\Program Files (x86)\CA\Service Desk Manager\<hostname>.his* file
  – NX_ROOT\pdmconf\version
  – NX_ROOT\env.info
  – HELP, ABOUT

  NOTE
  For CA SDM, the Binary and Language Combo patches are installed irrespective of the environment. The language patch for the corresponding CA SDM environment is installed.

  To validate the successful installation of the patches, follow these steps:

  1. Open the <sdm_installation>\<hostname>.his file in a text editor.
  2. Search for the instances of "gol-168". In a successful install, you should come across these three entries (Binary, Language Combo, and corresponding language patch).

Application	Windows	Linux
CA Asset Portfolio Management	T6EE1742	NA
CA Service Catalog	T6D91742	NA
CA Service Desk Manager - Binary	gol-168_cum_C	gol-168_x86_64Linux_cum_C
CA Service Desk Manager - Languag504e Comb	gol-168_langcombo	gol-168_langcombo

Application	Windows	Linux
CA Service Desk Manager - English	gol-168_en_US	gol-168_x86_64Linux_en_US
CA Service Desk Manager - German	gol-168_de_DE	gol-168_x86_64Linux_en_DE
CA Service Desk Manager - Spanish	gol-168_es_ES	NA
CA Service Desk Manager - French	gol-168_fr_FR	gol-168_x86_64Linux_fr_FR
CA Service Desk Manager - Italian	gol-168_it_IT	NA
CA Service Desk Manager - Japanese	gol-168_ja_JP	gol-168_x86_64Linux_ja_JP
CA Service Desk Manager - Brazilian Portuguese	gol-168_pt_BR	NA

Post-Installation Tasks for CA Service Management 17.4.2.0

After successful installation of CA Service Management 17.4.2.0, perform the following post-installation steps.

CA Service Desk Manager

Manual Steps required for Automated Post-Installation

CA Service Management provides an option in the installer to automate the post-install tasks.
If you have selected **Yes** to automate the post-installation steps while running the CA Service Management Installer Wizard, you are not required to perform any manual post-install steps for CA Service Desk Manager (SDM).

If you have selected **No** for automating the post-install steps while running the CA Service Management Installer wizard, perform the below manual post-install tasks as per your deployment requirements:

Manual Post-Install Tasks After Installing CA Service Desk Manager (SDM) 17.4.2.0 on CA SDM 17.4 or CA SDM 17.4.1.0

Perform the following steps:

1. Stop CA SDM services.
2. Navigate to NX_ROOT/site/config.properties file and ensure the value of resources.created parameter is set to 0.
3. Open a command prompt window and run the following command:
   ```
   pdm_configure
   ```
4. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_02_insert.dat
   pdm_load -u -f r17_4_02_update.dat
   ```
5. Notification message template is modified to update the existing email templates with the html_description field.
   Tool location: NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate This has to be executed one time when the SDM service is up and running. **For e.g:**
   Windows
   ```
   NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate.bat
   ```
   Linux
   ```
   NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate.sh
   ```

Manual Post-Installation Task for CMDB

> **NOTE**
> For Oracle 21c, set the **isClusterEnv** setting to "true" in the application.conf file of CMDB viz and restart the CA SDM Services.:

- For Windows: <SDM installed location>\bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\WEB-INF\classes\application.conf)
- For LINUX: <SDM installed location>/bopcfg/www/CATALINA_BASE_VIZ/webapps/CMDBVisualizer/WEB-INF/classes/application.conf).

If you are applying CA Service Management 17.4.2.0 in an SSL environment, CA SDM Administrators must perform the following post-installation steps for CMDB Visualizer Interface to open using the **HTTPS** protocol when launching from CA SDM UI:

1. In the NX.env file, change the **NX_CMDB_VISUALIZER** entry to provide **HTTPS protocol** and **HTTPS port**.
   For example: @NX_CMDB_VISUALIZER=https://sdmurl:<VIZ_SSL_PORT>/CMDBVisualizer
2. In **casm.conf.js** file from NX_root\bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\viz-ux\conf, provide the HTTPS as protocol and HTTP port.
   For example:

```
sdm: {

      vizserver: 'https://sdmurl:<VIZ_SSL_PORT>/CMDBVisualizer/viz',
      server: 'https:// sdmurl:<SDM_SSL_PORT>/CAisd/pdmweb.exe'
    }
```

Manual Post-Installation Task for OAuth 2.0 (Maileater/ Mailer)

After generating an access token for OAuth 2.0 to connect to a mail server, perform the mandatory post-install tasks on all servers in your environment:

1. Create a backup of web.xml from NX_ROOT\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF in your local directory to perform backout if required.
2. Open the web.xml file from NX_ROOT\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF.
3. Search for the following statement:
   ```
   <!--USD servlet mappings start-->
   ```
4. Copy and paste the following configuration under the statement:

```
<servlet>
  <servlet-name>OAuthProcessor</servlet-name>
  <servlet-class>com.broadcom.oAuth.OAuthProcessor</servlet-class>
 </servlet>
```

5. Copy and paste the following configuration after any <servlet-mapping>:

```
<servlet-mapping>
  <servlet-name>OAuthProcessor</servlet-name>
  <url-pattern>/OAuthProcessor</url-pattern>
</servlet-mapping>
```

6. Save and close the web.xml file.
7. For OAuth servlet preservation in a primary and secondary environment, the secondary server must also have the OAuth processor entries in the following file: *<NX_ROOT>\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF\web.xml.last*.
8. Repeat Steps 1-8 to update **web.xml.tpl** file in the NX_ROOT\samples\pdmconf\web.xml.tpl folder to avoid losing these changes when pdm_configure is run at a later point of time.
9. Run the following command:
   ```
   pdm_tomcat_nxd -c STOP command
   ```
10. Wait for some time (a minute or so) and run the following command:

```
pdm_tomcat_nxd -c START command
```

For more information, see Define a mailbox.

Manual Post-Installation Task for Excel file (.xlsx) export*

1. Execute the following command:
   ```
   pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst
   ```
2. Execute the following command to add the new NX variable to NX.env.tpl file.
   ```
   pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst -t
   ```
3. Restart CA SDM services.

HTML Tags Sanitization

The sanitization tool can be run any number of times. Administrators can choose if they wish to run the tool for each ticket type separately or for all ticket types at one go.

Before running the Sanitization tool ensure you take a backup of all the ticket objects using the following commands or by taking a backup of the sdm databse :

```
"Call_Req": pdm_extract Call_Req > cr_backup.txt
"Issue": pdm_extract Issue > Issue_backup.txt
"Change Orders": pdm_extract Change_Request >change_orders_backup.txt.
```

Both active and archived tickets can be sanitized.
For Windows:

```
NX_ROOT\samples\sdk\SanitizationTool\sanitizeTool.bat
```

For Linux:

```
NX_ROOT\samples\sdk\SanitizationTool\sanitizeTool.sh
```

> **NOTE**
> We recommend executing the sanitization during slack time on any Service Desk Manager server.

After executing the sanitization tool, execute the following command to update domsrvr memory cache:

```
pdm_cache_refresh -t Call_Req
pdm_cache_refresh -t Issue
pdm_cache_refresh -t Change_Request
```

(Optional) Manual Post-Installation Task for Knowledge Document export with German fields

If you are exporting Knowledge Document with German Fields (included in the export field list), then perform the below post-install steps for successful export of knowledge documents:

1. Take the backup of NX_ROOT\NX.env file (NX_ROOT is the installation directory for CA Service Desk Manager).
2. Open NX_ROOT\pdmconf\NX.env_nt.tpl file using any text editor and take the value of NX variable @NX_KEIT_AVAILABLE_FIELDS which is COPIED_DATA and update Nx.env in NX_ROOT by executing below command:
   ```
   pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <COPIED_DATA>  -a  pdm_option.inst
   ```
   Where COPIED_DATA is the value copied from NX.env_nt.tpl (step 2).
   For example, " pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <provide the exact string here> -a pdm_option.inst "
   Note to avoid losing the updated changes when you run pdm_configure, execute the above command with the '-t' flag as follows:
   ```
   pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <COPIED_DATA> -a pdm_option.inst -t
   ```

(Optional) Handle HTML Mails that contains Tables in MailEater

Java based Maileater already has the ability to process the emails that were sent in plain format or HTML format, to support the processing of emails that contain Tables in the HTML body. But the format in which the email was sent is lost when received by Maileater.

1. Run the following commands from NX_ROOT/bin from the command prompt/ terminal:
   ```
   pdm_options_mgr -c -s NX_ENFORCE_HTML_EMAIL_PARSING -v "Yes" -a pdm_option.inst
   pdm_options_mgr -c -s NX_ENFORCE_HTML_EMAIL_PARSING -v "Yes" -a pdm_option.inst -t
   ```
2. Restart CA SDM and XFlow applications.

(Optional) Comments are not allowed when a Data Partition (O_COMMENTS) is created with Customer, Employee and ServiceDesk Analyst

To disable comments:

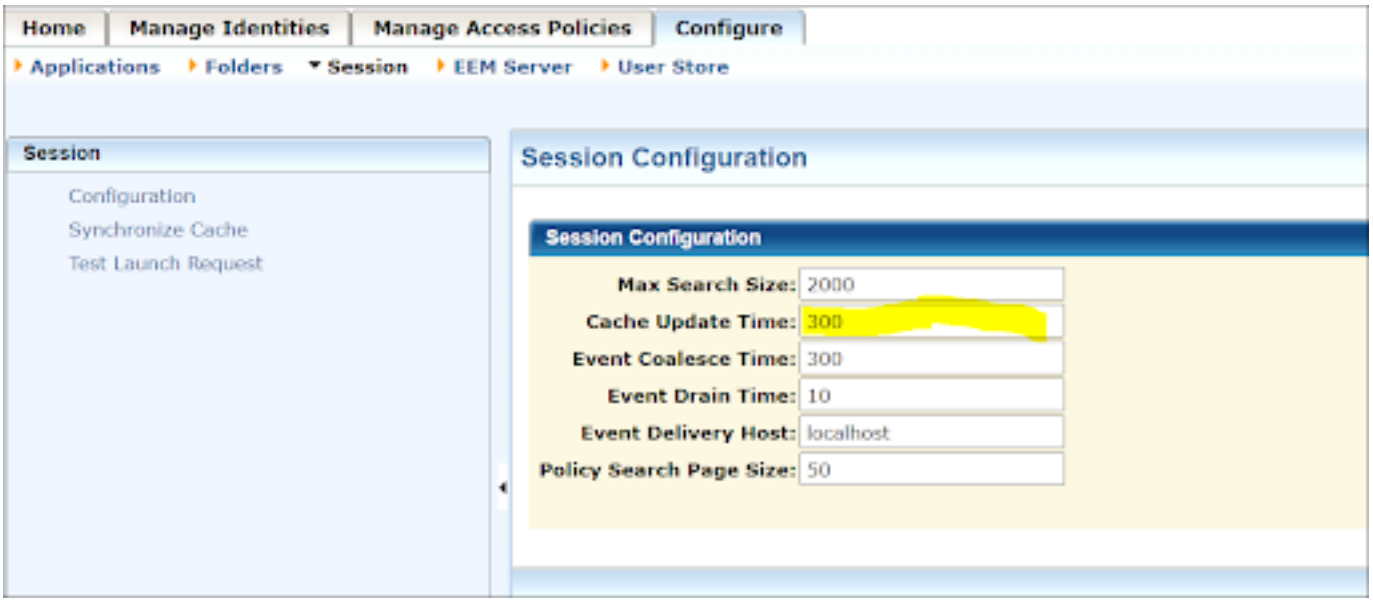
1. Login to SDM and navigate to Administration -> Security and Role Management-> Data partition-> Data Partition List.
2. In Data Partition List, create a constraint (O_COMMENTS with the condition id=0) and link it to Customer, Employee and ServiceDesk Analyst data partitions.
3. Run the following commands from NX_ROOT/bin from the command prompt/ terminal:
   ```
   pdm_options_mgr -c -s KT_COMMENT_USE_SUPERUSER -v 0 -a pdm_option.inst
   pdm_options_mgr -c -s KT_COMMENT_USE_SUPERUSER -v 0 -a pdm_option.inst -t
   ```
4. Restart CA SDM and XFlow applications.

(Optional) Manual Post-Installation Task for EEM Cache Timeout Configuration Update

You may face issues while logging in to EEM or SDM using the EEM user accounts due to a session cache timeout mismatch between EEM and SDM.

You can update the EEM cache timeout configuration by adding a new NX variable, "NX_EEM_CACHE_UPDATE_TIME" in SDM.

Keep the value the same as the EEM cache timeout configuration value mentioned in the following screenshot.



To set the EEM cache update time to 300 seconds, perform the following steps:

To add the variable in the **nx.env** file, run the following command:

```
pdm_options_mgr -c -s  EEM_CACHE_UPDATE_TIME  -v 300 -a pdm_option.inst
```

To add the variable in the **nxenv_nt.tpl** file, run the following command:

```
pdm_options_mgr -c -s  EEM_CACHE_UPDATE_TIME  -v 300 -a pdm_option.inst -t
```

Service Point

After successful installation of Service Point, refresh index and data on the Search Server.

> **NOTE**
> In case of Linux Search Server environment, ensure to run the following commands on the terminal:
>
> ```
> sysctl -w vm.max_map_count=262144
> ulimit -Hn 65535
> ```

(Optional) Manual Post-Installation Task for Rebuild Index

If you have upgraded or are planning to install CA EEM 12.6 with Service Point and CA Service Catalog, ensure that you rebuild the CA Service Catalog index after completing the CA EEM upgrade/installation process. For more information, see Perform Initial Load and Refresh Index Data on Search Server.
Run the following command to rebuild the index:

```
$ES_HOME/search/bin/pdm_es_rebuild_index.bat index=catalog_index
```

CA Service Catalog

Perform the following CA Service Catalog post-installation steps as per your environment requirements:

- Post-Installation Tasks after installing CA Service Catalog 17.4.2.0 on CA Service Catalog 17.4
- gMSA Authentication

Post-Install Tasks After Installing CA Service Catalog 17.4.2.0 on CA Service Catalog 17.4 or later versions

Review and perform the post-installation steps based on your deployment requirements.

> **NOTE**
> If any SSL certificate(s) chain was imported to the Oracle Java's JAVA_HOME\lib\security\cacerts Keystore, those certificate(s) chain again need to be exported explicitly and imported properly into the new AdoptOpenJDK's %USM_HOME%\embedded\jdk\lib\security\cacerts Keystore.

Follow these steps

- (Optional) If Service Catalog is accessed from applications like Service Point, SharePoint and so on, then you must perform this step. Open the "**web.xml**" file located in *USM_HOME%\view\webapps\usm\WEB-INF* and update the respective parameter values for the parameter name "cors.allowed.origins" and "cors.support.credentials". For example, if you are using Catalog Widgets in Service Point
- (Optional) Unable to approve any workflow requests through email. The email sent for approvals is corrupted with special characters. Follow the KB article steps.

(Optional) Approve workflow requests through email

The workflow email sent for approvals is corrupted with special characters. To approve any workflow requests through email, follow the KB article steps.

gMSA Authentication Post-Install Steps for CA Service Catalog (Automated steps)

CA Service Catalog provides automated post-installation steps for gMSA Authentication. Review the following before you proceed:

- Prerequisites and Considerations
- How to Automate gMSA Post-Installation Steps
- Unconfigure gMSA

Prerequisites and Considerations:

Ensure that you have taken care of the below considerations on all nodes of CA Service Catalog where you want to automate the gMSA post-installation procedure.

1. If the accounting service is available, perform the automated post-install steps by updating serviceName to ServiceAccounting and providing the appropriate gMSA account name in the **gmsa.properties** file.
2. If the filestore path is external to the server from where the **GMSAPostInstall.bat** is running, ensure to provide appropriate access to the server for setting the gMSA account permissions.
3. While preparing the properties file, check for any copy/paste issues, special characters, spaces, and so on.

How to Automate gMSA Post-Installation Steps

Perform the following steps to enable the batch file **GMSAPostInstall.bat** and to automate the gMSA post-installation steps:

1. Create a gMSA account for CA Service Catalog.
2. Ensure that appropriate DB (database) permission is given to the newly created account(s).
3. Enter the below values in the **gmsa.properties** file and save it.

   NOTE
   A template file (**gmsa.properties**) is added in the common installer in *"\filestore\SLCM\gMSAProperties"* . Optionally. use this file as a template file to fill gmsa properties. This can be copied to "USM_HOME/scripts/GMSA" where Catalog is installed.

   NOTE
   All values are mandatory. Make sure that there are no leading or trialing spaces while providing these values.

   a. **serviceName**: Application service name to enable GMSA. In the case of Catalog, it will be ServiceCatalog and for accounting, it will be ServiceAccounting.
   b. **folderName**: Absolute path of the application installation directory.
   c. **gMSAName**: Name of the GMSA service account (domain\accountName$).
   d. **filestorePath**: Shared network path (\\Server_name\filestore) or local filestore path
4. Navigate to %USM_HOME% and launch **usm.cmd**
5. Navigate to %USM_HOME%/scripts/GMSA/ folder and run the "GMSAPostInstall.bat" in command prompt.

   NOTE
   If the command executes without any error, "Post-installation steps for GMSA executed successfully" message is displayed with exit code 0.
   If there are errors, the error message is shown with a non-zero exit code. Correct the error to continue and perform step **5** again.

Unconfigure gMSA for CA Service Catalog

To disable or unconfigure gMSA for CA Service Catalog, follow the steps below:

1. Replace **config.properties** file from*%USM_HOME%*\ folder.
2. Revert back all the folder permissions which were assigned to domain users.
3. Start Catalog and Accounting Services with the local system account.

   NOTE
   In the case of load balancers, repeat steps 1-3 to unconfigure gMSA on all Catalog servers.

CA Asset Portfolio Management

Manual Post-Installation Task for Removing jQuery, log4net, and log4j Vulnerabilities

After installing 17.4.2.0, delete jquery-1.3.2.min.js, jquery-ui-1.7.2.custom.min.js , log4net.dll, and log4j from their respective installed folders.

NOTE
Perform the below steps if you have not done this earlier.

Perform the following steps:

1. Log on to CA APM Web Server, navigate to the <ITAM_install_dir>\ITAM\Web Server\castylesr5\javascript.
   Example: C:\Program Files (x86)\CA\ITAM\Web Server\castylesr5\javascript
   Locate and delete the jquery-1.3.2.min.js and jquery-ui-1.7.2.custom.min.js files from the directory.
2. Navigate to the ITAM_install_dir\CA\ITAM\Data Importer.
   Locate and delete the log4net.dll file from the directory.
3. Navigate to the C:\Program Files (x86)\CA\SC\CORA.
   Locate and delete the log4j-1.2.15.jar, log4j.properties, and ojdbc6.jar files from the directory.
4. Navigate to the ITAM_install_dir\CA\ITAM.
   Backup the following folders and manually delete them:
   - CDB
   - MDB
   - jre8

     NOTE
     jre8 folder has to be deleted manually for every RU installation.
5. Perform an IISRESET and delete the browser's cache to load the upgraded files.

Post-Installation Tasks - CA SDM Advance Availability 17.4.2.0

The installer wizard provides an option in the installer to automate the post-install tasks. Perform the following post-installation tasks for CA SDM Advanced Availability Configuration.

For the Advanced Availability configuration, the following host names are considered as an example:

- The background server hostname is sdmcahost1.
- The standby server hostname is sdmcahost2.
- The application server hostname is sdmcahost3.

Manual Steps required for Automated Post-Installation

If you have selected **Yes** for automating the post-install steps while running the installer wizard, then perform manually the following post-install tasks:

Manual Post-Install Tasks - After Installing CA Service Desk Manager (SDM) 17.4.2.0 on CA SDM 17.4 GA or CA SDM 17.4.1.0

1. Ensure that the patch is applied on the standby server (sdmcahost2).
2. Start the CA SDM service on the standby server (sdmcahost2). Open the command prompt and run the following command:
   ```
   pdm_server_control -b
   ```
3. Ensure that the patch is applied on the original background server (sdmcahost1) which is now a standby server.
4. Start the CA SDM service on the standby server (sdmcahost1). Run the following command:
   ```
   pdm_server_control -b
   ```
5. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_02_insert.dat
   pdm_load -u -f r17_4_02_update.dat
   ```
6. Clear the browser cache by the following command:
   ```
   pdm_webcache -H
   ```

7. Ensure that the patch is applied on all the application servers and the remaining standby servers if any. If you selected YES to automate the post-install steps, then there are no more manual post-install steps to be performed.

Manual Steps required for Non-Automated Post-Installation

If you have selected **No** for automating the post-install steps while running the CA Service Management installer wizard, perform manually the below appropriate post-install task as per your deployment requirements.

Post-Install Tasks After Installing CA SDM 17.4.2.0 on CA SDM 17.4 GA or CA SDM 17.4.1.0 for Advanced Availability Configuration

1. Ensure that the patch is applied on the standby server (sdmcahost2).
2. Navigate to NX_ROOT/site/config.properties file and ensure the value of resources.created parameter is set to 0. Open a command prompt and run the following command:
   ```
   pdm_configure
   ```
   On the installer configuration page, before clicking Finish, uncheck the Start service when completed checkbox. Failure to uncheck the box may result in the loss of custom schema changes and configurations that were changed on the server.
3. Promote the standby server as the new background server by performing the following steps. To suppress version control on the standby server and later on the background server, run the following command on each server:
   ```
   pdm_server_control -v
   ```
4. Start SDM service on the standby server. Run the following command:
   ```
   pdm_server_control -b
   ```
5. Ensure that the patch is applied on the original background server (sdmcahost1) which is now a standby server, and perform the following steps. Navigate to NX_ROOT/site/config.properties file and ensure that the value of resources.created parameter is set to 0. Run the following command:
   ```
   pdm_configure
   ```
6. Start the CA SDM service on the standby server (sdmcahost1). Run the following command:
   ```
   pdm_server_control –b
   ```
7. Change the directory to NX_ROOT/data, and execute the following command:
   ```
   pdm_load -f r17_4_02_insert.dat
   pdm_load -u -f r17_4_02_update.dat
   ```
8. Notification message template is modified to update the existing email templates with the html_description field. **Tool location**: NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate This has to be executed one time when the SDM service is up and running. **For e.g:**
   Windows
   ```
   NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate.bat
   ```
   Linux
   ```
   NX_ROOT\samples\sdk\SanitizationTool\SDMNotifUpdate.sh
   ```
9. Ensure that the patch is applied on all application servers and the remaining standby server if any. Perform the following steps on all application servers and standby servers.
10. Navigate to NX_ROOT/site/config.properties file and ensure that the value of resources.created parameter is set to 0. Run the following command:
    ```
    pdm_configure
    ```
11. Clear the browser cache by running the following command:
    ```
    pdm_webcache -H
    ```
12. Execute the following command.
    ```
    pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst
    ```
13. Execute the following command to add the new NX variable to NX.env.tpl file.
    ```
    pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst -t
    ```
14. Restart CA SDM Services.

NOTE
Ensure that

Uninstall CA Service Management 17.4.2.0

Review the following topics to uninstall CA Service Management 17.4.2.0.

NOTE

Uninstalling CA Service Management 17.4.2.0 will revert to CA Service Management 17.4 version on which 17.4.2.0 is installed.

Example: If CA Service Management 17.4.2.0 is installed on 17.4, uninstalling 17.4.2.0 will revert to CA Service Management 17.4.

Uninstall CA SDM 17.4.2.0 (Windows)
Perform the following steps to uninstall CA SDM 17.4.2.0 on Windows:

1. Log in to CA SDM as an Administrator.
2. Shut down CA Service Desk Manager Server.
3. Navigate to **<NX_ROOT>\bin** and run the following command to backup the unsupported jars from the older versions.
   ```
   pdm_perl pdm_restore_files.pl gol-168_tool ..\PATCHES\DELIVERABLES_REMOVAL.TXT
   ```
4. Navigate to the location *where you have extracted the CA Service Management Installer zip package*.
5. Locate *CASM-17.4.2.0-CommonPatchInstaller-Win\filestore\utils\ApplyPTF* folder.
6. Run the **APPLYPTF.exe**.
7. Select **Backout PTF** from the local or remote node option.
8. Click **Next**.
9. Enter the patch number for the language that is installed in your environment:
   - **Binary**: gol-168_cum_C
   - **Language Master**: gol-168_langcombo
   - **English**: gol-168_en_US
   - **French**: gol-168_fr_FR
   - **German**: gol-168_de_DE
   - **Spanish**: gol-168_es_ES
   - **Italian:** gol-168_it_IT
   - **Japanese**: gol-168_ja_JP
   - **Brazilian Portuguese**: gol-168_pt_BR
10. Click **Next** to continue backing out the specific patch.
11. Repeat steps 6-9, to back out the language English (gol-168_en_US) patch.
12. Repeat steps 6-9 to back out the language master (gol-168-langcombo) patch.
13. Repeat steps 6-9 to back out the binary (gol-168_cum_C) patch.
14. Reboot the server.
15. Repeat steps **6-12** on all standby, application, or secondary servers in your environment.
16. Restore the MDB database to the database backup that you took before applying the patch.
17. Navigate to ***<NX_ROOT>\site\config.properties*** file and ensure that the value of ***resources.created*** parameter is set to **0.** This must display as ***resources.created=0*** in the file.
18. Open a command prompt and run the following command:
    ```
    pdm_configure
    ```
19. If you roll-back from 17.4.2.0 to the base version, copyright text year will not change. To change the year:
    a. Add @NX_COPYRIGHT_YEAR=2023 into NX.env file located under CA SDM install directory (NX_ROOT).

b. To preserve the value even after pdm_configure, update the value of "genfact.gx_copyright_year in install.properties under NX_ROOT\site genfact.gx_copyright_year=2023

Uninstall CA SDM 17.4.2.0 (Linux)

Perform the following steps to uninstall CA SDM 17.4.2.0 on Linux:

1. Login to CA SDM as the root user.
2. Shut down the CA Service Desk Manager Server.
3. Navigate to **<NX_ROOT>/bin** and run the following command to backup the unsupported jars from the older versions.
   ```
   ./pdm_perl pdm_restore_files.pl ../replaced/gol-168_tool ../patches/deliverables_removal.txt
   ```
4. Navigate to the location where you have extracted the CA SDM Installer **tar.gz** package.
5. Navigate to the *casm_dvd.x86Linux \filestore\utils\ApplyPTF* folder.
6. The following binary/language-independent and language-dependent patches are supported:
   - Binary name: gol-168_x86_64Linux_cum_C
   - Language Master: gol-168_langcombo
   - English: gol-168_x86_64Linux_en_US
   - German: gol-168_x86_64Linux_de_DE
   - French: gol-168_x86_64Linux_fr_FR
   - Japanese: gol-168_x86_64Linux_ja_JP
7. Execute the following command to remove the binaries or the language-dependent patches. Replace the <patch_name> with the binary or language-dependent patch name:
   ```
   ./applyptf.<platform> -b <patch_name>  -e <NX_ROOT>
   ```
   Here, <platform> specifies the operating system and <NX_ROOT> specifies the CA SDM installed location.
   For example:
   ```
   ./applyptf.linux -b gol-168_x86_64Linux_cum_C  -e /opt/CA/ServiceDeskManager
   ```
8. Repeat step 6 to back out the language English (gol-168_x86_64Linux_en_US) patch.
9. Repeat step 6 to back out the binary (gol-168_x86_64Linux_cum_C) patch.

   NOTE
   During uninstallation, if you get any errors, ensure that the following steps are performed:

   1. Copy the subfolders from <NX_ROOT>/replaced/<gol-168_x86_64Linux_cum_C> and place it into the <NX_ROOT> folder.
   2. Copy the subfolders from <NX_ROOT>/replaced/<gol-168_x86_64Linux_en_US> and place it into the <NX_ROOT> folder.
   3. Open **.his** file under the <NX_ROOT> folder and delete the entries related to the current patch and save it.
10. To restore MDB database, revert to database backup that you took before applying the patch.
11. Navigate to ***<NX_ROOT>/site/config.properties*** file and ensure that the value of ***resources.created*** parameter is set to **0.** This must display as ***resources.created=0*** in the file.
12. Open a command prompt and run the following command:
    ```
    pdm_configure
    ```
13. If you roll-back from 17.4.2.0 to the base version, copyright text year will not change. To change the year:
    a. Add @NX_COPYRIGHT_YEAR=2023 into NX.env file located under CA SDM install directory (NX_ROOT).
    b. To preserve the value even after pdm_configure, update the value of "genfact.gx_copyright_year in install.properties under NX_ROOT\site genfact.gx_copyright_year=2023

    NOTE
    If you are unable to access the SDM URL, follow these steps:

    1. Stop the SDM Services.

2. Navigate to the <NX_ROOT>/bopcfg/www/CATALINA_BASE folder and delete the work folder.
3. Start the SDM Services.

Restore Visualizer Files (Windows)

NOTE
After uninstalling CA SDM, CMDB Visualizer does not function automatically as the uninstallation process will not restore the previous visualizer files . To restore, perform the below steps manually:

1. Navigate to the where you have installed Visualizer: <NX_ROOT>\bopcfg\www\CATALINA_BASE_VIZ\webapps.
2. Remove the CMDBVisualizer folder.
3. Copy the **Visualizer_17.4.2.0.OLD** folder from<NX_ROOT>*REPLACED* and paste it in <NX_ROOT>*bopcfg**www* *CATALINA_BASE_VIZ**webapps*. Now, rename the **Visualizer_17.4.2.0.OLD** to **CMDBVisualizer**.
4. Start the SDM Service.

CMDB Visualizer works as expected.

Restore Visualizer Files (Linux)

NOTE
After uninstalling CA SDM, CMDB Visualizer does not function automatically as the uninstallation process will not restore the previous visualizer files. To restore the files, perform the below steps manually:

1. Navigate to the where you have installed Visualizer: <NX_ROOT>/bopcfg/www/CATALINA_BASE_VIZ/webapps.
2. Remove the CMDBVisualizer folder.
3. Copy the **Visualizer_17.4.2.0.OLD** folder from <NX_ROOT>*/replaced* and paste it into <NX_ROOT>*bopcfg**www* *CATALINA_BASE_VIZ**webapps*. Now, rename the **Visualizer_17.4.2.0.OLD** to **CMDBVisualizer**.
4. Start the SDM Service.

CMDB Visualizer works as expected.

Uninstall the xFlow Interface 17.4.2.0 (Windows)
Perform the following steps to uninstall the xFlow Interface (Windows):

1. Click **Start**, **Control Panel**, **Uninstall a Program** to uninstall xFlow Interface 17.4.2.0.
   Or
2. Navigate to where you have installed the xFlow Interface (for example, <NX_ROOT>*/CA/xFlow)*.
3. Select xFlow Interface **17.4.2.0_installation** and click **Change xFlow Interface 17.4.2.0 Installation.exe** to complete the uninstallation process.
4. If you are using Microsoft SQL Server Database, run the following query:
```
update ofProperty set propValue='select c.access_token from casm_active_sessions c WHERE
 UPPER(CONVERT(varchar(32), c.contact_uuid ,2)) = UPPER(?)' where name = 'jdbcAuthProvider.passwordSQL'
```
5. If you are using Oracle Database, run the following query;
```
update ofProperty set propValue='select c.access_token from casm_active_sessions c WHERE
 UPPER(CAST( c.contact_uuid AS varchar2(32))) = UPPER(?)' where name = 'jdbcAuthProvider.passwordSQL'
```

Uninstall the xFlow Interface 17.4.2.0 (Linux)
To uninstall the xFlow Interface, complete the following steps on Linux :

1. Navigate to where you have installed the xFlow Interface server.
   For example:
   /opt/CA/_xFlow Interface_installation
2. Execute the following command to uninstall the xFlow Interface 17.4.2.0:
```
./Change xFlow_Interface 17.4.2.0 Installation
```

3. Click **Finish** to complete the uninstallation process.
4. Run the following query for Oracle Database:

```
update ofProperty set propValue='select c.access_token from casm_active_sessions c WHERE
 UPPER(CAST( c.contact_uuid AS varchar2(32))) = UPPER(?)' where name = 'jdbcAuthProvider.passwordSQL'
```

Uninstall CA Service Catalog 17.4.2.0

To uninstall CA Service Catalog, perform the following steps:

1. Click **Control Panel**, **Programs and Features**.
2. Double-click the CA Service Catalog 17.4.2.0 and follow the uninstallation wizard instructions.

Uninstall CA Asset Portfolio Management

CA Asset Portfolio Management (CA APM) architecture is highly database-driven and has no rollback mechanism for database-related changes. Hence, the uninstallation of the CA APM patch is not recommended and is not supported. The only way to revert the database changes, if required, is by restoring the database backup which can lead to data loss.

Run the Database Cleanup Utility for CA Service Management 17.4.2.0

During the installation of CA Service Management products, each of the installed product is registered in a common mdb table that is reflected in the deployment summary of the selected environment. These entries must be cleared in the following cases:

- Uninstallation of any CA Service Management products
- Moving Database or migration from one server to another

Run the CA Service Management database cleanup utility on a Windows or a Non-Windows environment. The database cleanup utility removes the entries and adds to the following tables:

Table Name from where the entries are removed	Table Name to which the removed entries are added
al_cdb_componentinstallstate	al_cdb_comp_installstate_bkup
al_cdb_configurationparameters	al_cdb_config_params_backup

NOTE

On a Non-Windows Platform, before running the **DBCleanup.sh** Utility, you must export the Oracle Environment variables on the terminal.

Perform the following steps:

1. Navigate to *DVD1\DBCleanupUtility* directory.
2. For Windows, double-click the **DBCleanupUtility.bat** to launch the DBCleanup utility.
   On a Non-Windows platform, you must run the **DBCleanupUtility.sh** file.
3. Enter the following details:
   a. **Database Server Type**: Specify the type of server. Microsoft SQL or Oracle.
   b. **Database Host Name:** Enter the host name of the server where the database resides.
   c. **Database User Name**:
      - **SQL Server**: Enter the privileged user detail that has permission to create and modify the schema.
      - **Oracle**: Provide the mdbadmin user name.
   d. **Database Password**:
      - **MS SQL**: Enter the database password used by the database admin user.
      - **Oracle**: Enter the password for the Oracle database user.
   e. **Database Port Number:** Provide the database port number.
   f. **Enter Database Name :** Enter the database name. For example, mdb.

g. **System Name**: Provide the hostname of the system from where you want to uninstall the CA Service Management product or products.

4. Select any of the following products that you want to uninstall:
   - **SDM -** CA Service Desk Manager
   - **SLCM-** CA Service Catalog
   - **xFlow Interface**
   - **ProductUpdates**
     Enter product name to be uninstalled: **ProductUpdates**
5. Enter product to clean up updates: (sdm,slcm,xflow,chatserver,searchserver): For example, slcm
6. Enter update version to clean up: 17.4.2.0
7. The utility cleans up the database and removes the entries of the selected product installed on the server.

Installing CA Service Management 17.4.1.0

Install CASM patch 17.4.1.0

Based on your CA Service Management implementation, review the following topics for a successful installation.

- Install Prerequisites for CA Service Management 17.4.1.0
- Install CA Service Management 17.4.1.0 (Windows)
- Install CA Service Management 17.4.1.0 (Linux)
- Validate CA Service Management 17.4.1.0 Installation
- Post-Installation Tasks for CA Service Management 17.4.1.0
- Post-Installation Tasks - CA SDM Advance Availability 17.4.1.0
- Uninstall CA Service Management 17.4.1.0

Install Prerequisites for CA Service Management 17.4.1.0

Installation prerequisites for patch 17.4.1.0

Verify and complete the following prerequisites before installation of CA Service Desk Manager, CA Service Catalog, and CA Asset Portfolio Management.

Installation Prerequisites for CA Service Desk Manager

Review the following CA SDM installation prerequisites before you start the installation process:

> **NOTE**
> We recommend that you place the installer in a shorter directory path, containing no spaces, to avoid errors when running the setup file. For example, unzip the file at: C:\WIN_17_4_1_0.

- Ensure that CA SDM and xFlow Interface 17.4 is installed in your environment.
- Back up the system database (MDB). The system database (MDB) backup is mandatory and ensures safe data recovery if any problems are encountered during the installation process.
- Do not invoke ApplyPTF manually in your system while running the CA Service Management CA Service Management 17.4.1.0 installer.
- In the case of, CA Service Desk Manager - Conventional configuration, if the Primary and Secondary servers are on separate nodes, and the xFlow Interface is deployed on the Secondary Server, then the Database Client (Microsoft SQL Native Client or Oracle Database Client) is required on the Secondary Server for a successful installation.
- CA SDM must be installed for deploying the xFlow Interface. In the conventional configuration, it's recommended to install the xFlow Interface server on a secondary server. Advanced Availability users can install the xFlow Interface only on an application server.

IMPORTANT
After upgrading to CA Service Management 17.4.1.0, Maileater does not work with POP3 on a non-TLS port with Clear Text as a security level. This is a limitation of the upgraded Javamail (Third-party jar) used in connection to the mail server. Users are required to use **LOGIN** as a security level.

(Optional) Backing up the CR_Stored_Queries Table

CA Service Management provides a fix to address a vulnerability related to SQL injection. As part of this fix, **Cr_Stored_Queries** table is updated. If you have made customizations or changes to the Out-of-the-box (OOTB) stored queries, perform the below steps to take a backup before applying the CA Service Management patch:

1. Open a command prompt window and navigate to *$NX_ROOT\patches.* and create a folder **Backup_Data**. Navigate to this folder and take the Backup of the Cr_Stored_Queries table by running the following command:
   ```
   pdm_extract Cr_Stored_Queries> Cr_Stored_Queries_17.4_backup.dat
   ```
2. Verify that the **Cr_Stored_Queries_17.4_backup.dat** file is successfully created.
3. Now, proceed with CA Service Management 17.4.1.0 installation.
4. After applying the patch, if required based on your customizations, you can update the database files created in **Step 1**. Navigate to $NX_ROOT\patches\Backup_Data location and run the following command:

   ```
   pdm_load -f Cr_Stored_Queries_17.4_backup.dat
   ```

Installation Prerequisites for CA Service Catalog
Verify and complete the following prerequisites before proceeding with CA Service Catalog 17.4.1.0 installation:

- Ensure that CA Service Catalog 17.4 is installed in your environment.
- Back up the system database (MDB). The system database (MDB) backup is mandatory and ensures safe data recovery if any problems are encountered during the installation process.

Installation Prerequisites for CA Asset Portfolio Management
Consider the following prerequisites:

WARNING
CA Asset Portfolio Management (CA APM) architecture is highly database-driven and has no rollback mechanism for database-related changes. Hence, the uninstallation of the CA APM patch is not recommended and is not supported. The only way to revert the database changes, if required, is by restoring the database backup which can lead to data loss.

Verify and complete the following prerequisites before proceeding with the CA Asset Portfolio Management installation:

- Ensure that CA Asset Portfolio Management 17.4 is installed in your environment.
- Back up the system database (MDB). The system database (MDB) backup is mandatory and ensures safe data recovery if any problems are encountered during the installation process.

Install CA Service Management 17.4.1.0 (Windows)

Installing CASM 17.4.0.1 for windows.

CA Service Management 17.4.1.0 installer performs prerequisite checks and mandatory validations before installing the patch.

NOTE

- We recommend that you place the installer in a **shorter directory path**, containing no spaces, to avoid errors when running the setup file. For example, unzip the file at: C:\WIN_17_4_1_0
- In CA Service Desk Manager (SDM) Availability mode, the xFlow Interface can only be installed on an Application Server. If you have converted CA SDM conventional configuration to advanced availability configuration, and you have a previously installed version of xFlow Interface, ensure that you uninstall xFlow Interface and then, reinstall xFlow Interface on an Application server.

Perform the following steps to install 17.4.1.0 on Windows:

1. From the Broadcom Support portal, download the **WIN_17_4_1_0.zip** file.

   NOTE
   CA Service Management 17.4.1.0 (Windows) installer is provided as a ZIP file and not as a CAZ file. Extract/unzip the content of the ZIP file to your local folder.
2. Copy **WIN_17_4_1_0.zip** on all servers in your environment.
3. Extract the contents of the ZIP file to the folder named WIN_17_4_1_0.
4. In CA SDM conventional configuration, stop CA SDM services in your environment. In the case of Advance Availability configuration, stop CA SDM services only on the server on which CA SDM will be installed.
5. Log in to the server as a local admin to install the patch.
6. Navigate to **WIN_17_4_1_0** folder. Right-click **Setup.exe** and select **run as administrator**.
7. Review and Accept the License Agreement Information.
8. Select **Microsoft SQL Server** or **Oracle** as the database type in the Database Configuration screen.
   For Windows Microsoft SQL Server database, *mdbadmin* is the default user.
9. Provide the database details:
   a. If you have selected **Microsoft SQL Server**, provide the following field information:
      - **Database Server**: Enter the hostname of the database server.
        If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
      - **Database Name**: Enter the Database name (MDB), the name of the target DBMS. The default value is mdb.
      - **Database Port**: Provide the port identifier for the target DBMS.
      - **Database Server Instance**: The database instance name. Leave this field blank if you are using the default instance.
        If you are using the SQL named instance and a non-default port number, the **Database Server Instance** field should look like this: ***<database instance name>,<non-default port number>***
        For example:
        ```
        sdmcasmqa,10555
        ```
      - **Database Admin User**: For Microsoft SQL Server, **sa** is the default value.
        The **sa** user is the admin user with permission to create a user and schema.
      - **Database Admin Password**: Enter the database password of the user specified by a database admin user. No default value is assigned to this parameter.
      - **mdbadmin Password**: Enter the password for the user specified for the MDB admin user.
      - **Confirm mdbadmin Password**: Confirm the password.
   b. If you have selected **Oracle** database, provide the following field information:
      - **Database Server**: Enter the hostname of the Oracle database server.
        If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
      - **Oracle Service Name**: Enter the Oracle Service name.
      - **Listener Port**: Enter the listener port for the database.
      - **Net Service Name**: Enter the Net Service Name of the Oracle database where the database resides.

If the database is remote, use the Net Service Name that is defined in the Oracle client on the local computer. CA SDM has access to the database through a local installation of the Oracle client.

- **DBA User Name**: Provide the name of an Oracle user with DBA access. The default value for DBA user is **SYS**.
- **DBA User Password**: Enter the password for the DBA user.
- **mdbadmin Password**: Enter the password for MDB admin.
- **Confirm mdbadmin Password**: Confirm the password.
- **Tablespace Path (on DB Server)**: Provide the tablespace path on the database server.
- **Oracle Home Path**: Provide the Oracle Client 64-bit path. Provide Oracle client 32-bit path. For CA Asset Portfolio Management, provide the Oracle 32-bit client.
- **Data Tablespace Name**: Provide the name of the data tablespace. The default value is MDB_DATA.
- **Index Tablespace Name**: Provide the index Tablespace Name: The default value is MDB_INDEX.

Click **Next**.

10. On **Select the Products and Integrations** page, patch list is displayed. Select the required patch to install.

    WARNING

    CA Service Management does not support the uninstallation of the CA Asset Portfolio Management patch. Uninstalling the CA APM patch does not uninstall the MDB patch, as there is no rollback mechanism for the same. For more information, see Installation Prerequisites.

    a. **CA Service Desk Manager**
       - CA Service Desk Manager Patch
       - xFlow Interface Patch
       - Search Server Patch: Search server patch must be installed on a Server where an earlier version from previous releases is already installed.

    b. **CA Service Catalog**
       - CA Service Catalog Patch

    c. **CA Asset Portfolio Management**
       - CA Asset Portfolio Management Patch

    Click **Next**.

11. Review the Pre-Installation Configuration page. Click **Next**.

    NOTE

    Select the option to perform the automated post-install steps for CA SDM. If this option is not selected, you must manually perform the post-install steps for CA SDM. Note that for CA Service Catalog and CA Asset Portfolio Management, you need to perform the manual post-install steps.

12. Click **Install** to proceed with the installation. Review the Installation progress and when the installation is complete, click **Next.**
13. To review the installation logs, navigate to the path shown in the installation summary screen.
14. Click **Finish** to exit the installer
15. After installing the Key definition for "xflow" not found in the DITA map., start the **CA Key definition for "xflow" not found in the DITA map.** service from Windows Services (**Control Panel, Administrative Tools, Services**) as this service is not started by default.
16. After installing the search server, if the **Search Server** service is not started by default or if it stops, start the services from **Control Panel, Administrative Tools, Services.**
17. Validate the Installation.
18. Complete the Post-Installation Tasks.

For more information about how to configure cache size, see Perform initial load and refresh index on the search server.

Install CA Service Management 17.4.1.0 (Linux)

NOTE
In CA SDM Advanced Availability mode, the xFlow Interface can only be installed on an Application Server. If you have converted CA SDM conventional configuration to advanced availability configuration, and you have a previously installed version of xFlow Interface, ensure that you uninstall xFlow Interface and then reinstall xFlow Interface on an Application server.

CA Service Management 17.4.1.0 installer performs prerequisite checks and mandatory validations before installing the patch.

IMPORTANT
We recommend that you place the installer in a **shorter directory path**, containing no spaces, to avoid errors when running the setup file. For example, unzip the file at: *<root>\casm_dvd.x86Linux\<installer_file>*

Perform the following steps to install 17.4.1.0 on Linux:

1. From the Broadcom Support portal, download the **LNX_17_4_1_0.zip** file.
2. a. Unzip the LNX_17_4_1_0.zip file. After you extract the zip file, ensure the **CASM_17.4.1.0.tar** file is available. Run the following command to untar the **CASM_17.4.1.0.tar** file:
   ```
   $ tar -xvf CASM_17.4.1.0.tar
   ```
   OR
   b. Run the following command:
   ```
   tar -xvzf LNX_17_4_1_0.zip
   ```
3. Set CA SDM bin and library environment variables.
   For example:
   ```
   export PATH=/opt/CA/ServiceDeskManager/bin:$PATH
   export LD_LIBRARY_PATH=/opt/CA/ServiceDeskManager/lib:$LD_LIBRARY_PATH
   ```
4. In SDM conventional configuration, stop CA SDM services in your environment. In the case of Advance Availability, stop CA SDM services only on the server on which CA SDM will be installed.
5. Run the setup file from the casm_dvd.x86Linux folder to install the application(s) using the following command:
   ```
   ./setup.sh
   ```
6. Review and accept the license agreement terms.
7. In Database Configuration, select **Oracle** as the database type. Ensure that you have installed the Oracle database client in your system.
   Provide the following Oracle database configuration details:
   - **Database Server**: Enter the hostname of the Oracle database server.
     If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
   - **Oracle Service Name**: Enter the Oracle Service name.
   - **Listener Port**: Enter the listener port for the database.
   - **Net Service Name**: Enter the Net Service Name of the Oracle database where the database resides.
     If the database is remote, use the Net Service Name that is defined in the Oracle client on the local computer. CA SDM has access to the database through a local installation of the Oracle client.
   - **DBA User Name**: Authenticates the name of the user with DBA access. The default value for DBA user is **SYS.**
   - **DBA User Password**: Authenticates the password for DBA user.
   - **mdbadmin Password**: Specify the password for the mdbadmin user.
   - **Confirm mdbadmin Password**: Confirm the mdbadmin user password.
   - **Tablespace Path (on DB Server)**: Enter the tablespace directory on the database server.
   - **Oracle Home Path**: Provide the Oracle Client 64-bit path. Provide Oracle client 32-bit path for fresh installation
   - **Data Tablespace Name**: Enter the tablespace name. The default value is **MDB_DATA**.
   - **Index Tablespace Name**: Enter the index tablespace name: The default value is **MDB_INDEX**.
8. Click **Next.**

9. On **Select the Products and Integrations** page, patch list is displayed. Select the required patch to install.
   a. **CA Service Desk Manager**
      - CA Service Desk Manager Patch
      - xFlow Interface Patch
      - Search Server Patch: A search server patch must be installed on a server where an earlier version from previous releases is already installed.
10. Click **Next**.
11. Review the Pre-Installation Summary page. Click **Next.**
12. Click **Install** to proceed with the installation. Review the Installation progress and when the installation is complete, click **Next.**
13. To review the installation logs, navigate to the path shown in the installation summary screen.
14. Click **Finish** to exit the installer.
    If patch installation fails for a product, retry the installation by using the **Retry** option in the wizard where it fails. If retry does not work, exit the installer and relaunch it. If the problem persists, contact Broadcom Support.
15. After installing XFlow Interface, start the**CA XFlow Interface**service. Navigate to /opt/CA/xFlow/Apps and run the following command from a command prompt window:
    ```
    ./xFlowServer start
    ```
    To stop the server, run the following command:
    ```
    ./xFlowServer Stop.sh
    ```
16. Navigate to /opt/CA/SC/SearchServer/elasticsearch/bin and run the following command from the command prompt window:
    ```
    ./ServicesStart.sh
    ```
    NOTE
    If you get the below message while restarting the search server service, ignore it and continue:
    ```
    groupadd: group 'elasticsearch' already exists
    useradd: user 'elasticuser' already exists
    runuser: warning: cannot change directory to /home/elasticuser: No such file or directory
    OpenJDK 64-Bit Server VM warning: Option UseConcMarkSweepGC was deprecated in version 9.0 and
     will likely be removed in a future release.
    ```
    To stop the server, run the following command:
    ```
    /ServicesStop.sh
    ```
17. Validate the Installation.
18. Complete the Post-Installation Tasks.

After installing the XFlow Interface and Search Server, you can configure the cache size for XFlow Interface. For more information about how to configure cache size, see Perform initial load and refresh index on the search server.

Validate CA Service Management 17.4.1.0 Installation

Validate CASM 17.4.1.0. insta.llation

To verify the successful installation of CA Service Management 17.4.1.0, validate the installation for the corresponding applications in the following location. You can also navigate to the root folder where you have locally installed the application and select the "env.info" file for validating your installation:

- **CA ITAM:**
  NOTE
  CORA version: 17.4.0.57

  - C:\Program Files (x86)\CA\ITAM\env.info
  - product=ITAM
  - major=17
  - minor=4
  - cum=1
  - roll-up=0

    NOTE
    CA CASM uses Apache Tomcat version 9.0.71.
- **CA Service Catalog:**
  - %USM_HOME%*CA_SLCM_<hostname>.his* file
  - %USM_HOME%\view\webapps\usm\locale\about_info.xml
  - %USM_HOME%\build.xml
  - %USM_HOME%\env.info
- **xFlow Interface:**
  - *C:\Program Files\CA\xFlow\<hostname>.his* file
  - NX_ROOT\env.info
  - NX_ROOT\version.xml
- **CA SDM:**
  - *C:\Program Files (x86)\CA\Service Desk Manager\<hostname>.his* file
  - NX_ROOT\pdmconf\version
  - NX_ROOT\env.info
  - HELP, ABOUT

    NOTE
    For CA SDM, the Binary and Language Combo patches are installed irrespective of the environment. The language patch for the corresponding CA SDM environment is installed.

    To validate the successful installation of the patches, follow these steps:

    1. Open the <sdm_installation>\<hostname>.his file in a text editor.
    2. Search for the instances of "gol-94". In a successful install, you should come across these three entries (Binary, Language Combo, and corresponding language patch).

Application	Windows	Linux
CA Asset Portfolio Management	T6EE815	NA
CA Service Catalog	T6D91741	NA
CA Service Desk Manager - Binary	gol-94_cum_C	gol-94_x86_64Linux_cum_C
CA Service Desk Manager - Languag504e Comb	gol-94_langcombo	gol-94_langcombo
CA Service Desk Manager - English	gol-94_en_US	gol-94_x86_64Linux_en_US
CA Service Desk Manager - German	gol-94_de_DE	gol-94_x86_64Linux_en_DE
CA Service Desk Manager - Spanish	gol-94_es_ES	NA
CA Service Desk Manager - French	gol-94_fr_FR	gol-94_x86_64Linux_fr_FR
CA Service Desk Manager - Italian	gol-94_it_IT	NA
CA Service Desk Manager - Japanese	gol-94_ja_JP	gol-94_x86_64Linux_ja_JP
CA Service Desk Manager - Brazilian Portuguese	gol-94_pt_BR	NA

Post-Installation Tasks for CA Service Management 17.4.1.0

After successful installation of CA Service Management 17.4.1.0, perform the following post-installation steps.

CA Service Desk Manager

Manual Steps required for Automated Post-Installation

CA Service Management provides an option in the installer to automate the post-install tasks.
If you have selected **Yes** to automate the post-installation steps while running the CA Service Management Installer Wizard, you are not required to perform any manual post-install steps for CA Service Desk Manager (SDM).

If you have selected **No** for automating the post-install steps while running the CA Service Management Installer wizard, perform the below manual post-install tasks as per your deployment requirements:

Manual Post-Install Tasks After Installing CA Service Desk Manager (SDM) 17.4.1.0 on CA SDM 17.4.

Perform the following steps:

1. Stop CA SDM services.
2. Navigate to NX_ROOT/site/config.properties file and ensure the value of resources.created parameter is set to 0.
3. Open a command prompt window and run the following command:
   ```
   pdm_configure
   ```

Manual Post-Installation Task for CMDB

> **NOTE**
> For Oracle 21c, set the **isClusterEnv** setting to "true" in the application.conf file of CMDB viz and restart the CA SDM Services.:
>
> - For Windows: <SDM installed location>\bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\WEB-INF\classes\application.conf)
> - For LINUX: <SDM installed location>/bopcfg/www/CATALINA_BASE_VIZ/webapps/CMDBVisualizer/WEB-INF/classes/application.conf).

If you are applying CA Service Management 17.4.1.0 in an SSL environment, CA SDM Administrators must perform the following post-installation steps for CMDB Visualizer Interface to open using the **HTTPS** protocol when launching from CA SDM UI:

1. In the NX.env file, change the **NX_CMDB_VISUALIZER** entry to provide **HTTPS protocol** and **HTTPS port**.
   For example: @NX_CMDB_VISUALIZER=https://sdmurl:<VIZ_SSL_PORT>/CMDBVisualizer
2. In **casm.conf.js** file from NX_root\bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\viz-ux\conf, provide the HTTPS as protocol and HTTP port.
   For example:

```
sdm: {

      vizserver: 'https://sdmurl:<VIZ_SSL_PORT>/CMDBVisualizer/viz',
      server: 'https:// sdmurl:<SDM_SSL_PORT>/CAisd/pdmweb.exe'
    }
```

Manual Post-Installation Task for OAuth 2.0 (Maileater/ Mailer)

After generating an access token for OAuth 2.0 to connect to a mail server, perform the mandatory post-install tasks on all servers in your environment:

1. Create a backup of web.xml from NX_ROOT\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF in your local directory to perform backout if required.
2. Open the web.xml file from NX_ROOT\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF.
3. Search for the following statement:
   ```
   <!--USD servlet mappings start-->
   ```
4. Copy and paste the following configuration under the statement:

   ```
   <servlet>
     <servlet-name>OAuthProcessor</servlet-name>
     <servlet-class>com.broadcom.oAuth.OAuthProcessor</servlet-class>
    </servlet>
   ```
5. Copy and paste the following configuration after any <servlet-mapping>:

   ```
    <servlet-mapping>
      <servlet-name>OAuthProcessor</servlet-name>
      <url-pattern>/OAuthProcessor</url-pattern>
    </servlet-mapping>
   ```
6. Save and close the web.xml file.
7. For OAuth servlet preservation in a primary and secondary environment, the secondary server must also have the OAuth processor entries in the following file: *<NX_ROOT>\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF\web.xml.last*.
8. Repeat Steps 1-8 to update **web.xml.tpl** file in the NX_ROOT\samples\pdmconf\web.xml.tpl folder to avoid losing these changes when pdm_configure is run at a later point of time.
9. Run the following command:
   ```
   pdm_tomcat_nxd -c STOP command
   ```
10. Wait for some time (a minute or so) and run the following command:
    ```
    pdm_tomcat_nxd -c START command
    ```

For more information, see Define a mailbox.

Manual Post-Installation Task for Excel file (.xlsx) export*

1. Execute the following command:
   ```
   pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst
   ```
2. Execute the following command to add the new NX variable to NX.env.tpl file.
   ```
   pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst -t
   ```
3. Restart CA SDM services.

(Optional) Manual Post-Installation Task for Knowledge Document export with German fields

If you are exporting Knowledge Document with German Fields (included in the export field list), then perform the below post-install steps for successful export of knowledge documents:

1. Take the backup of NX_ROOT\NX.env file (NX_ROOT is the installation directory for CA Service Desk Manager).
2. Open NX_ROOT\pdmconf\NX.env_nt.tpl file using any text editor and take the value of NX variable @NX_KEIT_AVAILABLE_FIELDS which is COPIED_DATA and update Nx.env in NX_ROOT by executing below command:
   ```
   pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <COPIED_DATA>  -a  pdm_option.inst
   ```
   Where COPIED_DATA is the value copied from NX.env_nt.tpl (step 2).

For example, " pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <provide the exact string here> -a pdm_option.inst "
Note to avoid losing the updated changes when you run pdm_configure, execute the above command with the '-t' flag as follows:

```
pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <COPIED_DATA> -a pdm_option.inst -t
```

(Optional) Handle HTML Mails that contains Tables in MailEater

Java based Maileater already has the ability to process the emails that were sent in plain format or HTML format, to support the processing of emails that contain Tables in the HTML body. But the format in which the email was sent is lost when received by Maileater.

1. Run the following commands from NX_ROOT/bin from the command prompt/ terminal:

```
pdm_options_mgr -c -s NX_ENFORCE_HTML_EMAIL_PARSING -v "Yes" -a pdm_option.inst
pdm_options_mgr -c -s NX_ENFORCE_HTML_EMAIL_PARSING -v "Yes" -a pdm_option.inst -t
```

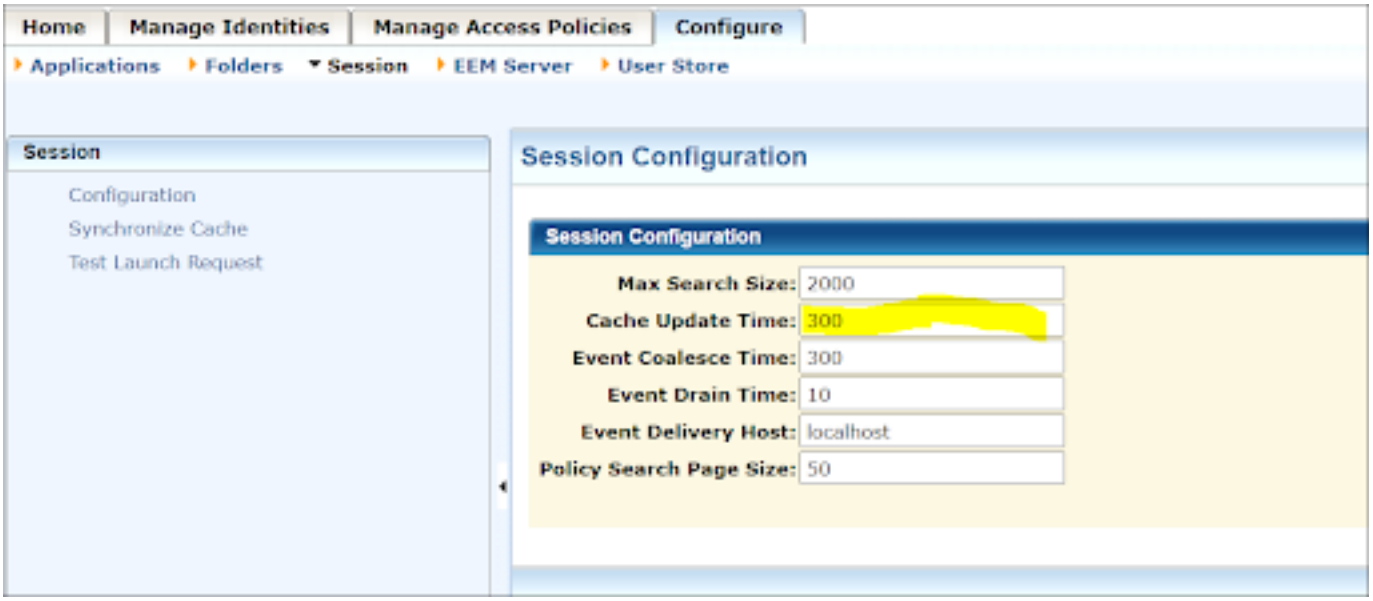
2. Restart CA SDM and XFlow applications.

(Optional) Manual Post-Installation Task for EEM Cache Timeout Configuration Update

You may face issues while logging in to EEM or SDM using the EEM user accounts due to a session cache timeout mismatch between EEM and SDM.

You can update the EEM cache timeout configuration by adding a new NX variable, "NX_EEM_CACHE_UPDATE_TIME" in SDM.

Keep the value the same as the EEM cache timeout configuration value mentioned in the following screenshot.



To set the EEM cache update time to 300 seconds, perform the following steps:

To add the variable in the **nx.env** file, run the following command:

```
pdm_options_mgr -c -s  EEM_CACHE_UPDATE_TIME  -v 300 -a pdm_option.inst
```

To add the variable in the **nxenv_nt.tpl** file, run the following command:

```
pdm_options_mgr -c -s  EEM_CACHE_UPDATE_TIME  -v 300 -a pdm_option.inst -t
```

Service Point

After successful installation of Service Point, refresh index and data on the Search Server.

NOTE
In case of Linux Search Server environment, ensure to run the following commands on the terminal:

```
sysctl -w vm.max_map_count=262144
ulimit -Hn 65535
```

(Optional) Manual Post-Installation Task for Rebuild Index

If you have upgraded or are planning to install CA EEM 12.6 with Service Point and CA Service Catalog, ensure that you rebuild the CA Service Catalog index after completing the CA EEM upgrade/installation process. For more information, see Perform Initial Load and Refresh Index Data on Search Server.
Run the following command to rebuild the index:

```
$ES_HOME/search/bin/pdm_es_rebuild_index.bat index=catalog_index
```

CA Service Catalog

Perform the following CA Service Catalog post-installation steps as per your environment requirements:

- Post-Installation Tasks after installing CA Service Catalog 17.4.1.0 on CA Service Catalog 17.4
- gMSA Authentication

Post-Install Tasks After Installing CA Service Catalog 17.4.1.0 on CA Service Catalog 17.4

Review and perform the post-installation steps based on your deployment requirements.

NOTE
If any SSL certificate(s) chain was imported to the Oracle Java's JAVA_HOME\lib\security\cacerts Keystore, those certificate(s) chain again need to be exported explicitly and imported properly into the new AdoptOpenJDK's %USM_HOME%\embedded\jdk\lib\security\cacerts Keystore.

Follow these steps

- (Optional) If Service Catalog is accessed from applications like Service Point, SharePoint and so on, then you must perform this step. Open the "**web.xml**" file located in *USM_HOME%\view\webapps\usm\WEB-INF* and update the respective parameter values for the parameter name "cors.allowed.origins" and "cors.support.credentials". For example, if you are using Catalog Widgets in Service Point
- (Optional) Unable to approve any workflow requests through email. The email sent for approvals is corrupted with special characters. Follow the KB article steps.

(Optional) Approve workflow requests through email

The workflow email sent for approvals is corrupted with special characters. To approve any workflow requests through email, follow the KB article steps.

gMSA Authentication Post-Install Steps for CA Service Catalog (Automated steps)

CA Service Catalog provides automated post-installation steps for gMSA Authentication. Review the following before you proceed:

- Prerequisites and Considerations
- How to Automate gMSA Post-Installation Steps
- Unconfigure gMSA

Prerequisites and Considerations:

Ensure that you have taken care of the below considerations on all nodes of CA Service Catalog where you want to automate the gMSA post-installation procedure.

1. If the accounting service is available, perform the automated post-install steps by updating serviceName to ServiceAccounting and providing the appropriate gMSA account name in the **gmsa.properties** file.

2. If the filestore path is external to the server from where the **GMSAPostInstall.bat** is running, ensure to provide appropriate access to the server for setting the gMSA account permissions.
3. While preparing the properties file, check for any copy/paste issues, special characters, spaces, and so on.

How to Automate gMSA Post-Installation Steps

Perform the following steps to enable the batch file **GMSAPostInstall.bat** and to automate the gMSA post-installation steps:

1. Create a gMSA account for CA Service Catalog.
2. Ensure that appropriate DB (database) permission is given to the newly created account(s).
3. Enter the below values in the **gmsa.properties** file and save it.

   NOTE
   A template file (**gmsa.properties**) is added in the common installer in *"\filestore\SLCM\gMSAProperties"* . Optionally. use this file as a template file to fill gmsa properties. This can be copied to "USM_HOME/scripts/GMSA" where Catalog is installed.

   NOTE
   All values are mandatory. Make sure that there are no leading or trialing spaces while providing these values.

   a. **serviceName**: Application service name to enable GMSA. In the case of Catalog, it will be ServiceCatalog and for accounting, it will be ServiceAccounting.
   b. **folderName**: Absolute path of the application installation directory.
   c. **gMSAName**: Name of the GMSA service account (domain\accountName$).
   d. **filestorePath**: Shared network path (\\Server_name\filestore) or local filestore path
4. Navigate to %USM_HOME% and launch **usm.cmd**
5. Navigate to %USM_HOME%/scripts/GMSA/ folder and run the "GMSAPostInstall.bat" in command prompt.

   NOTE
   If the command executes without any error, "Post-installation steps for GMSA executed successfully" message is displayed with exit code 0.
   If there are errors, the error message is shown with a non-zero exit code. Correct the error to continue and perform step **5** again.

Unconfigure gMSA for CA Service Catalog

To disable or unconfigure gMSA for CA Service Catalog, follow the steps below:

1. Replace **config.properties** file from*%USM_HOME%*\ folder.
2. Revert back all the folder permissions which were assigned to domain users.
3. Start Catalog and Accounting Services with the local system account.

   NOTE
   In the case of load balancers, repeat steps 1-3 to unconfigure gMSA on all Catalog servers.

CA Asset Portfolio Management

Manual Post-Installation Task for Removing jQuery, log4net, and log4j Vulnerabilities

After installing 17.4.1.0, delete jquery-1.3.2.min.js, jquery-ui-1.7.2.custom.min.js , log4net.dll, and log4j from their respective installed folders.

NOTE
Perform the below steps if you have not done this earlier.

Perform the following steps:

1. Log on to CA APM Web Server, navigate to the <ITAM_install_dir>\ITAM\Web Server\castylesr5\javascript.
   Example: C:\Program Files (x86)\CA\ITAM\Web Server\castylesr5\javascript
   Locate and delete the jquery-1.3.2.min.js and jquery-ui-1.7.2.custom.min.js files from the directory.

2. Navigate to the ITAM_install_dir\CA\ITAM\Data Importer.
   Locate and delete the log4net.dll file from the directory.
3. Navigate to the C:\Program Files (x86)\CA\SC\CORA.
   Locate and delete the log4j-1.2.15.jar, log4j.properties, and ojdbc6.jar files from the directory.
4. Navigate to the ITAM_install_dir\CA\ITAM.
   Backup the following folders and manually delete them:
   - CDB
   - MDB
   - jre8

     NOTE
     jre8 folder has to be deleted manually for every RU installation.
5. Perform an IISRESET and delete the browser's cache to load the upgraded files.

Post-Installation Tasks - CA SDM Advance Availability 17.4.1.0

post install tasks for casm ru1

The installer wizard provides an option in the installer to automate the post-install tasks. Perform the following post-installation tasks for CA SDM Advanced Availability Configuration.

For the Advanced Availability configuration, the following host names are considered as an example:

- The background server hostname is sdmcahost1.
- The standby server hostname is sdmcahost2.
- The application server hostname is sdmcahost3.

Manual Steps required for Automated Post-Installation

If you have selected **Yes** for automating the post-install steps while running the installer wizard, then perform manually the following post-install tasks:

Manual Post-Install Tasks - After Installing CA Service Desk Manager (SDM) 17.4.1.0 on CA SDM 17.4 GA

1. Ensure that the patch is applied on the standby server (sdmcahost2).
2. Start the CA SDM service on the standby server (sdmcahost2). Open the command prompt and run the following command:
   ```
   pdm_server_control -b
   ```
3. Ensure that the patch is applied on the original background server (sdmcahost1) which is now a standby server.
4. Start the CA SDM service on the standby server (sdmcahost1). Run the following command:
   ```
   pdm_server_control -b
   ```
5. Clear the browser cache by the following command:
   ```
   pdm_webcache -H
   ```
6. Ensure that the patch is applied on all the application servers and the remaining standby servers if any. If you selected YES to automate the post-install steps, then there are no more manual post-install steps to be performed.

Manual Steps required for Non-Automated Post-Installation

If you have selected **No** for automating the post-install steps while running the CA Service Management installer wizard, perform manually the below appropriate post-install task as per your deployment requirements.

Post-Install Tasks After Installing CA SDM 17.4.1.0 on CA SDM 17.4 GA for Advanced Availability Configuration

1. Ensure that the patch is applied on the standby server (sdmcahost2).
2. Navigate to NX_ROOT/site/config.properties file and ensure the value of resources.created parameter is set to 0.
   Open a command prompt and run the following command:

```
pdm-configure
```

On the installer configuration page, before clicking Finish, uncheck the Start service when completed checkbox. Failure to uncheck the box may result in the loss of custom schema changes and configurations that were changed on the server.

3. Promote the standby server as the new background server by performing the following steps. To suppress version control on the standby server and later on the background server, run the following command on each server:
   ```
   pdm_server_control -v
   ```
4. Start SDM service on the standby server. Run the following command:
   ```
   pdm_server_control -b
   ```
5. Ensure that the patch is applied on the original background server (sdmcahost1) which is now a standby server, and perform the following steps. Navigate to NX_ROOT/site/config.properties file and ensure that the value of resources.created parameter is set to 0. Run the following command:
   ```
   pdm_configure
   ```
6. Start the CA SDM service on the standby server (sdmcahost1). Run the following command:
   ```
   pdm_server_control –b
   ```
7. Ensure that the patch is applied on all application servers and the remaining standby server if any. Perform the following steps on all application servers and standby servers.
8. Navigate to NX_ROOT/site/config.properties file and ensure that the value of resources.created parameter is set to 0. Run the following command:
   ```
   pdm_configure
   ```
9. Clear the browser cache by running the following command:
   ```
   pdm_webcache -H
   ```
10. Execute the following command.
    ```
    pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst
    ```
11. Execute the following command to add the new NX variable to NX.env.tpl file.
    ```
    pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst -t
    ```
12. Restart CA SDM Services.

Uninstall CA Service Management 17.4.1.0

uninstall CASM 17.4.1.0

Review the following topics to uninstall CA Service Management 17.4.1.0.

> **NOTE**
>
> Uninstalling CA Service Management 17.4.1.0 will revert to CA Service Management 17.4 version on which 17.4.1.0 is installed.
>
> **Example**: If CA Service Management 17.4.1.0 is installed on 17.4, uninstalling 17.4.1.0 will revert to CA Service Management 17.4.

Uninstall CA SDM 17.4.1.0 (Windows)

Perform the following steps to uninstall CA SDM 17.4.1.0 on Windows:

1. Log in to CA SDM as an Administrator.
2. Shut down CA Service Desk Manager Server.
3. Navigate to **<NX_ROOT>\bin** and run the following command to backup the unsupported jars from the older versions.
   ```
   pdm_perl pdm_restore_files.pl gol-94_tool ..\PATCHES\DELIVERABLES_REMOVAL.TXT
   ```
4. Navigate to the location *where you have extracted the CA Service Management Installer zip package*.
5. Locate *CASM-17.4.1.0-CommonPatchInstaller-Win\filestore\utils\ApplyPTF* folder.
6. Run the **APPLYPTF.exe**.

7. Select **Backout PTF** from the local or remote node option.
8. Click **Next**.
9. Enter the patch number for the language that is installed in your environment:
   - **Binary**: gol-94_cum_C
   - **Language Master**: gol-94_langcombo
   - **English**: gol-94_en_US
   - **French**: gol-94_fr_FR
   - **German**: gol-94_de_DE
   - **Spanish**: gol-94_es_ES
   - **Italian:** gol-94_it_IT
   - **Japanese**: gol-94_ja_JP
   - **Brazilian Portuguese**: gol-94_pt_BR
10. Click **Next** to continue backing out the specific patch.
11. Repeat steps 6-9, to back out the language English (gol-94_en_US) patch.
12. Repeat steps 6-9 to back out the language master (gol-94-langcombo) patch.
13. Repeat steps 6-9 to back out the binary (gol-94_cum_C) patch.
14. Reboot the server.
15. Repeat steps **6-12** on all standby, application, or secondary servers in your environment.
16. Restore the MDB database to the database backup that you took before applying the patch.
17. Navigate to ***<NX_ROOT>\site\config.properties*** file and ensure that the value of ***resources.created*** parameter is set to **0.** This must display as ***resources.created=0*** in the file.
18. Open a command prompt and run the following command:
    ```
    pdm_configure
    ```

Uninstall CA SDM 17.4.1.0 (Linux)

Perform the following steps to uninstall CA SDM 17.4.1.0 on Linux:

1. Login to CA SDM as the root user.
2. Shut down the CA Service Desk Manager Server.
3. Navigate to **<NX_ROOT>/bin** and run the following command to backup the unsupported jars from the older versions.
   ```
   ./pdm_perl pdm_restore_files.pl gol-94_tool deliverables_removal.txt
   ```
4. Navigate to the location where you have extracted the CA SDM Installer **tar.gz** package.
5. Navigate to the *casm_dvd.x86Linux \filestore\utils\ApplyPTF* folder.
6. The following binary/language-independent and language-dependent patches are supported:
   - Binary name: gol-94_x86_64Linux_cum_C
   - Language Master: gol-94_langcombo
   - English: gol-94_x86_64Linux_en_US
   - German: gol-94_x86_64Linux_de_DE
   - French: gol-94_x86_64Linux_fr_FR
   - Japanese: gol-94_x86_64Linux_ja_JP
7. Execute the following command to remove the binaries or the language-dependent patches. Replace the <patch_name> with the binary or language-dependent patch name:
   ```
   ./applyptf.<platform> -b <patch_name>  -e <NX_ROOT>
   ```
   Here, <platform> specifies the operating system and <NX_ROOT> specifies the CA SDM installed location.
   For example:
   ```
   ./applyptf.linux -b gol-94_x86_64Linux_cum_C  -e /opt/CA/ServiceDeskManager
   ```
8. Repeat step 6 to back out the language English (gol-94_x86_64Linux_en_US) patch.

9. Repeat step 6 to back out the language master (gol-94_langcombo) patch.
10. Repeat step 6 to back out the binary (gol-94_x86_64Linux_cum_C) patch.

    NOTE
    During uninstallation, if you get any errors, ensure that the following steps are performed:

    1. Copy the subfolders from <NX_ROOT>/replaced/<gol-94_x86_64Linux_cum_C> and place it into the <NX_ROOT> folder.
    2. Copy the subfolders from <NX_ROOT>/replaced/<gol-94_x86_64Linux_en_US> and place it into the <NX_ROOT> folder.
    3. Open **.his** file under the <NX_ROOT> folder and delete the entries related to the current patch and save it.
11. To restore MDB database, revert to database backup that you took before applying the patch.
12. Navigate to ***<NX_ROOT>/site/config.properties*** file and ensure that the value of ***resources.created*** parameter is set to **0.** This must display as ***resources.created=0*** in the file.
13. Open a command prompt and run the following command:

    ```
    pdm_configure
    ```

    NOTE
    If you are unable to access the SDM URL, follow these steps:

    1. Stop the SDM Services.
    2. Navigate to the <NX_ROOT>/bopcfg/www/CATALINA_BASE folder and delete the work folder.
    3. Start the SDM Services.

Restore Visualizer Files (Windows)

NOTE
After uninstalling CA SDM, CMDB Visualizer does not function automatically as the uninstallation process will not restore the previous visualizer files . To restore, perform the below steps manually:

1. Navigate to the where you have installed Visualizer: <NX_ROOT>\bopcfg\www\CATALINA_BASE_VIZ\webapps.
2. Remove the CMDBVisualizer folder.
3. Copy the **Visualizer_17.4.1.0.OLD** folder from<NX_ROOT>*REPLACED* and paste it in <NX_ROOT>*bopcfg**www* *CATALINA_BASE_VIZ**webapps*. Now, rename the **Visualizer_17.4.1.0.OLD** to **CMDBVisualizer**.
4. Start the SDM Service.

CMDB Visualizer works as expected.

Restore Visualizer Files (Linux)

NOTE
After uninstalling CA SDM, CMDB Visualizer does not function automatically as the uninstallation process will not restore the previous visualizer files. To restore the files, perform the below steps manually:

1. Navigate to the where you have installed Visualizer: <NX_ROOT>/bopcfg/www/CATALINA_BASE_VIZ/webapps.
2. Remove the CMDBVisualizer folder.
3. Copy the **Visualizer_17.4.1.0.OLD** folder from <NX_ROOT>*/replaced* and paste it into <NX_ROOT>*bopcfg**www* *CATALINA_BASE_VIZ**webapps*. Now, rename the **Visualizer_17.4.1.0.OLD** to **CMDBVisualizer**.
4. Start the SDM Service.

CMDB Visualizer works as expected.

Uninstall the xFlow Interface 17.4.1.0 (Windows)

Perform the following steps to uninstall the xFlow Interface (Windows):

1. Click **Start**, **Control Panel**, **Uninstall a Program** to uninstall xFlow Interface 17.4.1.0.
   Or
2. Navigate to where you have installed the xFlow Interface (for example, <NX_ROOT>*/CA/xFlow)*.
3. Select xFlow Interface **17.4.1.0_installation** and click **Change xFlow Interface 17.4.1.0 Installation.exe** to complete the uninstallation process.
4. If you are using Microsoft SQL Server Database, run the following query:
   ```
   update ofProperty set propValue='select c.access_token from casm_active_sessions c WHERE
    UPPER(CONVERT(varchar(32), c.contact_uuid ,2)) = UPPER(?)' where name = 'jdbcAuthProvider.passwordSQL'
   ```
5. If you are using Oracle Database, run the following query;
   ```
   update ofProperty set propValue='select c.access_token from casm_active_sessions c WHERE
    UPPER(CAST( c.contact_uuid AS varchar2(32))) = UPPER(?)' where name = 'jdbcAuthProvider.passwordSQL'
   ```

Uninstall the xFlow Interface 17.4.1.0 (Linux)

To uninstall the xFlow Interface, complete the following steps on Linux :

1. Navigate to where you have installed the xFlow Interface server.
   For example:
   /opt/CA/_xFlow Interface_installation
2. Execute the following command to uninstall the xFlow Interface 17.4.1.0:
   ```
   ./Change xFlow_Interface 17.4.1.0 Installation
   ```
3. Click **Finish** to complete the uninstallation process.
4. Run the following query for Oracle Database:
   ```
   update ofProperty set propValue='select c.access_token from casm_active_sessions c WHERE
    UPPER(CAST( c.contact_uuid AS varchar2(32))) = UPPER(?)' where name = 'jdbcAuthProvider.passwordSQL'
   ```

Uninstall CA Service Catalog 17.4.1.0

To uninstall CA Service Catalog, perform the following steps:

1. Click **Control Panel**, **Programs and Features**.
2. Double-click the CA Service Catalog 17.4.1.0 and follow the uninstallation wizard instructions.

Uninstall CA Asset Portfolio Management

CA Asset Portfolio Management (CA APM) architecture is highly database-driven and has no rollback mechanism for database-related changes. Hence, the uninstallation of the CA APM patch is not recommended and is not supported. The only way to revert the database changes, if required, is by restoring the database backup which can lead to data loss.

Run the Database Cleanup Utility for CA Service Management 17.4.1.0

During the installation of CA Service Management products, each of the installed product is registered in a common mdb table that is reflected in the deployment summary of the selected environment. These entries must be cleared in the following cases:

- Uninstallation of any CA Service Management products
- Moving Database or migration from one server to another

Run the CA Service Management database cleanup utility on a Windows or a Non-Windows environment. The database cleanup utility removes the entries and adds to the following tables:

Table Name from where the entries are removed	Table Name to which the removed entries are added
al_cdb_componentinstallstate	al_cdb_comp_installstate_bkup
al_cdb_configurationparameters	al_cdb_config_params_backup

NOTE

On a Non-Windows Platform, before running the **DBCleanup.sh** Utility, you must export the Oracle Environment variables on the terminal.

Perform the following steps:

1. Navigate to *DVD1\DBCleanupUtility* directory.
2. For Windows, double-click the **DBCleanupUtility.bat** to launch the DBCleanup utility.
   On a Non-Windows platform, you must run the **DBCleanupUtility.sh** file.
3. Enter the following details:
   a. **Database Server Type**: Specify the type of server. Microsoft SQL or Oracle.
   b. **Database Host Name:** Enter the host name of the server where the database resides.
   c. **Database User Name**:
      - **SQL Server**: Enter the privileged user detail that has permission to create and modify the schema.
      - **Oracle**: Provide the mdbadmin user name.
   d. **Database Password**:
      - **MS SQL**: Enter the database password used by the database admin user.
      - **Oracle**: Enter the password for the Oracle database user.
   e. **Database Port Number:** Provide the database port number.
   f. **Enter Database Name :** Enter the database name. For example, mdb.
   g. **System Name**: Provide the hostname of the system from where you want to uninstall the CA Service Management product or products.
4. Select any of the following products that you want to uninstall:
   – **SDM -** CA Service Desk Manager
   – **SLCM-** CA Service Catalog
   – **xFlow Interface**
   – **ProductUpdates**
   Enter product name to be uninstalled: **ProductUpdates**
5. Enter product to clean up updates: (sdm,slcm,xflow,chatserver,searchserver): For example, slcm
6. Enter update version to clean up: 17.4.1.0
7. The utility cleans up the database and removes the entries of the selected product installed on the server.

CA Service Management 17.4 Solution Architecture

CA Service Management is a seamless integration of CA Service Desk Manager, CA Service Catalog, and CA IT Asset Manager products. The solution consists of a collaborative platform and offers self-service and customization capabilities. CA Service Management delivers a modern, collaborative user experience interface to access knowledge, collaborate, resolve issues, request services, and manage IT assets.

The following diagram illustrates high-level CA Service Management solution architecture and the capabilities offered by the solution:

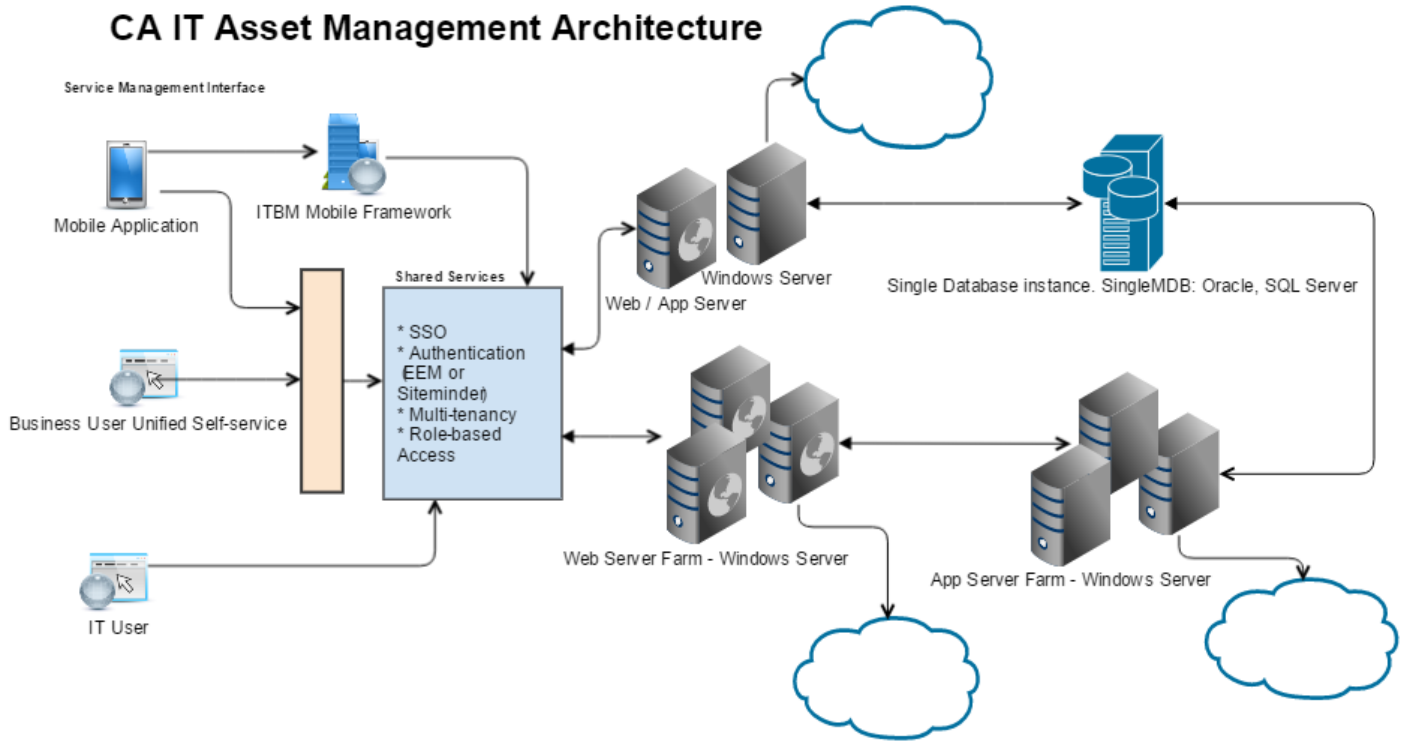
CA Asset Portfolio Management Product Architecture

CA IT Asset Management supports two types of architectures.

NOTE
CA Asset Portfolio Management(formerly 'ITAM') must be deployed on a separate server as part of Service Management Solution Deployment. Service Management supports 64-bit architecture where as Asset Portfolio Management is supported on 32-bit architecture.

CA Asset Portfolio Management supports two types of architectures:

- When only one server hosts the Web UI and services.
- When different servers host the Web UI and services.



CA Service Catalog Product Architecture

The number of *catalog requests per minute* is the key criterion for determining the size of the system architecture as small, medium and large. This criterion is much more important than the number of users in the system or other criteria. The higher the number of catalog requests per minute, the larger the recommended architecture. The following are the three types of architecture sizes that are typically followed in the CA Service Catalog implementation.

Availability refers to the ability of an organization to deliver consistent, predictable access to applications and data.

In addition to small, medium, and large architectures, CA Service Catalog also supports a standalone deployment. In a standalone deployment, all the components, including the database server, are installed on a single physical computer. This deployment is for demonstration (demo) purposes only and is *not* suitable for a production environment.

WARNING

Verify that the DBMS is tuned for maximum performance. This directive applies to all system architecture (large, medium, and small).

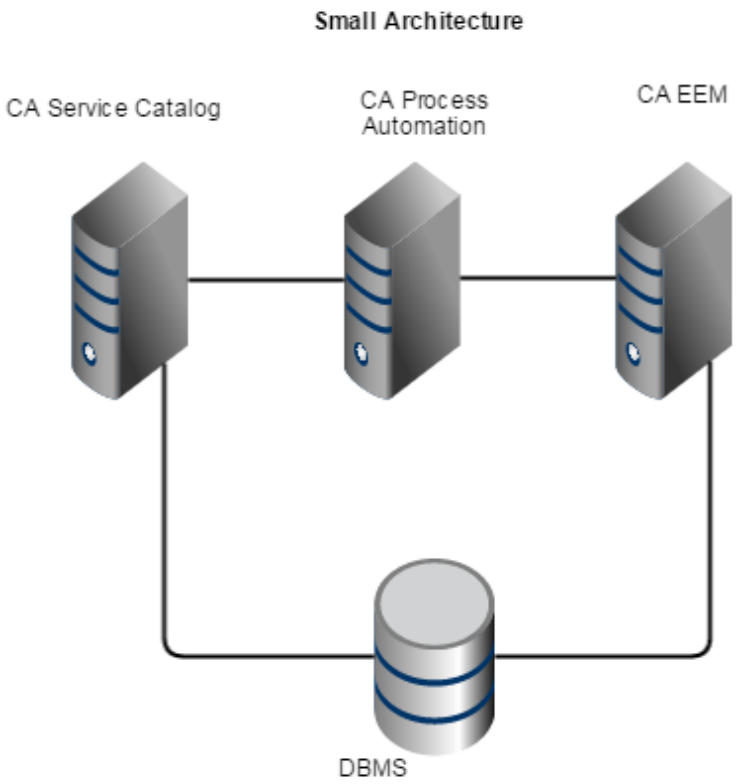
Review the following sections, to identify the CA Service Catalog architecture that suits your organization requirements:

Small Architecture

CA Service Catalog small architecture can include the following servers:

- Server 1 hosts CA Service Catalog, including Service Accounting Component.
- Server 2 hosts CA Process Automation.
- Server 3 hosts the DBMS.
- Server 4 hosts CA EEM. You use configuration parameters to connect CA Service Catalog and CA Process Automation with CA EEM.

Figure 1: CA Service Catalog System Architecture _Small



This model applies to systems with an expected average load of 1 to 10 catalog requests per minute. Clustering does *not* apply to small architecture.

Also consider, any performance-related information and other stress test data that you have from implementing previous releases of CA Service Catalog

Medium Architecture

If you expect more than a small percentage of the requests to be complex, consider moving to medium architecture. Complex requests include one or more of the following items:

- Multiple (two or more) services or service options.
- Attachments.
- Long forms or multiple forms.
- Long web service calls or multiple web service calls.
- Multiple CA Process Automation processes.

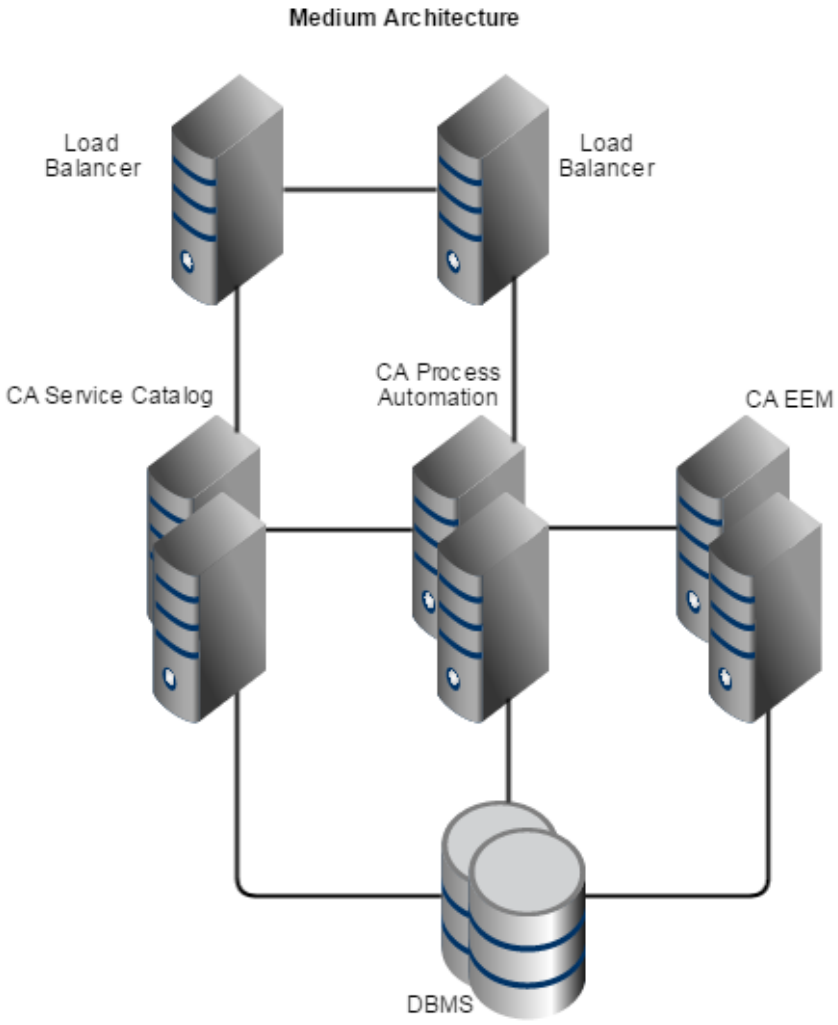
Similarly, consider moving to a medium architecture if both of the following conditions exist:

- Your implementation includes more than 5,000 users.
- You expect more than a small percentage of these users to access the catalog simultaneously.

The medium architecture can efficiently process a load of 11-50 catalog requests per minute. The medium architecture expands the small architecture by implementing clustering and adding load balancers.

The following diagram illustrates an example of medium architecture:

Figure 2: CA Service Catalog System Architecture _Medium



The medium architecture setup is as follows: *Two clustered servers* refers to two virtual computers that are clustered.

- Two clustered servers host CA Service Catalog.
- Two clustered servers host CA Process Automation. Install and cluster CA Process Automation according to the specifications in the CA Process Automation documentation.
- One or preferably two load balancers are the front ends to the clusters for CA Process Automation and CA Service Catalog, respectively. Both the CA Process Automation and CA Service Catalog clusters require a load balancer, which can be an existing instance. CA Process Automation and CA Service Catalog can share a load balancer.
- Two clustered servers host CA EEM. CA EEM is clustered but is not used with a load balancer.

  NOTE

  We recommend clustering CA EEM to provide failover protection. You can use the configuration parameters to connect CA Service Catalog and CA Process Automation with the CA EEM cluster. You can increase CA EEM performance by pointing each CA Process Automation domain server to different CA EEM servers. Install and cluster CA EEM according to the specifications in the CA EEM documentation.
- Two clustered servers host the DBMS. You cluster the DBMS to improve throughput and responsiveness. Verify that you cluster your DBMS using a method that improves performance. For example, using an **active-active** database cluster can reduce performance, especially on write operations. For more information about clustering your DBMS, see its documentation.
- Some virtual machine software uses scheduling algorithms that result in decreased performance when the number of CPUs increases. This performance loss is most noticeable when the virtual machines are sharing systems with other virtual machines that also have a lower number of CPUs allocated. Typically, in such cases, increasing the number of virtual machines in the cluster improves performance more than increasing the number of CPUs per virtual machine.

Large Architecture

Consider the factors for moving from a small architecture to a medium architecture. The same factors in greater magnitude can cause you to add computers and clusters to a large architecture. The large architecture can efficiently process an average load of 50 or more catalog requests per minute.

The large architecture includes multiple web server clusters and a database cluster.

The following diagram illustrates an example of large architecture:

Figure 3: CA Service Catalog System Architecture _Large

The large architecture setup is as follows:

- Two or more clustered servers host CA Service Catalog.
- Two or more clustered servers host CA Process Automation.
- You install and cluster CA Process Automation according to the specifications in the CA Process Automation documentation. Alternatively, you install CA Process Automation on three physical computers and place them in a separate cluster.
- Two or more load balancers are the front ends to the clusters for CA Process Automation and the Catalog Component of CA Service Catalog, respectively. Both the CA Process Automation and CA Service Catalog clusters require a load balancer, which can be an existing instance.
- Two or more clustered servers host CA EEM. CA EEM does not *use* a load balancer.

  NOTE

  We recommend clustering CA EEM to provide failover protection and high availability. You use configuration parameters to connect CA Service Catalog and CA Process Automation with the CA EEM cluster. You can increase CA EEM performance by pointing each CA Process Automation domain server to different CA EEM servers.
- Two or more clustered servers host the DBMS.
- Some virtual machine software uses scheduling algorithms that result in decreased performance when the number of CPUs increases. This performance loss is most noticeable when the virtual machines are sharing systems with other

virtual machines that also have a lower number of CPUs allocated. Typically, in such cases, increasing the number of virtual machines in the cluster improves performance more than increasing the number of CPUs per virtual machine.

- A filestore serves as the single location for all shared files.

Example Business Scenario

This example illustrates, how to architect the CA Service Catalog system to meet the requirements for the following scenario: **I have 60,000 end users who are distributed across the country. My system is located in a centralized data center that the service provider owns. We want to integrate with CA Service Desk Manager, CA Asset Portfolio Management, and other products. Our expected load is about 100 requests per day with an average of 1000 concurrent connections. We are planning to define CA Process Automation processes to meet our requirements.** This scenario is common. Because of the variability around usage patterns and architecture there is no simple calculator that can generate sizing estimates. However, the CA Service Catalog components are dynamically scalable. The CA Service Catalog architecture is n-tier, stateless, and web-based. Users make HTTP requests. These HTTP requests are passed to one or more application servers. The application server performs the processing logic using a pool of connections to the database. The web server can be co-located with application server instances. Also, several computational engines run independently from any user interactions; examples include the billing and SLA correlation engines. Other web servers, application servers, and computational engines can be added, as required. The database, where state is maintained, is the potential performance bottleneck. The scalability of the database platform is important. Therefore, the sizing and architecture of the MDB is the most critical factor. **Metrics** First, consider the concurrent connection metric: Because HTTP is connectionless, there is no "concurrent user" metric. Next, consider the metric of 100 requests per day: This metric does not provide the peak usage, a critical factor. If the 100 requests are evenly distributed through the day, system impact would be minimal. However if the 100 requests are all made at the same time of day, then the system could be challenged. Also, the type of request has a direct impact on the resource utilization. **Variations** Variations in usage and architecture are important. Consider them carefully and tune your system. Adjust your tuning over time as changes in demand or system load occur, if necessary. **Business Requirements and Updates** When you are implementing CA Service Catalog, it is critical to capture accurate business requirements. Use the business requirements to formulate efficient technical architectures. Therefore, you start an implementation with a discovery phase per module to capture the business requirements. Next, you study the limitations and capabilities of the client operational infrastructure, and you formulate an efficient implementation architecture. Once you obtain all the information, you can formulate an initial sizing estimate. Based on the possible variations in usage and architecture, organizations must start with two instances of each component. One component for fail-over and one component for load balancing. Because the components can be co-located, start with at least two server class machines in addition to the database servers. If computational engines are heavily used during peak activity times, they require their own server or servers. The usage-patterns typically change over time as the clients grow to understand the features and use them more heavily. As you discover usage patterns over time, you can dynamically add and distribute components as needed.

CA Service Desk Manager Product Architecture

For a successful CA SDM implementation, you need to understand the CA SDM deployment model and the different installation types that are available. Review the following sections, to identify the CA Service Desk Manager architecture that suits your organization requirements:

CA SDM Deployment Model

You can deploy CA SDM using one of the following deployment models that best suits your requirement:

- **Centralized** – Installs and configures all product components on one server. This is the default installation. You can implement multiple Object Managers and web engines for load balancing and failover, however your business may outgrow this implementation.
- **Distributed** – Installs and configures product components on servers that are closer to the clients receiving the service. For example, a business with many subnets can have analysts that are using the Web Client. In this type of deployment, you place an additional server at the branch location. This server performs caching and reduces the network traffic and response time between the branch location and the main server location. This type of implementation supports the implementation of multiple Object Managers and web engines for load balancing and failover.
- **Global** – Having two or more centralized or distributed implementations that are known as regions. The main server of a region replicates minimal information to and from a master region. Hence, a single region can have all necessary information about all other regions. An analyst is aware of tickets from all regions and can connect to a region when required. This type of implementation is useful when network bandwidth is too limited for a distributed implementation. For example, business locations in different countries with a slow link between them.

CA SDM deployment model consists of the following categories:

1. Small
2. Medium
3. Large

CA SDM Advanced Availability configuration is recommended since it provides better performance and availability. Customers with less demanding needs can opt for CA SDM conventional configuration. Use clustered DBMS configurations to support large data volumes. Each server in advanced availability mode requires DBMS connectivity.

NOTE

It is difficult to give exact recommendations for deployment models since customers use CA SDM differently based on environment and organization requirements. Deployment model showcased in this article is based on feedback received from CA SDM customers, in general.

NOTE

If you are using a load balancer for Advanced Availability, ensure that the load balancer is configured to use sticky sessions.

This table describes CA SDM environment category and concurrent Analyst sessions for CA SDM, xFlow Interface, Insights, Search Server, and Collaboration Server:

Category	Analyst Sessions	CA Service Desk Manager + xFlow Interface	MDB Database	Datamart / Aggregate Reporting Database	Transactional Reporting Database	Search Server
Tiny* (*Not depicted in the diagram)	1-10	(recommended 16-24 GB RAM) Conventional Configuration: • 1 Primary Server (along with **xFlow Interface**)	On CA SDM Server	On CA SDM Server	On CA SDM Server	On CA SDM Server

Small	1-200	(recommended 16-24 GB RAM) Advanced Availability Configuration: • 1 Background Server • 1 Standby Server • 2 Application Servers (along with **xFlow Interface**)	Dedicated Server	Dedicated Server	Dedicated DBMS replica with shadow SDM	Dedicated Server
Medium	200-5000	(recommended 16-32 GB RAM) Advanced Availability Configuration: • 1 Background Server • 1 Standby Server • 5 Application Servers (along with **xFlow Interface**)	Clustered	Dedicated Server	Dedicated DBMS replica with shadow SDM with multiple domsrvrs	Cluster of 3
Large	5000+	(recommended 16-32 GB RAM) Advanced Availability Configuration: • 1 Background Server • 1 Standby Server • 5+ Application Servers (along with **xFlow Interface**)	Clustered	Dedicated Server	Dedicated DBMS replica cluster with shadow sdm and multiple domsrvrs	Cluster > 3 Solid-State Drive (SSD) disks

NOTE

For Aggregate(Datamart) JasperReports database, we recommend that you use HDD data storage for small architecture, and SAN or RAID for medium and large architectures.

RASA Server Requirements

Consider the following RASA server requirements for environment category and concurrent Employee sessions for CA SDM and xFlow Interface

Table 2: RASA Server Requirements

Category	Employee Sessions	RASA Server	Considerations
Small	1-180	One machine (recommended 16-24 GB RAM and 8 CPUs)	1. Each RASA server node can scale up to 60 users. 2. Ability to configure upto 8 Rasa Server nodes with load balancer enabled.
Medium	180-5000	6 - 8 machines (recommended 32-64 GB RAM and 16 CPUs)	1. Each RASA server node can scale up to 60 users.. 2. Ability to configure upto 16 Rasa Server nodes on each machine with load balancer enabled.

CA SDM Architecture

CA SDM can be deployed using one of the architectures from Conventional Configuration and Advanced Availability using the centralized and distributed models.

CA SDM Architecture for Conventional Configuration

The conventional configuration includes a primary server, a database, and one or more secondary servers. The secondary servers are optional; configure them to support a large number of concurrent users. Only the primary server can access the database directly. The secondary servers access the database through a central process that is available on the primary server. A secondary server can be removed from the configuration without disrupting other servers. Only the users connected to the specific secondary server are affected.

When to Opt for Conventional Configuration

Conventional is the default configuration and is suitable for smaller deployments. Choose the conventional configuration if you do not require any high availability. Be aware that with conventional configuration, the application is not available during maintenance or when a server crashes.

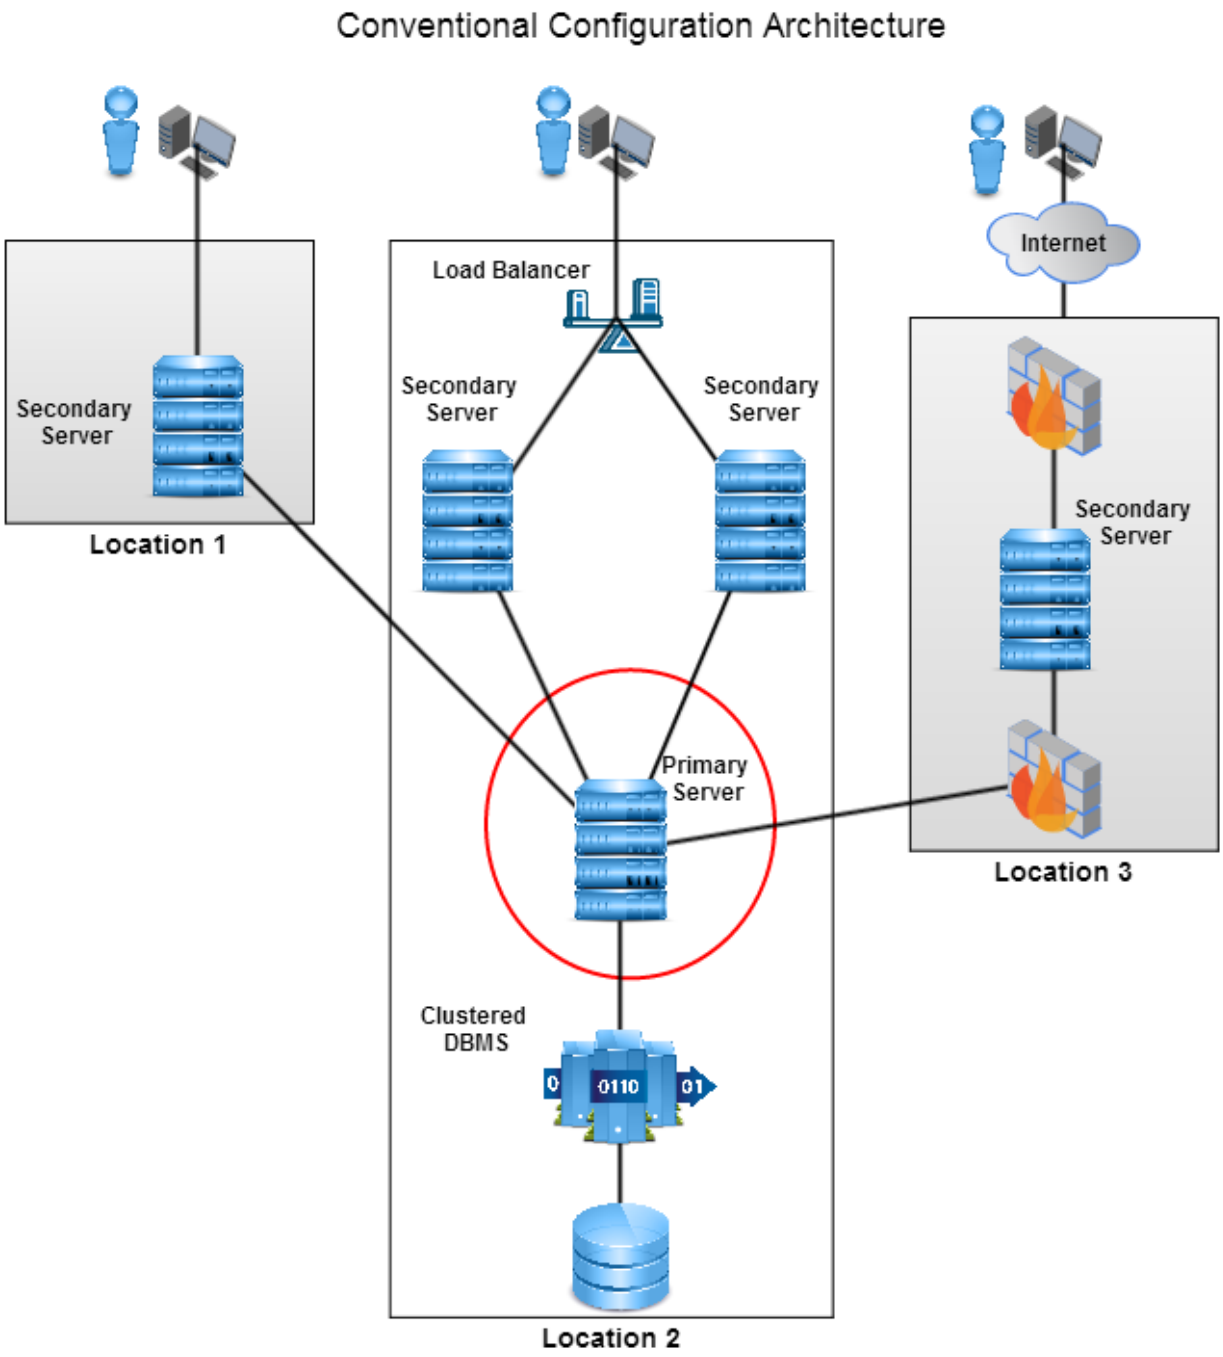
Primary Server

The Primary Server is the main server in a conventional configuration. In a single server CA SDM configuration, the server is the Primary Server. When CA SDM is distributed across two or more servers, one server is designated as the Primary Server. This server performs roles in the configuration such as accessing the database. There is always only one Primary Server.

Secondary Server

A Secondary Server is configured when there are more than one CA SDM server in a configuration. In this scenario, all servers other than the Primary Server are configured as Secondary Servers. Secondary servers perform only a subset of the roles of the Primary Server. Secondary Servers are added to a configuration to scale CA SDM to handle more users.

The following diagram provides an example of the conventional configuration architecture:



CA SDM Architecture for Advanced Availability

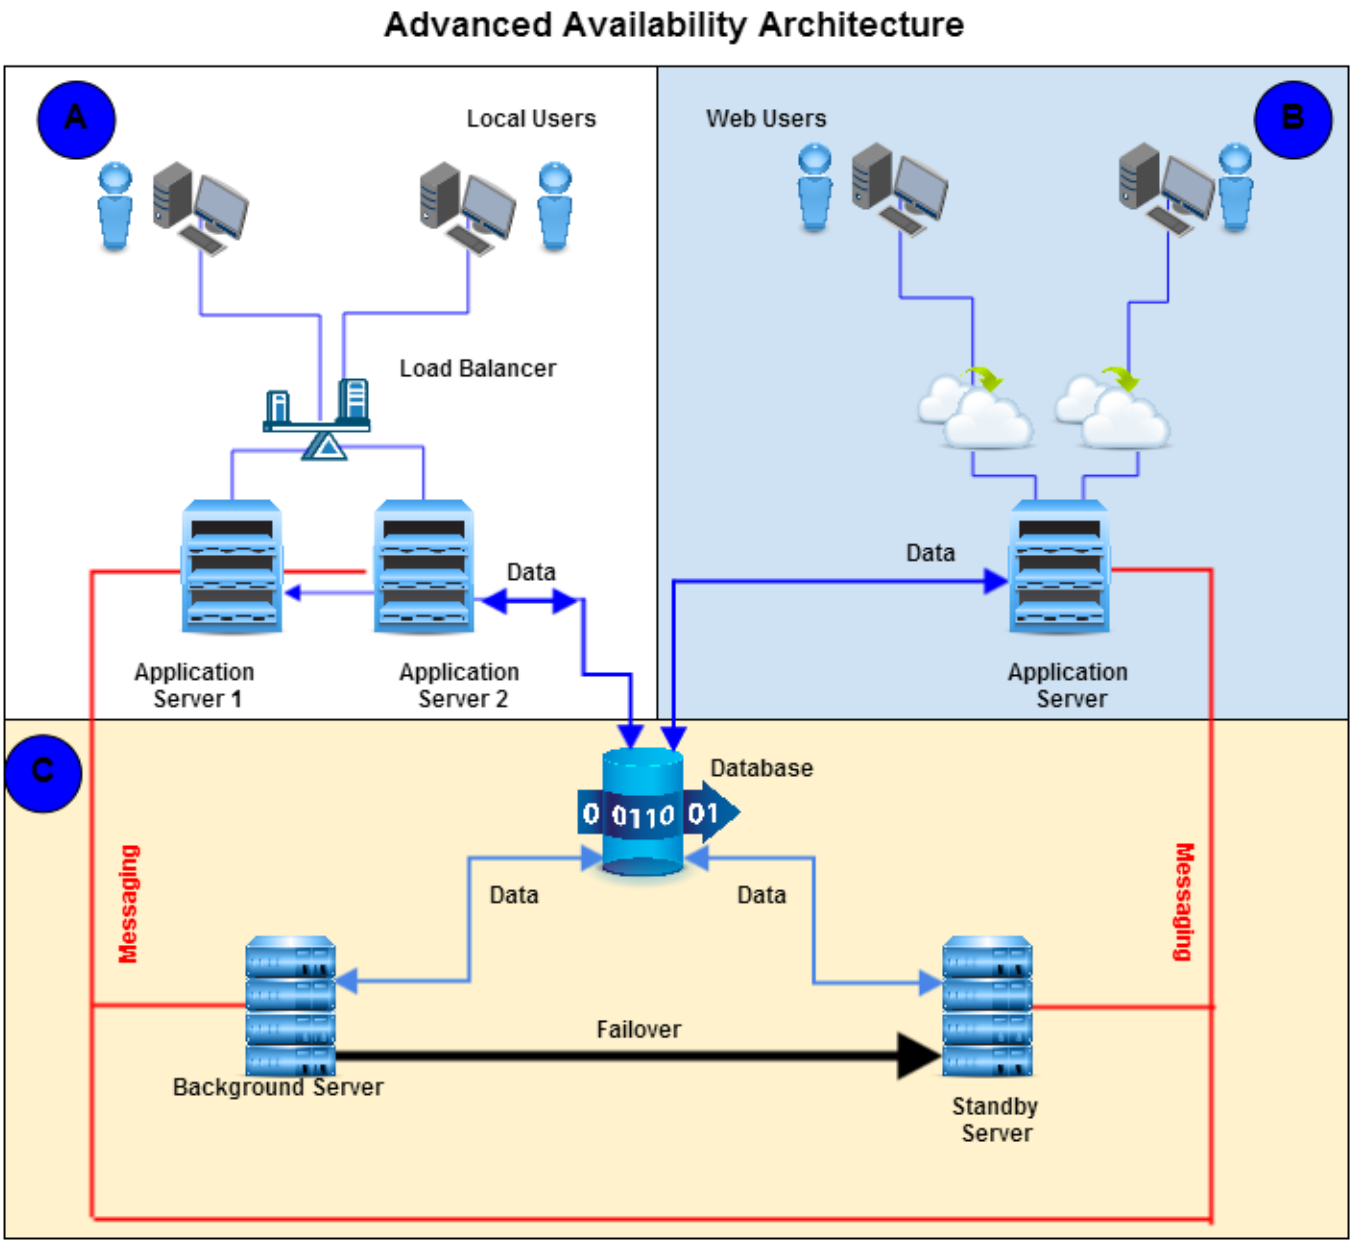
The advanced availability configuration includes a background server, one or more standby servers, and one or more application servers. To reduce the single point of failure, each of these servers has a direct connection with the database. All the components of the architecture communicate using an internal CA protocol.

When to Opt for Advanced Availability Configuration

The advanced availability configuration provides higher availability, reduces down times, and supports rolling maintenance. Consider the advanced availability configuration when any of the following factors is true:

- You require a high degree of CA SDM availability.
- You require the CA SDM servers to be more independent and more resilient to failures.
- You require an ability to remove and return the CA SDM servers to service, without bringing down the entire CA SDM installation.
- You require near zero downtime during rolling maintenance.

The following diagram provides an example of advanced availability architecture:



The architecture is spread across three different locations A, B, and C. Location A has two application servers, serving users through a load balancer. The location B has an application server directly serving the users and the location C has the background server, the standby server, and the database. Each of the servers has direct connection to the database. The blue lines mark the flow to and from the database. The red lines identify the internal communication between the components.

Background Server

The background server is the core of the advanced availability architecture. This server provides ancillary services to other servers and runs all singleton processes of CA SDM. A process can be is designated as singleton when only single copy of it can be active in any SDM installation. Only the users with the Administrator Access Type have access to the background server. To increase the availability, the standby server shadows the background server. You can switch the standby server as the background server in case of any failure or when performing rolling maintenance.

Standby Server

The primary function of the standby server is to act as a warm standby for the background server. The standby server has the same hardware and OS platform as the background server. The standby server can run all processes that run on the background server. The standby server stays idle during normal working of the system. However, it listens to the internal CA SDM system messages for database changes and updates the critical caches continuously. If the background server fails or requires rolling maintenance, you can promote the standby server to background server. When you promote the server, the application servers as well as the end users have minimal disruption. You can invoke a utility to perform this switchover.

The standby server is only running a small subset of the processes that normally run on the background server. You cannot log on to the web interface on the standby server.

Application Server

The application server has all the CA SDM components necessary to serve the end users through various interfaces like web, SOAP, and RESTful web services. The application servers are independent of each other and resilient to the background server outages for short periods of time. Users access the application servers. You can individually remove the application servers and return to service by using the new Quiesce facility. The quiesce facility allows current users to complete their work and then sign in to an alternate application server.

Installation Prerequisites

CA Service Management installer checks for deployment prerequisites and performs mandatory validations before installing the products. Review the following installation prerequisites before you proceed with the installation:

- Operating System Requirements
- Server and Hardware Requirements
- Software Requirements
- Database Requirements
- Supported Ports and Port Ranges
- Supported Browser and Network Settings

Operating System Requirements

This article describes the following topics:

Review the following OS requirements for CA Service Management 17.4. For more information, see Supportability Matrix.

Red Hat Enterprise Linux Operating Systems

> **NOTE**
> Ensure that you have glibc 2.14 or later in your environment.

Red Hat Enterprise Linux 9.4

To install CA SDM on Red Hat Enterprise Linux 9.4, verify that you have the following RPM packages and their dependencies:

Required RPM	Dependencies
libXp-1.0.3-3.el9.i686_64.rpm libXp-1.0.3-3.el9.i686.rpm	libXau-1.0.9-8.el9.x86_64 libXau-1.0.9-8.el9.i686 libX11-1.7.0-9.el9.x86_64 libX11-1.7.0-9.el9.i686 libxcb-1.13.1-9.el9.x86_64 libxcb-1.13.1-9.el9.i686 libXext-1.3.4-8.el9.x86_64 libXext-1.3.4-8.el9.i686
libXtst-1.2.3-16.el9.x86_64 libXtst-1.2.3-16.el9.i686	libXi-1.7.10-8.el9.x86_64 libXi-1.7.10-8.el9.i686
openssl-libs-3.0.7-27.el9.x86_64 openssl-libs-3.0.7-27.el9.i686	zlib-1.2.11-40.el9.x86_64 Zlib-1.2.11-40.el9.i686 libselinux-3.6-1.el9.x86_64 Libselinux-3.6-1.el9.i686 keyutils-libs-1.6.3-1.el9.x86_64 keyutils-libs-1.6.3-1.el9.i686 krb5-libs-1.21.1-1.el9.x86_64 Krb5-libs-1.21.1-1.el9.i686
openldap-2.6.6-3.el9.x86_64 openldap-2.6.6-3.el9.i686	audit-libs-3.1.2-2.el9.x86_64 cracklib-2.9.6-27.el9.x86_64 cyrus-sasl-2.1.27-21.el9.x86_64 cyrus-sasl-lib-2.1.27-21.el9.x86_64 cyrus-sasl-lib-2.1.27-21.el9.i686 libcap-ng-0.8.2-7.el9.x86_64 libdb-5.3.28-53.el9.x86_64 pam-1.5.1-19.el9.x86_64

Verify that you have the following *pcre* and *libuuid* packages:

- pcre-8.44-3.el9.3.x86_64 *and* pcre-8.44-3.el9.3.i686
- libuuid-2.37.4-18.el9.x86_64 *and* libuuid-2.37.4-18.el9.i686

> **NOTE**
> These 32-bit packages (pcre-8 and libuuid-2) are required on both 32-bit and 64-bit systems.

Red Hat Enterprise Linux 8.6

To install CA SDM on Red Hat Enterprise Linux 8.6, verify that you have the following RPM packages and their dependencies:

Required RPM	Dependencies
libXp-1.0.3-3.el8.i686.rpm	libXau-1.0.8-3.el8.i686.rpm libX11-1.6.8-5.el8.i686.rpm libxcb-1.13.1-1.el8.i686.rpm libXext-1.3.4-1.el8.i686.rpm
libXtst-1.2.3-7.el8.i686.rpm	libXi-1.7.10-1.el8.i686.rpm
openssl-libs-1.1.1k-6.el8_5.i686.rpm	zlib-1.2.11-18.el8_5.i686.rpm libselinux-2.9-5.el8.i686.rpm keyutils-libs-1.5.10-9.el8.i686.rpm krb5-libs-1.18.2-14.el8.i686.rpm

openldap-2.4.46-18.el8.i686.rpm	openldap-devel-2.4.46-18.el8.i686.rpm audit-libs-3.0.7-2.el8.2.i686.rpm cracklib-2.9.6-15.el8.i686.rpm cyrus-sasl-2.1.27-6.el8_5.i686.rpm cyrus-sasl-devel-2.1.27-6.el8_5.x86_64.rpm cyrus-sasl-devel-2.1.27-6.el8_5.i686.rpm cyrus-sasl-lib-2.1.27-6.el8_5.i686.rpm libcap-ng-0.7.11-1.el8.i686.rpm libdb-5.3.28-42.el8_4.i686.rpm pam-1.3.1-16.el8.i686.rpm

Verify that you have the following *pcre* and *libuuid* packages:

- pcre-8.42-4.el8.i686.rpm
- libuuid-2.32.1-17.el8.i686.rpm

NOTE
These 32-bit packages (pcre-8 and libuuid-2) are required on both 32-bit and 64-bit systems.

Red Hat Enterprise Linux 7.2

To install CA SDM on Red Hat Enterprise Linux 7.2, verify that you have the following RPM packages and their dependencies:

Required RPM	Dependencies
libXp-1.0.2-2.1.el7.i686.rpm	libXau-1.0.8-2.1.el7.i686.rpm libxcb-1.11-4.el7.i686.rpm libXext-1.3.3-3.el7.i686.rpm libX11-1.6.3-2.el7.i686.rpm
libXtst-1.2.2-2.1.el7.i686.rpm	libXi-1.7.4-2.el7.i686.rpm
openssl-1.0.1e-42.el7_1.10.i686.rpm	zlib-1.2.7-15.el7.i686.rpm libselinux-2.2.2-6.el7.i686.rpm keyutils-libs-1.5.8-3.el7.i686.rpm krb5-libs-1.13.2-10.el7.i686.rpm
openldap-2.4.40-8.el7.i686.rpm	cyrus-sasl-lib-2.1.26-19.2.el7.i686.rpm

Verify that you have the following *pcre* and *libuuid* packages:

- pcre-8.42-6.el8.i686.rpm
- libuuid-2.32.1-35.el8.i686.rpm

```
These 32-bit packages (pcre-8 and libuuid-2) are required on both 32-bit and 64-bit
systems.
```

Suse Linux Enterprise Server 15.6

To install CA SDM on Suse Linux Enterprise Server 15.6, verify that you have the following RPM packages and their dependencies:

Required RPM	Dependencies
glibc-2.38-150600.14.5.1.x86_64 glibc-32bit-2.38-150600.14.5.1.x86_64	glibc-devel-2.38-150600.14.5.1.x86_64 glibc-devel-32bit-2.38-150600.14.5.1.x86_64

libXp6-1.0.3-1.24.x86_64 libXp6-32bit-1.0.3-1.24.x86_64	libXau6-1.0.8-1.26.x86_64 libXau6-32bit-1.0.8-1.26.x86_64 libX11-6-1.8.7-150600.1.2.x86_64 libX11-6-32bit-1.8.7-150600.1.2.x86_64 libxcb1-1.13-150000.3.9.1.x86_64 libxcb1-32bit-1.13-150000.3.9.1.x86_64 libXext6-1.3.3-1.30.x86_64 libXext6-32bit-1.3.3-1.30.x86_64 libXext-devel-1.3.3-1.30.x86_64 libXext-devel-32bit-1.3.3-1.30.x86_64

Operating System Requirements for CA Asset Portfolio Manager (ITAM)

Complete the following prerequisites before proceeding with CA APM installation:

- Install .NET Framework on Windows Server
- Add ASP.NET in IIS on Windows Server

Install .NET 4.6 Framework on Windows Server 2016, .NET 4.7 Framework on Windows Server 2019, .NET 4.8 Framework on Windows Server 2022

For more information see, .NET Framework System Requirements.

Install .NET 4.6 Framework on Windows Server 2016

To install the .NET 4.6 Framework on Windows Server 2016, complete the following steps:

1. Launch the Server Manager.
2. Click **Add roles and features**. Click **Next**.
3. Select **Role-based or feature-based installation**.
4. In the **Server** section, select your server and click **Next**.
5. Scroll down to **Web Server (IIS)** to set up the following required features.
6. Expand **Application Development** and select, **.Net Extensibility 3.5**, **.Net Extensibility 4.6**, **Application Initialization**, **ASP.NET 3.5,** and **ASP.NET 4.6**. Click Next.
7. Navigate to **Features** > **.NET framework 4.6** > **WCF Services**. Select **HTTP Activation**.
8. Follow on-screen instructions. Click **Next**.
9. Review the summary screen.
10. Click **Finish** to exit the installer. The .NET 4.6 framework is now installed.

Install .NET 4.7 Framework on Windows Server 2019

To install the .NET 4.7 framework on Windows Server 2019, complete the following steps:

1. Launch the Server Manager.
2. Click **Add roles and features**. Click **Next**.
3. Select **Role-based or feature-based installation**.
4. In the **Server** section, select your server and click **Next**.
5. Scroll down to **Web Server (IIS)** to set up the following required features.
6. Expand **Application Development** and select, **.Net Extensibility 3.5**, **.Net Extensibility 4.7**, **Application Initialization**, **ASP.NET 3.5,** and **ASP.NET 4.7**. Click Next.
7. Navigate to **Features** > **.NET framework 4.7** > **WCF Services**. Select **HTTP Activation**.
8. Follow on-screen instructions. Click **Next**.
9. Review the summary screen.
10. Click **Finish** to exit the installer. The .NET 4.7 framework is now installed.

Install .NET 4.8 Framework on Windows Server 2022

To install the .NET 4.8 framework on Windows Server 2022, complete the following steps:

1. Launch the Server Manager.
2. Click **Add roles and features**. Click **Next**.
3. Select **Role-based or feature-based installation**.
4. In the **Server** section, select your server and click **Next**.
5. Scroll down to **Web Server (IIS)** to set up the following required features.
6. Expand **Common HTTP Feeatures** and select **Static Content.**
7. Expand **Performance** and select **Static Content Compression.**
8. Expand **Application Development** and select, **.Net Extensibility 3.5**, **.Net Extensibility 4.8**, **Application Initialization**, **ASP.NET 3.5,** and **ASP.NET 4.8**. Click **Next**.
9. Navigate to **Features** > **.NET framework 4.8** > **WCF Services**. Select **HTTP Activation**.
10. Follow on-screen instructions. Click **Next**.
11. Review the summary screen.
12. Click **Finish** to exit the installer. The .NET 4.8 framework is now installed.

Add ASP.NET 4.6 on Windows Server 2016, and ASP.NET 4.7 on Windows Server 2019, and ASP.NET 4.8 on Windows Server 2022

For more information, see Install ASP.NET in IIS Web Server.

To add ASP.NET in IIS on Windows Server, perform the following steps:

1. Open Server Manager.
2. Navigate to **Manage**, **Add Roles and Features**.
3. Follow on-screen instructions. Select installation type and destination server.
4. Select **Roles** from the select server roles pane, expand **Web Server (IIS)**, **Application Development (IIS)**.
5. Select **ASP.NET 3.5** and **ASP.NET 4.5**. or **ASP.NET 4.6** or **ASP.NET 4.7** or **ASP.NET 4.8** as per your deployment.
6. Click **Next**.
7. Follow on-screen instructions and complete the installation.
   ASP.Net is now added in IIS.

For more information on supported operating system, databases, web browsers, and so on, see Supportability Matrix.

Operating System Requirements for CA Service Catalog

Install CA Service Catalog products and components on supported Windows Server operating systems only.

CA Service Catalog is certified on several operating system languages. Language certification implies that you can install CA Service Catalog for a supported operating system in a supported language. Similarly, Service Catalog can store and retrieve data using the character set of the supported language. Web application server for CA Service Catalog is Apache Tomcat. When you install the base files for CA Service Catalog using the CA Service Management installation media, Apache Tomcat and related files are installed.

```
Ensure that all server operating systems use the same language.
```

Server and Hardware Requirements

Recommendation is that your environment must have at least 4 GB of temporary disk space for CA Service Management installer to extract required product installation files. If the temporary available disk space is less than 4 GB, use the **IATEMPDIR** variable to redirect this temporary space of the installer to another folder.

This article contains the following topics:

Server Requirements for CA Service Management Solution Products

The following table lists the CA Service Management Products, Common Components, and the minimum number of servers that you require for installation:

Component	Number of Servers (Minimum)	Description
CA MDB	1	Service Management Master Database
CA Service Desk Manager (Advanced Availability Configuration)	3	One Background Server, one Standby Server, one or more Application Servers **Recommended:** 4 servers [One Background Server, one Standby Server, two Application Servers]
CA Service Desk Manager (Conventional Configuration)	1	One Primary Server
CA Service Catalog	1	CA Service Catalog and the accounting components are installed on the same server.
CA IT Asset Manager	1	Web and Application Server can be installed on the same server. **Recommended:** 2 servers; one each for Web and Application servers.
CA Embedded Entitlements Manager	Cluster: 2 Standalone: 1	
CA Business Intelligence JasperReports Server	1	
CA Process Automation	1	

CA Service Desk Manager Hardware Requirements

Based on the size of your CA SDM environment, the following requirements must be met or exceeded for CA SDM to install and run properly:

Database Size	Hardware	Requirements
Small—Used for installing CA SDM in a test environment.	• CPU • RAM • Disk Space	• Minimum Dual Processor 2.0 GHz • Minimum 6 GB • 8 GB minimum. This will increase over time to accommodate database growth.
Medium—The CA SDM default. The recommended setting for most CA SDM installations.	• CPU • RAM • Disk Space	• Minimum Dual Processor 2.0 GHz • Minimum 12GB • 16 GB minimum. This will increase over time to accommodate database growth.
Large—Used for large CA SDM installations.	• CPU • RAM • Disk Space	• Quad Processor 2.0 GHz • Minimum 16 GB • 24 GB minimum. This will increase over time to accommodate database growth.

NOTE

The domsrvr or DOM server is the internal daemon which manages the CA SDM objects in the memory. The webengine is the internal daemon which generates the HTML pages and sends it to the client. A single webengine and domsrvr are deployed in pairs. Each pair requires one dedicated processor core and at least 1 GB of RAM. Each webengine or domsrvr pair can serve 200-250 users. If you want to add more than one pair for scaling up the system, ensure that you have the necessary processor and the RAM available.

NOTE
The data files directory of the database server for the MDB requires at least 2 GB of space.

When CA SDM is up and running, it is recommended to check the process memory. For optimal performance, we recommend the following method:

1. Set a notification when the process memory exceeds 1.25 GB and check the processes that are running.
2. Set a warning notification when the process memory exceeds 1.5 GB and take corrective actions to check the memory usage.

CA Service Management Virtual Analyst Requirements

Review the following hardware requirements for Virtual Analyst Implementation in CA SDM.

Hardware	Requirements
CPU	4-8 Core CPU CPU must support AVX Instruction set. In general, CPUs manufactured on or after year 2011 support AVX. For more information, see your CPU manual instructions.
RAM	Minimum 16 GB. Recommended 32 GB
Disk Space	40 GB

Requirements

Review the following hardware requirements for xFlow Interface installation.

Hardware	Requirements
CPU	Minimum Dual Processor 2.0 GHz Preferred Quad Core Processor 2.0 GHz
RAM	Minimum 16 GB Recommended 32 GB
Disk Space	Minimum 12 GB

Insights (CABI JasperReports Server) Requirements

Review the following hardware requirements for Insights (CABI JasperReports Server) installation:

NOTE

The rendering time for Insights App varies with the CABI JasperReports server response time and network lag (if any) when the Insights App is launched from CA SDM or xFlow Interface.

Hardware	Requirements
CPU	Minimum Dual Processor 2.0 GHz Preferred Quad Core Processor 2.0 GHz
RAM	Minimum 16 GB Recommended 32 GB

Disk Space	Minimum 12 GB

Search Server Requirements

Review the following hardware requirements for, Search Server.

Hardware	Requirements
CPU	4-8 Core CPU
RAM	Minimum 16 GB Recommended 32 GB
Disk Space	Minimum 12 GB

CA SDM Advanced Availability Requirements

NOTE
Use only one *DOM server or web engine pair for each CPU and allocate 1GB RAM per pair.

The following hardware requirements must be met or exceeded for a CA SDM Advanced Availability server:

Server Type	CPU Requirements	RAM Requirements	Disk Space Requirements
Standby or Background server	Minimum Dual Processor 2 GHz Preferred Quad Core Processor 2 GHz	Minimum 4 GB Recommended 8 GB	4 GB (for product installation and for minimal application log growth.)
Application server (minimum recommended configuration for each of the application servers must be the same)	Minimum Dual Processor 2 GHz Preferred Quad Core Processor 2 GHz	Minimum 4 GB Recommended 8 GB (Can be increased based on the number of *domsrvr or webengine pairs)	4 GB
Remote MDB	Minimum Dual Processor 2 GHz Preferred Quad Core Processor 2 GHz	Minimum 4 GB Recommended 8 GB	20 GB (recommended minimum disk space) You should also allow for incremental growth to accommodate both new MDB table entries and to provide enough space for extra Service Desk-related document
Attachments We do not recommend having the attachment repository location as part of the standby or background or application server to avoid any link breakup during failover. We recommend keeping it on an independent file server, preferably on a shared storage location. For advanced availability configuration, you may use SAN with RAID 5 configured. Best performance is achieved by using multiple repositories on multiple application servers.			Based on your organization requirements.

CA SDM Conventional Configuration Requirements

NOTE
Use only one *DOM server or web engine pair for each CPU and allocate 1GB RAM per pair.

The following hardware requirements must be met or exceeded for a CA SDM conventional configuration:

Server Type	CPU Requirements	RAM Requirements	Disk Space Requirements
Primary server	Minimum Dual Processor 2 GHz	Minimum 4 GB Recommended 6 GB (Can be increased based on the number of domsrvr or webengine pairs)	4 GB
Secondary server	Minimum Dual Processor 2 GHz	Minimum 4 GB Recommended 6 GB (Can be increased based on the number of *domsrvr or webengine pairs)	4 GB
Remote MDB	Minimum Dual Processor 2 GHz Recommended: Quad Core Processor 2 GHz	Minimum 4 GB Recommended 8 GB	20 GB (recommended minimum disk space) You should also allow for incremental growth to accommodate both new MDB table entries and to provide enough space for extra Service Desk-related documents.

CA SDM Web Client Requirements

The following hardware requirements must be met or exceeded for a CA SDM Web Client computer to access CA SDM:

Hardware	Requirements
CPU	Dual Processor 2.0 GHz preferred
RAM	Minimum 2 GB
Disk Space	4 GB

CA Service Catalog Hardware Requirements

Ensure that your system meets the following hardware requirements before proceeding with the CA Service Catalog installation:

Hardware	Requirements
CPU	Minimum Intel Platform 3.0 GHz Processor Recommended: Multi-Processor
RAM	Minimum 4 GB Recommended 6 GB
Disk Space	80 GB with at least 4 GB free space

WARNING

For production, it is recommended to install each required application on separate servers. For example, you install Catalog Component on server 1, CA Process Automation on server 2, Accounting Component on server 3, and the DBMS server software on server 4.

CA IT Asset Management Hardware Requirements

The following hardware requirements assume that you have 80 -100 concurrent users. For assistance with deployment architectures exceeding 100 concurrent users, contact Broadcom Support

Component	Web Server and Application Server
Processor	3 GHz (dual core processor)
RAM	8 GB
Disk Space	5 GB

Component	Database Server
Processor	3 GHz (dual core processor)
RAM	8 GB
Disk Space	4 GB

Software Requirements

CA Service Management installer performs prerequisite checks and mandatory validations before installing CA Service Management solution products. Ensure that you have considered the following prerequisites for CA Service Desk Manager (CA SDM), CA Service Catalog, and CA Asset Portfolio Management (CA APM) before proceeding with the installation process:

CA Service Desk Manager Requirements

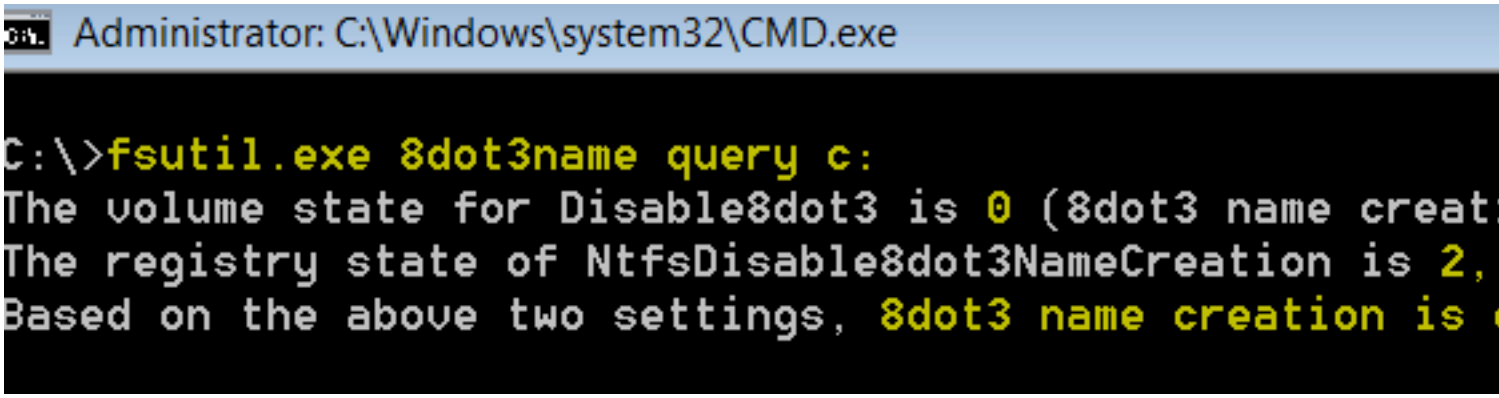
The following software applications are required for CA Service Desk Manager:

8dot3 name creation

Required for CA Service Desk Manager (CA SDM). You must enable the **8.3 name creation** before installing CA Service Desk Manager on the Windows operating system.

Follow these steps:

1. Execute the following command on the drive where you want to install CA SDM:
   <installation drive>:\Users\Administrator>FSUTIL.EXE 8dot3name query <installation drive>:
   This example screenshot displays the status of 8dot3 name at volume and registry level:



2. Changes the file system behavior for 8dot3 name in the following instances:
   When *DefaultValue* is specified, the registry key,**HKLM\System\CurrentControlSet\Control\FileSystem \NtfsDisable8dot3NameCreation**, is set to the *DefaultValue*.
   The *DefaultValue* can have the following values:
   - **0**: Enables 8dot3 name creation for all volumes on the system.
   - **1**: Disables 8dot3 name creation for all volumes on the system.
   - **2**: Sets 8dot3 name creation on a per volume basis.
   - **3**: Disables 8dot3 name creation for all volumes except the system volume.
3. To enable 8dot3 name, run the following command:
   <installation drive>:\Users\Administrator>FSUTIL.EXE 8dot3name set <installation drive>: 0

TIP

1. For more information about how to enable 8dot3 name, see Microsoft Website and search for Fsutil 8dot3name.
2. Ensure 8dot3name is enabled while creating a directory, otherwise the folder is created without a valid short name.

(Optional) PsTools Suite

The PsTools Suite from Microsoft is optional for CA SDM. The PsTools Suite helps implement the CA SDM Interval Logging utility. This utility is used for collecting application performance and system statistics. Extract **pstools.zip** to any directory of your choice and add the directory to the **Windows %PATH%** environment variable. If PsTools is not available on your local environment, download it from Microsoft.

JointJS

Required for xFlow interface. Jointjs is a JavaScript library which helps to visualize the SDM classic workflow as a graphical representation. The xFlow user interface uses Jointjs and requires certain files for successful installation. You must download the required JointJS files before starting the installation.

Perform the following steps:

1. Download the **CA SERVICE MANAGEMENT 17.4 3RD PARTY COMPONENTS.iso** from Broadcom Support.
2. Extract the Jointjs folder from the Jointjs.zip file.
3. Verify that Jointjs folder includes the following files:
   joint.min.js
   joint.min..css

WARNING

Note the path where you placed the Jointjs folder that includes the files. When you run the installer, on the screens corresponding to the xFlow installation you must provide the path for the Jointjs folder you saved.

CA Asset Portfolio Management Requirements

The following software applications are required for CA Asset Portfolio Management:

CA Embedded Entitlements Manager

The CA Embedded Entitlements Manager is required for installing CA Asset Portfolio Management Requirements.

Microsoft .NET Framework

Ensure that you have any of these supported version of Microsoft .NET Framework. This is mandatory for CA Asset Portfolio Management installation:

- Microsoft .NET Framework 2.0
- Microsoft .NET Framework 3.5
- Microsoft .NET Framework 4.0
- Microsoft .NET Framework 4.5.2/ 4.6/ 4.7/ 4.8

Windows Installer 5.0

Microsoft Windows Installer is a component of the Windows operating system. Windows Installer provides a standard foundation for installing and uninstalling the software.

Internet Information Services (IIS)

Required for CA APM and supports IIS version 7.5 or above. IIS is a flexible, general-purpose web server from Microsoft that runs on Windows systems to serve requested HTML pages or files.

Database Requirements

Consider the following database requirements (Oracle or Microsoft SQL Server) for installing CA Service Management.:

NOTE
The SDM privileged user must have read access to **tnsnames.ora** as well as **sqlnet.ora** files.

NOTE
Add the mdbadmin user on all nodes of Microsoft SQL Server AlwaysOn Environment.
For example:

```
CREATE LOGIN mdbadmin WITH PASSWORD = 'xxxx@123', SID = 0x9033FDA09F4C49438D0A4B094C243CDA; GO
```

NOTE
For Oracle database in CA Service Management Solution deployment, ensure that the Oracle-32 bit path is set on top of the Environment path variable list for CA APM.

CA Service Desk Manager (SDM)

NOTE
Interactive ODBC SQL (isql) tool is no longer supported for CA SDM.

Consider the following if you are installing CA SDM with Microsoft SQL Server or Oracle Database:

SDM SQL Server (2016, 2017, 2019 or 2022) Database Requirements

If you are using a remote MDB, the database client tools for Microsoft SQL Server must be installed on the same system or computer where you install CA Service Desk Manager (SDM).

SDM Advanced Availability Configuration: Database Client tools for Microsoft SQL Server are required on SDM standby server, background server, and application servers.

SDM Conventional Configuration: Database Client Tools for Microsoft SQL Server are required on the Primary server.

NOTE
Use client tools and management tools for command line utilities when installing or configuring the SDM server (**pdm_configure**). In case, if you do not want to install these components for the command line, use the Microsoft ODBC driver for Microsoft SQL Server.

Download the following from Microsoft Download Center:

- Microsoft ODBC Driver for Microsoft SQL Server. For more information and compatibility, see Microsoft ODBC Driver compatibility.
- Microsoft Command Line Utilities for Microsoft SQL Server. For more information, see Microsoft Command Line Utilities.
- Microsoft SQL Server Management Studio (SSMS). For more information, see SQL Server Management Studio.

NOTE
Prerequisite for MS SQL Server 2022: Microsoft has removed the SQL Native Client 11 for out of the box SQL 2022. CA Service Management uses SQL Native Client 11, you must manualy install it from the Microsoft website. Download the 64-bit SQL Native Client 11", named as Microsoft® SQL Server® 2012 Native Client from: https:// www.microsoft.com/en-us/download/confirmation.aspx?id=50402

SDM Oracle Database Requirements

- If you are doing a fresh installation of 17.4 or upgrading from an earlier version, ensure that the Oracle PATH environment variable refers to the 32-bit Oracle client first, and then, to the 64-bit Oracle client. To change the sequence, navigate to **Environment Variables**, **System Variables**, **Path**, **Edit**.
- For Linux Oracle implementations, set the Oracle environment variables before you install or migrate CA SDM.
- (For Oracle database only) 32-bit and 64-bit ORACLE client with administrator must be installed on all CA SDM servers.

CA Service Catalog

- **Oracle Dtabase**
  - If you are planning to use an Oracle database, ensure that you identify the system identifier (SID) and verify that the ORACLE_HOME and ORACLE_SID variables are set correctly.
  - In a distributed implementation, any computer on which you install CA Service Catalog must have either your DBMS server or DBMS client installed. This requirement applies to both Microsoft SQL Server and Oracle.
- **Microsoft SQL Server Database**
  Use a user ID that has **SA (System Administrator)** privileges to install or upgrade CA Service Catalog.

CA Asset Portfolio Management (APM)

Consider the following database requirements for CA APM or ITAM:

NOTE
CA APM uses Oracle 32-bit client for supported Oracle databases. For more information, see Supportability Matrix.

NOTE
For installing CA APM on Oracle 21c database, add a new system environment variable "TNS_ADMIN" on the CA APM Web / Application servers. This variable value must point to the Oracle 21c 32-bit client installed location. Set the variable value, for example <oracle32bit_client_installed_location>\product \21.0.0\client32bit_1\NETWORK\ADMIN

NOTE

If CA APM is installed on a SQL Server database, install the 64-bit SQL Native Client 11.0 on the APM Application server to ensure CORA functionality works, as CORA uses the SQLNCLI11 provider to connect to

the database. Download the 64-bit SQL Native Client 11", named as Microsoft® SQL Server® 2012 Native Client from: https://www.microsoft.com/en-us/download/confirmation.aspx?id=50402

Supported Ports and Port Ranges

CA Service Managementinstallation requires various ports and port ranges to be opened for configuration and integration with CA products and other third-party products. This article describes the following:

Ports and Port Ranges for CA Service Desk Manager

By default, CA SDM selects a port based on availability. The system reserves ports less than 1024, but can request for a port as high as 65335. The ports that you require to open on a firewall depends on the settings defined in the NX.env file.

The following NX.env variables set the starting port (2100) and the incremental increase (plus 1):

- *NX_SLUMP_FIXED_SOCKETS=1*
- *NX_SLUMP_SECONDARY_SOCKET=2100*

The following list displays default and recommended ports (and port ranges) for a typical CA SDM installation:

Port Name	Port Number
xFlow Interface/Service Point	• Web Server Port: 9002 • Incident Service Port: 9002 • Search Service Port: 9006 • Notification Search Service Port (requires Web Sockets Protocol): 9008
RASA NLU Server	5005 (Core) 5055 (Action)
Insights Services Port	• 9016
Search Server	• HTTP Port: 9012 • TCP Port: 9300
CA SDM Tomcat	• Tomcat Port: 8080 • Tomcat Shutdown Port: 8085
Database	• Oracle: 1521 • SQL Server: 1433

CA SDM	• FTP: 21 • SMTP: 25 • IIS: 80 • HTTP: 8080 • HTTPS: 8443 • HTTPS (secondary): 8081 • POP3: 110 • IMAP: 143 • LDAP: 389 • WebEx: 1270 • mstsc: 1389 • Slump Socket: 2100 • qserver: 2234 • Proctor Socket: 2300 • Communications: 2365 • Apache Tomcat: 8080 • Apache Tomcat Shutdown: 8085 • SSL on Apache Tomcat: 8443
CA CMDB	• Visualizer: 9080 • Visualizer Apache Tomcat Shutdown: 9085
CA EEM	• Administration Port: 5250
REST	• Apache Tomcat: 8050 • Apache Tomcat Shutdown: 8055
CA Business Intelligence	• Apache Tomcat: 8080 **Recommended:** 8070 • Apache Tomcat Redirect: 8443 • Apache Tomcat Shutdown: 8075
EBR Search	• Base Port: 1300
Portal Server	• Apache Tomcat: 8080 • Apache Tomcat Shutdown: 8085 • SSL Functionality: 8443 • Portal_Safe_List: 8444
Visualizer	• Apache Tomcat: 9080 • Apache Tomcat Shutdown: 9085

Ports and Port Ranges for CA Service Catalog

Specify the startup and shutdown port numbers, if you do not want to use the default ports **8080** and **8085**.

> **WARNING**
> We recommend that you do *not* use port **7777** as the startup or shutdown port. Port **7777** is reserved for Java Messaging Service (JMS). If you must use port 7777 for the startup or shutdown port, reset the JMS port number after you have finished running the setup utility. Otherwise, port conflicts occur, and the product does not function correctly.

On each system where you plan to install CA Service Catalog, specify the port number for CA Service Catalog to communicate with the web server. You can change the default values during installation. If these ports are not available, have other non-conflicting port numbers available. You require port numbers **8080** and **8085** for Catalog Component service communication.

NOTE

CA EEM by default uses port number **5250** (for iTechnology iGateway service). You cannot change it during installation.

CA Service Catalog requires the following ports for communication with products and components. If you have disabled these ports, enable them before proceeding with CA Service Catalog Installation. If you are not using the default ports, verify that they are open before using them. You do not need to open the shutdown ports for the products and components listed in this table:

Product or Component	Default Port
CA Service Catalog startup port (includes access for CA Service Catalog and Service Accounting Component)	8080
CA Process Automation, CA Service Desk Manager, CA Business Intelligence/CABI Jaspersoft Server Reports and other CA products that integrate with CA Service Catalog	8080
CA Service Catalog shut down port	8085
Visualizer port for CA Service Desk Manager	9080
SQL Server server	1433
Oracle server	1521
CA EEM	5250
IMQ port of CA EEM	7676

If you plan to implement clustering for CA Service Catalog, open all Apache JServ Protocol (AJP) and load balancing ports.

Ports and Port Ranges for CA Asset Portfolio Manager

The following list displays default ports for a typical CA APM installation:

Product or Component	Default Port
ITAM default	99
SQL Server server	1433
Oracle server	1521
CA EEM	5250
ITAM default https	443

Supported Browser and Network Settings

For the detailed list of CA Service Management supported web browsers, see Supportability Matrix. Review the following related to browser and network settings before you start the installation:

IPV 6 Settings

- **IPV6**: If you are installing CA SDM in an IPV6 environment, the installation may fail. Ensure that the **NX_PROTOCOL_ONLY** variable is set to IPV6 and click **Retry Install.**
  You can change the default TCP Internet Protocol (TCP/IP) setting on one or more servers. This setting cannot be forced on the client if it is not supported on the server.

The TCP/IP setting is controlled by using the **NX.env** file, which is found in the **$NX_ROOT** directory. Use a text editor such as WordPad to edit this file. The following option controls the TCP/IP setting:
NX_PROTOCOL_ONLY=mode
For example: *NX_PROTOCOL_ONLY=ipv4*

- For Windows installation, install the **pslist.exe** tool and add its directory path variable to the system path variable.
- IIS 8.0 with support for ASP.NET 3.5 and ASP.NET 4.5 (Applicable only for ITAM).

Pre Installation Considerations

Before you proceed with CA Service Management installation, review the following installation considerations:

- CA Service Management Default User Information
- CA Service Desk Manager Considerations
- CA Service Catalog Considerations
- CA Asset Portfolio Manager Considerations
- Oracle Real Application Clusters (RAC) Considerations

CA Service Management Default User Information

The following table lists default user information for CA Service Management implementation:

CA Service Management Products	DBMS Users	Roles
• CA Service Desk Manager • CA Service Catalog • CA Asset Portfolio Manager		Needs user with DBMS Administrator privileges for installation.
CA Service Management	MDBADMIN	• **ams_group** • **amsgroup** • **db_ddladmin** • **db_owner** • **db_securityadmin** • **regadmin** • **service_desk_admin_group** • **service_desk_ro_group** • **usmgroup** • **workflow_admin_group**
CA Service Desk Manager	mdbadmin	• **ams_group, amsgroup** • **db_ddladmin** • **dbsecurityadmin** • **regadmin** • **service_desk_admin_group** • **service_desk_ro_group** • **workflow_admin_group**
CA Asset Portfolio Manager (ITAM)	uapmadmin	• **uapmadmin_group** • **Db_owner**
CA Asset Portfolio Manager	uapmbatch	**uapmbatch_group**
CA Asset Portfolio Manager	uapmreporting	**uapmreporting_group**

CA Process Automation (formerly known as IT PAM)	Defined during Installation	Users of this type require the DB owner privileges when starting CA Process Automation server for the first time. After that, permissions to Select, Insert, Update, and/or Delete the workflow processes are sufficed.
CA Service Management Products	**OS/CA EEM Users**	**Rights**
CA Asset Portfolio Manager (ITAM)	casmadmin	OS – Admin full rights
CA Asset Portfolio Manager	uapmadmin	CA APM internal application use only
CA Service Desk Manager	ServiceDesk	OS - Admin Full Rights
CA Service Catalog	spadmin	CA EEM Only
CA Process Automation	pamadmin	CA EEM Only.

For more information, see CA Service Desk Manager Default User Information

CA Service Desk Manager Considerations

Review the following for implementing CA Service Desk Manager (CA SDM):

NOTE

When planning for CA SDM deployment, for Scalability purposes, ensure that the upper limit of 64 processes is adhered to for a Primary Server. If the number of processes exceeds 64 on a Primary Server, plan to have more processes on CA SDM secondary server. CA SDM installation can ideally have up to 40 Processes on a single server. Adding a new web engine domserver to your existing environment results in adding 3 more processes.

NOTE

Ensure to restart xFlow interface services whenever you restart CA SDM Services. This is applicable for an environment that CA SDM and xFlow Interface Installation.

NOTE
For SUSE 15.6, before you start the 17.4GA SDM Installation, ensure you create a soft link using the command mentioned below:

```
ln -s /usr/bin/ifconfig /sbin/ifconfig
```

SUSE Linux Enterprise Server 15.6 supports 17.4.3.0 and above.

NOTE
For RHEL 9.4, before you start the 17.4GA SDM Installation, ensure you create soft links using the commands mentioned below:

```
yum install libnsl
 yum install libnsl2
 ln -s /usr/bin/ifconfig /sbin/ifconfig
 sudo ln -s /lib64/libnsl.so.3 /lib64/libnsl.so.2
```

RHEL 9.4 supports **17.4.5.0** and above.

Prerequisites for SDM 17.4.0.0 on SUSE Enterprise Linux 15.6 and RHEL 9.4

Follow these steps:

1. Download the latest applyPTF tool for SUSE with APAR No. 99112268 from Broadcom Support, and extract the T5UG572.tar.Z file.

2. Download the CA Service Desk Manager 17.4 installer DVD from Broadcom Support, and extract "**CA SERVICE DESK MANAGER 17.4 FOR LINUX.iso**"
3. Paste the file **applyptf.linux** in the path:
   ```
   <extracted "CA SERVICE DESK MANAGER 17.4 FOR LINUX.iso">\filestore\utils\ApplyPTF\
   ```
4. Before you start the 17.4GA SDM Installation, ensure you create a soft link using the command mentioned below:

   NOTE
   For SUSE 15.6, before you start the 17.4GA SDM Installation, ensure you create a soft link using the command mentioned below:
   ```
   ln -s /usr/bin/ifconfig /sbin/ifconfig
   ```
   SUSE Linux Enterprise Server 15.6 supports 17.4.3.0 and above.

   NOTE
   For RHEL 9.4, before you start the 17.4GA SDM Installation, ensure you create soft links using the commands mentioned below:

   ```
   yum install libnsl
    yum install libnsl2
    ln -s /usr/bin/ifconfig /sbin/ifconfig
    sudo ln -s /lib64/libnsl.so.3 /lib64/libnsl.so.2
   ```

   RHEL 9.4 supports **17.4.5.0** and above.
5. SUSE Linux Enterprise Edition 15.6 and RHEL 9.4:
   a. Ensure that you have exported Oracle variables on the server where you want to install CA SDM.
   b. Navigate to the root directory extracted from step 2, and start the installation by running the following command:
      ```
      ./setup.sh
      ```
      To install CA Service Management from the non-root user on Unix or Linux, you must have the permissions to execute the sudo command.

      NOTE
      To install CA Service Management from the non-root user on Unix or Linux, you must have the permissions to execute the sudo command. Follow these steps:

      1. Export the appropriate oracle variables and library paths. Navigate to where you have downloaded the CA Service Management installer DVD and execute the below command:
      2. **sudo -E PATH=$PATH ./setup.sh**

For the rest of the installation follow from **Step 5** from Installing CA Service Desk Manager.

Search Server

Consider dedicating a server to install Search Server. The Search server has a built-in clustering feature and can be installed on a standalone setup. For large setups, we recommend installing the search server on three or more servers and manually configuring it to a fault-tolerant cluster.

Default User Information

The following table lists default user information for a typical CA SDM implementation:

OS	User	Default Username	OS Level	How it is Created?
Windows	CA SDM	ServiceDesk	Yes	Automatically
	CA EEM	EiamAdmin	No	Created while configuring CA EEM.

	Microsoft SQL Server	mdbadmin	No	Created in Microsoft SQL Server during configuration.
	Oracle	mdbadmin	No	Created in Oracle database during configuration.
	CA Service Management Admin User	CASMAdmin	No	Manually created.
	Oracle	mdbadmin	No	Created in the MDB during configuration.
	CA Service Management Admin User	CASMAdmin	No	Manually created.
Linux	CA SDM	srvcdesk	Yes	Manually created.
	Oracle	mdbadmin	No	Created in the database during configuration.
	CA Service Management Admin User	CASMAdmin	No	Manually created.

Password Policy

User authentication does not work if the system is using shadow files and there is an **x** in the password field of the /etc/passwd file. Users cannot log in to CA SDM. The password that you have specified for the CA SDM privileged user must conform to the password policy imposed by the network domain. If password confirms to the policy, only then CA SDM configuration works.

Shared Components

- When installing CA SDM, do not install the CA Shared Components in the same directory as the CA SDM installation directory (**NX_ROOT**).
- References to NX_ROOT pertain to the environmental variable containing the installation path of CA SDM. The NX_ROOT variable is set in the **NX.env** configuration file that is used to set environment variables for CA SDM. **Example:** NX_ROOT Definition @NX_ROOT=C:\Program Files(x86)\CA\Service Desk Manager
- Do not specify spaces in the installation media path and folder name to avoid installation failure.

Options Manager

When you are installing CA Service Desk Manager for the first time, the Options Manager **copy_inactive** web option is not installed by default. The links to inactive objects are not copied. Consider the following information when you do not install the **copy_inactive** option:

- CA SDM copies SRELs that point to inactive objects when SREL is required.
  For example, Organization org1 has an inactive Location. When you copy org1, the new organization does not have a location. However, if SREL is required, CA SDM ignores this rule and copies the location. CA SDM ignores the rule and you can copy a CI with an inactive class.
- CA SDM does not copy LREL (many-to-many) relationships to inactive objects. For example, the CI named **CITest1** has a relationship to the inactive Organization org2. When you copy **CITest1**, org2 does not link to the new CI.
- These rules also apply when you copy a ticket, even when you create a ticket from a template. Even if you have installed copy_inactive, the exception to the rule is for Inactive Areas and Categories, which are not copied from existing tickets or populated from the templates.

Database Considerations

- If CA SDM has been configured with one database, and then the configuration is run a second time with a different database type, the configuration does not work. For example, you initially configure the Microsoft SQL Server and then, you configure it again for an Oracle database. The workaround is to restart the computer before the second configuration is run.
- Database connection information, if different, is not accepted in subsequent configurations. If an extra configuration is needed as a result of a change in the database connection information, delete the $NX_ROOT\NX.env file before proceeding.
- Suppose that you are using an Oracle database and you want to use existing tablespaces. Create a Data tablespace that is at least 400 MB, and an Index tablespace that is at least 100 MB before configuring CA SDM.
- Set the Oracle environment variables before you install or migrate CA SDM, as follows:
  - Verify that the ORACLE_HOME variable is set correctly. You must export TWO_TASK variable when Oracle 32-bit client variables are exported on non-windows.
  - Include the 32-bit and 64-bit Oracle libraries in the library path variable LD_LIBRARY_PATH. It is applicable only on LINUX servers.

Web Server Considerations

- Tomcat is set as the default CA SDM web server during the product installation. You can also use the following web servers based on your requirement:
  - **Internet Information Services (IIS)**
    Applicable only on Windows. If you want to use IIS as the CA SDM web server, you must configure the IIS before installing CA SDM. For more information about how to configure IIS, see Configuring IIS.
  - **Apache**
    Applicable only on Linux and Solaris. If you want to use Apache as the CA SDM web server, you must configure the Apache before installing CA SDM.
- If Tomcat is configured with the external authentication on the primary server, set up a secondary server with a webengine and repository daemon. This setup allows users that are not authenticated to use attachments. The Tomcat installation on the secondary server cannot use external authentication.
- The CA SDM installation uses the Tomcat port **8080**. Other CA products, such as CA Asset Portfolio Management or the Service Delivery Suite of products also uses Tomcat port to 8080. If you are installing multiple CA products on the same server, select a port number other than 8080 for subsequent CA product installations. Selecting a different port number helps the products function properly together. To change the Tomcat port number to something other than 8080 for CA SDM, install the product and if the product is already installed, re-run the product configuration and specify an available port number for Tomcat when prompted.
- After CA SDM restart, the CA SDM Tomcat process may not start properly. To start Tomcat properly, stop and restart Tomcat using the following commands:

```
pdm_tomcat_nxd -c STOP
pdm_tomcat_nxd -c START
```

Configuring Internet Information Services (IIS)

Follow these steps:

1. Launch the **Server Manager** on the IIS installed server.
   Server Manager **Dashboard** screen opens.
2. Navigate to **Local Server** and go to the **ROLES AND FEATURES** section.
3. Select the **Add Roles and Features** option from the **TASKS** drop-down list.
   The Add Roles and Features wizard opens.
4. Click **Next** on the **Before You Begin** screen.

The Select installation type screen opens.

5. Select the **Role-based or feature-based installation** radio button and click Next.
   The Select destination server screen opens.
6. Select the **Select a server from the server pool** radio button and ensure that the local server is listed in the Server Pool section. Click **Next**.
7. The **Select server roles** screen opens.
8. Select **WEB SERVER (IIS)** from the Roles list.
   The Add features that are required for Web Server (IIS)? window opens.
9. Click **Add Features** and then click **Next**.
   The Select features page opens.
10. Select the additional IIS features as required and click **Next**.
    The Web Server Role (IIS) screen opens.
11. Click **Next**.
    The Role Services page opens.
12. Select the following from the **Role Services** and click **Next.** You can optionally select the other role services as required.
    - Web Server
    - Common HTTP Features
    - Default Document
    - Directory Browsing
    - HTTP Errors
    - Static Content
    - Health and Diagnostics
    - HTTP Logging
    - Performance
    - Static Content Compression
    - Security
    - Request Filtering
    - Management Tools
    - IIS Management Console
    - Application Development
    - CGI
    - Server Side Includes

    NOTE

    If you do select CGI, then only the web browser launches CA Service Desk Manager. The web browser attempts to open the PDMWEB.EXE file.

    The Confirm installation section screen opens.
13. Review the roles and features that you selected to install, and click **Install**.
14. Click **Close** when the installation is completed.
15. Launch the **Command Line Interface** and run the following command:
    pdm_configure

    NOTE

    To run the command pdm_configure, you must have the privileged user access or root access on the CA SDM server.

Internationalization

- **Multi-byte Characters -** You cannot use multi-byte characters for the user you are logged in as or for the CA SDM privileged username. This applies when you install on multi-byte operating systems such as Simplified Chinese and Japanese. Knowledge searches containing multi-byte Japanese characters works properly with SQL Server only when SQL Server is installed with Windows collation. Ensure to specify the Collation option for your data during the SQL Server installation.

  NOTE

  Do not specify multi-byte characters in the file path names during installation and configuration. Doing so causes failure.

- **UTF-8** - CA SDM must run on UTF-8 locale on Linux and UNIX platforms.
- **Timespan** Symbol names that are provided with the default CA SDM installation (**Administration** tab, **Service Desk**, **Application Data**, **Codes**, **Timespans**) are in English. For example, TODAY, YESTERDAY, THIS MONTH**.** For localized versions of the product, administrators may want to define new localized Timespans as required. Do not delete or modify the default Timespans.
- **Date formats-** in CA SDM do not support international specifiers such as, localized date-picture specifiers. For example, "jj/MM/AAAA" for French. The syntax is limited to generic specifiers such as "DD/MM/YYYY". However, many international short date-time patterns can be constructed from these generic specifiers (for example, "YYYY.MM.DD" would supply a common Japanese short date format).
  International users may want to adjust the **DateFormat** property in **web.cfg** to use the date and date-time formats.
- For outbound plain-text email notifications, the **NX_SMTP_HEADER_CHARSET** and **NX_SMTP_BODY_CHARSET** options may have to be adjusted in the NX.env file. Adjusting the options helps to tag the email message correctly with the character encoding used by the international operating environment. The default values for these options are set to UTF-8 on all platforms.
- International users may want to change the default spell check locale in lexicon to a regional locale. Use the **LEX_LANG** option in the Options Manager.
- **Short File Names** - If you have disabled short file names on your Windows operating system enable these before installing CA SDM. Set both the **TEMP** and **TMP** environment variables to a short file name. For example, **c:\temp**, after enabling short file names. For more information, see Microsoft Knowledge Base Article 121007.
- **Web Interface and Internet Information Services (IIS)**: To configure the web interface with IIS 7.0 on Windows 2008, install the CGI and Metabase Compatibility components of IIS 7.0. Add these components using the Roles section of the Server Manager, after installing the IIS Management Compatibility modules.
- Localized releases of CA SDM are supported only on the matching localized Windows server operating environment. In all cases, configure the **Language for non-Unicode programs** for your system to support the target certified language. This setting is available in the **Regional and Language Options** window in the Control Panel.
  For more information about the localized releases of Windows Server operating systems, see the Microsoft Global Development and Computing Portal.

CA SDM Server Components

CA SDM includes components that work together and run on different servers, depending on the CA SDM configuration. Before you begin your implementation, ensure that you have a basic understanding of the following components:

SDM Server Components Name	Description
Daemon Manager (pdm_d_mgr)	Starts the process sets as defined in the startup file, pdm_startup. By default, the daemon manager tries to start a failed component up to 10 times. To check the status of all CA SDM components, use the **pdm_status** utility. The **pdm_d_refresh** utility instructs the daemon manager to start a new cycle of 10 attempts to start any process marked as previously failed. The daemon manager runs on all CA SDM servers.
Message Dispatcher (sslump_nxd)	Acts as a common bus or message passing system. Components that require to communicate with each other first register with the Message Dispatcher. When a component sends a message, the Message Dispatcher delivers it to those components that have registered to receive that type of message. If two components communicate so much that it would be inefficient to pass the messages through the Message Dispatcher, they create a fast channel between them. You can view a list of registered components using theslstatutility. The message dispatcher runs on the following servers, depending on your CA SDM configuration: • Conventional: **Primary server** • Advanced Availability: **All servers**
Database Agent (platform_agent)	Performs Microsoft SQL Server queries on the database. Database agents adhere to the logical schema of CA SDM and translate the SQL at this level to the physical database platform SQL. **Note:** The database agent detects momentary disconnection and failed queries, and attempts to reconnect and communicate with the database. This is only meant for short outages, such as for a brief network outage and momentary disconnection. It is not meant for long outages such as taking down a database service for maintenance and so forth. The agent only retries the connection for a defined number of times (the default is 3 times), and only for a short time period of a few minutes interval. If the outage is longer than a few minutes, the agent stops trying to connect. CA SDM must be recycled after the database is made available again. The database agent runs on the following servers based on the CA SDM configuration: • Conventional: **Primary server** • Advanced Availability: **All servers**

Virtual Database (bpvirtdb_srvr)	Enables the operation of multiple Object Managers. All Object Managers running on primary or secondary servers connect to the Virtual Database, which arbitrates their access to database agents. For example, when retrieving a new range of ticket reference numbers, the Virtual Database ensures that only one Object Manager at a time accesses the table containing the reference numbers. The Virtual Database also performs caching of database information for Object Managers. The Virtual Database runs on the following servers: • Conventional: **Primary server** • Advanced Availability: **All servers**
Continuous Archive and Purge (arcpur_srvr)	Runs the archive and purge rules as configured by the CA SDM administrator. The Continuous Archive and Purge runs on the following servers: • Conventional: **Primary server** • Advanced Availability: **Background server**
Database Monitor (dbmonitor_nxd)	Monitors changes to common tables in CA MDB, for example, ca_contact. The Database Monitor runs on the following servers: • Conventional: **Primary server** • Advanced Availability: **Background server**
Mail Daemon (pdm_mail_nxd)	Sends outbound email notifications. The Mail Daemon runs on the following servers: • Conventional: **Primary server** • Advanced Availability: **All servers**
Mail Eater (pdm_maileater_nxd)	Accepts inbound email for ticket creation and updates. The Mail Eater daemon runs on the following servers: • Conventional: **Primary server** • Advanced Availability: **Background server**
Notification Manager (bpnotify_nxd)	Manages notifications in a Windows environment. The Notification Manager runs on the following servers: • Conventional: **Primary server** • Advanced Availability: **Application, background, and standby servers**
Spell Checker (lexagent_nxd)	Performs spell checking as requested by users. The Spell Checker runs on all CA SDM servers.
Text API Daemon (pdm_text_nxd)	Creates and updates tickets by external interfaces, such as the command line and email. The Text API daemon runs on all CA SDM servers.
Timed Event (animator_nxd)	Runs the delay times of events. If an implementation has many service types or contracts, the Timed Event engine tracks the active events. You must dedicate the primary server Object Manager entirely to the Timed Event engine. You can configure other Object Managers on the primary or secondary servers for product access as appropriate. The Timed Event daemon runs on the following servers: • Conventional: **Primary server** • Advanced Availability: **Background server**

Time-To-Violation (ttv_nxd)	Calculates projected violation times for service types. The Time-To-Violation daemon runs on the following servers: • Conventional: **Primary server** • Advanced Availability: **Background server**
Proctor Daemon (pdm_proctor_nxd)	(For Windows only) Starts and restarts the CA SDM components, as instructed by the Daemon Manager, on primary and secondary servers. When you install a secondary server, the **pdm_proctor_nxd** process is installed as the CA SDM Remote Daemon Proctor service. When the primary server starts, the Daemon Manager instructs the Remote Daemon Proctor to connect to the Message Dispatcher. The Daemon Manager then instructs the Remote Daemon Proctor to start components on the secondary server. The process for starting the components is defined by the Process Sets in the startup file **pdm_startup**. The Proctor daemon runs on all the CA SDM servers in advanced availability configuration.
Object Manager (domsrvr)	Acts as the server process of CA SDM. When you install a primary server, by default, two Object Managers are installed: one for connections to the product, and one dedicated to the Web Screen Painter. Having multiple Object Managers helps you test your modifications without affecting the production environment. When you install a secondary server, you can configure more Object Managers. There must always be a default Object Manager running on the primary server to which clients such as the Timed Event engine can connect. The Object Manager also caches various records and tables for clients. If you use **pdm_userload** to manipulate these records, you can also use the **pdm_cache_refresh** utility to make the Object Manager retrieve the new data. The Object Manager runs on all the CA SDM servers in advanced availability configuration. The dedicated object managers have been added for heat weather daemon and reminder daemon.
Method Engine (spel_srvr)	Runs SPEL code, event, macros, and so forth, for an Object Manager. We recommend that you run every Object Manager with its own method engine. The Method Engine runs on all CA SDM servers.
Login Server (boplgin)	Manages authenticated user sessions. The Login Server runs on the following servers: • Conventional: **Primary server** • Advanced Availability: **All servers**
LDAP Virtual Database (ldap_virtdb)	Interfaces with an LDAP directory. The Method Engine runs on the following servers: • Conventional: **Primary or secondary server** • Advanced Availability: **Background or application server**

Knowledge Management Search Daemon (bpebr_nxd)	Performs knowledge base searches. Upon CA SDM startup, the **bpebr_nxd** daemon caches Knowledge Document data in its memory from the database. With a large document base, you might have memory resource issues. The **bpebr_nxd** daemon has the following size requirements: Knowledge Management Search • 100,000 documents • Memory size = 332,000 KB The Knowledge Management daemon runs on the following servers: • Conventional: **Primary or secondary server** • Advanced Availability: **Background server**
Knowledge Management/Keyword Indexing Daemon (bpeid_nxd)	Indexes the knowledge base The Keyword Index daemon runs on the following servers: • Conventional: **Primary or secondary server** • Advanced Availability: **Background server**
Knowledge Management FAQ Ratings Daemon (bu_daemon)	The bu_daemon runs on the following servers: • — Conventional: **Primary or secondary server** — Advanced Availability: **Background server**
Knowledge Report Card Daemon (krc_daemon)	Performs the calculations for the Knowledge Management Knowledge Report Card (KRC) feature. This feature enables analysts and managers to display different matrix views of their knowledge contributions and provide feedback about which documents are most effective. The information that is provided can be used to improve the processes of creating knowledge documents and providing the best support to customers. The Knowledge Report Card daemon runs on the following servers: • Conventional: **Primary or secondary server** • Advanced Availability: **Background server**
Knowledge Management Daemon (kt_daemon)	Manages knowledge base administration and knowledge management logic. It also manages notifications and the document approval process. The Knowledge Management daemon runs on all CA SDM servers.
Repository Daemon (rep_daemon)	Manages the attachment repositories for CA SDM and the Knowledge Management/Keyword Search Daemon. The Repository Daemon runs on the following servers: • Conventional: **Primary or secondary servers** • Advanced Availability: **All servers**
Version Control Daemon (pdm_ver_nxd)	Synchronizes the schema files between a primary and secondary server to ensure that they are using the same schema. The Version Control Daemon runs on the following servers: • Conventional: **Primary server** • Advanced Availability: **Background server**
Apache Tomcat Web Server (javaw)	Enables certain features to be implemented, regardless of whether Microsoft Internet Information Server (IIS) is used as the web server for access to CA SDM. These features include Graph Items, Attachments, and Web Services. The Apache Tomcat web server can be administered with the Apache Tomcat controller (***pdm_tomcat_nxd***). The Apache Tomcat Web Server runs on all CA SDM servers.

Web Engine (webengine)	Connects to web browsers through apdmwebcgirunning on a Microsoft IIS or Apache Tomcat web server. There must be at least one web engine for WSP on the following servers. • Conventional: **Primary server** • Advanced availability: **Application, standby, and background servers** This process ensures that Web Screen Painter Schema Designer can write schema files. Web engines are the true client of an Object Manager, which the web browser uses to access the product. Web engine uses cache.htmplweb forms for connected users. You can manipulate the cache using the **pdm_webcache** utility and can see connection statistics using the **pdm_webstat** utility. The Web Engine runs on all CA SDM servers.
RF Broker (pdm_rfbroker_nxd)	(Applicable for advanced availability configuration only). Manage the roles of the servers and controls them across the configuration. This daemon runs on all servers in advanced availability configuration and performs the following tasks: • Acquire information about background and standby servers. • Update information (such as slump ID, node name, server type) in the server status monitor class. • Receive broadcast messages of server status changes. • Quiesce the requests. Register for **SLUMP_NODE_GONE** messages that are forwarded to ServerStatusMonitor objects when the failing node is the background server.
Login User Authentication (bopauth_nxd)	This daemon performs the operating system user account validation. To match a user with an access type, the contact record lookups using the System Login field. If your business provides CA SDM for other client businesses, place the Login server on a secondary server at a single client location. The external authentication is then enabled in access types. Based on the CA SDM configuration, the daemon runs on the following servers: • Conventional: **Primary or secondary (if configured) server** • Advanced Availability: **Background or application (if configured) server**
Interval Logger (pdm_intrvlog_nxd)	The interval logger daemon gathers the debugging information for debugging the system. Runs on all CA SDM servers.
QRY KPI Daemon (kpi_qry_daemon)	Executes the SQL queries for updating the Key Performance Indicators (KPIs) in the database. The QRY KPI daemon runs on the following servers: • Conventional: **Primary server** • Advanced Availability: **Background server**
SYS KPI Daemon (kpi_sys_daemon)	Daemon to collect system type key performance indicators and write to the database. The SYS KPI daemon runs on the following servers: • Conventional: **Primary server** • Advanced Availability: **All servers**
Confirm Database (confirm_db)	A utility to verify database access that runs on all CA SDM servers.
Data Dictionary (ddictbuild)	A utility to build the data dictionary and runs on all CA SDM servers.

Set LogFile (pdm_logfile)	A utility to display or set the log file size limits. The **pdm_logfile** daemon runs on all CA SDM servers.
Report Manager (pcrpt_nxd)	A utility for PC reporting that runs on all CA SDM servers.
RPC Server (rpc_srvr)	Used for making outbound SOAP web service calls and runs on all CA SDM servers.
CA SA Tomcat (sa_tomcat)	CA SATomcat to run support automation and can be configured on any CA SDM server.
Visualizer Tomcat (viz_tomcat)	The Tomcat instance to run visualizer and can be configured on the following servers: • Conventional: **All servers** • Advanced Availability: **Application server**
Knowledge Management Indexing Daemon (bpeid_nxd)	Responsible for indexing the knowledge documents and runs on the following servers: • Conventional: **Primary server** • Advanced Availability: **Background server**
Registration Server (mdb_registration_nxd)	An agent for handling MDB registration requests. The Registration Server runs on the following servers: • Conventional: **Primary server** • Advanced Availability: **All servers**
Search Deamon (es_ebl)	Responsible for the CA SDM data sync with the elastic search server.
Catalog_sync	Deamon syncs new log comments & attachments with Ca. **Note:** Sync only happens for Incidents/Change Order that is created by Catalog.
SDM Telemetry Deamon (sdmtelemetry)	A new singleton process which reads kpi data and push into the segment for Telemetry.
Heat Weather Deamon (pdm_hw_nxd)	Calculates the heat of tickets and weather for analyst **Note:** The Demon runs only when the xFlow is enabled.
Reminder Deamon (reminder_nxd)	Responsible for triggering the follow-up reminders for tick **Note:** The Demon runs only when the xFlow is enabled.

Considerations for Conventional Configuration

Review the following topics before you install CA Service Desk Manager (CA SDM) in Conventional Configuration:

Login Permissions

For CA SDM conventional configuration, perform the following installation tasks:

1. Install Primary Server
2. Install Secondary Servers
3. Install xFlow Interface
4. Install Search Server

Complete the following steps:

- (Windows) Log in as an Administrator and have full Administrative permissions.
- (Linux) Log in as the root user and have the correct permissions to the root account.
- Create the **CA Service Desk Manager Server Privileged** user before you begin the installation.

Installation Home Directory

Complete the following steps:

- Determine the home directory in which you want to install the product. The default home directory for CA SDM (on Windows) is *\Program Files (x86)\CA\Service Desk Manager*.
- Determine the home directory in which you want to install the shared components that the product uses (for example, the Java Runtime Environment (JRE) and Apache Tomcat). The default home directory for the shared components is *\Program Files (x86)\CA\SC*.

Database

CA Service Management supports both Microsoft SQL Server and Oracle databases.

Microsoft SQL Server

Microsoft SQL Server is only natively supported on the Windows platform. For example, if your implementation consists of servers with heterogeneous operating systems like Windows and Linux, select Oracle as the DBMS as Microsoft SQL Server is not supported on Linux.

Obtain the following information:

- – The named instance of the server that is running Microsoft SQL Server
  – The Microsoft SQL Server database user name and password
  – The Microsoft SQL Server database port number

Oracle Server

To ensure that you can configure the product and components on Oracle, obtain the following information:

- – Whether the Oracle database is local or remote
  – Whether you are required to create tablespaces
  – The Net service name
  – The DBA user name and password
  – The data and index tablespace name
  – The complete path for the tablespace
  – JDBC connection information, including the system identifier (SID) and listener port

For configuring Oracle 19c/ 21c database

Install the Oracle 32-Bit/ 64-Bit Client with adminstrator option. Also, create a net service name on the Oracle client to point to the Oracle database server instance.

If you are using an Oracle database and you want to use an existing tablespace:

- Create a Data tablespace that is at least 400 MB, and an Index tablespace that is at least 100 MB before configuring CA SDM.
- Increase the hardware configuration of the DBMS server. Each of the servers is directly connected to the database, leading to an increased resource contention at the DBMS level.

Primary, Secondary Server, and User Configuration

NOTE

If in the Conventional configuration the Primary and Secondary are on separate nodes, and the **xFlow Interface** is deployed on the Secondary server, it is observed that a Database Client is needed on the Secondary Server for the installation to complete successfully.

To ensure that you can configure both the primary and optional secondary servers at the end of the product installation, have the following information available:

- The Domain Name System (DNS) of the primary and secondary servers
- The name or alias of the server
- The name or aliases of the object manager to which you want to establish a connection
- The name or IP address of the secondary server
- The slump socket port to be used for communication by all of CA SDM
- The proctor socket port to be used by the secondary server to listen for messages from the primary server
- To ensure that you can configure account information for product administration at the end of the product installation, have the **CA SDM privileged user name** and password ready
  (Linux) Manually create your privileged user. On Windows, this user is automatically created during the product configuration, but on Linux, you must manually create this user.

Web Interface Configuration

To ensure that you can configure the web interface at the end of the product installation, have the following information available:

- The web host name and web server
- (Windows NT only) The website to be used by the CA SDM server
- The Tomcat port number and socket port number for shutdown requests
- Browsers and Antivirus Software—Complete the following steps:
  - (Firefox) Optionally enable Windows authentication (enterprise single sign-on).
  - Temporarily disable any antivirus software, as it speed up the installation. After the installation, enable your antivirus software again.

For More Information, see IIS Prerequisites.

Web Screen Painter

- Web Screen Painter automatically installs on the primary server when you install CA SDM. You can install Web Screen Painter on separate computers using the installation media.
- File Name Creation: CA SDM requires 8.3 File Name Creation. See your operating system Help and Support documentation for more information.

Considerations for Advanced Availability

CA SDM advanced availability configuration provides higher availability, reduces down times, and supports rolling maintenance. Consider opting for the advanced availability configuration when any of the following factors in your CA SDM environment are true:

- You require a high degree of CA SDM availability.
- You require the CA SDM servers to be more independent and more resilient to failures.
- You require an ability to remove and return the CA SDM servers to service, without bringing down the entire CA SDM installation.

- You require near zero downtime during rolling maintenance.

The biggest difference between conventional (**Primary**/**Secondary**), and Advanced Availability (**Background**, **Standby**, **App servers**), is that in a conventional configuration, only the primary server talks to the database. However, in an Advanced Availability environment, each server independently talks to the database and has its own virtual database process and database agents for better performance.

CA SDM advanced availability configuration offers more resilience to server outages, higher application availability, and supports rolling maintenance with minimal end-user disruption. This configuration requires the following type of servers:

- **Database server for the MDB**
- **One Background Server**
  The Background server takes the place of the Primary server in the conventional mode. It handles all background transactions, for example, triggering events and notifications, checking for conditions, and so on.
- **One or more Standby Servers**
  The Standby server is meant for standby purposes. During server failures and disruptions, the standby server is promoted as the background server when the original background server is revived and repaired.
- **One or more Application servers**
  End-user traffic only hits the Application servers, on which you use an F5 load balancer to balance the load between two (or more) application servers. End-user traffic load does not affect the Background or Standby servers. Use the background server and log in to the CA SDM console to configure the standby and app servers.

When you opt for CA SDM Advanced Availability mode, you perform the following installation tasks:

1. Install Background Server
2. Install Application Servers
3. Install xFlow Interface
4. Install Search Server

Ensure that you have considered the following planning consideration before installing CA SDM Advanced availability configuration:

Login Permissions

Complete the following steps:

- (Windows) Log in as an Administrator and have full Administrative permissions.
- (Non-Windows) Log in as the root user and have the correct permissions to the root account.
- Create the **CA Service Desk Manager Server Privileged** user before you begin the installation.

Installation Home Directory

Complete the following steps:

- Determine the home directory in which you want to install the product. The default home directory for the product is *C:\Program Files (x86)\CA\Service Desk Manager*.
- Determine the home directory in which you want to install the shared components that the product uses (for example, the Java Runtime Environment (JRE) and Apache Tomcat). The default home directory for the shared components is *C:\Program Files (x86)\CA\SC*.

Database Considerations

CA Service Management supports both Microsoft SQL Server and Oracle databases. Select a database as per your environment requirement.

- Microsoft SQL Server is only natively supported on the Windows platform. For example, if your implementation consists of servers with heterogeneous operating systems like Windows and Linux, select Oracle as the DBMS as Microsoft SQL Server is not supported on Linux. Obtain the following information:
  - The named instance of the server that is running Microsoft SQL Server.
  - The Microsoft SQL Server database user name and password.
  - The Microsoft SQL Server database port number.
- To help ensure that you can configure the product and components on Oracle, obtain the following information:
  - Whether the Oracle database is local or remote.
  - Whether you are required to create tablespaces.
  - The Net service name.
  - The DBA user name and password.
  - The data and index tablespace name.
  - The complete path for the tablespace.
  - JDBC connection information, including the system identifier (SID) and listener port.
- To configure a 32-bit/ 64-bit Oracle 19c/ 21c database, do the following:
  - Install the Oracle 32-bit/ 64-bit client with adminstrator option on the server. Also, create a net service name on the Oracle client to point to the Oracle database server instance.
- If you are using an Oracle database and you want to use an existing tablespaces, do the following:
  - Create a Data tablespace that is at least 400 MB, and an Index tablespace that is at least 100 MB before configuring CA SDM.
  - Increase the hardware configuration of the DBMS server. Each of the servers is directly connected to the database, leading to an increased resource contention at the DBMS level.

Advanced Availability Configuration Considerations

Planning Consideration	Checklist
General Advanced Availability Consideration	• Additional hardware costs are expected as you require one background, at least one standby, and one or more application servers. The configuration of standby and background server must be identical. • You require a remote database server and a server to share knowledge tools index files, knowledge tools import/export files, archive purge output files, and attachment repositories. To allow the background and the standby server to access these files, a shared location is required. Linux installations can use NFS mounts. UNC support has been added for Windows installations. • The CA SDM performance is expected to remain the same even with the additional servers for background and standby operations. If you deploy more application servers, the performance can possibly improve. • Each of the servers is directly connected to the database, leading to an increased resource contention at the DBMS level. We recommend increasing the hardware configuration of the DBMS server. • Converting a conventional configuration to an advanced availability configuration is a manual effort. The larger implementations are more complex and you can engage CA Services for assistance. • Install the background and the standby server on the same network subnet to make ping times and latencies from different application servers similar. • Consider locating the background and the standby servers in a central location with a good network connectivity to all your users. The application servers can be located either centrally or they can be distributed across the globe. • An advanced availability configuration must always have **one background server** and at least **one standby server**. • (Recommended) Ensure that both background server and all other standby servers have similar configuration. During a failover when a standby server becomes the new background server, it functions exactly like the old background server. • Any number of standby servers can be configured. To increase the CA SDM availability, consider placing one standby server in your backup data center or the disaster recovery site. • The minimum advanced availability implementation requires one application server. We recommend you to have two application servers to increase the availability and a load balancer to direct web traffic. • Except for CA SDM administrators, no other users are allowed to log in to the background server. Also, no users are allowed to log in to the standby servers. • You can send email notifications from all CA SDM servers. There is no way to limit or configure this option. Every server in the advanced availability configuration must have a connection to the mail server. • An email notification resulting from an end user interaction is sent from the application server to which the user is connected.to. • An email notification resulting from any background processes (such as Animator processing an Attached Event) is send by the **pdm_mail_nxd** utility running on the background server. • During a background server failure, the queued emails are sent when the background server comes up as a standby server.

Failover Consideration	During failover of the background server to the standby server, consider the following: • New users cannot log in during a failover process. • For those users who are already connected, the following actions do not work during a failover. These actions must be repeated by the user after the failover is complete: • — Creating the tickets with attachments. — Downloading the attachments. — Searching Knowledge documents. — Indexing the new knowledge documents. — Inbound emails. — The SLA events that are not triggered until the failover is complete. **Warning!** If you have configured a third-party tool to enable auto-failover of CA SDM servers, you must disable the tool before performing a rolling maintenance.
Database Considerations	• A direct connection exists from each of the servers to the other as well as to the database. If CA SDM server is within DMZ, you are required to open the firewall ports or implement a tunneling proxy technology for this connectivity. Also consider licensing arrangements with your DBMS vendor. • Ensure that you install the database client on all the CA SDM servers. • In advanced availability configuration, all the servers still connect to a single database. As the database can be a single point of failure, consider taking the advantages of database clustering to increase the availability of DBMS. • Microsoft SQL Server is only natively supported on the Windows platform. For example, if your implementation consists of servers with heterogeneous operating systems like Windows and Linux, select Oracle as the DBMS as Microsoft SQL Server is not supported on Linux.

System Configuration, Administration, and Operation	• SOAP Web Services and RESTful Web Services are only supported on the application servers. Web directors can be configured on all CA SDM servers. • The application servers are independent of each other,, therefore, web directors can only service web engines running on the same application server. Web directors cannot service web engines across application servers. • Because the servers in the advanced availability configuration have a higher degree of independence, most command-line utilities function only on the local server. For example, **pdm_status** only shows you the CA SDM processes running on the server on which you are executing the command. The **pdm_webcache** utility only refreshes the form caches on the server on which it was issued. • Unlike conventional configuration, where you start and stop CA SDM processes by **pdm_d_mgr** running on the primary server, in advanced availability, processes on each server are controlled independently. • We recommend you to use the new pdm_server_control instead of pdm_halt command to shut down application servers. Before the shutdown, you can ask the active users to move to another application server. Notify the users using the **quiesce** option. • The pdm_edit utility has been replaced with a new graphical user interface, eliminating many manual configuration file changes required earlier. • Unlike conventional, in the advanced availability configuration, you can use the bopauth_host option from the Options Manager of the background server web UI to specify the authentication server details. You no longer make this configuration change in pdm_edit for the advanced availability configuration. Users cannot log in when the authentication server is unavailable. **Note:** In the conventional configuration, you can use a secondary server to integrate CA SDM with an authentication system running on a different system or even on a different hardware platform. • To prevent rogue servers from joining the advanced availability configuration, all servers must be defined from the background server web UI, before they can be configured. • The role and other information for a server in the advanced availability configuration can be changed from the Administration tab. Stop the CA SDM services before attempting to change a server definition. The server reconfiguration is required for the changes to take effect. • You can change a server between the conventional configuration and the advanced availability configuration by running the configuration utility. Be sure to change all servers in the implementation. Your data remains unaffected, but the manual updates are required to change the settings. • Use the latest **pdm_startup** files when migrating to the latest release version. Do not use the files from previous versions of CA SDM. For example, files that are generated by the **pdm_edit** utility **Warning!** Do not change the **Nx.env** variable manually unless you are instructed to do so. • A new facility generates ticket numbers and numeric record keys. To avoid possible database corruption, never try to load or manually alter the **Key_Control** table. • You cannot move the Knowledge Tools daemons to another server in the advanced availability configuration. The **kt_daemon** runs on all servers. All other Knowledge Tools daemons run as singletons on the background server. • Knowledge Tools now support UNC file paths on Windows

General Web User Interface Considerations	• A web server is required on all the servers of the advanced availability configuration. • When the background server is not available due to failover, a Delayed Server Response form is presented to the web users. Users are allowed to resume their work when the standby server is promoted to the background server. • The value of the web_cgi_url option must point to: • The load balancer if you have more than one application servers. • The application server, if you have only one application server.
Attachment Considerations	• You can increase the availability of attachments by configuring multiple document repository processes to access a shared file repository.
Web Screen Painter Considerations	You can use the Web Screen Painter (WSP) only on the background server. • Follow the recommended procedure to publish WSP form changes so that the updated forms are distributed to all the servers in the installation. For more information, see How to Modify Schema Using Web Screen Painter. • The virtual database layer daemons run on all servers. Install the CA SDM database customizations and object definitions on all the servers.
Reporting Considerations	CABI Jaspersoft can automatically retrieve data from alternate application servers. You can configure this feature to increase the availability of CA SDM reporting. For more information, see Integrate JasperReports Server 8.1.1 with CA Service Management.
Options Manager Considerations	• You can install or uninstall options through Options Manager only from the background server web UI. Use the rolling maintenance procedure to propagate the changes to all servers in the configuration. For more details on performing the rolling maintenance, see the Performing Rolling Maintenance on the CA SDM Server scenario.
Web Services Considerations	• You can configure web services only on the application servers. • The webservices_domsrvr option no longer exists in the Options Manager. You can configure NX_WEBSERVICES_DOMSRVR variable independently on each application server by modifying NX.env.

General Integration Considerations	• The URL to the CA SDM web user interface must point to a properly configured application server. The ca_application_registration contains a URL to your CA SDM installation that is used by other CA products. This URL points to the CA SDM server that is configured first, which is most commonly the background server. Only the CA SDM administrators can change the value through the administration facility. If you are using a load balancer, point this URL to the load balancer instead of a single application server. • Most end-users interaction and integrations with other software products are done at the application server level. There is no failover for the application servers. If the application server is unavailable, the web services for the application server are also unavailable. To increase the application server availability, you can deploy a load balancer to route requests among different application servers • CA Process Automation can be installed on any of the application servers. If the application server goes down, workflow becomes unavailable..
Federated Search Considerations	• To enable and use the federated search feature, select the federated search option while configuring the application servers.

CA SDM Configuration Conversion Considerations

Consider the following when converting the CA SDM server configuration mode:

- You can convert the background server to a primary server only.
- You can convert the primary server to a background server only.
- You can convert the secondary server to a standby server or application server only.
- You can convert the standby or an application server to the secondary server only.

Advanced Availability Additional Considerations

All the planning considerations that are applicable for CA SDM conventional configuration are valid for the advanced availability configuration too. Consider the following before you decide to implement an advanced availability configuration:

General Considerations

Review and implement the following considerations if you are opting for CA SDM Advanced Availability configuration:

- An advanced availability configuration must always have one background server and at least one standby server. (Recommended) Ensure that both background server and all other standby servers have similar configuration. This process ensures that during a failover when a standby server becomes the new background server, it can function exactly like the old background server. Except for CA SDM administrators, no other users are allowed to log in to the background server. Also, no users are allowed to log in to the standby servers. Any number of standby servers can be

configured. To increase the CA SDM availability, consider placing one standby server in your backup data center or the disaster recover site.

- The CA SDM performance is expected to remain the same even with the additional servers for background and standby operations. If you deploy more application servers, the performance can possibly improve.
- The minimum advanced availability implementation requires one application server. We recommend you to have two application servers to increase the availability and a load balancer to direct web traffic.
- Additional hardware costs are expected as you require one background, at least one standby, and one or more application servers. The configuration of standby and background server must be identical.
- You require a remote database server and a server to share knowledge tools index files, knowledge tools import/export files, archive purge output files, and attachment repositories. To allow the background and the standby server to access these files, a shared location is required.
- Linux installations can use NFS mounts. UNC is supported for Windows installations.
- We can send email notifications from all CA SDM servers. Every server in the advanced availability configuration must have a connection to the mail server.
- Install the background and the standby server on the same network subnet to make ping times and latencies from different application servers similar.
- Consider locating the background and the standby servers in a central location with a good network connectivity to all your users. The application servers can be located either centrally or they can be distributed across the globe.
- An email notification resulting from an end user interaction is sent from the application server to which the user is connected.
- An email notification resulting from any background processes (such as Animator processing an Attached Event) are sent by the pdm_mail_nxd utility running on the background server.
- During a background server failure, the queued emails are sent when the background server comes up as a standby server.

System Configuration, Administration, and Operation Considerations

Consider the following before you implement CA SDM Advanced Availability Configuration:

- SOAP Web Services and REST Web Services are only supported on the application servers. Web directors can be configured on all CA SDM servers. As the application servers are independent of each other, web directors can only service web engines running on the same application server. Web directors cannot service web engines across application servers.
- Since the servers in the advanced availability configuration have a higher degree of independence, most command-line utilities function only on the local server. For example, pdm_status only shows you the CA SDM processes running on the server on which you are executing the command. The pdm_webcache utility only refreshes the form caches on the server on which it was issued.
- In advanced availability, processes on each server are controlled independently. This is unlike conventional configuration, where you have to run **pdm_d_mgr** on the primary server to start and stop CA SDM processes.

  NOTE

  We recommend that you use the new **pdm_server_control** instead of **pdm_halt** command to shutdown application servers. Before the shutdown, you can move active users to another application server. This can be done by notifying users that are using the **quiesce** option.
- Unlike conventional, in the advanced availability configuration, you can use the **bopauth_host** option from the **Options Manager** of the background server Web UI to specify the authentication server details. Users cannot log in when the authentication server is unavailable.

NOTE

The pdm_edit utility is replaced with a new graphical user interface, eliminating many manual configuration file changes required earlier.

- Unlike conventional, in the advanced availability configuration, you can use the **bopauth_host** option from the Options Manager of the background server Web UI to specify the authentication server details. You no longer make this configuration change in **pdm_edit** for the advanced availability configuration. Users cannot log in when the authentication server is unavailable.
- In the conventional configuration, you can use a secondary server to integrate CA SDM with an authentication system running on a different system or even on a different hardware platform.
- To prevent rogue servers from joining the advanced availability configuration, all servers must be defined from the background server Web UI, before they are configured.
- The role and other information for an advanced availability server can be changed from the **CA SDM Console, Administration** tab . Stop the CA SDM services before attempting to change a server definition. The server reconfiguration is required for the changes to take effect.
- You can change a server between the conventional configuration and the advanced availability configuration by running the configuration utility. Be sure to change all servers in the implementation. Your data remains unaffected, but manual updates are required to change the settings.
- New environment variables have been added to NX.env to support the advanced availability and the system automatically maintains the variable values.

WARNING

Do not change NX.env manually unless instructed to do so.

- Use the latest **pdm_startup** files while migrating/upgrading CA SDM. Do not use the files from previous versions of CA SDM. For example, files that are generated by the pdm_edit utility.
- A facility generates ticket numbers and numeric record keys. To avoid possible database corruption, never try to load or manually alter the **Key_Control** table.

NOTE

In Advanced Availability configuration, ticket numbers and numeric record keys, may be out of order. This is not an error. Other fields can be used for sorting based on timestamp such as Open Date for tickets.

- You cannot move the Knowledge Tools daemons to another server in the advanced availability configuration. The **kt_daemon** runs on all servers. All other Knowledge Tools daemons run as singletons on the background server.
- Knowledge Tools support UNC file paths on Windows for the location of the EBR index files and input/output files that are used by the Knowledge Export Import facility. This feature is available for both the advanced availability and the conventional configurations.

WARNING

EBR Index Files path & KEIT Files path must refer to the same UNC credentials and the path must reside on a same server to support this.

- Version control distributes the files (for example, htmpl, .maj, .mod, and .sch) that are configured in the server_secondary_custom.ver file from the background server. Upon startup, the standby or the application server runs the version control client to pull updated files from the background server.
- Archive/Purge runs on the background server and supports UNC file paths on Windows for output files. This feature is available in the advanced availability and the conventional configurations.
- Attachments on incoming emails are now stored by pdm_maileater when the repository is on a remote server.
- Ensure that you allow the daemon manager to modify the procsets and do not run the pdm_dmnmode command for this action.

CA SDM Configuration Conversion

Consider the following before you start converting a conventional configuration to the advanced availability or vice-versa:

- You can convert the background server to a primary server only.
- You can convert the primary server to a background server only.
- You can convert the secondary server to a standby server or application server only.
- You can convert the standby or an application server to the secondary server only.

Failover Considerations

During a failover of the background server to the standby server, consider the following:

- New users must not log in. For users who are already connected, the following actions will not work during the failover process and must be attempted again (retried) by the user after failover is complete:
  - Creating tickets with attachments.
  - Downloading attachments.
  - Searching Knowledge documents.
  - Indexing new knowledge documents.
  - Inbound email.
  - The SLA events that are not triggered until the failover process is complete. .

    NOTE

    If you are using a third-party tool to auto-failover CA SDM servers, you must disable it before starting rolling maintenance.

Web User Interface and Web Server Considerations

Web User Interface

A web server is required on all servers having an advanced availability configuration. When background server is not available due to failover, a delayed server response form is presented to the web users. Users are allowed to resume their work when the standby server is promoted to the background server. The value of the **web_cgi_url** option must point to:

- The load balancer if you have more than one application servers.
- The application server, if you have only one application server.

Web Services

You can configure web services only on the application servers. The **webservices_domsrvr** option no longer exists in the **Options Manager**. You can configure the **NX_WEBSERVICES_DOMSRVR** variable independently on each application server by modifying the **NX.env** file.

Integration Considerations

- The URL to the CA SDM web user interface must point to a properly configured application server. The *ca_application_registration* contains a URL to your CA SDM installation that is used by other CA products. This URL points to the CA SDM server that is configured first, which is most commonly the background server. Only the CA SDM administrators can change the value through the administration facility. If you are using a load balancer, point this URL to the load balancer instead of a single application server.
- Most end-users interaction and integrations with other software products are done at the application server level. There is no failover for the application servers. If the application server is unavailable, the web services for the application server are also unavailable. To increase the application server availability, you can deploy a load balancer to route requests through different application servers

Database Considerations

A direct connection exists from each of the servers to the other as well as to the database. If the CA SDM server is within DMZ, you are required to open the firewall ports or implement a tunneling proxy technology for this connectivity. Also consider licensing arrangements with your DBMS vendor.

- Ensure that you install the database client on all the CA SDM servers.
- In advanced availability configuration, all servers connect to a single database. As the database can be a single point of failure, consider taking the advantages of database clustering to increase the availability of DBMS.
- Microsoft SQL Server is only natively supported on the Windows platform. For example, if your implementation consists of servers with heterogeneous operating systems like Windows and Linux, select Oracle as the DBMS since Microsoft SQL Server is not supported on Linux.

Options Manager Considerations

You can install or uninstall options through Options Manager only from the background server web UI. Use the rolling maintenance procedure to propagate the changes to all servers in the configuration. For more details on performing the rolling maintenance, *see the Performing Rolling Maintenance on the CA SDM Server scenario.*

Web Screen Painter Considerations

- You can use the Web Screen Painter (WSP) only on the background server.
- Follow the recommended procedure to publish WSP form changes so that the updated forms are distributed to all the servers in the installation. For more information, see *Web Interface Modifications*.
- The virtual database layer daemons run on all servers. Install the CA SDM database customizations and object definitions on all the servers.

xFlow Interface Considerations

xFlow Interface uses Jointjs and requires certain files for successful installation. Jointjs is a JavaScript library which helps to visualize the SDM classic workflow as a graphical representation. The xFlow Interface uses Jointjs and requires certain files for successful installation. You must download the required Jointjs files before starting the installation.

Follow these steps:

1. Download the CA Service Management **CA SERVICE MANAGEMENT 17.4 3RD PARTY COMPONENTS.iso** from Broadcom Support.
2. Extract the **Jointjs** folder from the **Jointjs.zip** file available in the DVD.
3. Verify that Jointjs folder includes the following files:
   a. **joint.min.js**
   b. **joint.min..css**
4. Note the path where you placed the Jointjs folder that includes the files.

> **NOTE**
>
> When you run the CA Service Management 17.4 installer, you are required to browse and provide the Jointjs folder path from where you have saved the files in the xFlow Interface configuration details page.

CABI JasperReports Server (Insights) Considerations

This article contains the following topics:

> **NOTE**
>
> CA Service Management no longer supports role switching for Insights App. The default OOTB role for Insights app is available with CA Service Management 17.4, and it is similar to the Out-of-the-Box (OOTB) Reporting

role of an Access Type for a contact. In case, if you change the default role of the app to any other role than the Reporting role, ensure that you consider the following:

- Aggregated Reporting reflects data as per the new default role the app
- Transactional Reporting honors only reporting role of the contact

Ensure that the reporting role of an access type and default role of an access type for Insights App is same.

NOTE

ODBC is deprecated for CA Service Management 17.4 and for JasperReports Server - Transactional Reports.

CABI JasperReports Server 17.4 uses the JDBC driver client which only supports one instance of CA SDM. If you setup JasperReports Server in a clustered setup, each JasperSoft Server instance can point to a different CA SDM server. This helps in scalability and better performance. We recommend that you use a replicated database and a shadow/passive CA SDM for Transactional reporting. If you configure Transactional reporting on an online or active CA SDM server, the performance of the online/active system may get impacted. For more information, see Replicated Database for Offline Reporting.

You can add multiple domsrvrs for better performance of Transactional reporting through the JDBC driver. For more information, see Configure Multiple Domsrvr for Transactional Domain Reports.

NOTE

CA Service Management Installer automatically sets the CA SDM data source for CABI JasperReports Server. However, if you are manually editing the CA SDM data source through CABI JasperReports Server, you must restart the CABI services.

NOTE

If you have installed CA SDM with Oracle database on a Server (Example: Server **A**) and installed CABI JasperSoft on another server (Example: Server **B**), in order to integrate CABI with CA Service Management Install & Integrate CABI JasperReports server with CA Service Management), you must install the Oracle Client on the CABI JasperSoft Server and establish an Oracle -Server-Client connection.

Upgrade Considerations

NOTE
As a prerequisite, upgrade to JasperReports Server 8.1.1.

Refer Upgrade JasperReports Server from 7.9 to 8.1.1 for upgrading to JasperServer Reports 8.1.1

Enable KPI Option "kpi_ticket_data_table"

The KPI option "kpi_ticket_data_table", enables the KPI daemon to collect data whenever CA SDM tickets are opened, closed, or certain fields are modified. Ticket data is written into the usp_kpi_ticket_data database table and is available for generating web-based reports. For more information about enabling the kpi_ticket_data_table in CA Service Desk Manager, see Options Manager.

- The "kpi_ticket_data_table" option must be enabled before generating the report. Not enabling the “kpi_ticket_data_table” leads to inconsistent data in the report.
- To ensure that the data is consistent and correct in the report, configure the Trend Start Date to a date later than that of CA Service Management implementation.
- The "kpi_ticket_data_table" option is enhanced to capture additional information while creating tickets. The tickets that are created prior to CA Service Management 17.4 implementation/upgrade, do not include this additional information.

So, the reports which include these ticket details will show the incorrect data, if Trend Start Date is configured to a date prior than that of your CA Service Management 17.4 implementation. The following reports are impacted:

- Incidents Cost for Top Categories (USD)
- Incidents Cost Trend for Top Categories (USD)
- MTTR for Top Categories (In Hours) Report
- MTTR Quarterly Trend for Top Categories (In Hours) Report
- MTTR Weekly Trend for Top Categories (In Hours) Report
- MTTR Yearly Trend for Top Categories (In Hours) Report

CA Service Catalog Considerations

The CA Service Catalog products and components are an integrated set of business applications that a Service Delivery Manager uses to manage services. To optimize your use of CA Service Catalog and the system resources that it uses, prepare your environment for a successful implementation.

As a best practice, verify that all CA Service Catalog systems are *geographically collocated.*

Review the following considerations before you start installing CA Service Catalog:

Network Share

When you install CA Service Catalog products and components on a network share, map a drive letter to this share. Alternatively, copy the installation image to a local folder with a short path name, for example, **C:** or **C:\Temp**. Run the installation programs locally from this folder.

NOTE

Avoid long path names because they can cause problems during the installation process. The maximum length of a path name in Windows is 260 characters. If the path names exceed this limit, the installation (or upgrade) can fail. Verify that the path name where you install CA Service Catalog does not exceed this limit.

Service Provider Business Unit ID

During the CA Service Catalog installation, you can specify the **service provider** business unit ID. This ID specifies the top level (root) business unit. All other business units are structured under the root business unit. As a best practice, specify your company domain name or a short version of your company name for this ID.

NOTE

After you have installed CA Service Catalog, you cannot change the business unit ID of the service provider. But, you can change the business unit login ID and the business unit name service provider.

Determine the Authentication Methods to Use

Administrators can authenticate users in CA Service Catalog by any one of the following methods:

- CA EEM alone
- CA EEM with an external directory. For example: an LDAP directory, such as Microsoft Active Directory
- Windows NTLM authentication

You can specify whether to use CA EEM as standalone or with an external directory. When you use CA EEM standalone, CA EEM stores the user information and passwords in its data store. When you use CA EEM with an external directory, such as Microsoft Active Directory, the external directory stores the users and passwords in its data store. If the client system uses a Windows domain, you can configure CA Service Catalog to use NTLM authentication. NTLM authentication enables a user who has been authenticated to the domain to skip the login page.

Failover Mechanisms

As part of your implementation, you can perform the following tasks to provide failover mechanisms:

- Deploy CA Service Catalog in a cluster.
- If you use CA Process Automation, deploy clustering in CA Process Automation.
- Use *database* clusters. CA Service Catalog components are also compatible with database clusters which are recommended for environments experiencing heavy load.
- For information about database clustering, see your DBMS documentation.
- Use a load balancer. Clustering requires a load balancer. To maximize the uptime of CA Service Catalog, include the load balancer and cluster computers in your failover plan.
- Implement clustering on the load balancer computer.
- Move user-generated files from the local file system to a filestore (a central location) on a high-availability network shared file system. CA Service Catalog maintains several user-generated files on the local file system. These files include forms and XSL and XML customizations.
- If you are using CA EEM for authentication, cluster CA EEM, using operating system level clustering.
- For information about clustering and implementing failover with CA EEM, see CA EEM Documentation.
- Improve the robustness of the hardware used in your environment, by using all applicable means, including RAID hard disks, redundant power supply, and network cards. For more information, see your hardware documentation.

Session Management

Session management is very important for performance. Use a process automation tool such as CA Process Automation to handle session management effectively.

Effective use of web service sessions is crucial for maintaining throughput as your environment scales up. Creating a web service session is a task which requires multiple invocations of authentication and authorization logic and accounts for the majority of time and effort spent when using web services. Design CA Process Automation processes and other web service clients to avoid creating extra web service sessions. Exception handling should create a session only when the exception is known to be the result of an invalid or expired session.

CA Service Catalog Integration with CA Process Automation

If you want to integrate CA Service Catalog with CA Process Automation, ensure that:

- The CA Service Catalog computer name must not begin with a number.
- If you are using a load balancer for CA Service Catalog or CA Process Automation, the computer name of the load balancer must not begin with a number.

Failure to meet these requirements can result in a web service call error. For example:

```
Caused by: com.sun.xml.messaging.saaj.util.JaxmURI$MalformedURIException: Host is not a well formed address!
```

CA Asset Portfolio Manager Considerations

NOTE
We do not recommend the installation of CA Asset Portfolio Management components, except the Management Database, on a 64-bit computer that hosts a 64-bit Oracle database server.

NOTE
For Oracle database in CA Service Management Solution deployment, ensure that the Oracle-32 bit path is set on top of the Environment path variable list for CA APM.

WARNING

CA Asset Portfolio Management (APM) architecture is highly database driven and has no rollback mechanism for database-related changes. Hence, CA Service Management, currently does not provide support for uninstallation of a CA APM patch. The only mechanism to revert database changes is by restoring database backup, which may result in data loss.

Perform the following pre-installation tasks as part of CA APM installation and configuration:

WARNING

CA APM has time-sensitive processes. Verify that all servers are set to their correct date and time with their respective time zones.

NOTE

If Microsoft Visual C++ Redistributable 2015 32-bit is a pre-requisite for CORA functionality. If not installed, download and install Microsoft Visual C++ Redistributable 2015 32-bit on the Application server of CA APM.

NOTE

If CA APM is installed on a SQL Server database, install the 64-bit SQL Native Client 11.0 on the APM Application server to ensure CORA functionality works, as CORA uses the SQLNCLI11 provider to connect to the database. Download the 64-bit SQL Native Client 11", named as Microsoft® SQL Server® 2012 Native Client from: https://www.microsoft.com/en-us/download/confirmation.aspx?id=50402

Verify the Internet Information Services Installation

Before you install CA APM, Install IIS and ASP.NET on all applications and web servers. If the service is not on a server, add the service before you begin the installation.

Perform the following steps:

1. Navigate to Windows Server Manager.
2. From **Manage** menu, select **Add Roles and Features**.
3. Follow on-screen instructions and provide the installation type and destination server details.
4. In the Select server roles pane, under **Roles**, expand **Application Server**, and select the appropriate ASP.NET version.
   Click **Next**.Follow the on-screen instructions and complete the installation.
   ASP.NET is now registered with IIS.
5. Refer Operating System Requirements for CA Asset Portfolio Manager ITAM.

Oracle Real Application Clusters (RAC) Considerations

Oracle RAC provides high availability to applications by removing the single server as a single point of failure. You can deploy one or a combination of CA Service Management solution products as required. This section describes how to deploy the CA Service Management Products (CA Service Desk Manager, CA Service Catalog, and CA IT Asset Manager) with Oracle Real Application Clusters (RAC).

NOTE

For more information about installing Oracle RAC, see the Oracle documentation.

Ensure to verify and complete the following Oracle RAC installation prerequisites:

- Download Oracle Database (Oracle Grid infrastructure and database) software from Oracle Downloads. Create the Oracle database (SID).
- The Single Client Access Name (SCAN) must be defined in the Domain Name Service (DNS) or Oracle Grid Naming Service (GNS).
- Create at least one single DNS or GNS name that resolves to three IP addresses using a round-robin algorithm. For the installation to succeed, the SCAN must resolve to at least one IP address.
- SCAN Virtual IP (VIP) addresses must be on the same subnet as the virtual IP addresses and public IP addresses.
- The virtual machines can be limited to 2 GB of swap but this results in a prerequisite install check failure. The best practices define a 3+ GB of swap.
- Ensure that you have Windows Server 2016/ 2019/ 2022 with Oracle 19c.
- Install the Oracle Grid Infrastructure following the Oracle Documentation installation procedures.

How to Install Oracle RAC With CA Service Management

To install Oracle RAC with CA Service Management (CA Service Desk Manager, CA Service Catalog, and CA IT Asset Manager), complete the following steps:

Follow these steps:

1. Install Oracle 19c 32-bit/ 64-bit client with administrator option on system or systems where you plan to install the CA Service Management products.
2. Create a TNS entry on the system or systems.
3. Enable the client-side connect-time failover by setting FAILOVER=ON in the corresponding client-side TNS entry:

```
TESTRAC =
(DESCRIPTION =
(ADDRESS_LIST=
(FAILOVER = ON)
(ADDRESS = (PROTOCOL = TCP)(HOST = <scan_host_name>)(PORT
= <1521>))
)(CONNECT_DATA = (SERVICE_NAME = <netservice name>))
```

Install the CA Service Management Products with Oracle RAC

For Installing the CA Service Management Product or products with Oracle RAC, perform the following steps:

Follow these steps:

1. Launch the CA Service Management installer.
   For more information, see Installing CA Service Management 17.4.
2. Select **CA Service Management** from Select the Required Installer screen.
3. Review and accept the license agreement information.
4. Select **Oracle** as the database type in the Database Configuration Screen and enter the following Oracle database details
   a. **Database Server**: Enter the Oracle database host name <SCAN_HOST_NAME>.
   b. **Tablespace Path (on DB Server)**: Enter +DATA.
      Complete all fields on the Oracle Database Configuration Screen.
5. Select the required CA Service Management product or products.
6. Follow the on-screen instructions on the installer wizard and complete the CA Service Management installation.

Installing CA Service Management 17.4

CA Service Management installer installs, upgrades, configures and integrates CA Service Desk Manager, CA Service Catalog, and CA Asset Portfolio Management. CA Service Management common installer performs prerequisite

installation checks and mandatory validations before installing the solution products. CA Service Desk Manager (SDM) installation includes xFlow Interface, Insights, Service Point, and Search Server.

WARNING

If you are using CA EEM configured with Active Directory, ensure to create **CasmAdmin** user before you install CA Service Management.

NOTE

mdbadmin is the default user across all CA Service Management products.

Follow these articles:

- Installing Common Components (CA EEM, Jaspersoft, and CA Process Automation)
- Enable and Configure Telemetry Services
- Installing CA Service Desk Manager
- Installing Web Screen Painter
- Installing CA Service Catalog
- Installing CA Asset Portfolio Management

Installing Common Components (CA EEM, Jaspersoft, and CA Process Automation)

The common components are software components that are used by different CA Technologies products. This section provides an overview of the CA components used by CA Service Management solution describes how to install and configure them.

Install the following CA Common Components and configure them with CA Service Management solution.

- Jaspersoft for CA Service Management
- Install CA Process Automation for CA Service Management
- Install CA EEM for CA Service Management

Jaspersoft for CA Service Management

Jaspersoft Studio allows you to create and customize reports. Once you have Jasper Studio installed, configure the data source, and connect it to your JasperReports Server so that you can create, edit and publish reports to JasperReports Server. JasperReports Server is a high-performance standalone and embedded Business Intelligence (BI) platform that provides rich reporting and analysis capabilities.

This article contains the following topics:

- Jaspersoft Studio
- JasperReports Server

Jaspersoft Studio

Jasper Studio allows you to create and customize the reports. Once you have Jasper Studio installed, configure the data source, and connect it to your Jasper Reports Server so that you can edit or create reports, and publish them to JasperReports Server.

TIP

We recommend that you save the customized reports with a different name. This prevents the customized reports from being overwritten when you import the same reports again.

Visit the Jaspersoft Community for related tutorials, tips and tricks, and other helpful information.

Integrate CA Service Management using one of these Jaspersoft Studio versions.

- Integrate Jaspersoft Studio 8.1.0 with CA Service Management
- Integrate Jaspersoft Studio 9.0.3 with CA Service Management
- Integrate Jaspersoft Studio 9.0.0 with CA Service Management

Integrate Jaspersoft Studio 8.1.0 with CA Service Management

CA Service Management 17.4 and later provide the ability to integrate Jaspersoft Studio 8.1.0. This integration enables reporting users to design and run report templates, write complex expressions, and layout visual components. The connection between CA Service Management's data access layer and Jaspersoft Studio is established via the JDBC driver. All the existing Out-of-the-box reports built for Jaspersoft Server work with Jaspersoft Studio as well.

> **NOTE**
> ODBC Driver is not supported on CA Service Management 17.4.

Download and Install Jaspersoft Studio Professional 8.1.0

To download and install Jaspersoft Studio 8.1.0 in your environment, perform the following steps:

1. Download the **CA Business Intelligence JasperSoft Studio 8.1.0 for CA Service Management.iso** installer from Broadcom Support.
2. Right-click the ISO and select **Mount**.
3. Right-click the **TIB_js-jss_8.1.0_windows_x86_64** application and run as **Administrator**.
4. Follow the Installation Wizard instructions to install Jaspersoft Studio 8.1.0 in a location of your choice.
5. After installing Jaspersoft Studio, the out-of-the-box installation package (For example, C:\Program Files\TIBCO \Jaspersoft StudioProfessional-8.1.0) displays the Evaluation License Version.

Update Jaspersoft Studio License (Evaluation License to PerpetualLicense)

To change the Evaluation License (default) provided with Jaspersoft Studio 8.1.0 to Perpetual or Full License, perform the following steps:

1. Navigate to where you have downloaded and extracted CA Service Management 17.4.
2. Navigate to **Filestore**, **Jasper**, **8.1.1**, **License**.

   > **NOTE**
   > Jaspersoft Reports 8.1.1 Install folder contains the Jaspersoft Studio Professional 8.1.0 License Information.
3. Now, launch Jaspersoft Studio 8.1.0.
4. Navigate to **Help**, **License Manager**, **Install New License**.
5. Browse and click open the License folder which is available in step 2 and select **jasperserver.license**.
6. Click **OK**.

Create Data Adapter

Perform the following steps to create a Data Adapter:

1. Open Jaspersoft Studio.
2. Right-click a project in Project Explorer and select **New**, **Data Adapter**.
3. In the Data Adapter File window, select a project where you want to save the data adapter file. The selected project must contain the report(s) that you want to use with your data adapter. The Data Adapter Wizard is displayed.
4. Enter a name for your adapter in the Data Adapter Wizard and click **Next**
   For example, Database JDBC Connection.

5. Provide the CA Service Desk Manager (SDM) connection details.
6. In the Database Location tab, enter the properties required by the data adapter type. For example, for database JDBC connection, select the JDBC driver, set the URL, and provide the CA SDM database username and password:
   a. JDBC Driver: com.ca.sdm.dal.sql.jdbc.driver.DalJdbcDriver
   b. JDBC URL: jdbc:sdm:bop:@<SDM Host Name>:2100;<UserUuid>=<ServiceDeskUUID>
   c. UserName: ServiceDesk
   d. Password: Encrypted Password must be used. Perform the following steps to encrypt the password:
      a. Navigate to CASM 17.4_DVD\filestore\Jasper\Utils folder.

         NOTE
         Ensure that java is added to PATH env. variable to run the below command.

      b. Run the following command:

         ```
         gen_passwd.bat <servide desk username> <service desk password>
         ```

         For example: Username: servicedesk. Password: servicedesk password (example: see the below image in Linux environment)

7. In the Driver Classpath tab, select the list of jars.
8. Provide the library location for the jars, the same jars as the Jaspersoft Reports 8.1.0 `DVD \filestore\Jasper \8.1.1\ExternalAuthJars`
9. a. BOPIntegration.jar
   b. domsrvr_utils.jar
   c. log4j-api-2.17.1.jar
   d. log4j-core-2.17.1.jar
   e. DurationFormatter.jar
   f. sd-utils.jar
   g. slump.jar
10. To test the connection, click the **Test button**.
11. Click **Finish** to create the Adapter.

Create a Report and Publish

To create a report in Jaspersoft Studio and publish it to your existing JasperReports Server (8.1.0), see TIBCO Documentation.

Create Subreports

To create subreports, perform the following steps:

Pass string parameters to subreports

Testing subreport in Jaspersoft Studio

Publish the Subreport in Jaspersoft Studio

Pass string parameters to subreports

Consider the following example scenarios:

Jaspersoft Studio Reports - Example 1

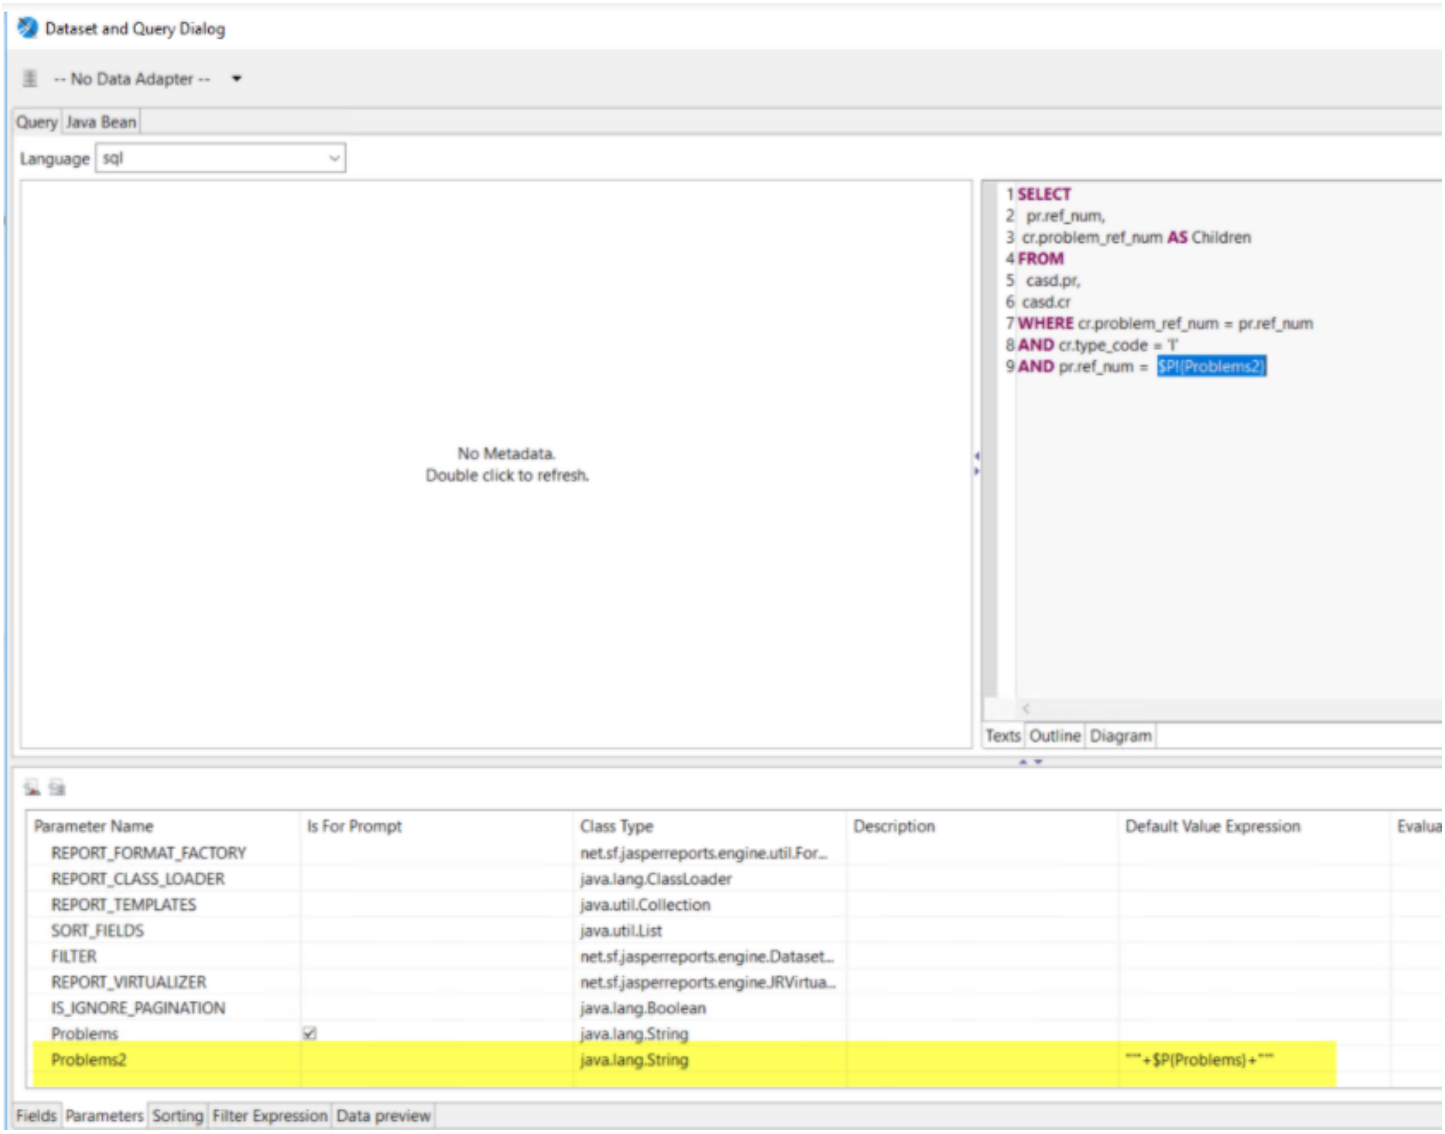
Jaspersoft Studio Reports - Example 2

Jaspersoft Studio Reports - Example 1

In this example report, a list of problem tickets is presented with a subreport to show the child Incidents related to each problem. The following query shows a parameter, defined as **java.util.Collection**, to prompt the user to enter or select a list of problem tickets. The parameter is flagged for **Is For Prompt**.

```
SELECT casd.pr.id,
casd.pr.ref_num,
casd.pr.summary,
casd.pr.group_name,
casd.pr.impact_symbol,
casd.pr.priority_symbol,
casd.pr.urgency_symbol,
casd.pr.status_symbol,
casd.pr.rootcause_symbol,
casd.pr.open_date,
casd.pr.description,
casd.pr.change_summary,
casd.pr.change_chg_ref_num,
casd.pr.caused_by_change_order_summary,
casd.pr.caused_by_change_order_chg_ref_num,
casd.alg.type,
casd.alg.type_symbol,
casd.alg.description,
casd.alg.last_mod_dt
FROM casd.alg,
casd.pr
WHERE $X{IN,pr.ref_num, Problems} AND
pr.persistent_id = alg.call_req_id
```

NOTE
Ensure that your subreport string parameter has a default expression to hard code single quotes. Also, this parameter must not be set for prompting the user to enter or select a list of problem tickets.



Jaspersoft Studio Reports - Example 2

In this example, the main report has data about one or more change orders. The subreport returns the correct properties for the change orders as a list.

Perform the following steps:

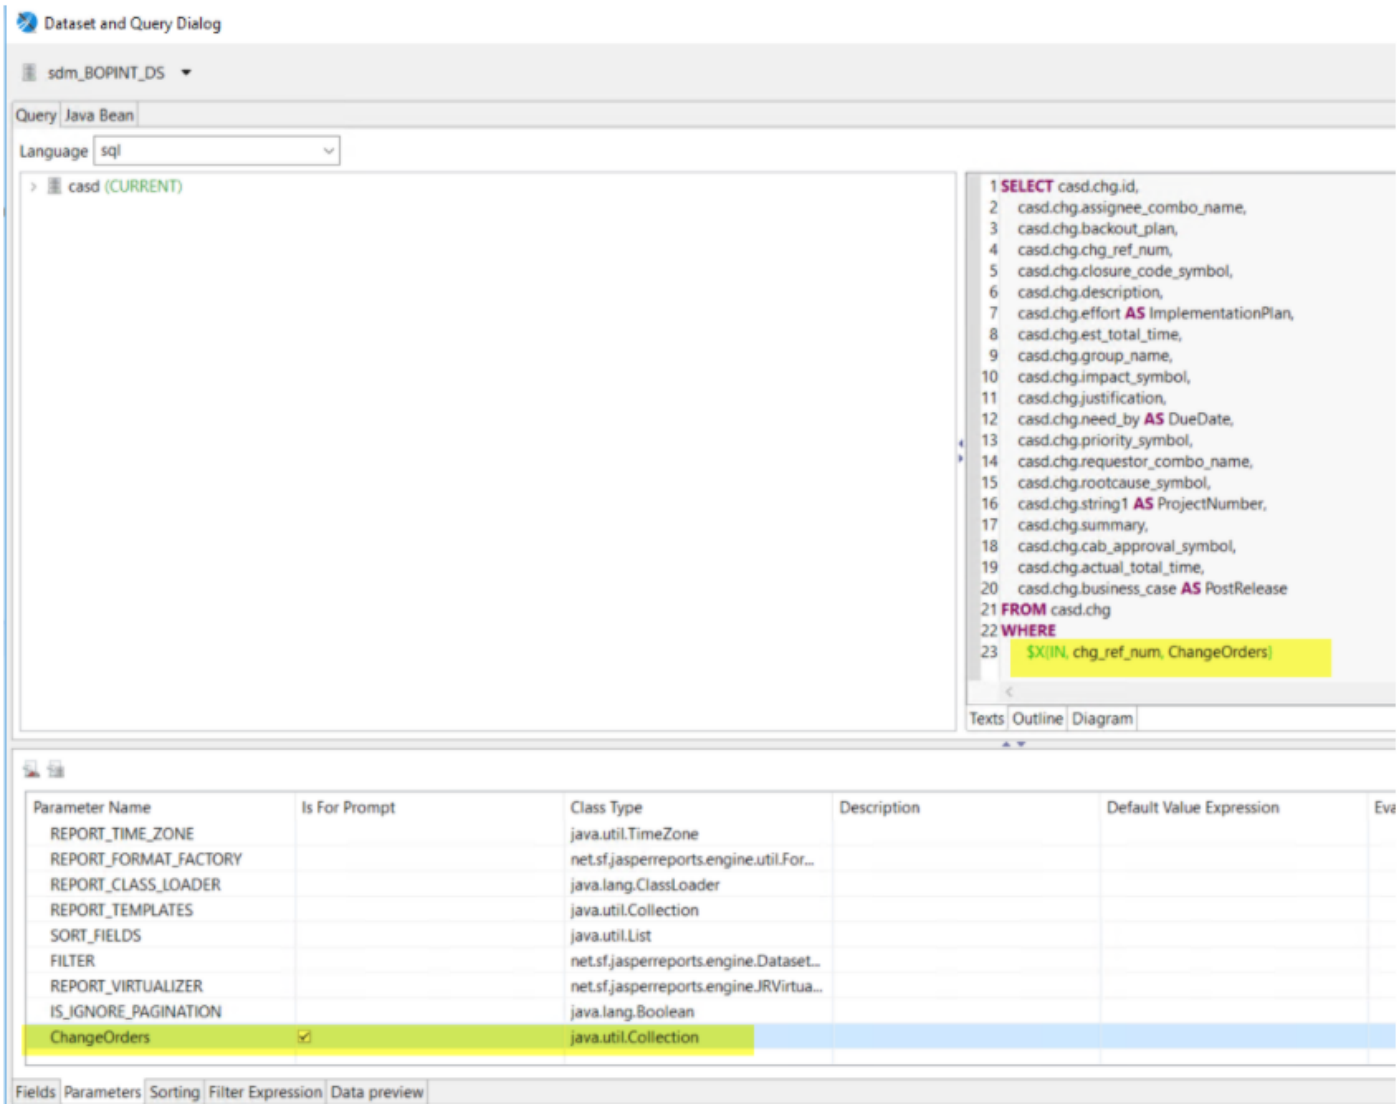
1. Run the following example query for the main report:

```
SELECT casd.chg.id,
casd.chg.assignee_combo_name,
casd.chg.backout_plan,
casd.chg.chg_ref_num,
casd.chg.closure_code_symbol,
casd.chg.description,
casd.chg.effort AS ImplementationPlan,
casd.chg.est_total_time,
```

```
casd.chg.group_name,
casd.chg.impact_symbol,
casd.chg.justification,
casd.chg.need_by AS DueDate,
casd.chg.priority_symbol,
casd.chg.requestor_combo_name,
casd.chg.rootcause_symbol,
casd.chg.string1 AS ProjectNumber,
casd.chg.summary,
casd.chg.cab_approval_symbol,
casd.chg.actual_total_time,
casd.chg.business_case AS PostRelease
FROM casd.chg
WHERE
$X{IN, chg_ref_num, ChangeOrders}
```

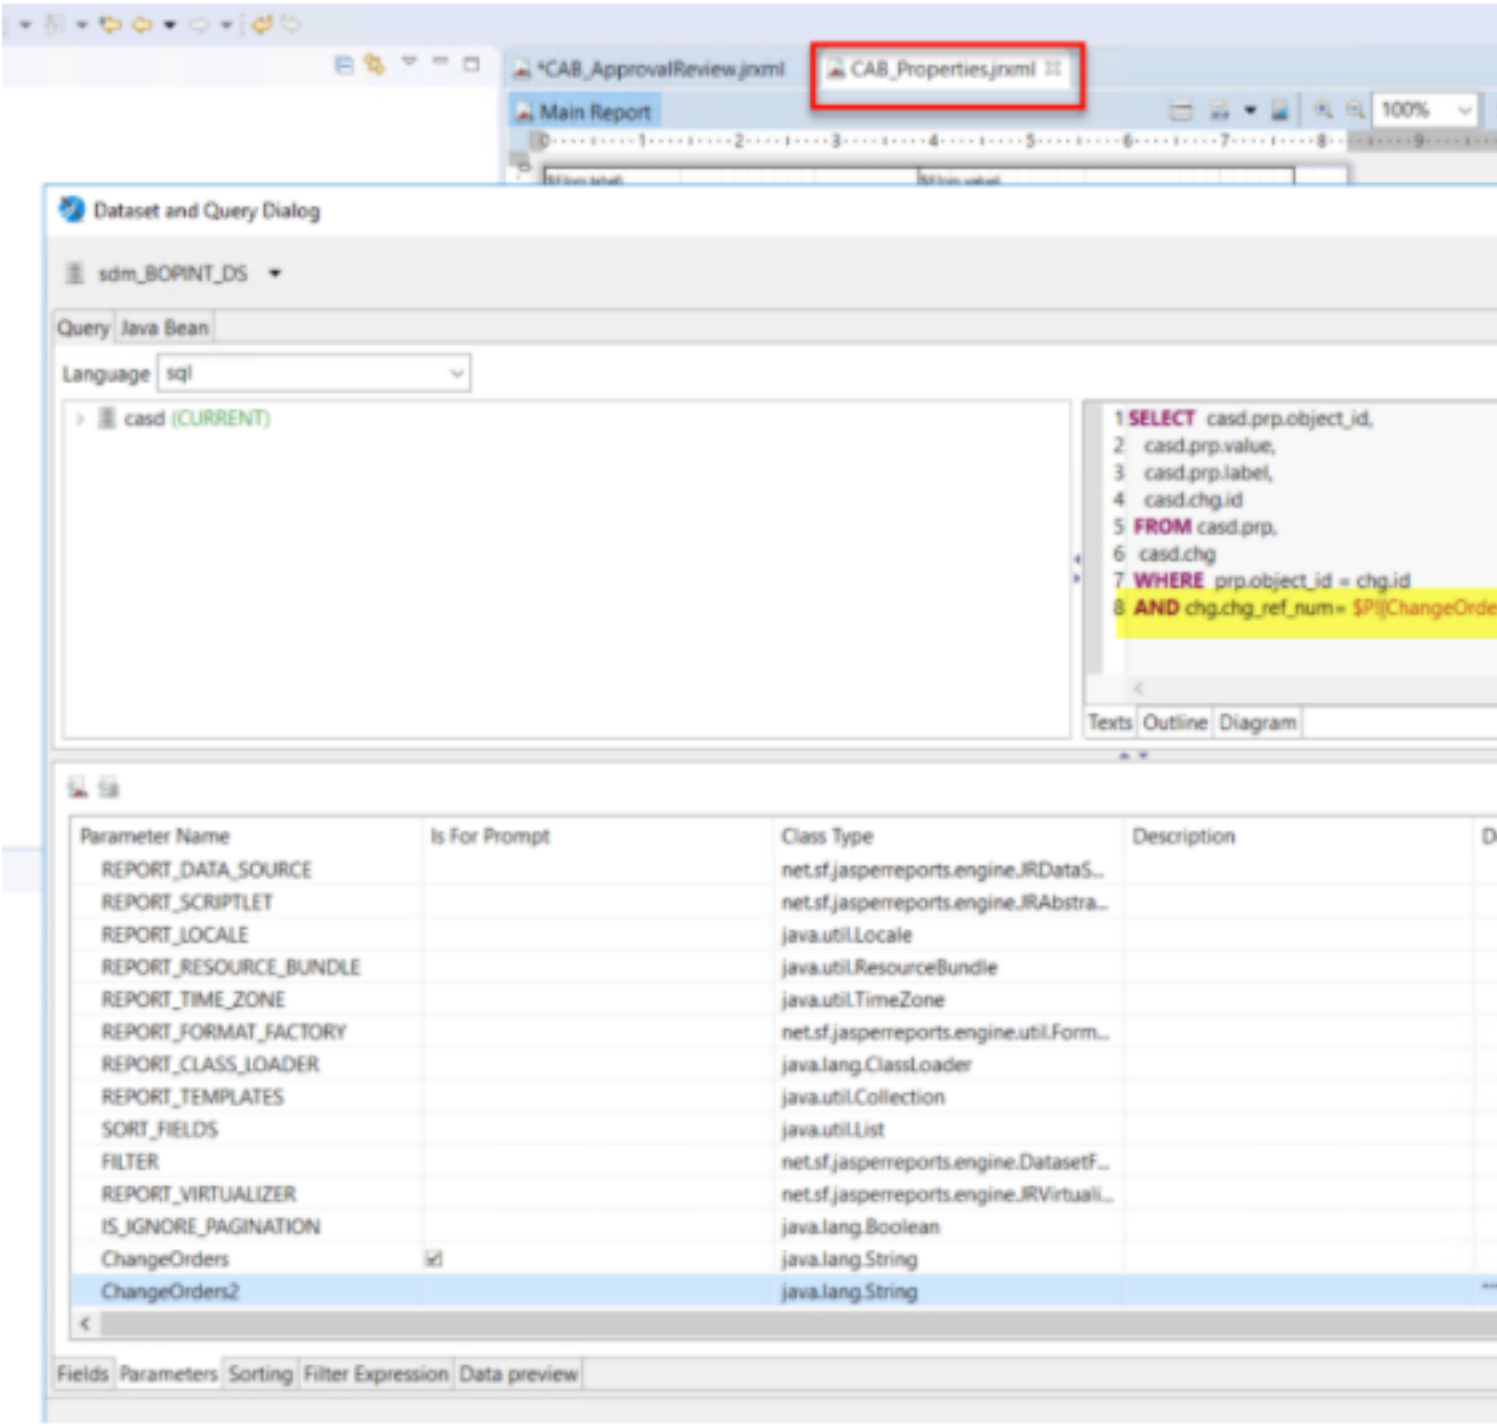
2. Run the following query to pass the list of values:

```
SELECT casd.chg.id,
casd.chg.assignee_combo_name,
casd.chg.backout_plan,
casd.chg.chg_ref_num,
casd.chg.closure_code_symbol,
casd.chg.description,
casd.chg.effort AS ImplementationPlan,
casd.chg.est_total_time,
casd.chg.group_name,
casd.chg.impact_symbol,
casd.chg.justification,
casd.chg.need_by AS DueDate,
casd.chg.priority_symbol,
casd.chg.requestor_combo_name,
casd.chg.rootcause_symbol,
casd.chg.string1 AS ProjectNumber,
casd.chg.summary,
casd.chg.cab_approval_symbol,
casd.chg.actual_total_time,
casd.chg.business_case AS PostRelease
FROM casd.chg
WHERE
$X(IN, chg_ref_num, ChangeOrders)
```



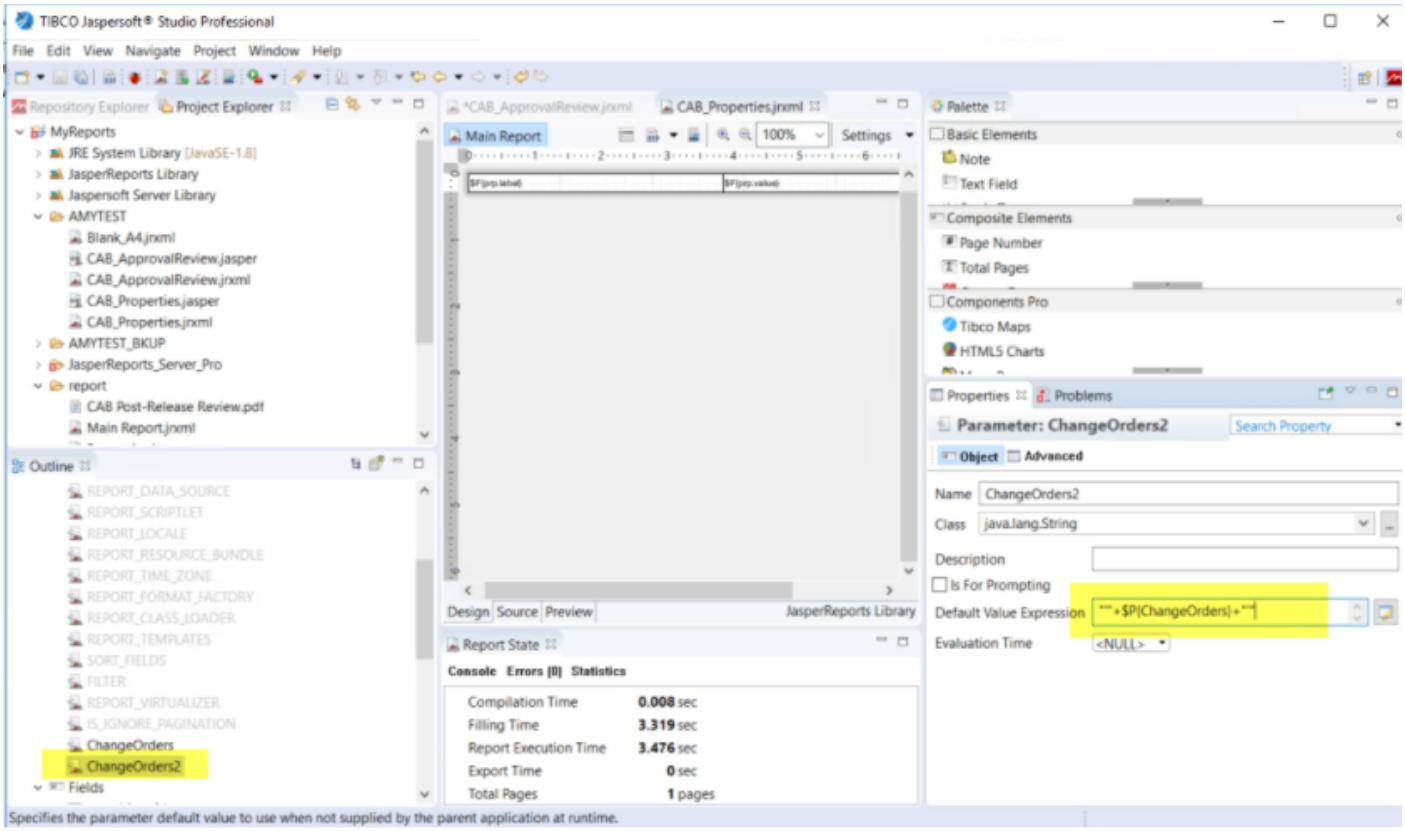
3. Run the following example query for subreports:

```
SELECT casd.prp.object_id,
casd.prp.value,
casd.prp.label,
casd.chg.id
FROM casd.prp,
casd.chg
WHERE prp.object_id = chg.id
AND chg.chg_ref_num= $P!{ChangeOrders2}
```

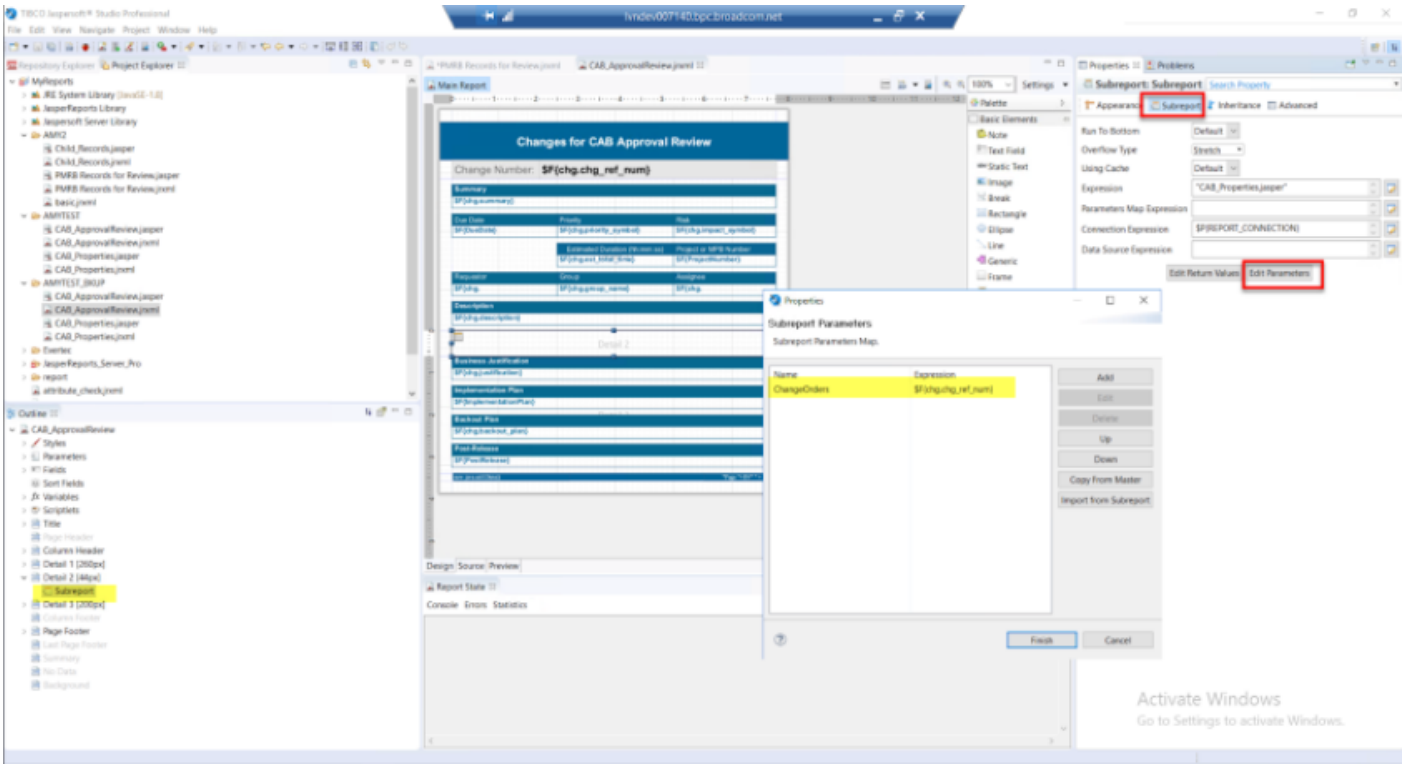


4. Add a new parameter to your subreport as shown below.

```
ChangeOrders2
Class: java.lang.String
Default Value Expression: "'"+$P{ChangeOrders}+"'"
```



5. Validate that the parameter to pass to the subreport is set as follows.



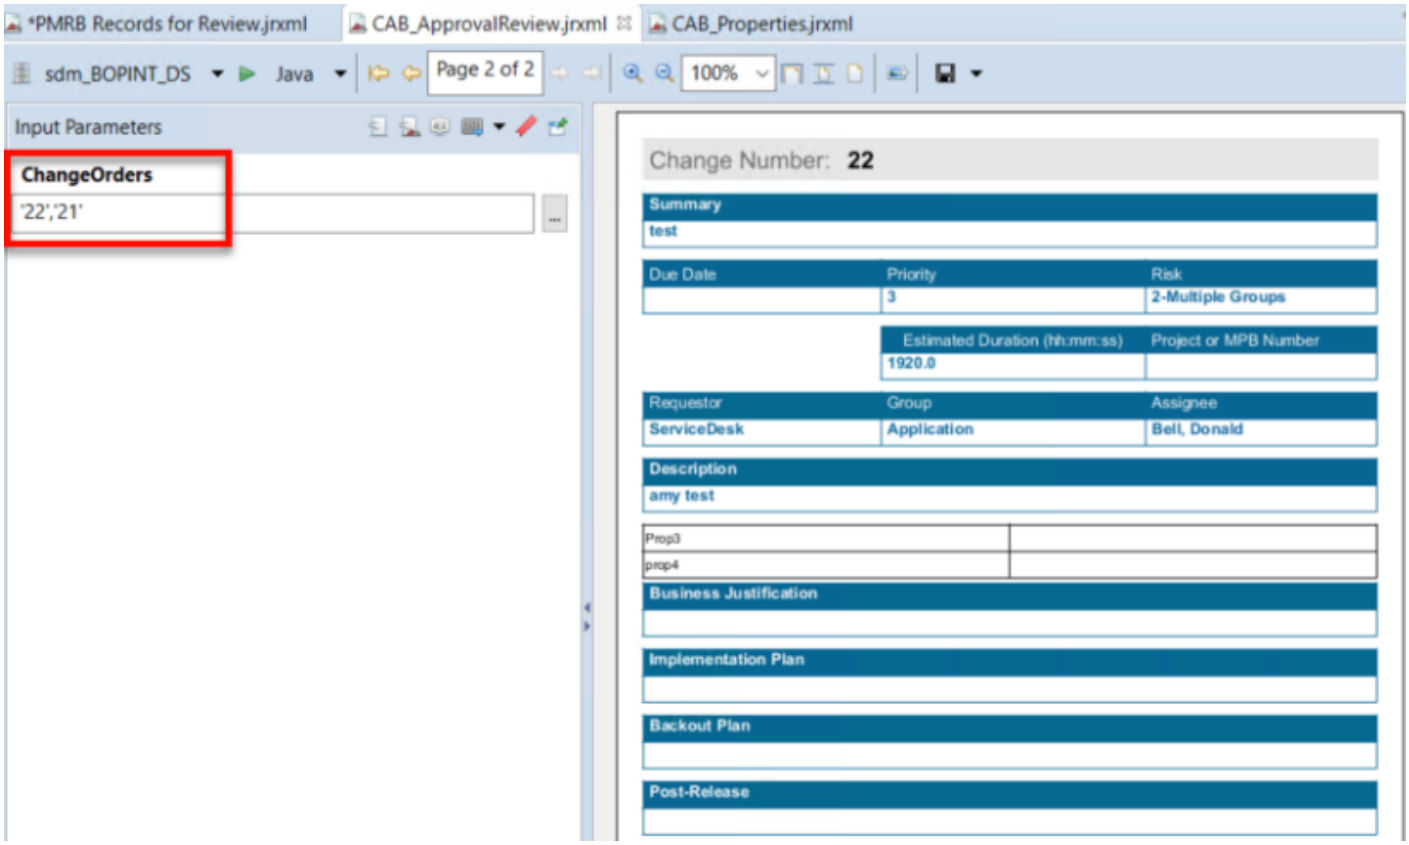
6. Compile the subreport after it is saved.

Testing Subreports in Jaspersoft Studio

Validate the subreports that you have created from Jaspersoft Studio. Ensure to list the change order numbers with single quotes, separated by a comma.

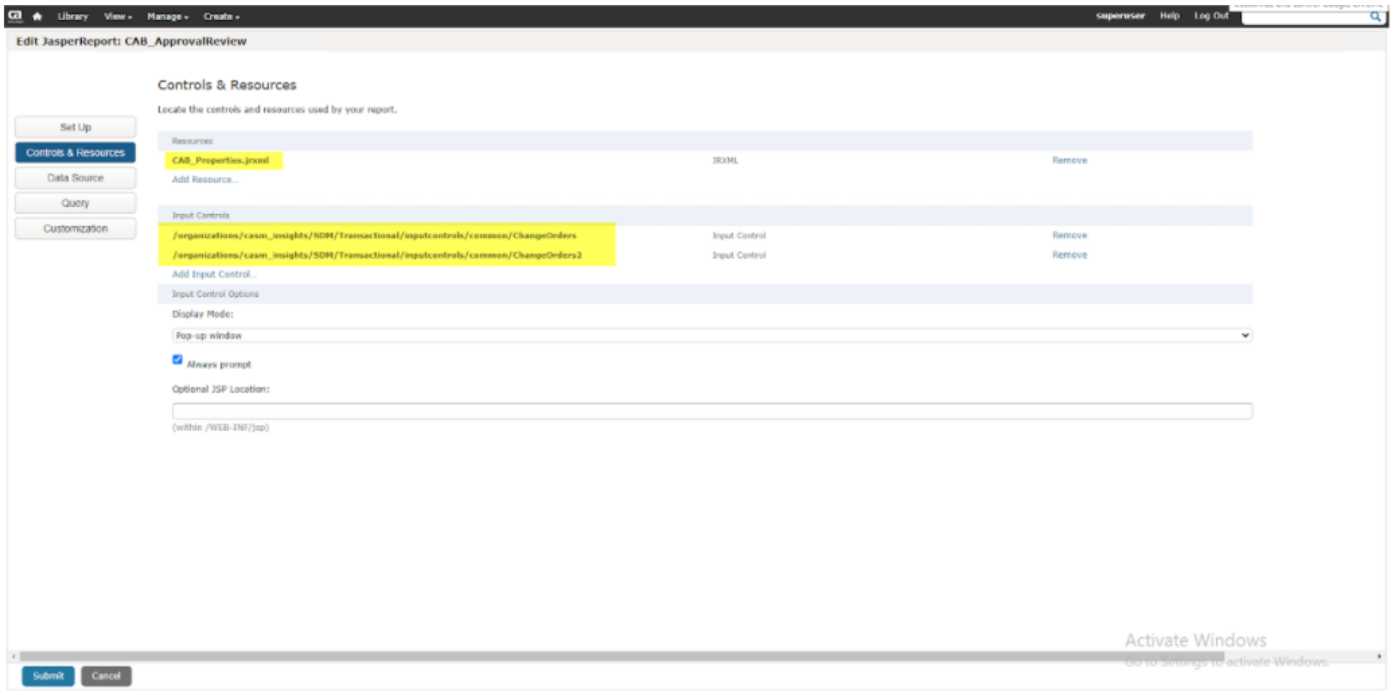
Perform the following steps:

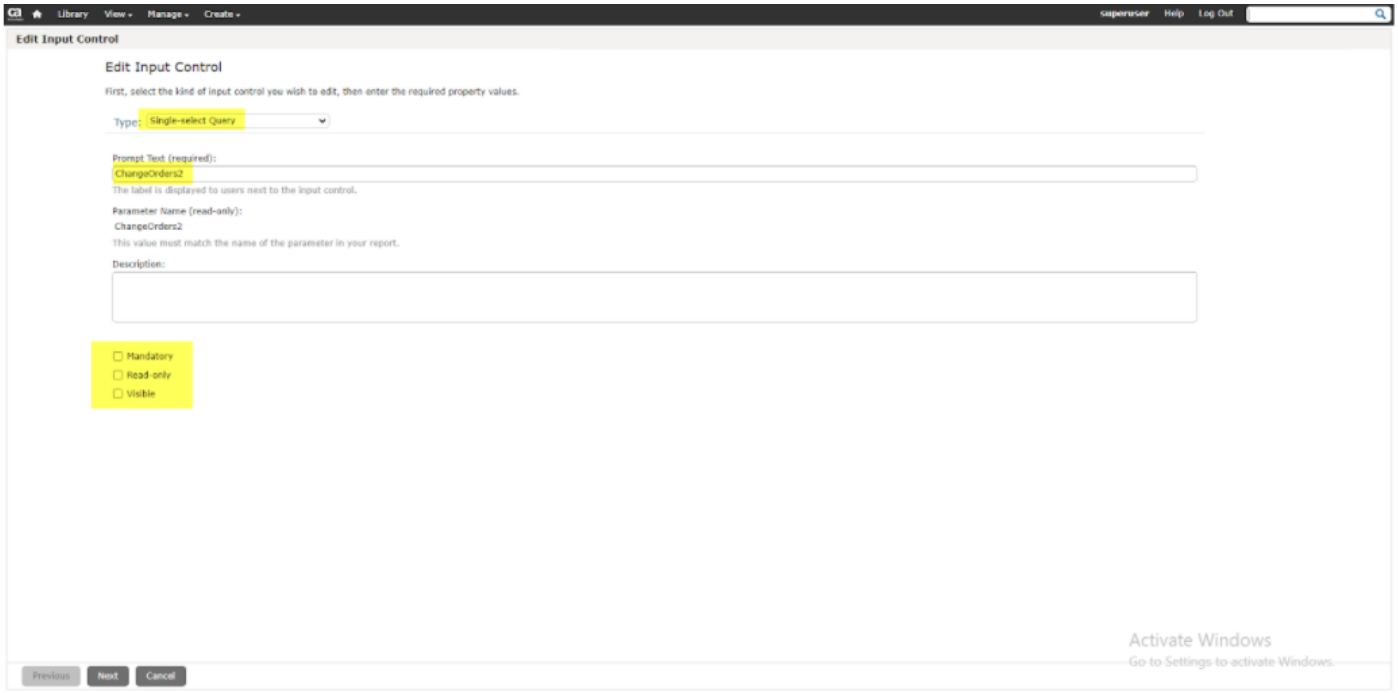
- Run the subreports and enter the change order numbers as shown below to test the subreport:



Publish the Subreport in Jaspersoft Studio

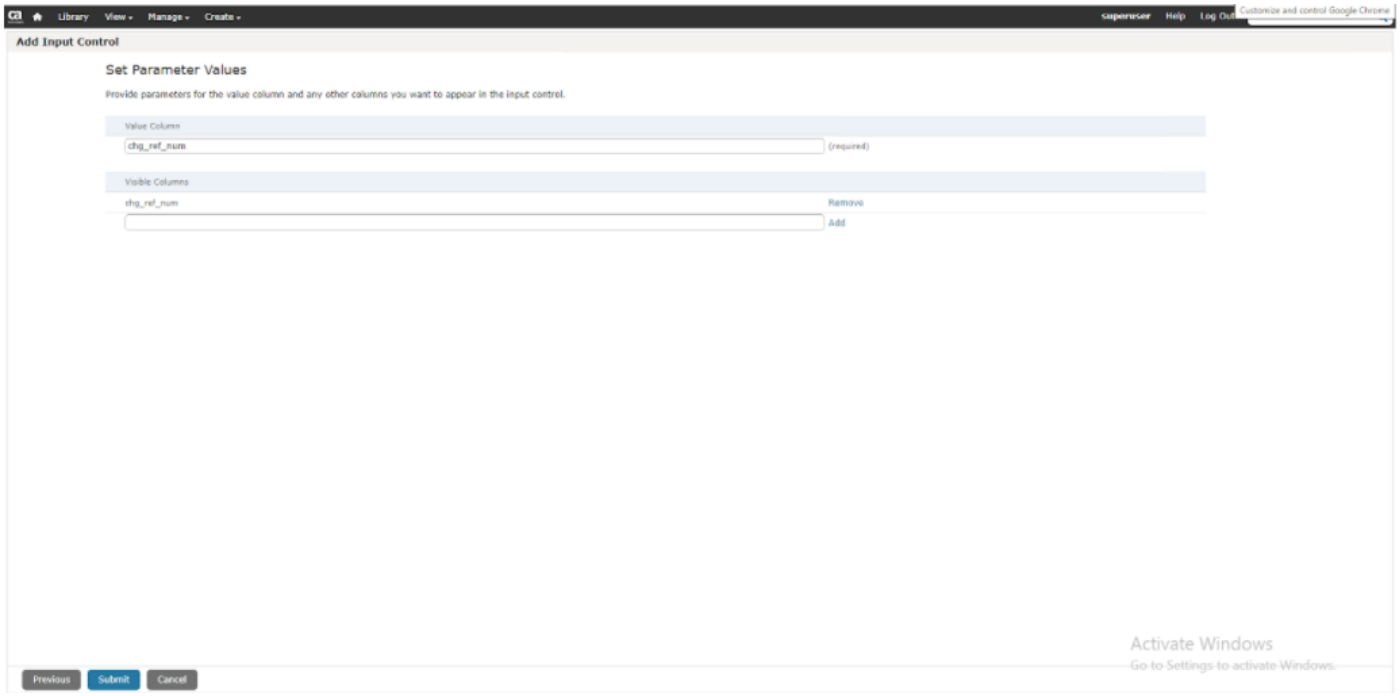
1. Add the **ChangeOrders2** input control as well. Ensure that the respective jrxml file is associated as a resource



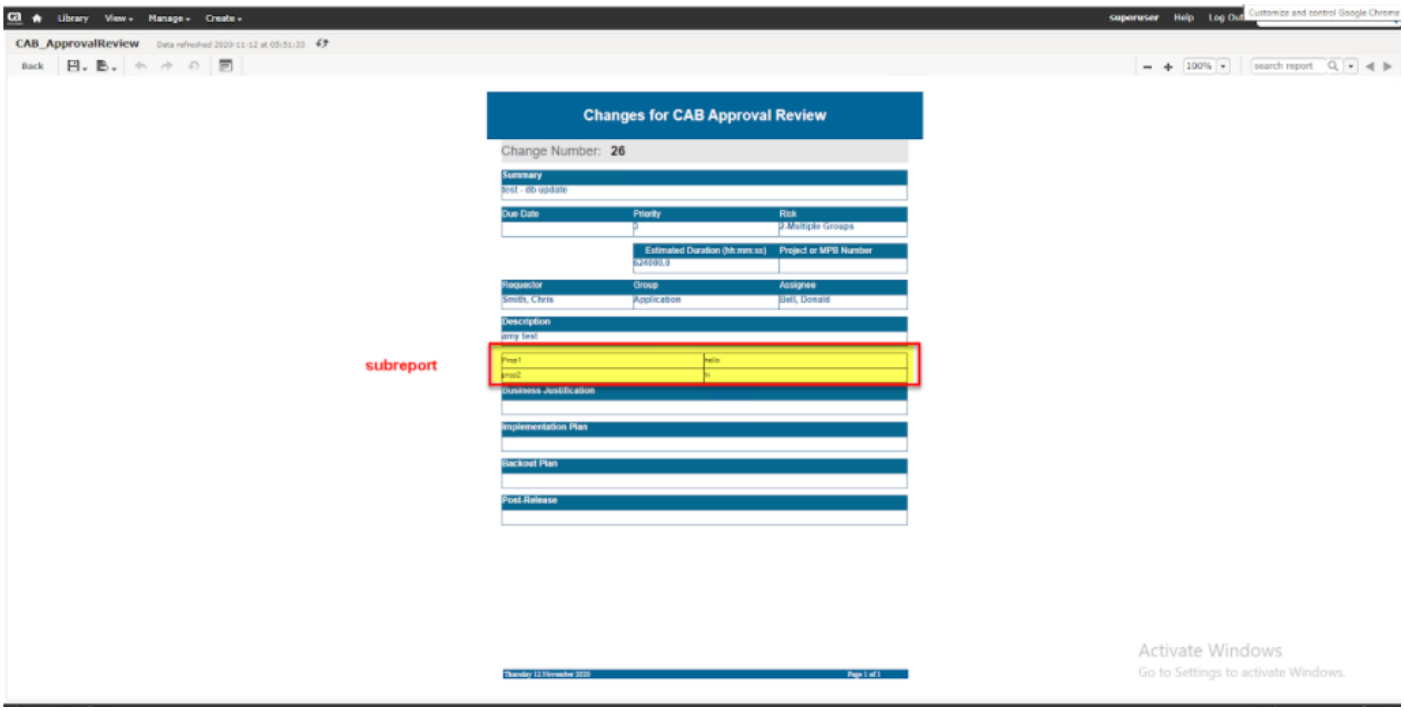


2. Link it to a query, in this example **Chg_Single** , pointing to the data source, with a query string of:

```
select ''''+chg_ref_num+'''' as chg_ref_num FROM chg where active =1
```



3. The subreport displays as follows.

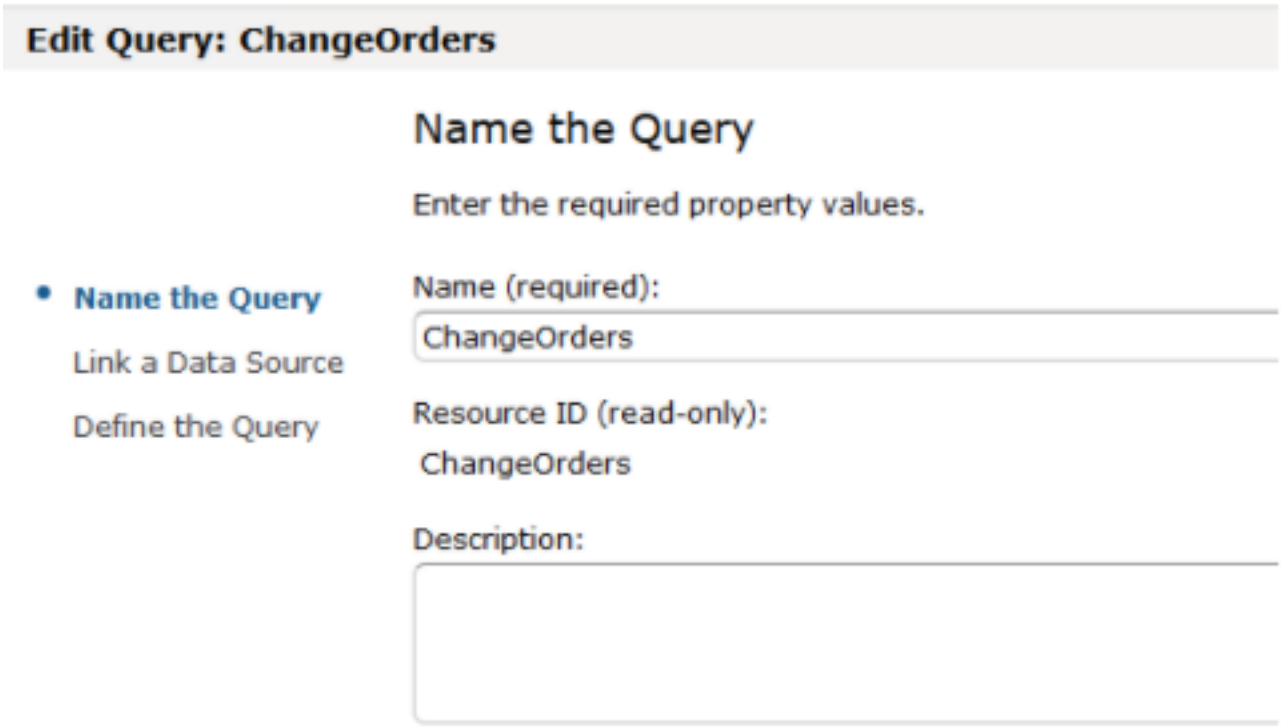


Modify the Input Parameters

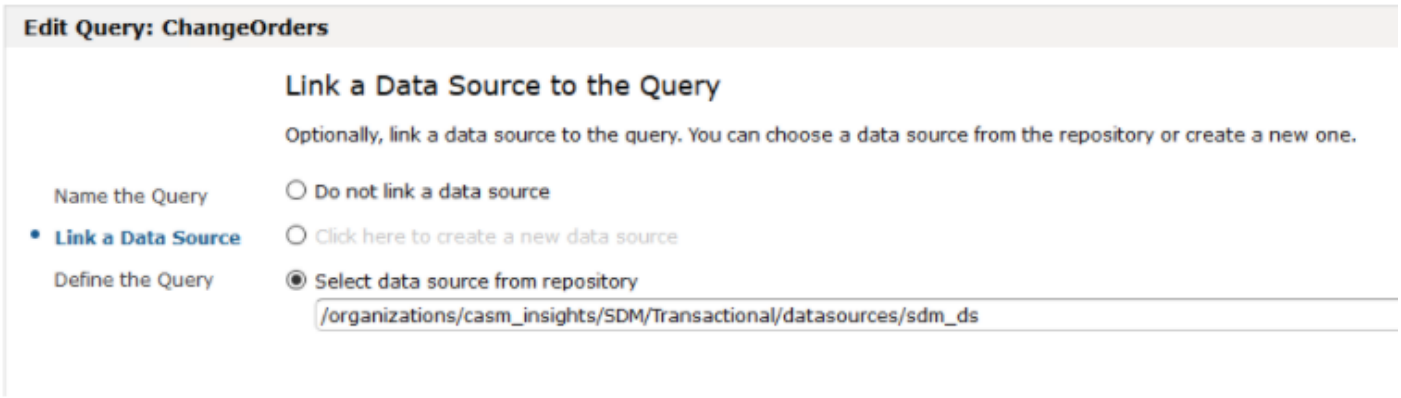
Input parameters/controls are used to prompt users for input or to pass the input to the report. Based on the input, the server modifiesthe WHERE filter clauses. Note Use single quotes to input a collection into a report, such as a list of Change Orders to return.

Perform the following steps:

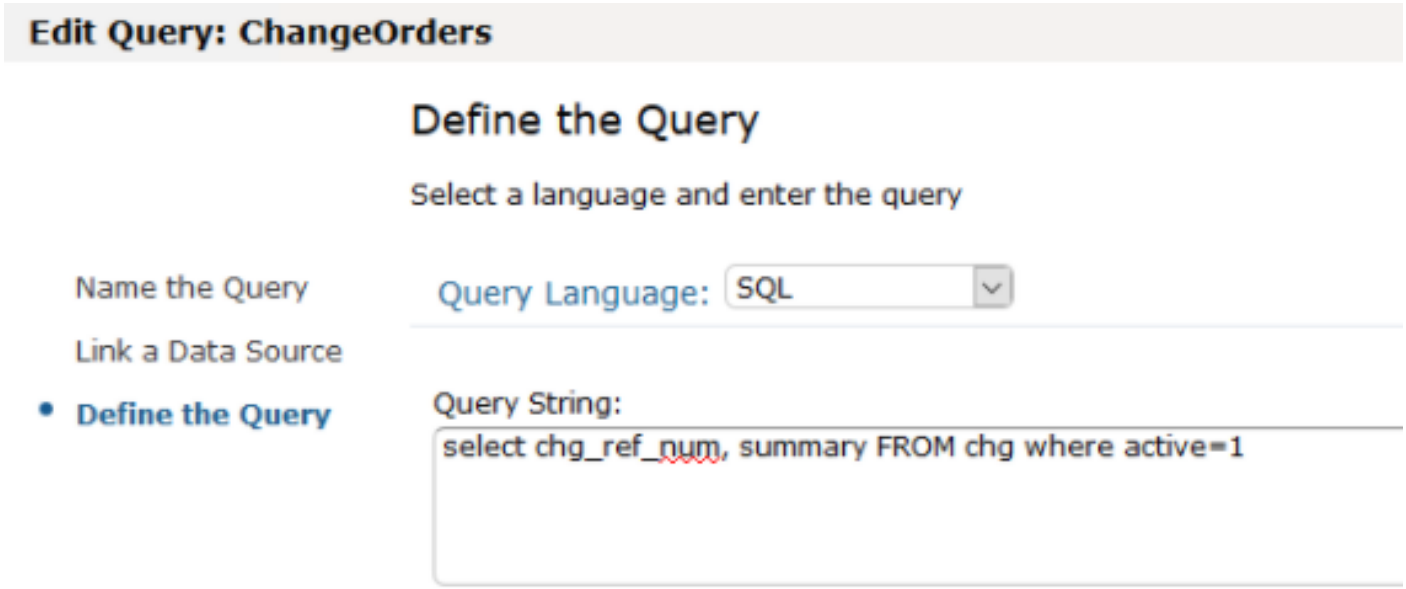
1. Create a query that the input parameter will use:
   a. View the repository, and drill down to: `\Organizations\SDM\Transactional\inputcontrols\queries`
   b. Right-click Queries, select Add Resource, Query.
   c. Provide a name as shown in the image below



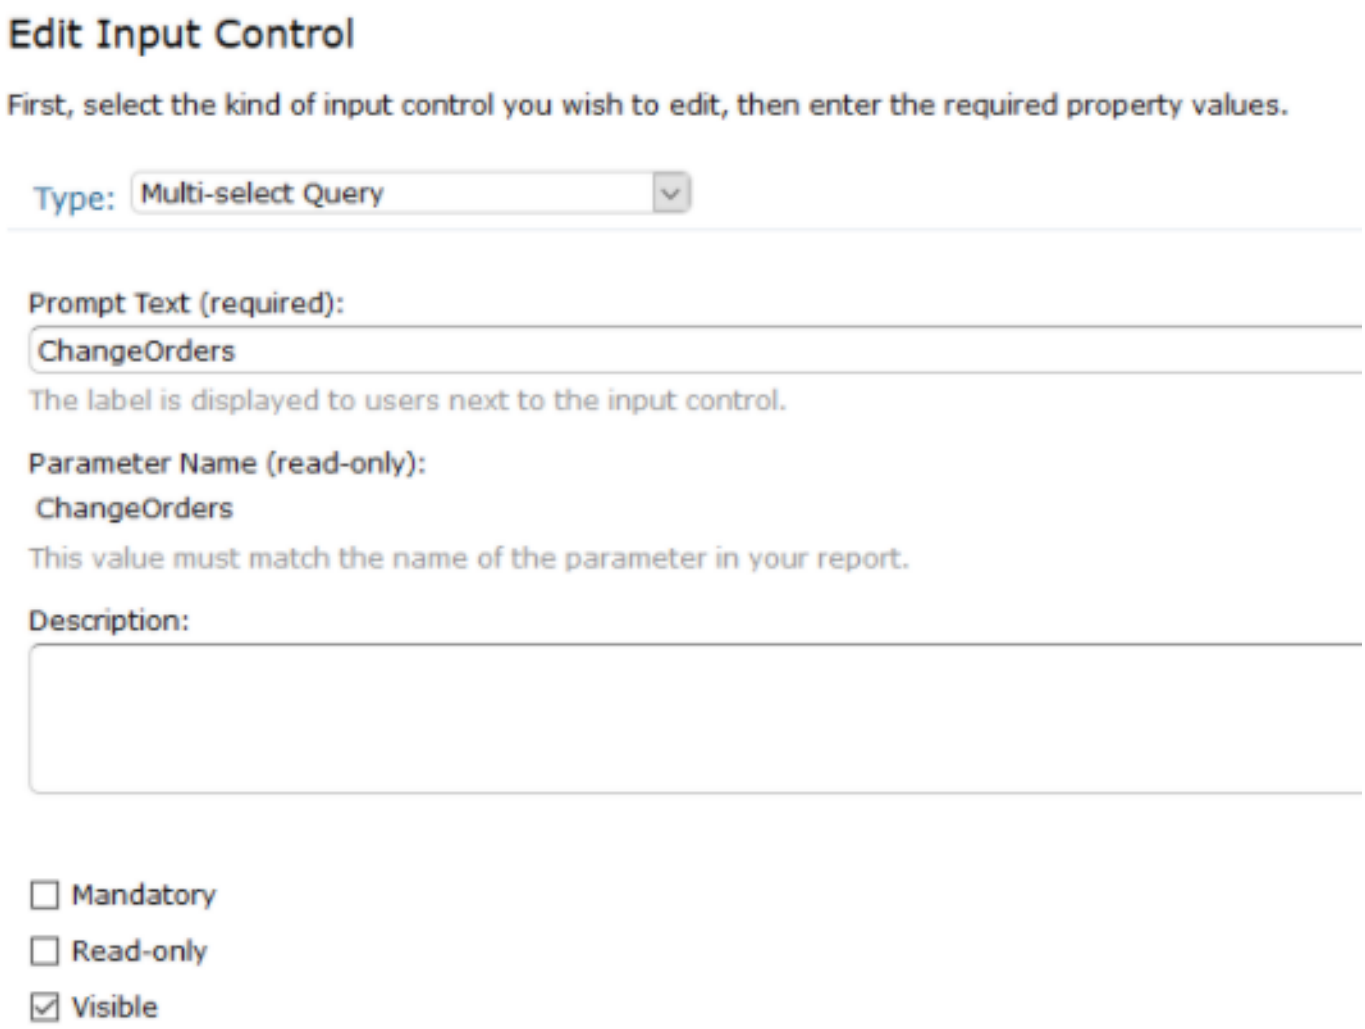
2. Select the data source



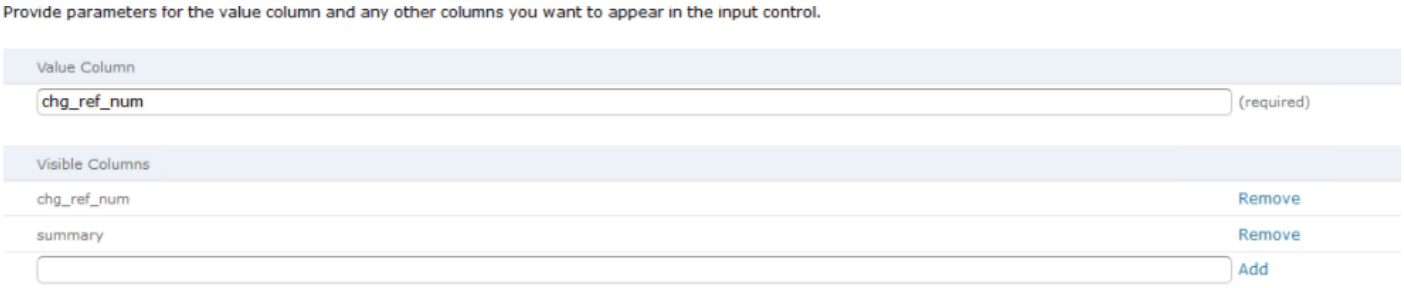
3. Define the query string with object names. For example: select chg_ref_num, summary FROM chg where active=1



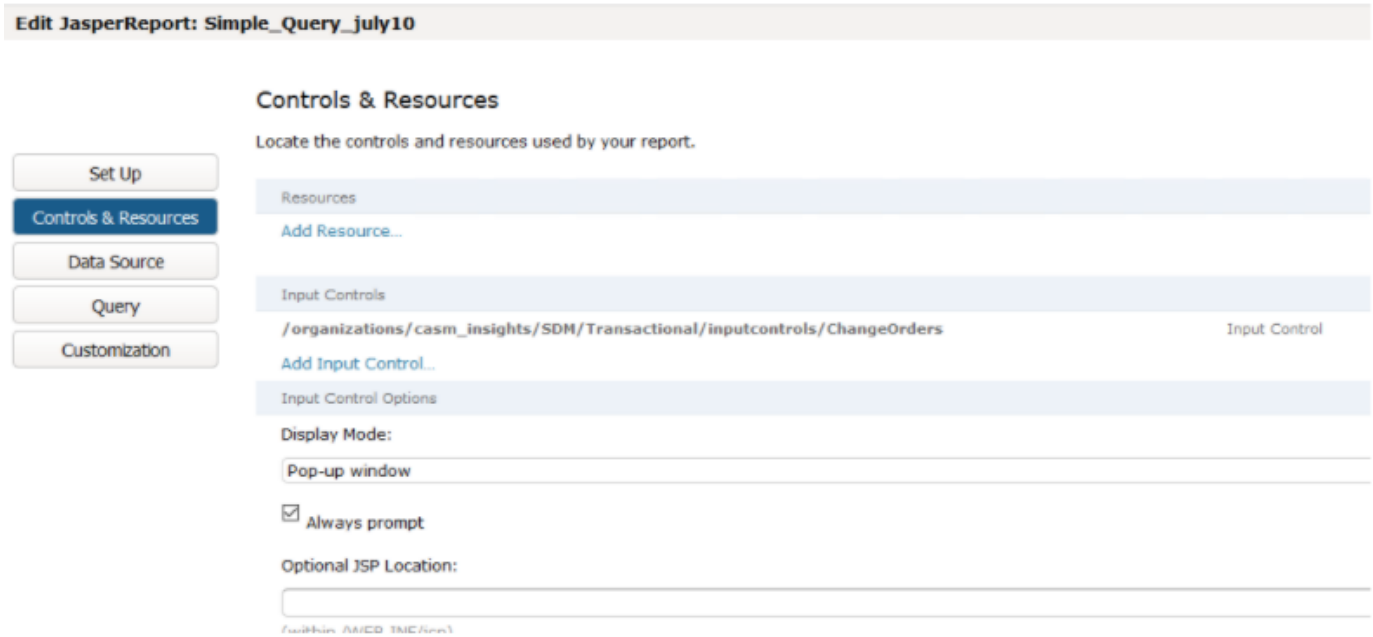
4. Right-click input controls, and select Add Resource, Input Control.
   a. Select the Type from the drop-down list. Example: Select Multi-select Query and select Visible.



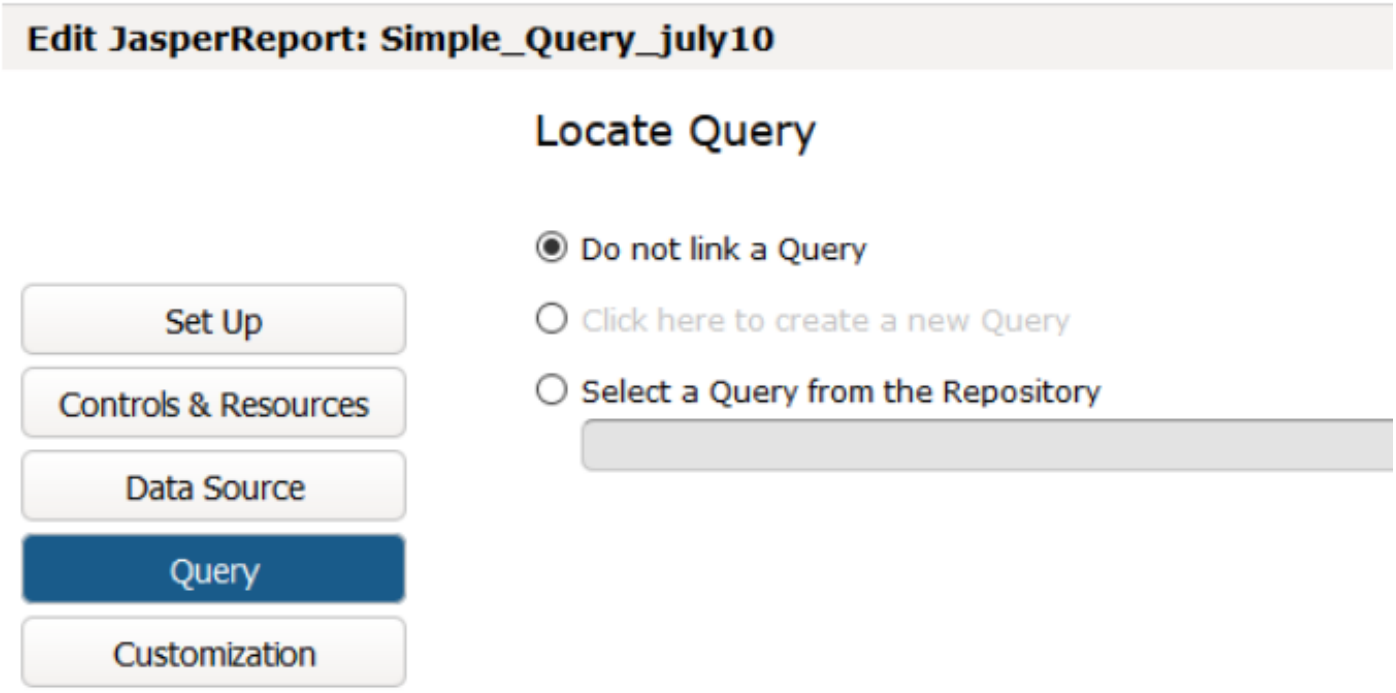
5. Select the query that you created in the first step:



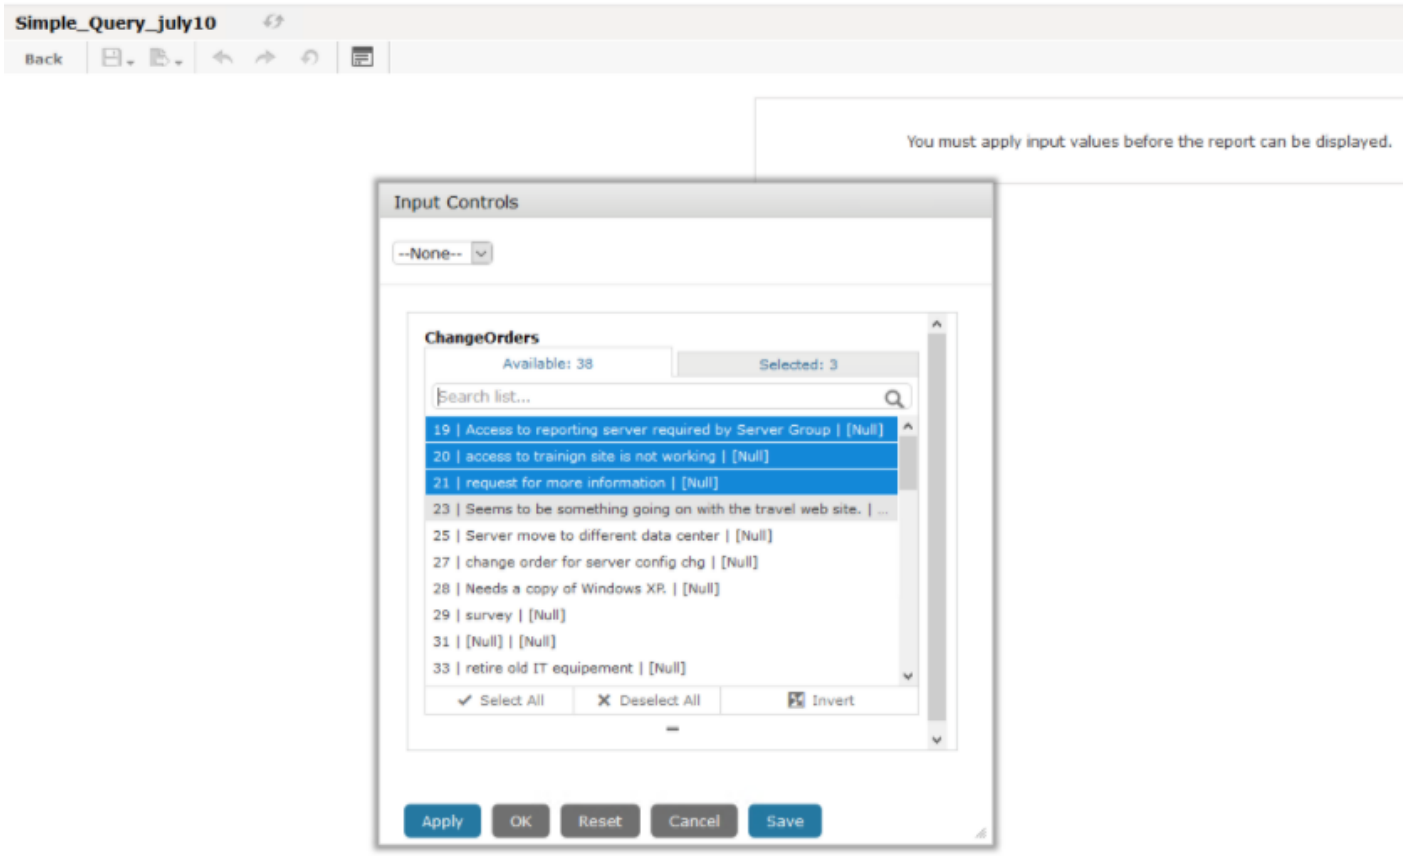
6. Select the column name that is queried, and create the columns that to display when the parameter is shown:



7. Browse to your report in the repository. Right-click to edit it.
8. Under Controls & Resources, browse to the Input Control you created in step 2.



9. Run your report to test the input control.

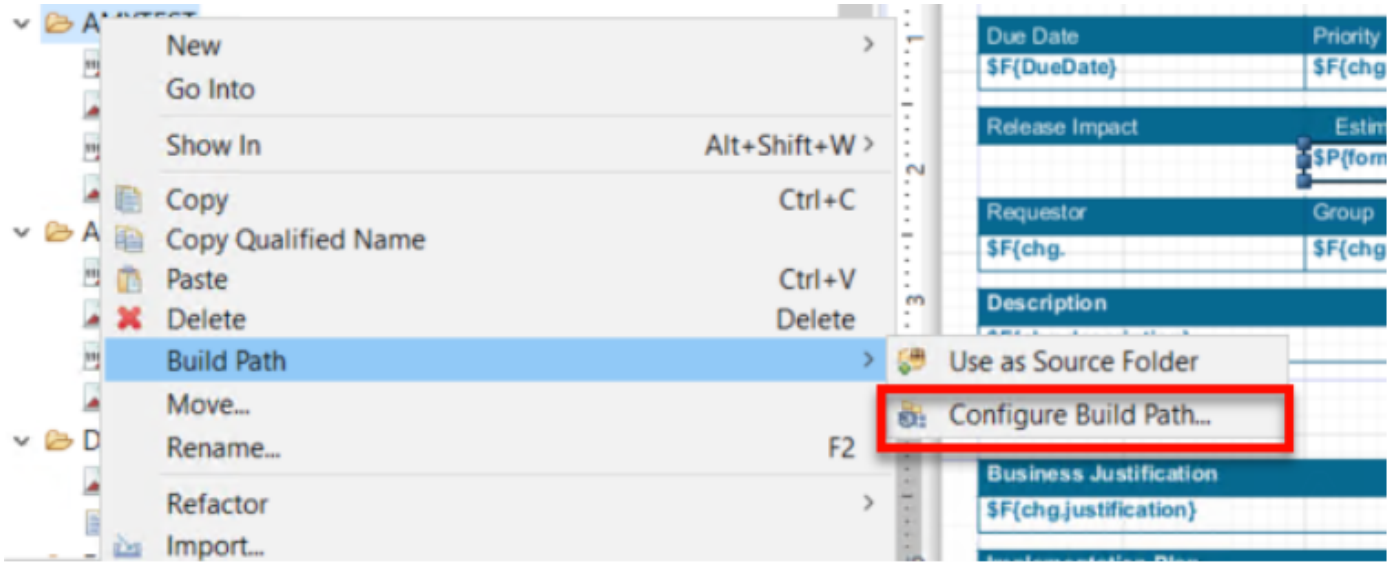


Add Duration Fields

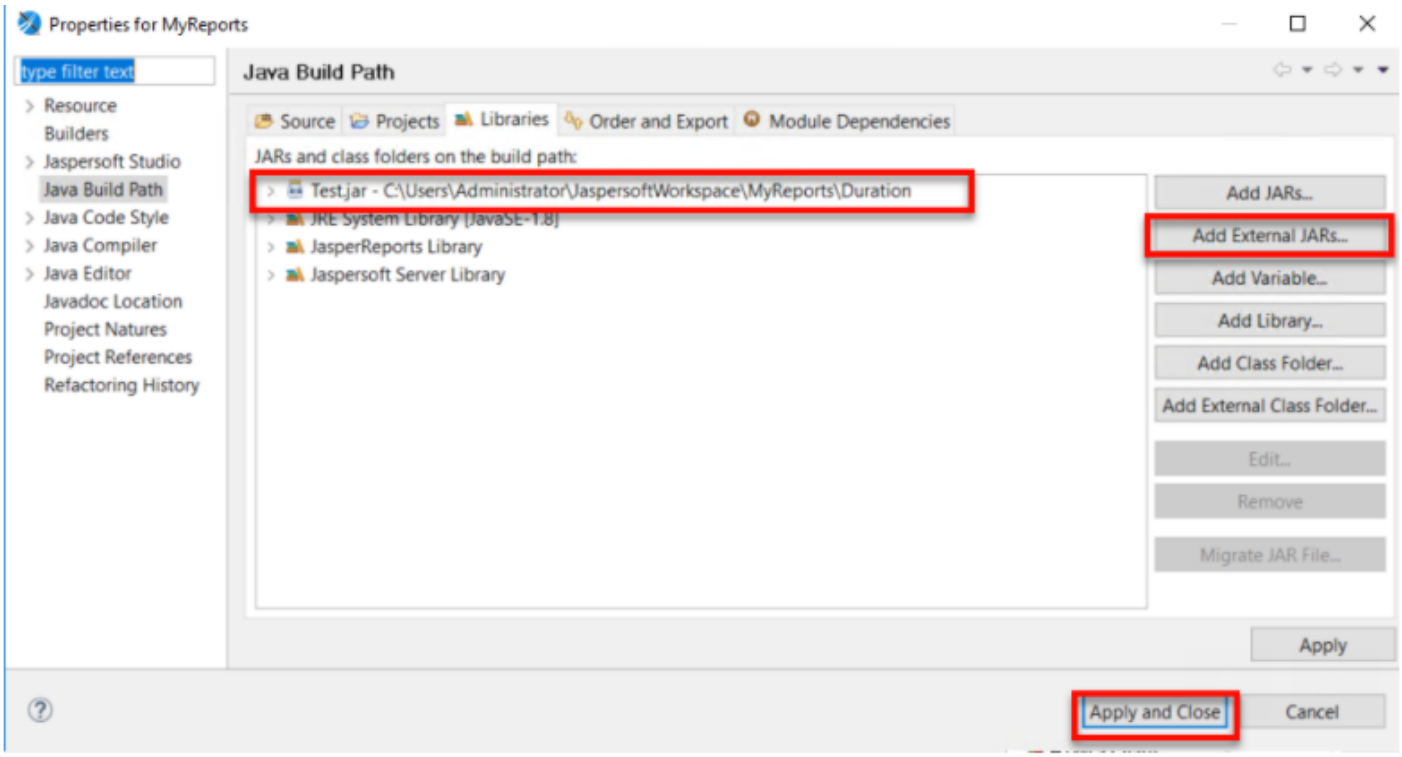
Add the duration fields to the build path of your project in the libraries. Then, import the class: com.duration.converter.

Perform the following steps:

1. Right-click a project folder, select **Build Path**, and **Configure Build Path**.



2. Copy the Jar from the DVD. CASM_17.4\filestore\Jasper\8.1.1\ExternalAuthJars and, copy it into the jasperserver tomcat lib folder. For eg: *C:\apache-tomcat-9.0.65\webapps\jasperserver-pro\WEB-INF\lib*.
3. Navigate to the **Libraries** tab, click **Add External JARs**, and browse for the above **DurationFormatter.jar** that you copied in Step 1.

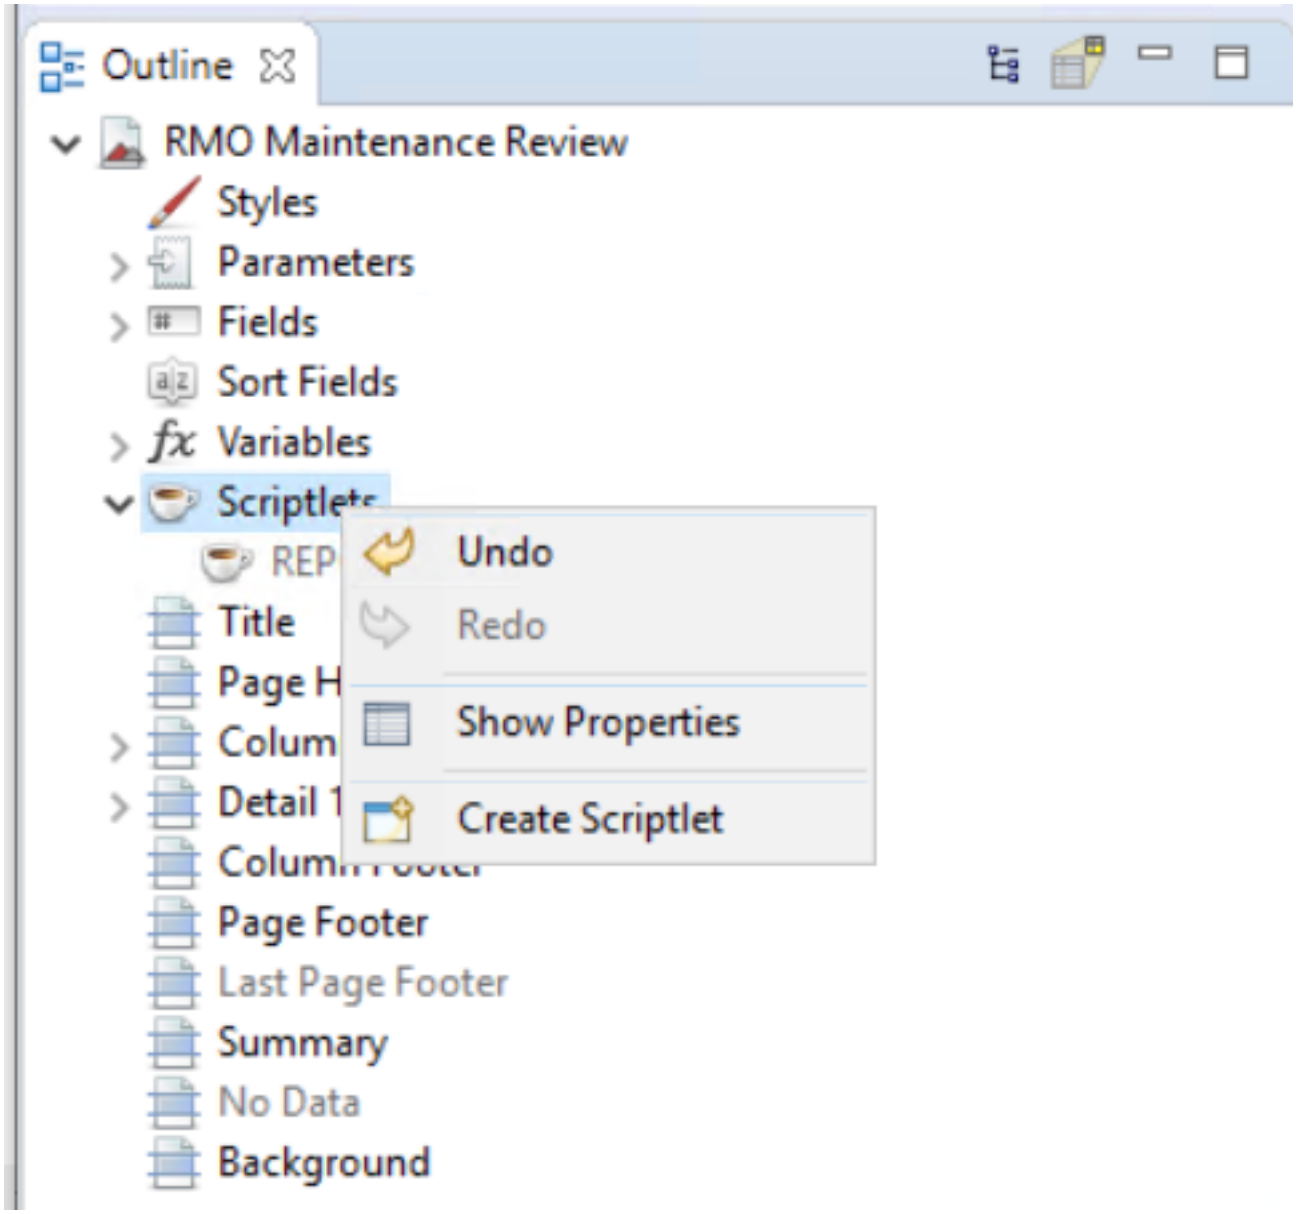


4. Click **Apply and Close**.

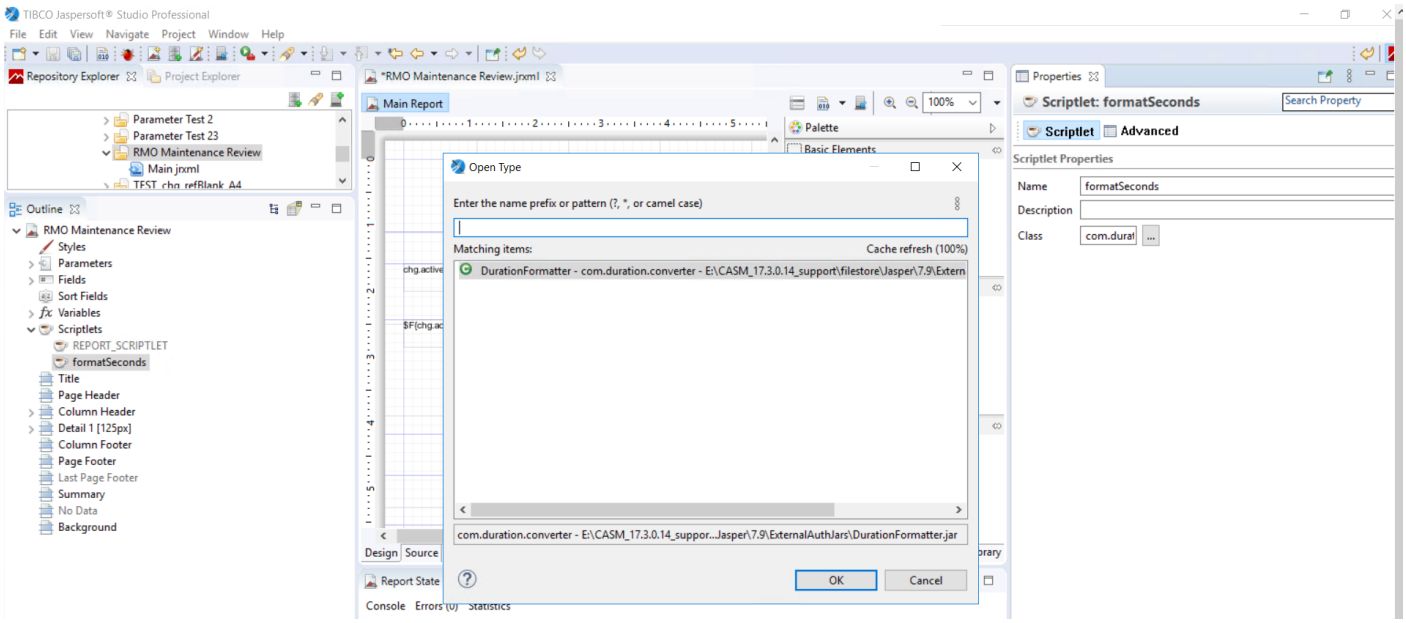
Add Parameter for Scriptlet

Perform the following steps:

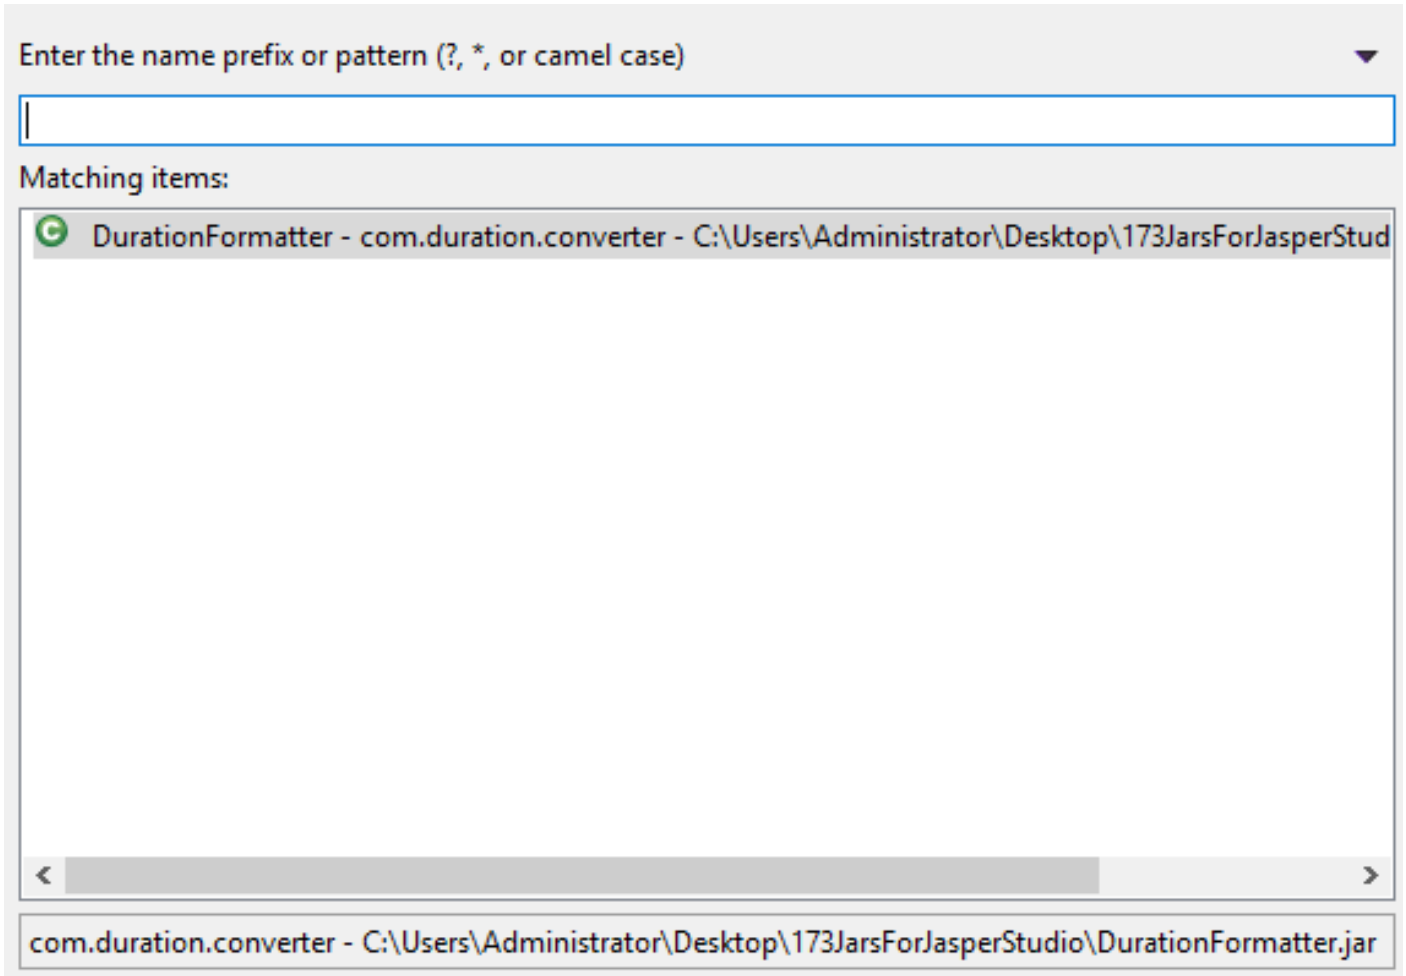
1. Right-click Scriptlets (under the report outline tab), and Click **Create Scriptlet** option.

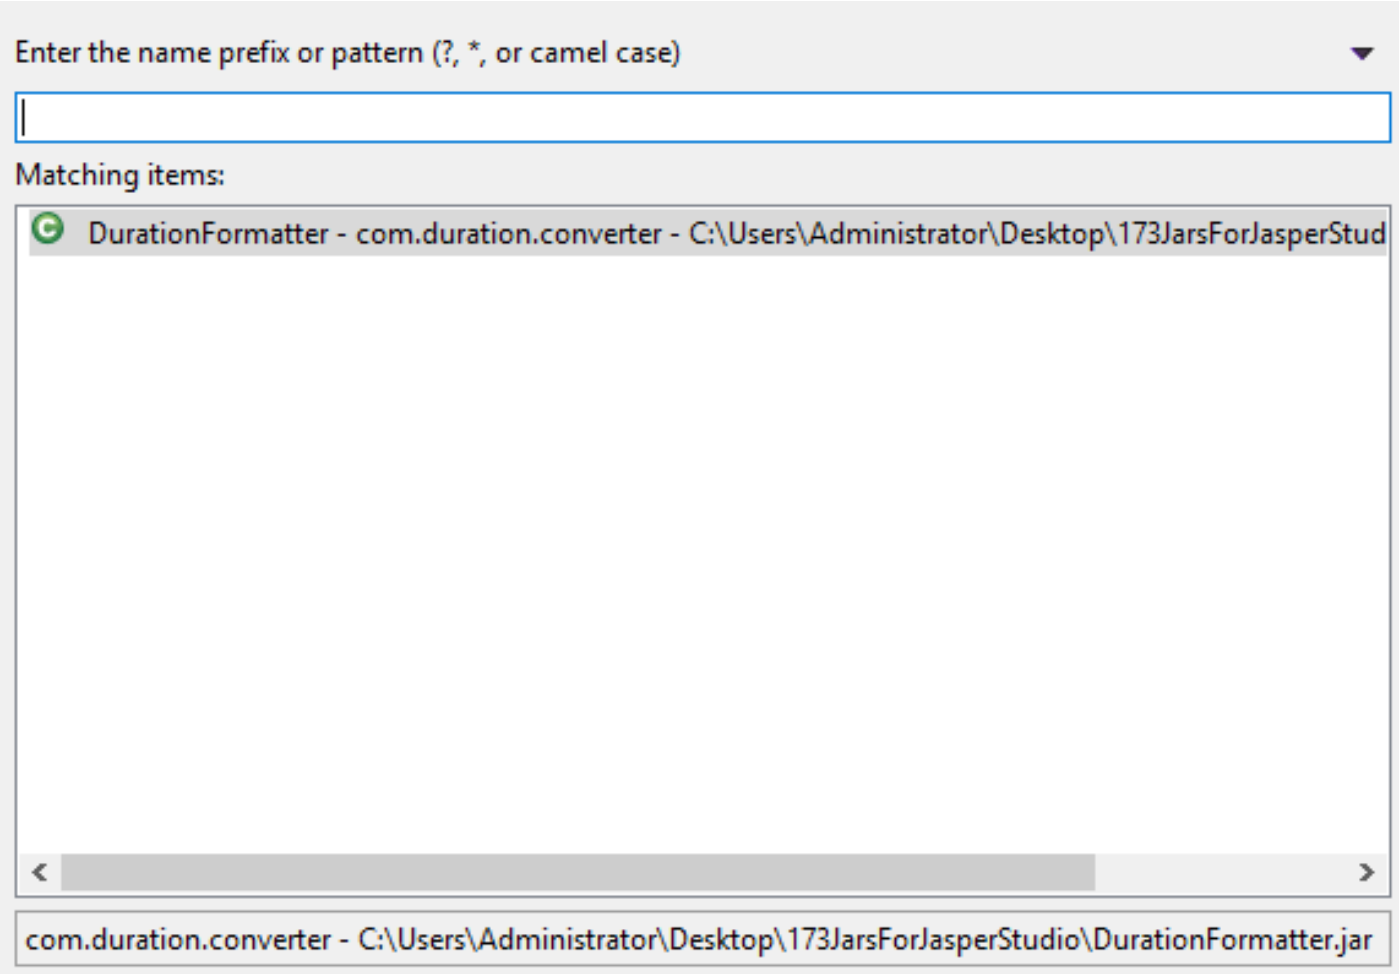


2. Under the **Properties** tab, give the scriptlet a name: **formatSeconds**
3. Next to the Class field, select the ellipsis (...)

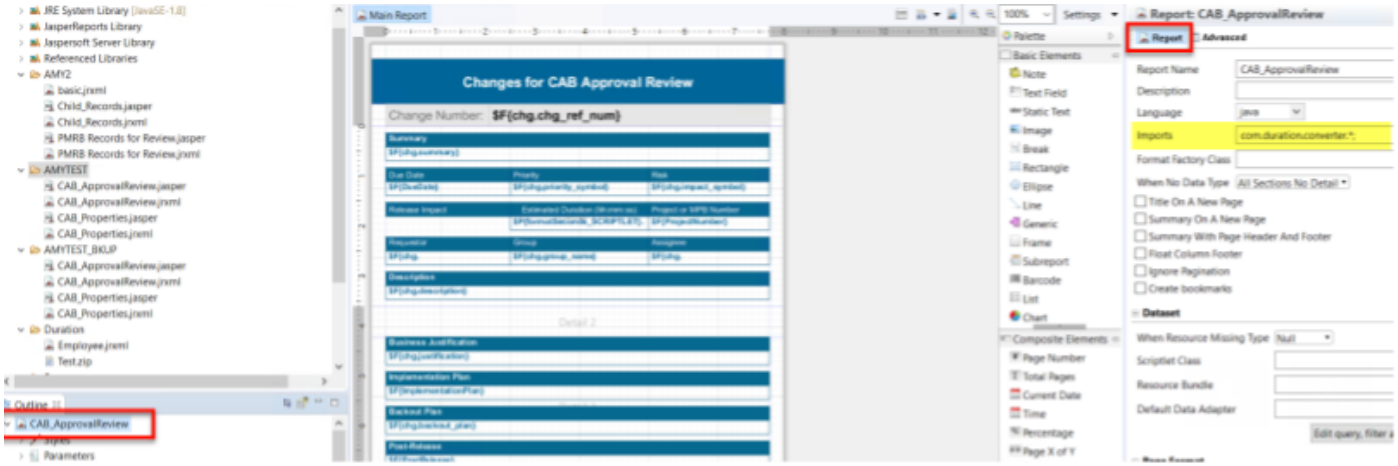


4. Select the **DurationFormatter**.

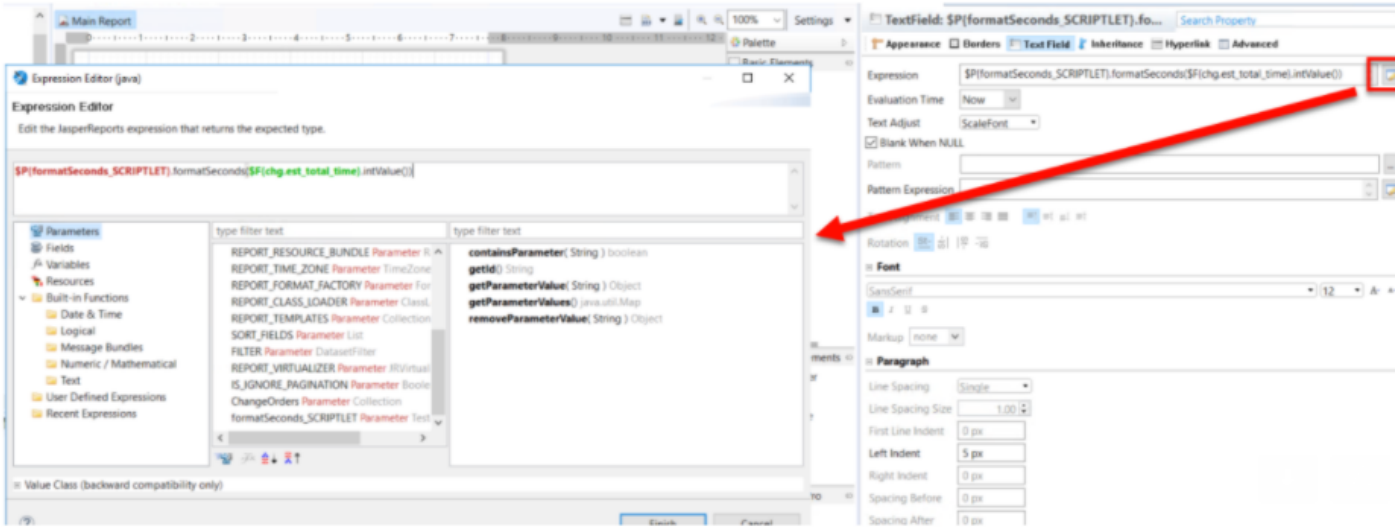




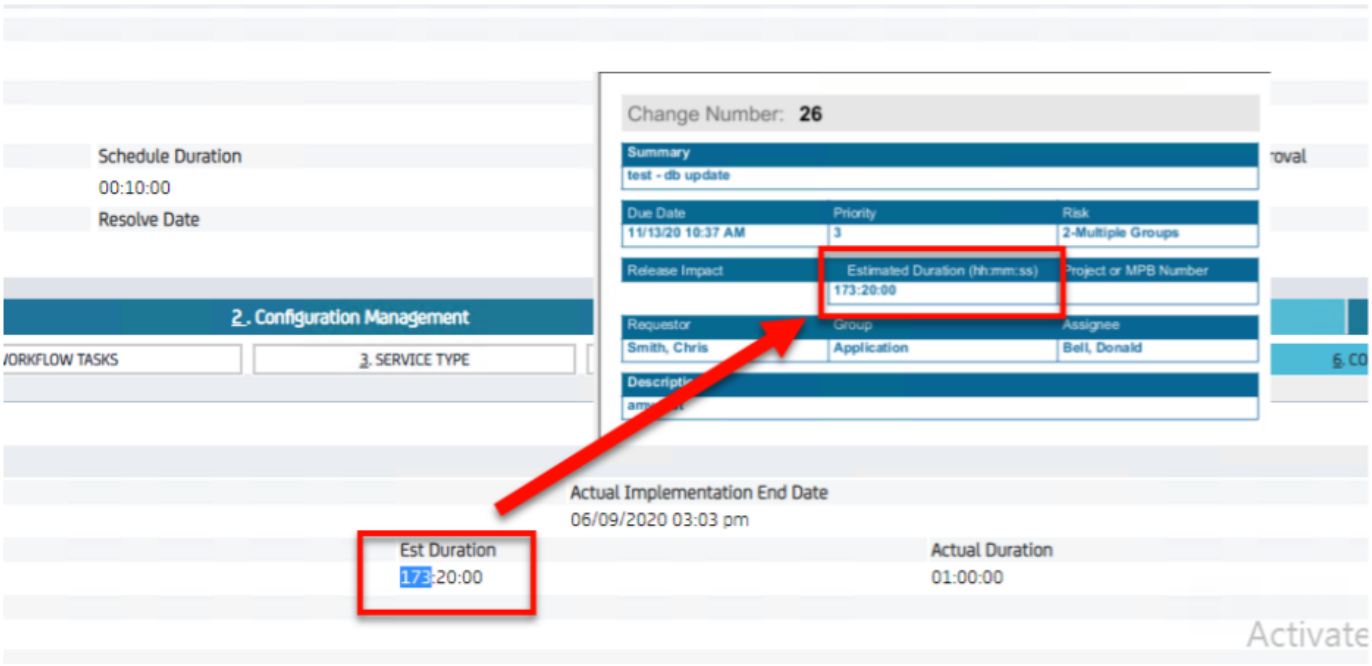
5. Click the Duration field in the report.
6. Click to add an expression for the Estimated Duration field:
   ```
   $P{formatSeconds_SCRIPTLET}.formatSeconds($F{chg.est_total_time}.intValue())
   ```
7. Click the report name under Outline Properties and click the dots next to Imports.
8. Select **Add Package**.
9. Select **com.duration.converter**.



10. Click **OK**.



11. Run the Report. It should match as shown in the following screenshot.



NOTE
If you are unable to run the report, ensure that the <import value> and <scriptlet name> parameters in the source tab of the report have the following values

```
<import value="com.duration.converter.*"/> <scriptlet name="formatSeconds"
 class="com.duration.converter.DurationFormatter"/>
```

12. Publish this report in the Jasper Server from the Jasper Studio.
13. Log in to the Jasper Server URL in which the report is published.
14. From the service console, stop the service: *jasperreportsTomcat.*
15. Copy the *DurationFormatter.jar* from CASM_17.4.2.0\filestore\Jasper\9.0.0\ExternalAuthJars and, copy it into the jasperserver tomcat lib folder. For eg: *C:\apache-tomcat-9.0.65\webapps\jasperserver-pro\WEB-INF\lib*.

16. Start the service: *jasperreportsTomcat.*
17. Run the report.
    The duration should match the report and SDM application as mentioned in Step 11.

SQL Queries with Strings

If you are using SQL queries with a string type parameter, ensure that the parameters are enclosed in single quotes. See the following example.

```
For example: select * from cr where cr.ref_num='$P{refNumParam}' Where refNumParam is a string.
```

When using FLOAT/ DOUBLE ATTRIBUTES in JasperStudio

If double type fields are in use, they convert to a String by default in JasperStudio. This string must be manually changed to double type.
For e.g. if field class is java.lang.String, then manually change it to java.lang.double

Integrate Jaspersoft Studio 9.0.0 with CA Service Management

CA Service Management 17.4 RU2 and later provide the ability to integrate Jaspersoft Studio 9.0.0. This integration enables reporting users to design and run report templates, write complex expressions, and layout visual components. The connection between CA Service Management's data access layer and Jaspersoft Studio is established via the JDBC driver. All the existing Out-of-the-box reports built for Jaspersoft Server work with Jaspersoft Studio as well.

> **NOTE**
> ODBC Driver is not supported on CA Service Management 17.4.

Download and Install Jaspersoft Studio Professional 9.0.0

To download and install Jaspersoft Studio 9.0.0 in your environment, perform the following steps:

1. Download the **CA Business Intelligence JasperSoft Studio 9.0.0 for CA Service Management.iso** installer from Broadcom Support.
2. Right-click the ISO and select **Mount**.
3. Right-click the **TIB_js-jss_9.0.0_windows_x86_64** application and run as **Administrator**.
4. Follow the Installation Wizard instructions to install Jaspersoft Studio 9.0.0 in a location of your choice.

   > **NOTE**
   > You must join the Jaspersoft Community to use Jasper Studio, refer **Logging in to the Jaspersoft Community** section in TIBCO documentation.
   >
   > **NOTE**
   >
   > - If you have trouble logging-in with your community credentials, apply the Hotfix 99112369.
   > - For more information refer this Jasper Community page.
5. After installing Jaspersoft Studio, the out-of-the-box installation package (For example, C:\Program Files\TIBCO \Jaspersoft StudioProfessional-9.0.0) displays the Evaluation License Version.

Update Jaspersoft Studio License (Evaluation License to PerpetualLicense)

To change the Evaluation License (default) provided with Jaspersoft Studio 9.0.0 to Perpetual or Full License, perform the following steps:

1. Navigate to where you have downloaded and extracted CA Service Management 17.4. RU2.
2. Navigate to **Filestore**, **Jasper**, **9.0.0**, **License**.

NOTE
Jaspersoft Reports 9.0.0 Install folder contains the Jaspersoft Studio Professional 9.0.0 License Information.

3. Now, launch Jaspersoft Studio 9.0.0.
4. Navigate to **Help**> **License Manager**> **Install New License**.
5. Browse and click open the License folder which is available in step 2 and select **jasperserver.license**.
6. Click **OK.**
7. If you see Edge related errors on your screen, follow the steps mentioned in **Using Edge in Jaspersoft Studio Window Builds** in TIBCO documentation.

Create Data Adapter

Perform the following steps to create a Data Adapter:

1. Open Jaspersoft Studio.
2. Right-click a project in Project Explorer and select **New**, **Data Adapter**.
3. In the Data Adapter File window, select a project where you want to save the data adapter file. The selected project must contain the report(s) that you want to use with your data adapter. The Data Adapter Wizard is displayed.
4. Enter a name for your adapter in the Data Adapter Wizard and click **Next**
   For example, Database JDBC Connection.
5. Provide the CA Service Desk Manager (SDM) connection details.
6. In the Database Location tab, enter the properties required by the data adapter type. For example, for database JDBC connection, select the JDBC driver, set the URL, and provide the CA SDM database username and password:
   a. JDBC Driver: com.ca.sdm.dal.sql.jdbc.driver.DalJdbcDriver
   b. JDBC URL: jdbc:sdm:bop:@<SDM Host Name>:2100;<UserUuid>=<ServiceDeskUUID>
   c. UserName: ServiceDesk
   d. Password: Encrypted Password must be used. Perform the following steps to encrypt the password:
      a. Navigate to CASM 17.4RU2_DVD\filestore\Jasper\Utils folder.

         NOTE
         Ensure that java is added to PATH env. variable to run the below command.

      b. Run the following command:

         ```
         gen_passwd.bat <servide desk username> <service desk password>
         ```

         For example: Username: servicedesk. Password: servicedesk password (example: see the below image in Linux environment)

7. In the Driver Classpath tab, select the list of jars.
8. Provide the library location for the jars, the same jars as the Jaspersoft Reports 9.0.0 `DVD \filestore\Jasper \9.0.0\ExternalAuthJars`
9. a. BOPIntegration.jar
   b. domsrvr_utils.jar
   c. log4j-api-2.17.1.jar
   d. log4j-core-2.17.1.jar
   e. DurationFormatter.jar
   f. sd-utils.jar
   g. slump.jar

10. To test the connection, click the **Test button**.
11. Click **Finish** to create the Adapter.

Create a Report and Publish

To create a report in Jaspersoft Studio and publish it to your existing JasperReports Server (9.0.0), see TIBCO Documentation.

Create Subreports

To create subreports, perform the following steps:

Pass string parameters to subreports

Testing subreport in Jaspersoft Studio

Publish the Subreport in Jaspersoft Studio

Pass string parameters to subreports

Consider the following example scenarios:

Jaspersoft Studio Reports - Example 1

Jaspersoft Studio Reports - Example 2

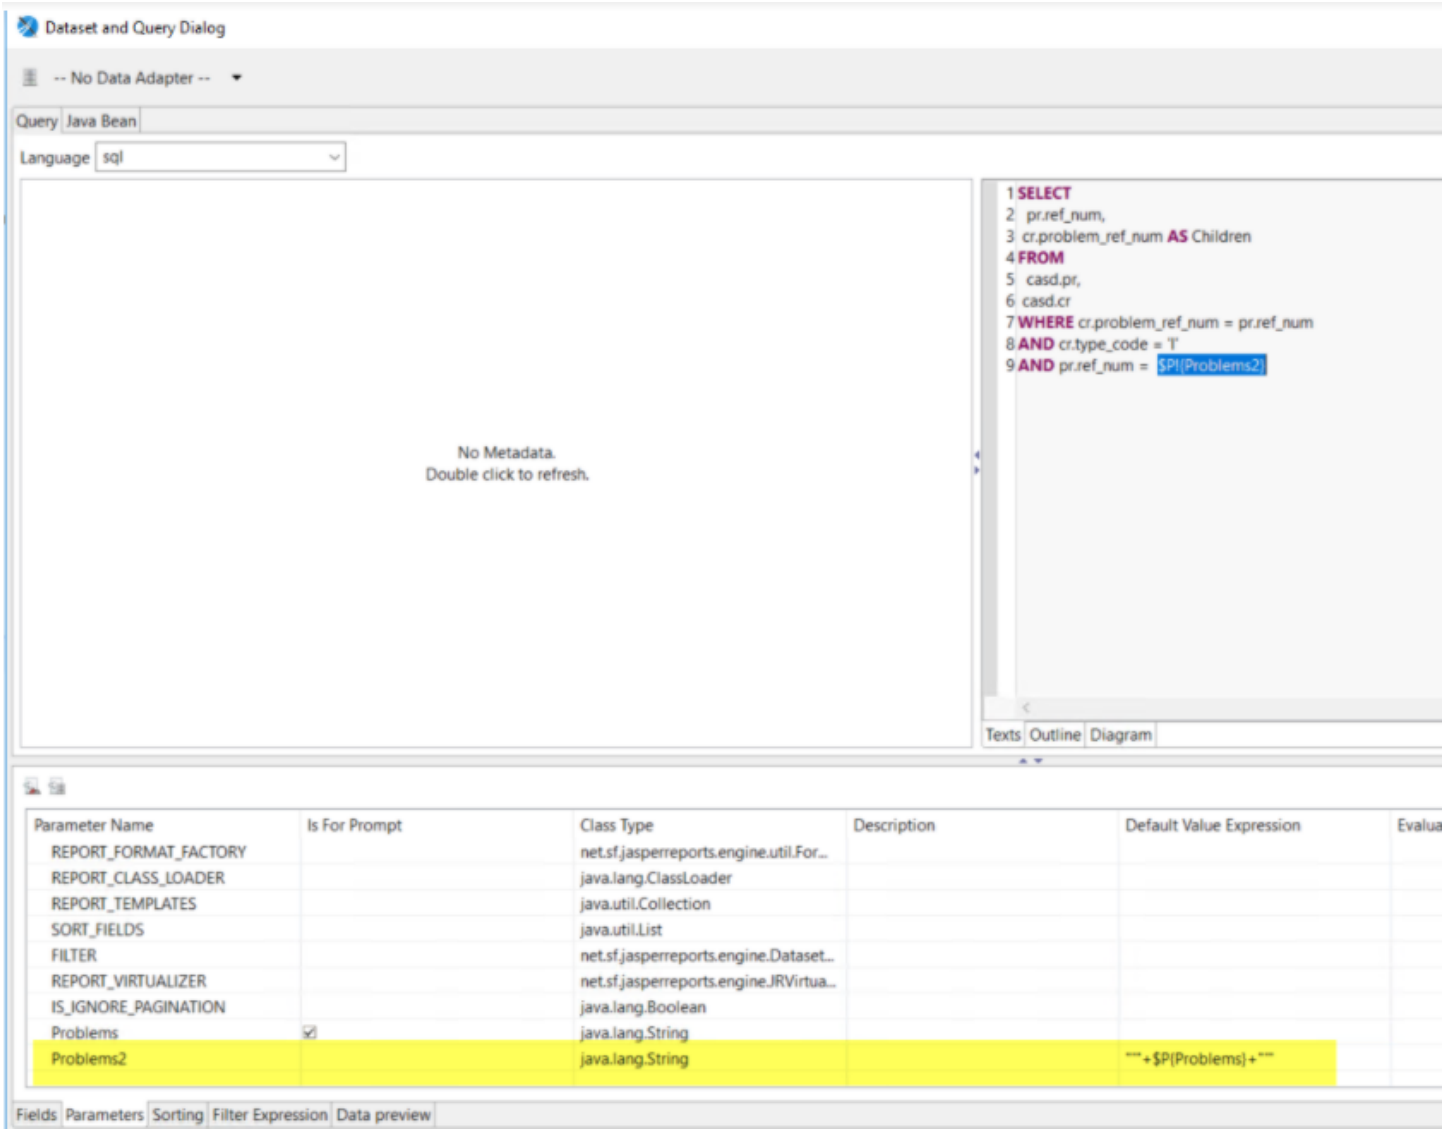
Jaspersoft Studio Reports - Example 1

In this example report, a list of problem tickets is presented with a subreport to show the child Incidents related to each problem. The following query shows a parameter, defined as **java.util.Collection**, to prompt the user to enter or select a list of problem tickets. The parameter is flagged for **Is For Prompt**.

```
SELECT casd.pr.id,
casd.pr.ref_num,
casd.pr.summary,
casd.pr.group_name,
casd.pr.impact_symbol,
casd.pr.priority_symbol,
casd.pr.urgency_symbol,
casd.pr.status_symbol,
casd.pr.rootcause_symbol,
casd.pr.open_date,
casd.pr.description,
casd.pr.change_summary,
casd.pr.change_chg_ref_num,
casd.pr.caused_by_change_order_summary,
casd.pr.caused_by_change_order_chg_ref_num,
casd.alg.type,
casd.alg.type_symbol,
casd.alg.description,
casd.alg.last_mod_dt
FROM casd.alg,
casd.pr
WHERE $X{IN,pr.ref_num, Problems} AND
```

```
pr.persistent_id = alg.call_req_id
```

NOTE
Ensure that your subreport string parameter has a default expression to hard code single quotes. Also, this parameter must not be set for prompting the user to enter or select a list of problem tickets.



Jaspersoft Studio Reports - Example 2

In this example, the main report has data about one or more change orders. The subreport returns the correct properties for the change orders as a list.

Perform the following steps:

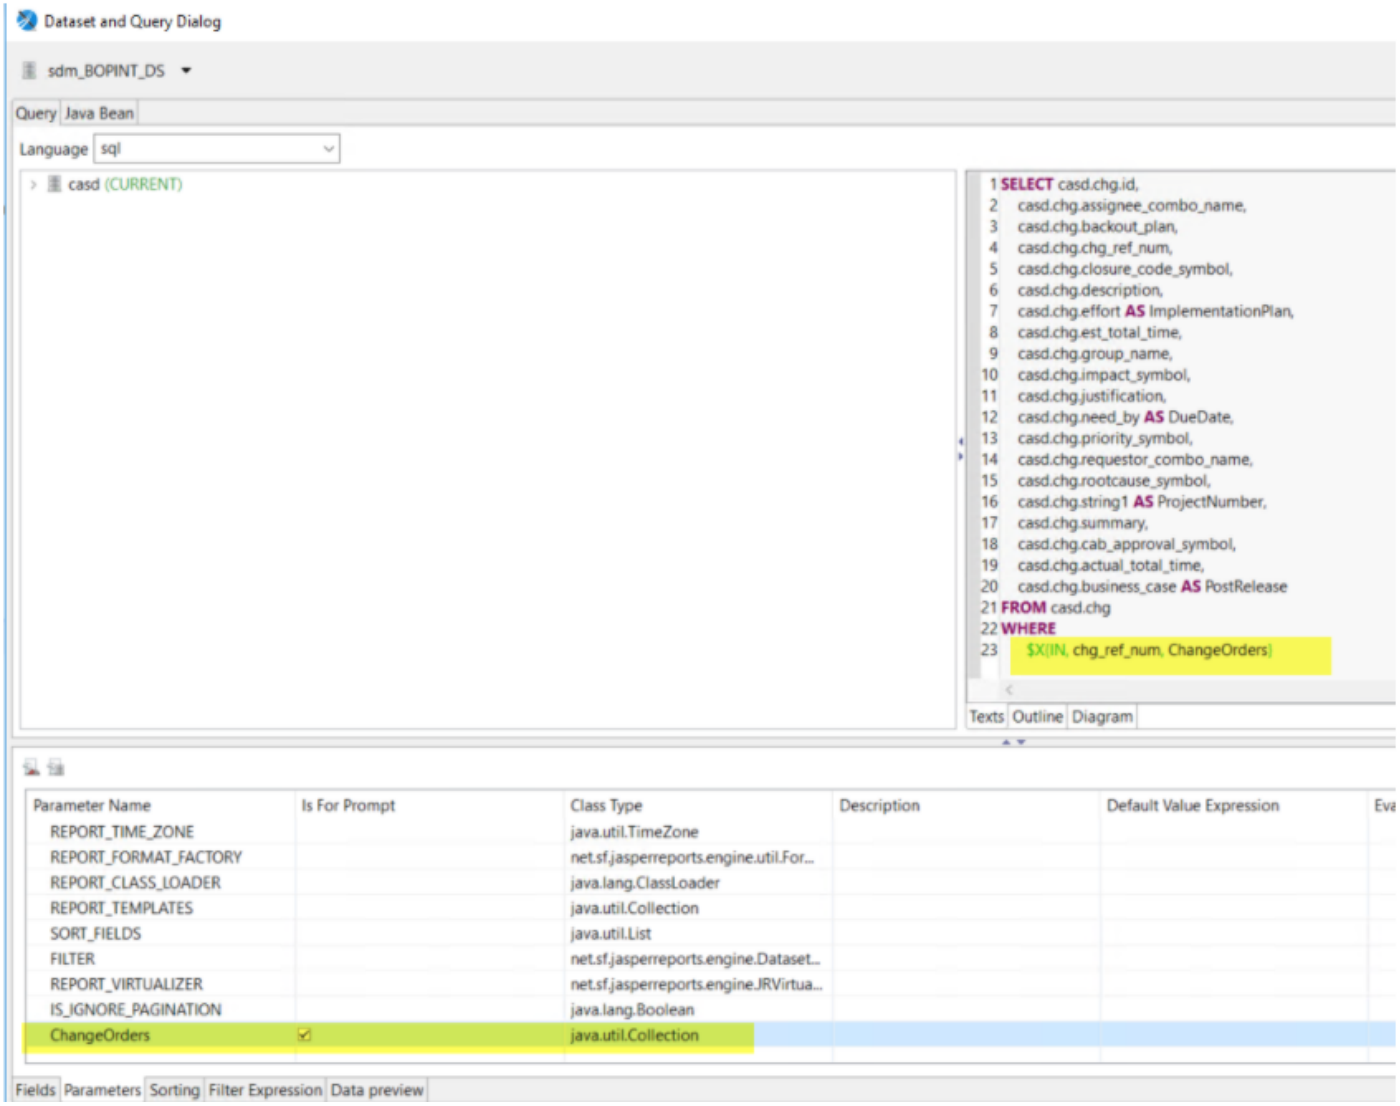
1. Run the following example query for the main report:

```
SELECT casd.chg.id,
casd.chg.assignee_combo_name,
casd.chg.backout_plan,
```

```
casd.chg.chg_ref_num,
casd.chg.closure_code_symbol,
casd.chg.description,
casd.chg.effort AS ImplementationPlan,
casd.chg.est_total_time,
casd.chg.group_name,
casd.chg.impact_symbol,
casd.chg.justification,
casd.chg.need_by AS DueDate,
casd.chg.priority_symbol,
casd.chg.requestor_combo_name,
casd.chg.rootcause_symbol,
casd.chg.string1 AS ProjectNumber,
casd.chg.summary,
casd.chg.cab_approval_symbol,
casd.chg.actual_total_time,
casd.chg.business_case AS PostRelease
FROM casd.chg
WHERE
$X{IN, chg_ref_num, ChangeOrders}
```

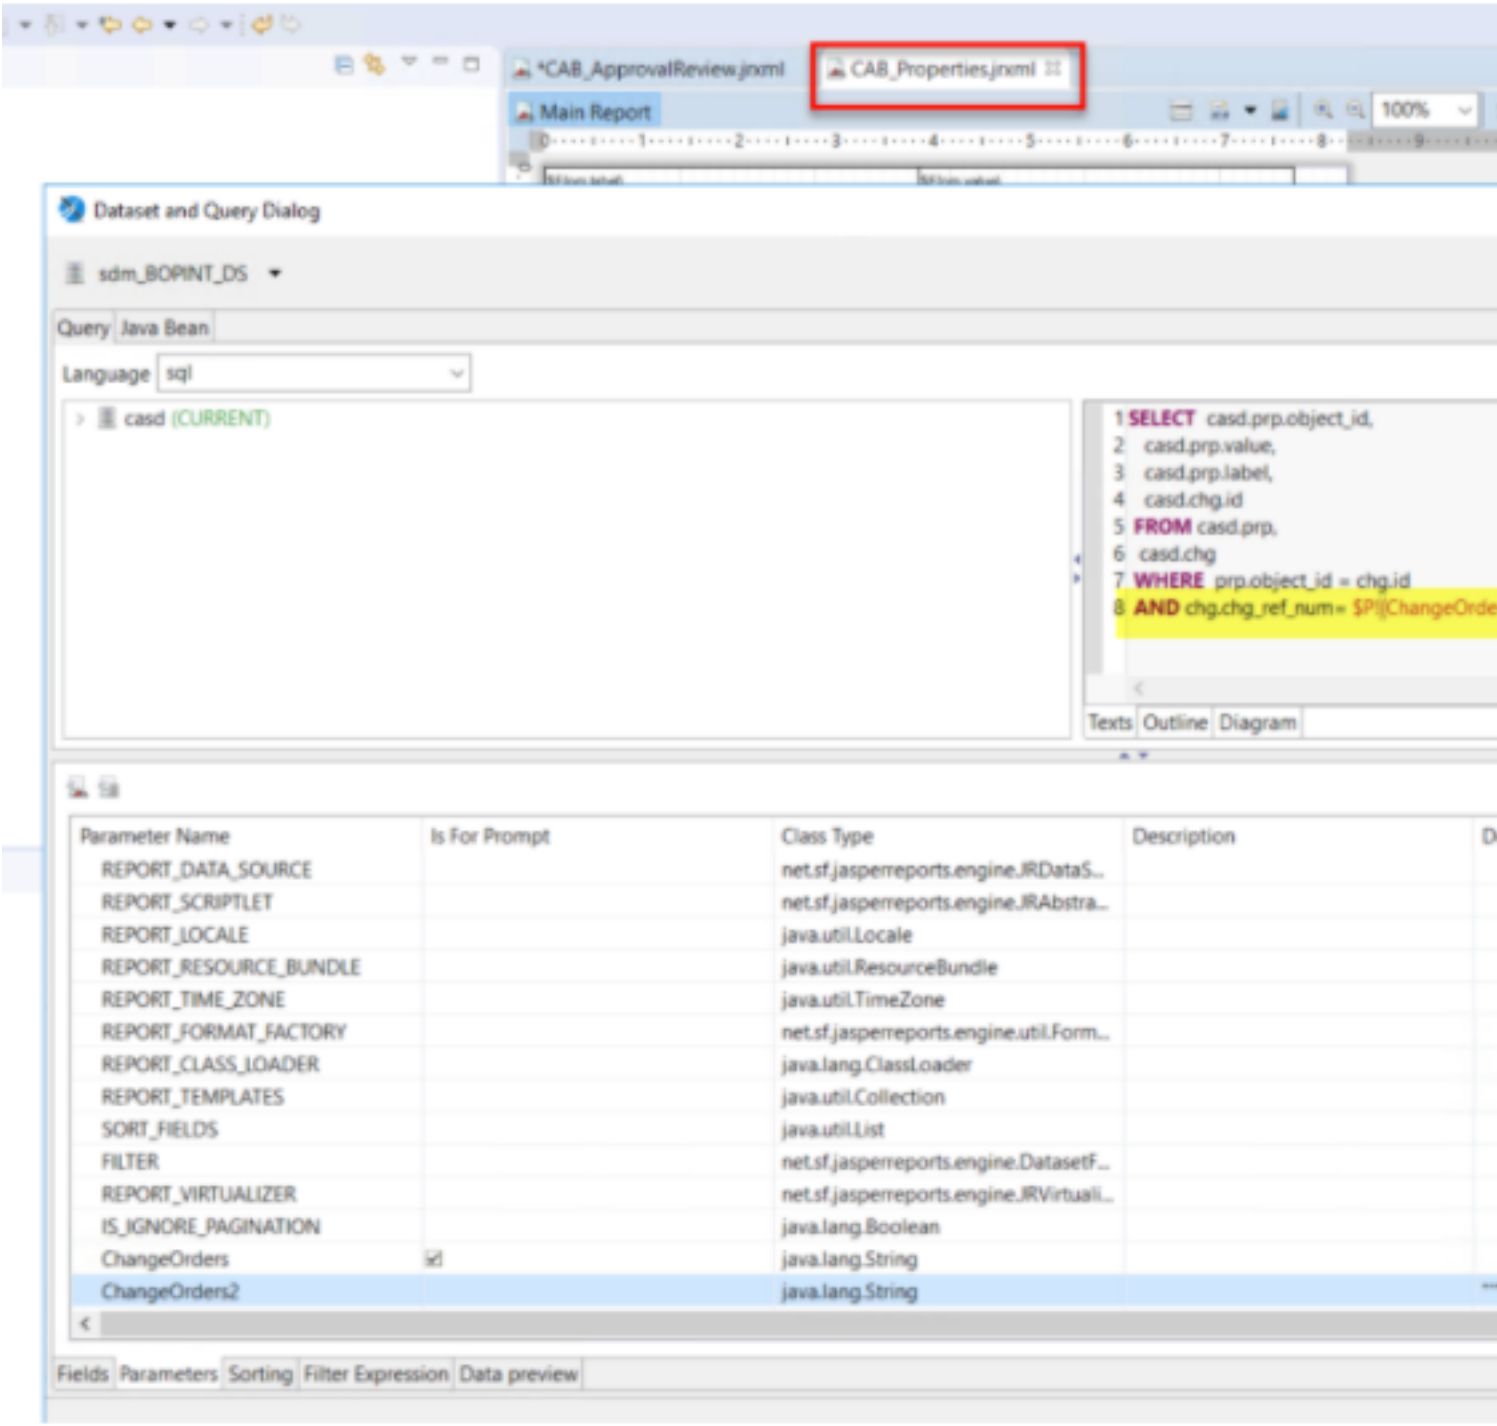
2. Run the following query to pass the list of values:

```
SELECT casd.chg.id,
casd.chg.assignee_combo_name,
casd.chg.backout_plan,
casd.chg.chg_ref_num,
casd.chg.closure_code_symbol,
casd.chg.description,
casd.chg.effort AS ImplementationPlan,
casd.chg.est_total_time,
casd.chg.group_name,
casd.chg.impact_symbol,
casd.chg.justification,
casd.chg.need_by AS DueDate,
casd.chg.priority_symbol,
casd.chg.requestor_combo_name,
casd.chg.rootcause_symbol,
casd.chg.string1 AS ProjectNumber,
casd.chg.summary,
casd.chg.cab_approval_symbol,
casd.chg.actual_total_time,
casd.chg.business_case AS PostRelease
FROM casd.chg
WHERE
$X(IN, chg_ref_num, ChangeOrders)
```



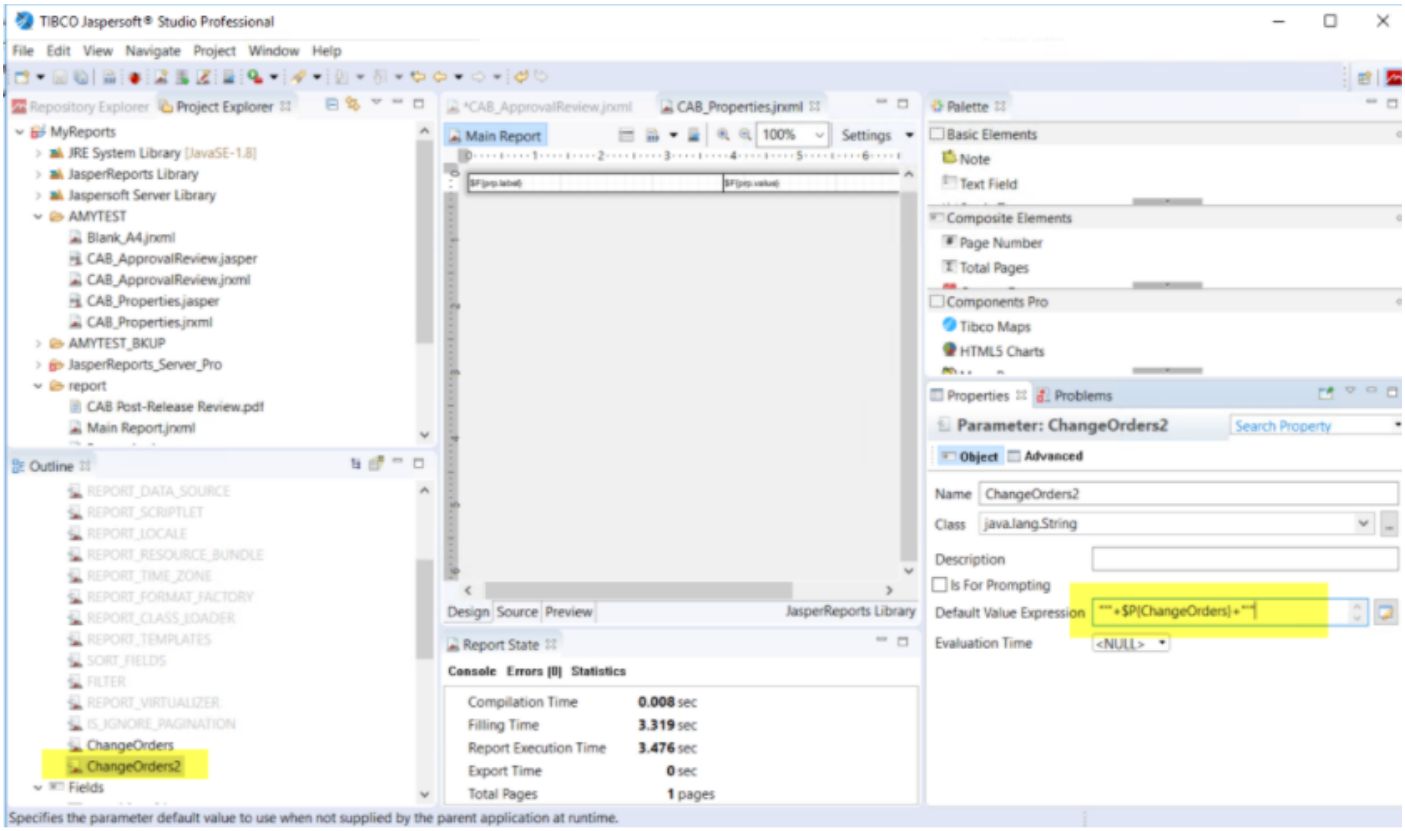
3. Run the following example query for subreports:

```
SELECT casd.prp.object_id,
casd.prp.value,
casd.prp.label,
casd.chg.id
FROM casd.prp,
casd.chg
WHERE prp.object_id = chg.id
AND chg.chg_ref_num= $P!{ChangeOrders2}
```

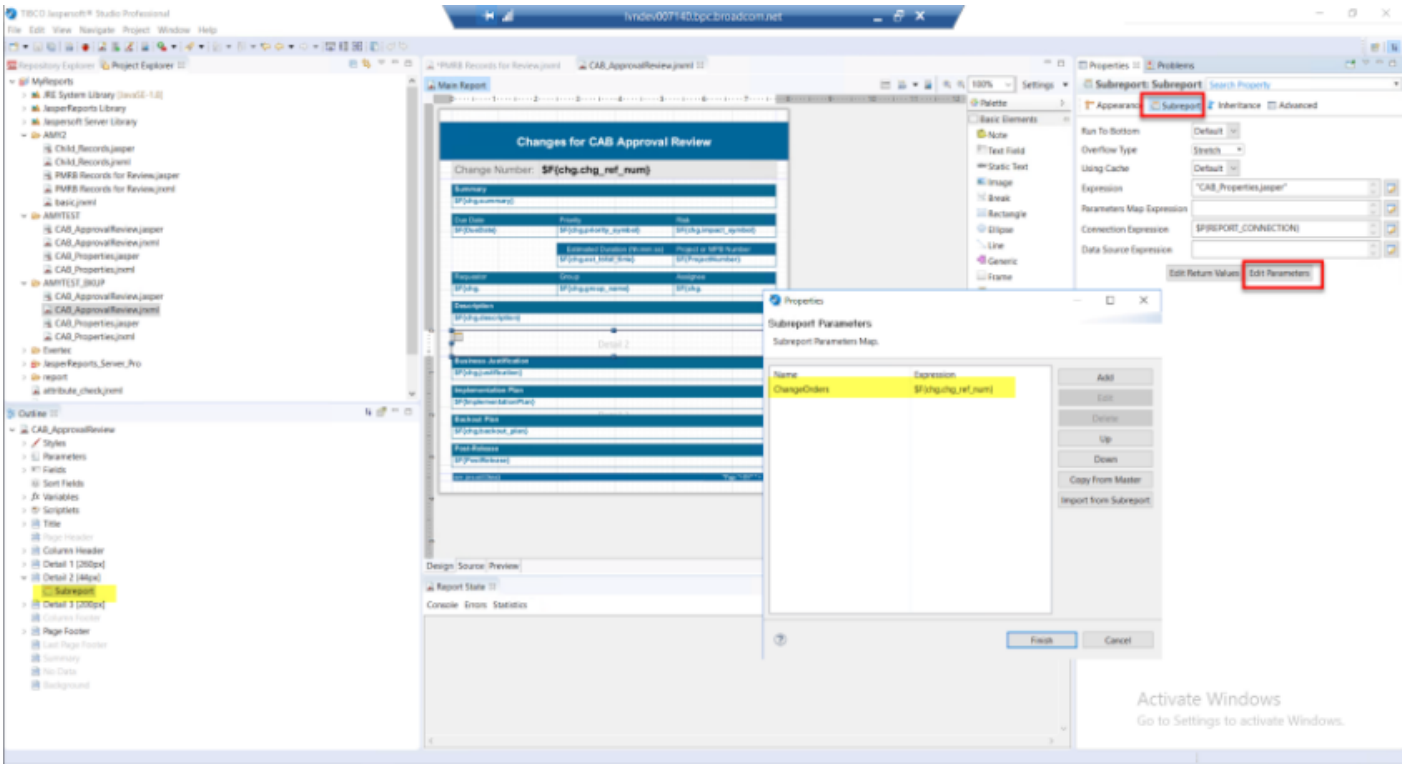


4. Add a new parameter to your subreport as shown below.

```
ChangeOrders2
Class: java.lang.String
Default Value Expression: "'"+$P{ChangeOrders}+"'"
```



5. Validate that the parameter to pass to the subreport is set as follows.



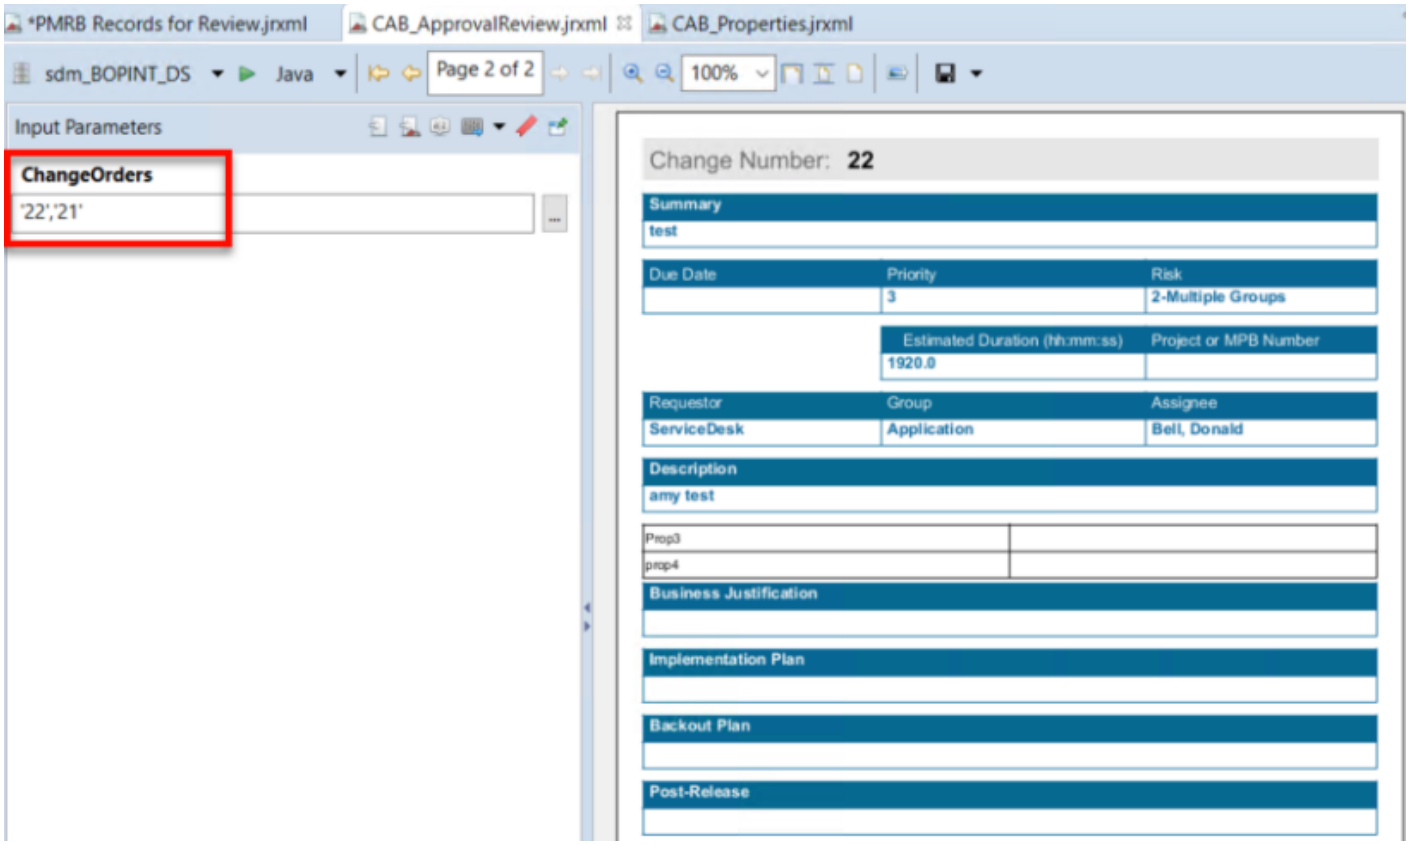
6. Compile the subreport after it is saved.

Testing Subreports in Jaspersoft Studio

Validate the subreports that you have created from Jaspersoft Studio. Ensure to list the change order numbers with single quotes, separated by a comma.

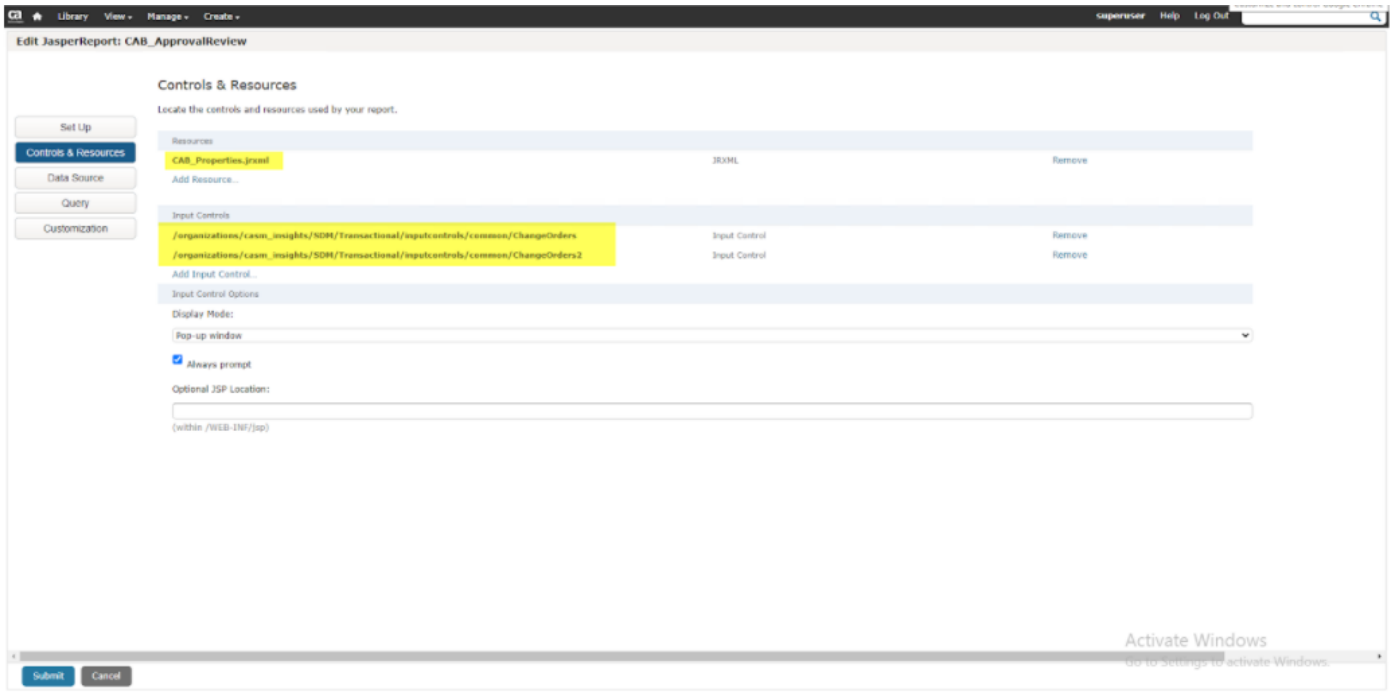
Perform the following steps:

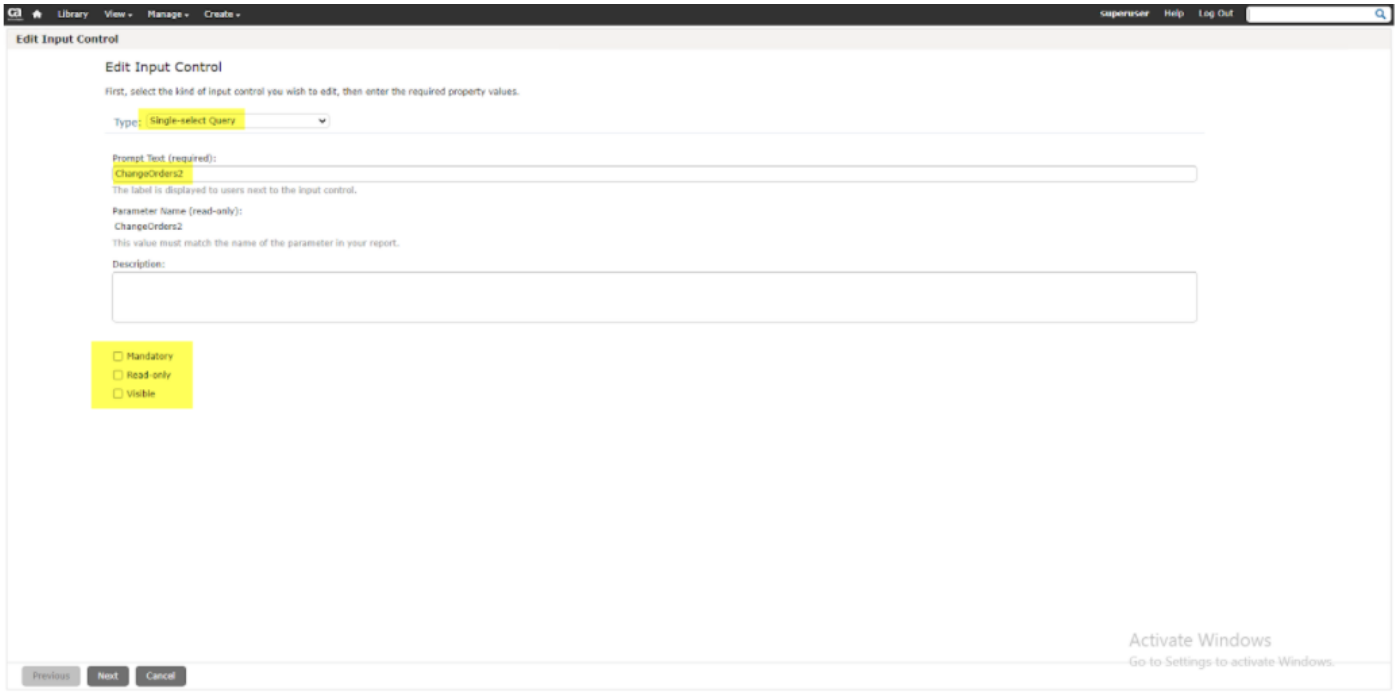
- Run the subreports and enter the change order numbers as shown below to test the subreport:



Publish the Subreport in Jaspersoft Studio

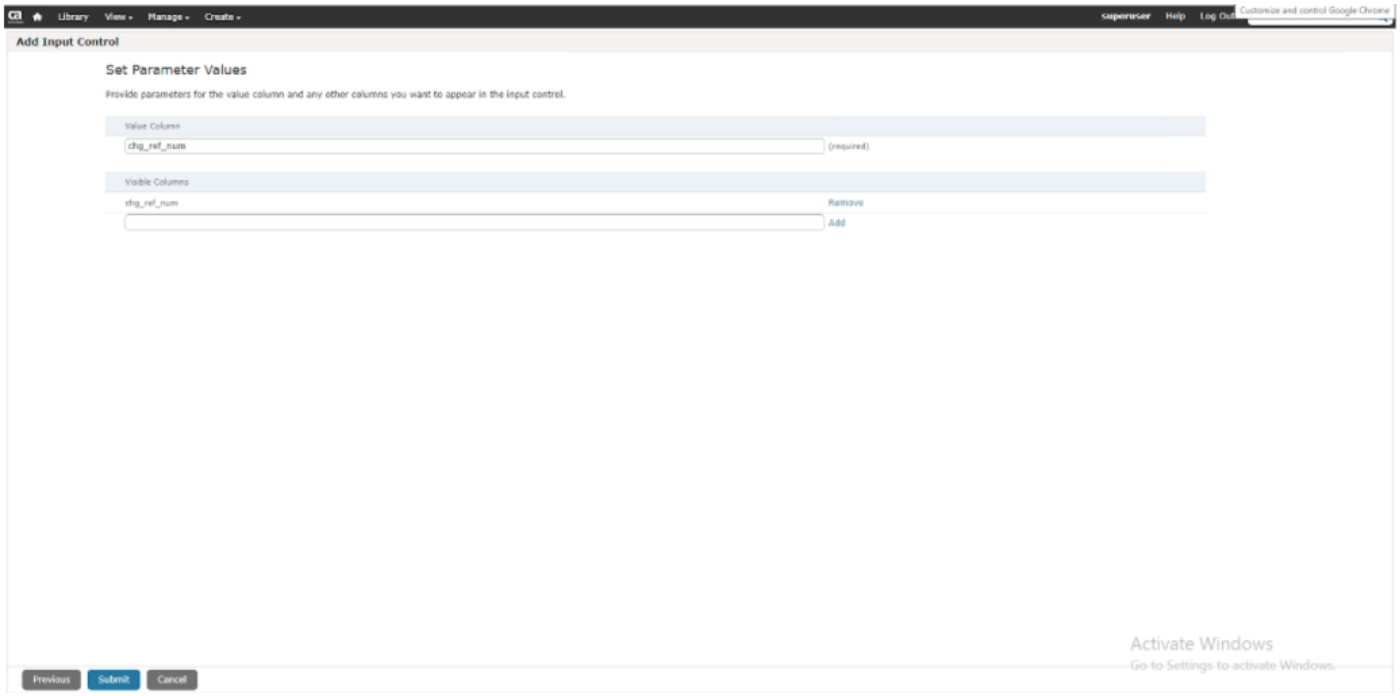
1. Add the **ChangeOrders2** input control as well. Ensure that the respective jrxml file is associated as a resource



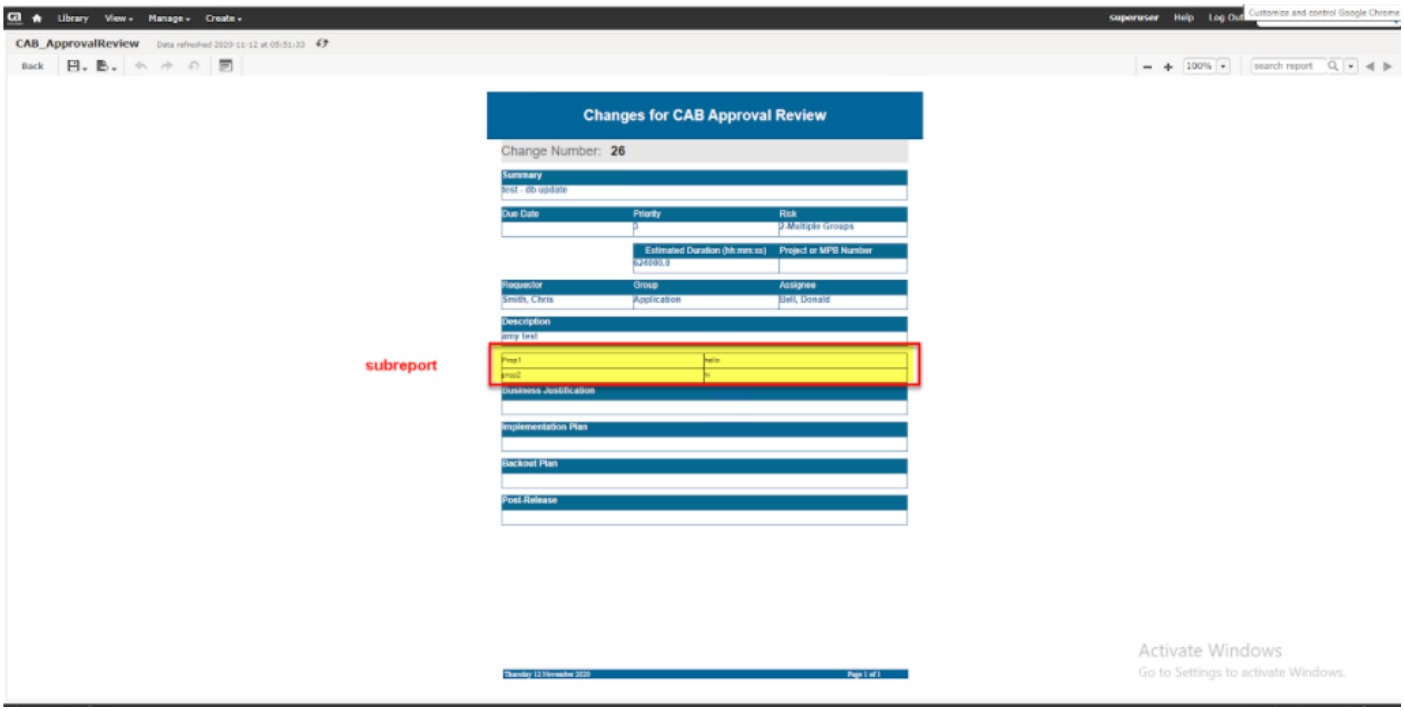


2. Link it to a query, in this example **Chg_Single** , pointing to the data source, with a query string of:

```
select ''''+chg_ref_num+'''' as chg_ref_num FROM chg where active =1
```



3. The subreport displays as follows.

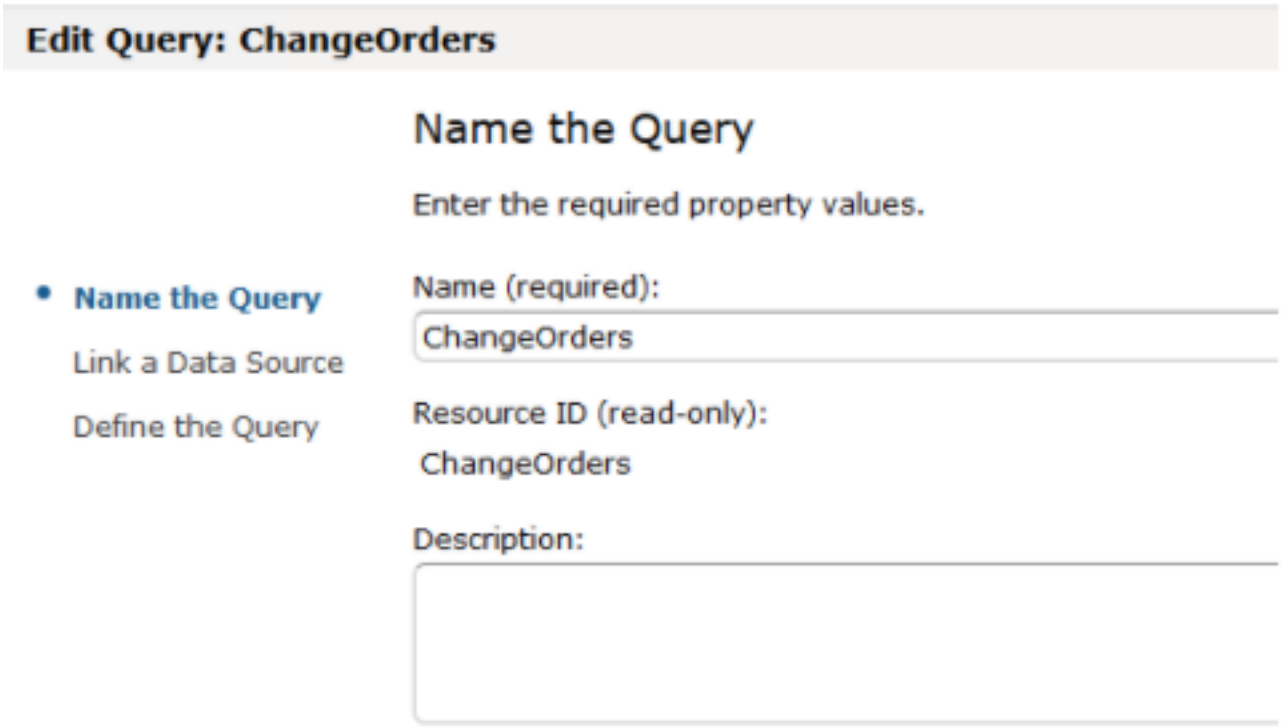


Modify the Input Parameters

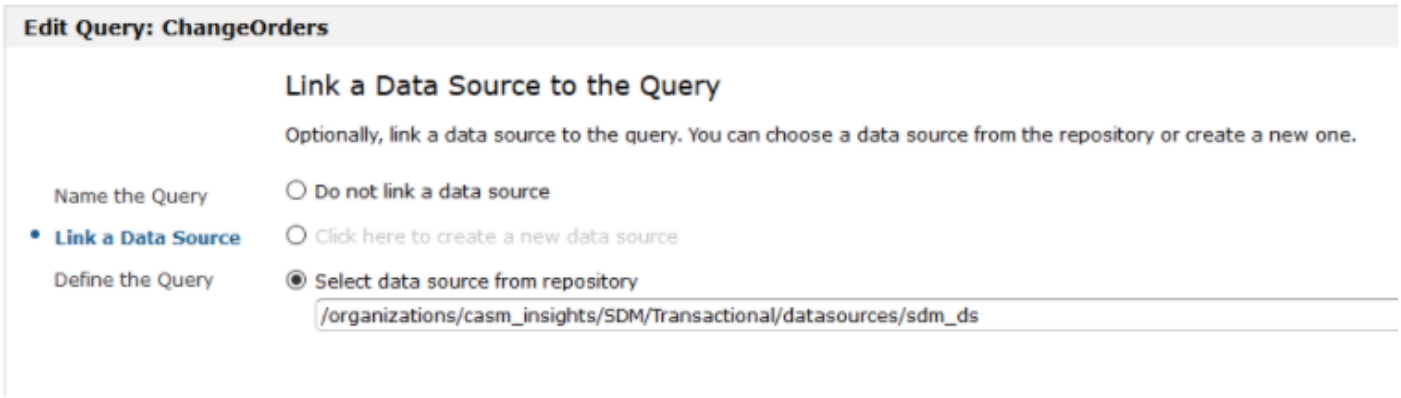
Input parameters/controls are used to prompt users for input or to pass the input to the report. Based on the input, the server modifiesthe WHERE filter clauses. Note Use single quotes to input a collection into a report, such as a list of Change Orders to return.

Perform the following steps:

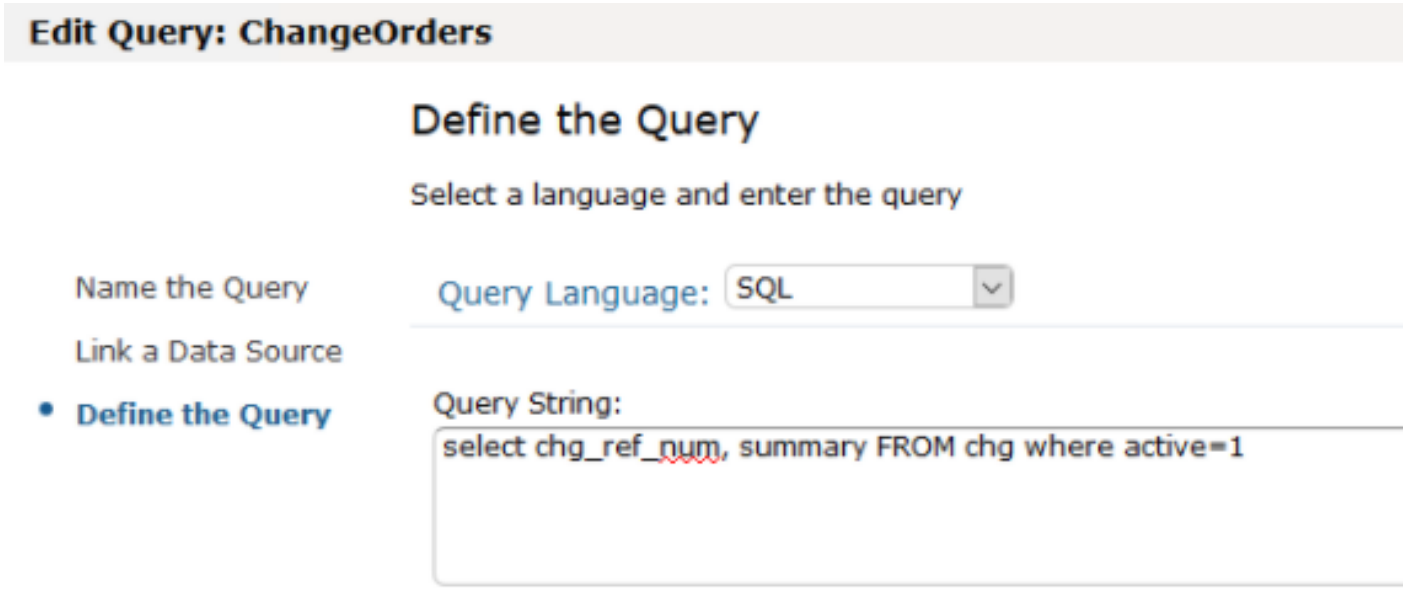
1. Create a query that the input parameter will use:
   a. View the repository, and drill down to: `\Organizations\SDM\Transactional\inputcontrols\queries`
   b. Right-click Queries, select Add Resource, Query.
   c. Provide a name as shown in the image below



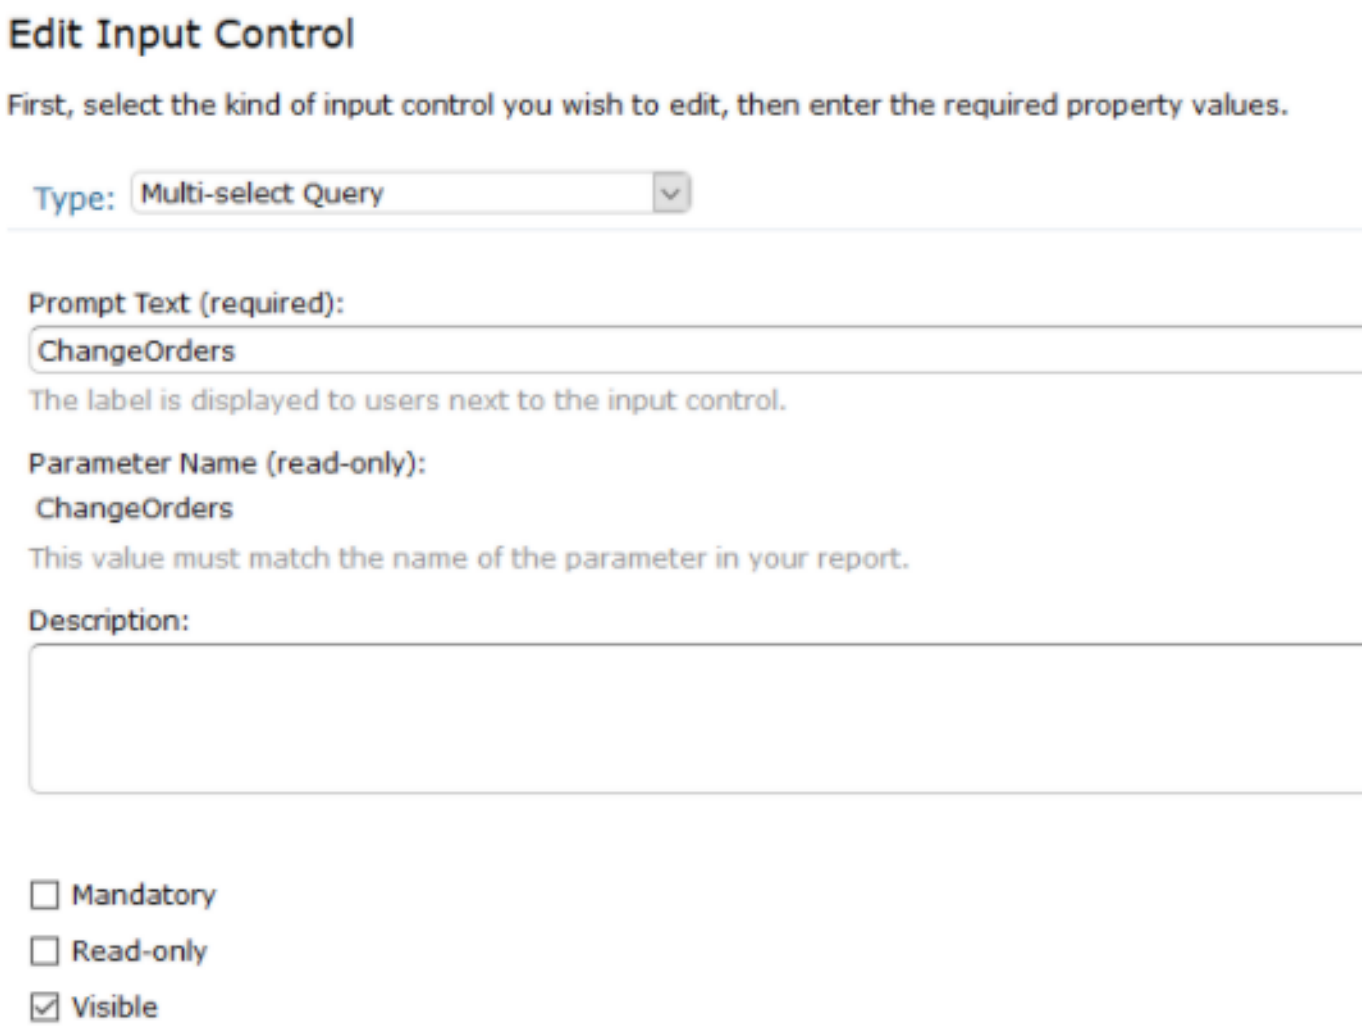
2. Select the data source



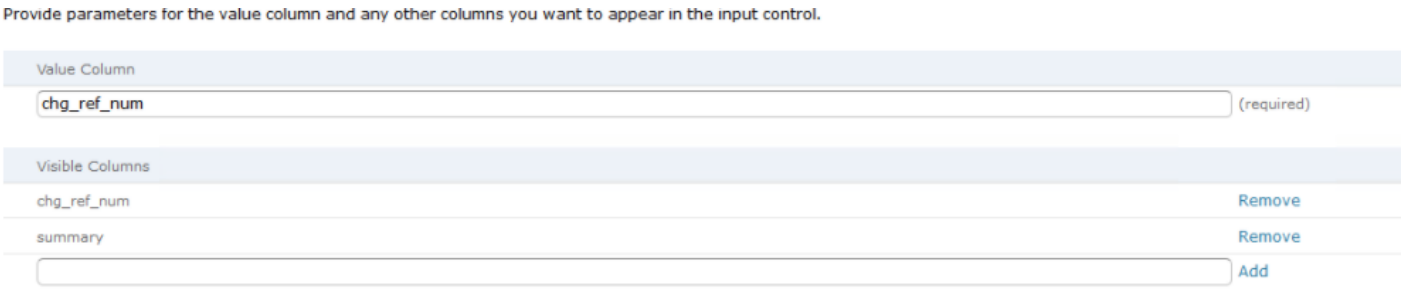
3. Define the query string with object names. For example: select chg_ref_num, summary FROM chg where active=1



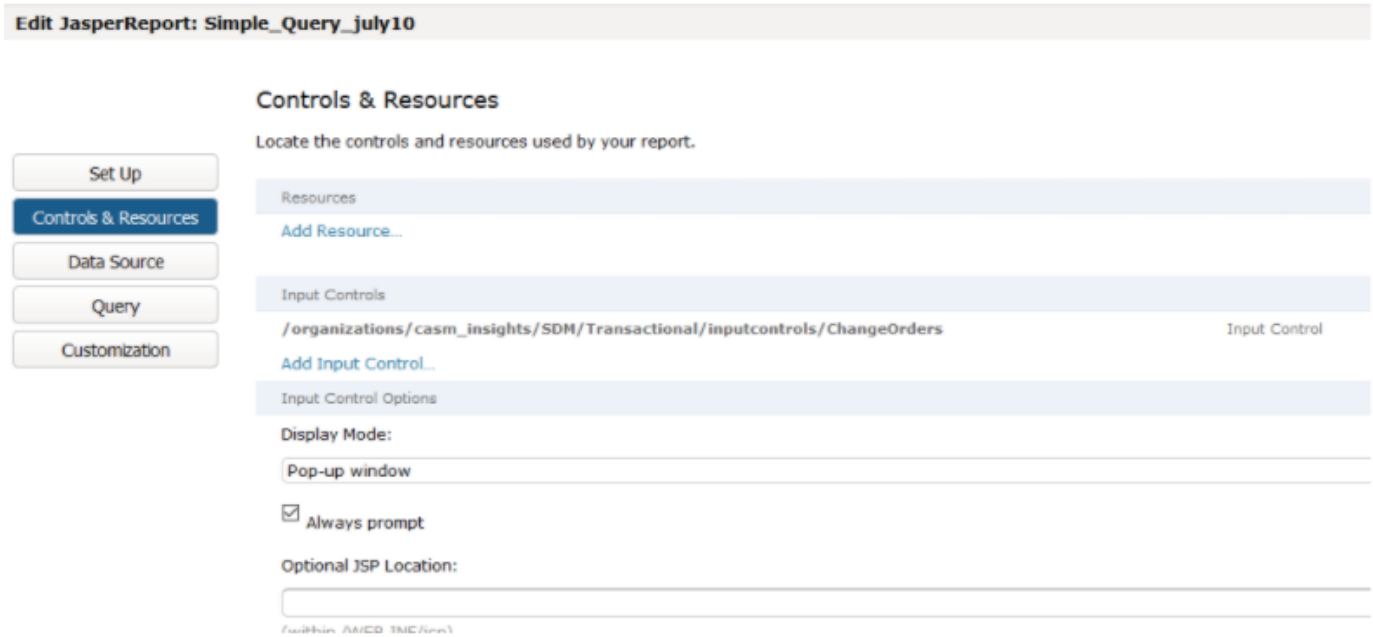
4. Right-click input controls, and select Add Resource, Input Control.
   a. Select the Type from the drop-down list. Example: Select Multi-select Query and select Visible.



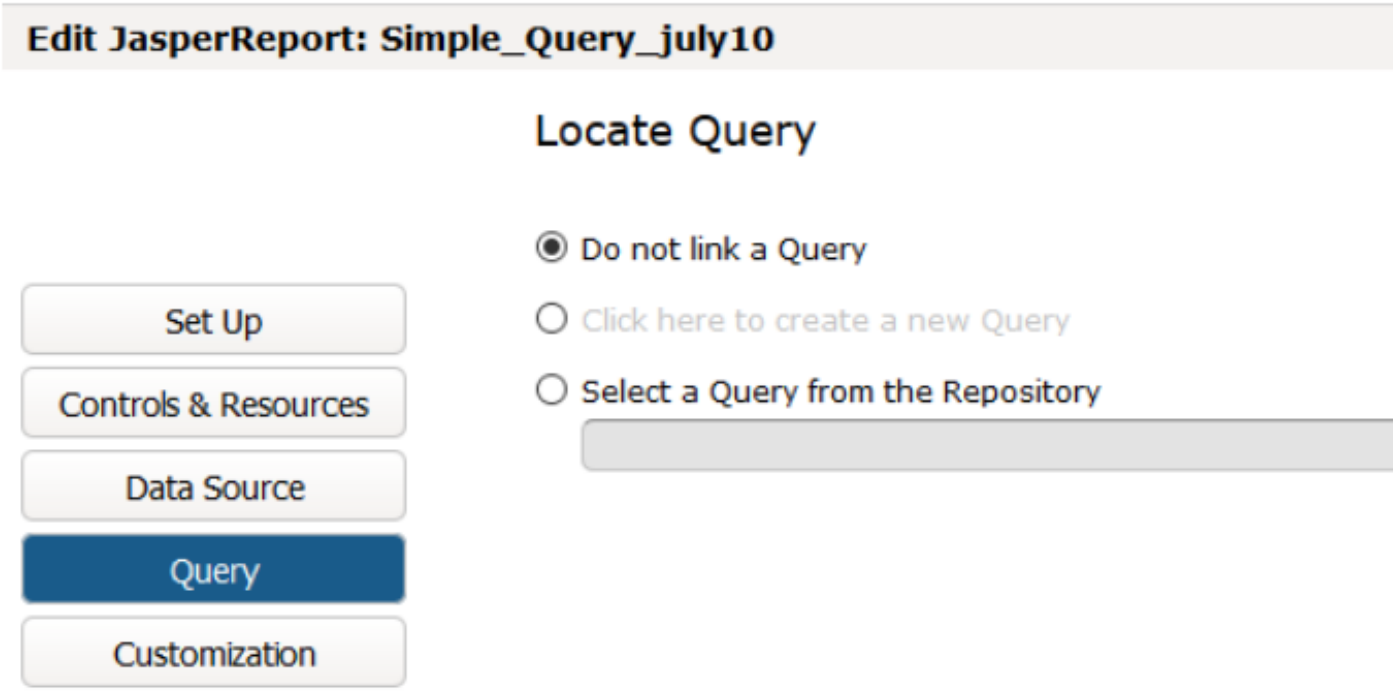
5. Select the query that you created in the first step:



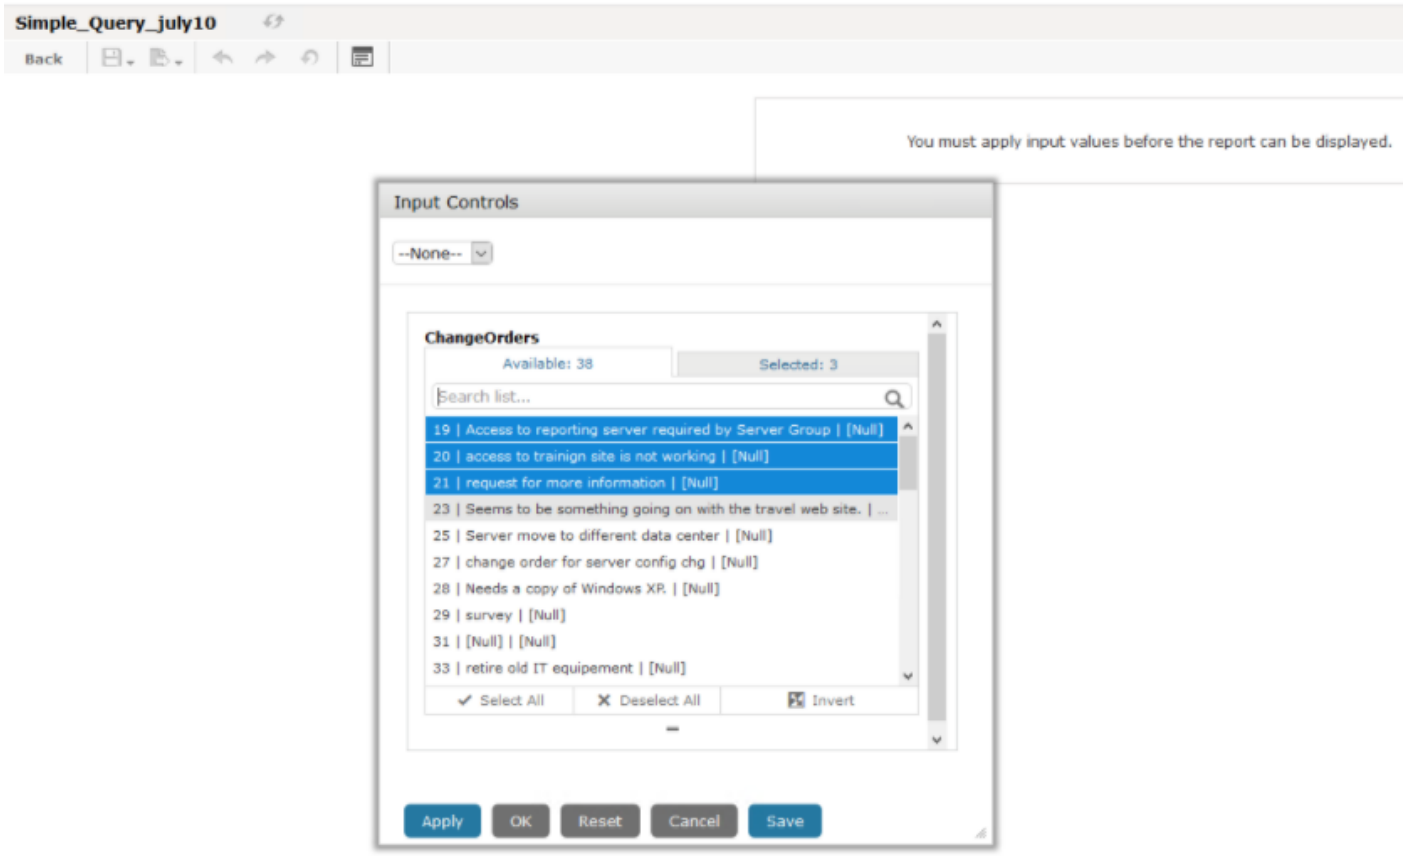
6. Select the column name that is queried, and create the columns that to display when the parameter is shown:



7. Browse to your report in the repository. Right-click to edit it.
8. Under Controls & Resources, browse to the Input Control you created in step 2.



9. Run your report to test the input control.

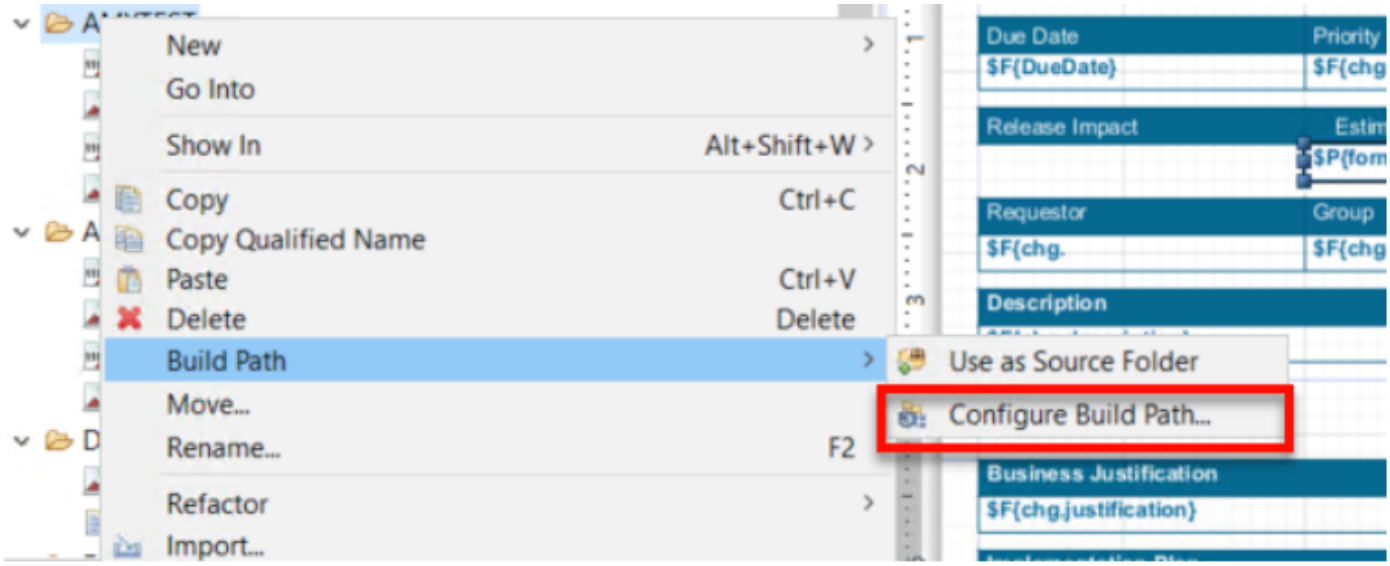


Add Duration Fields

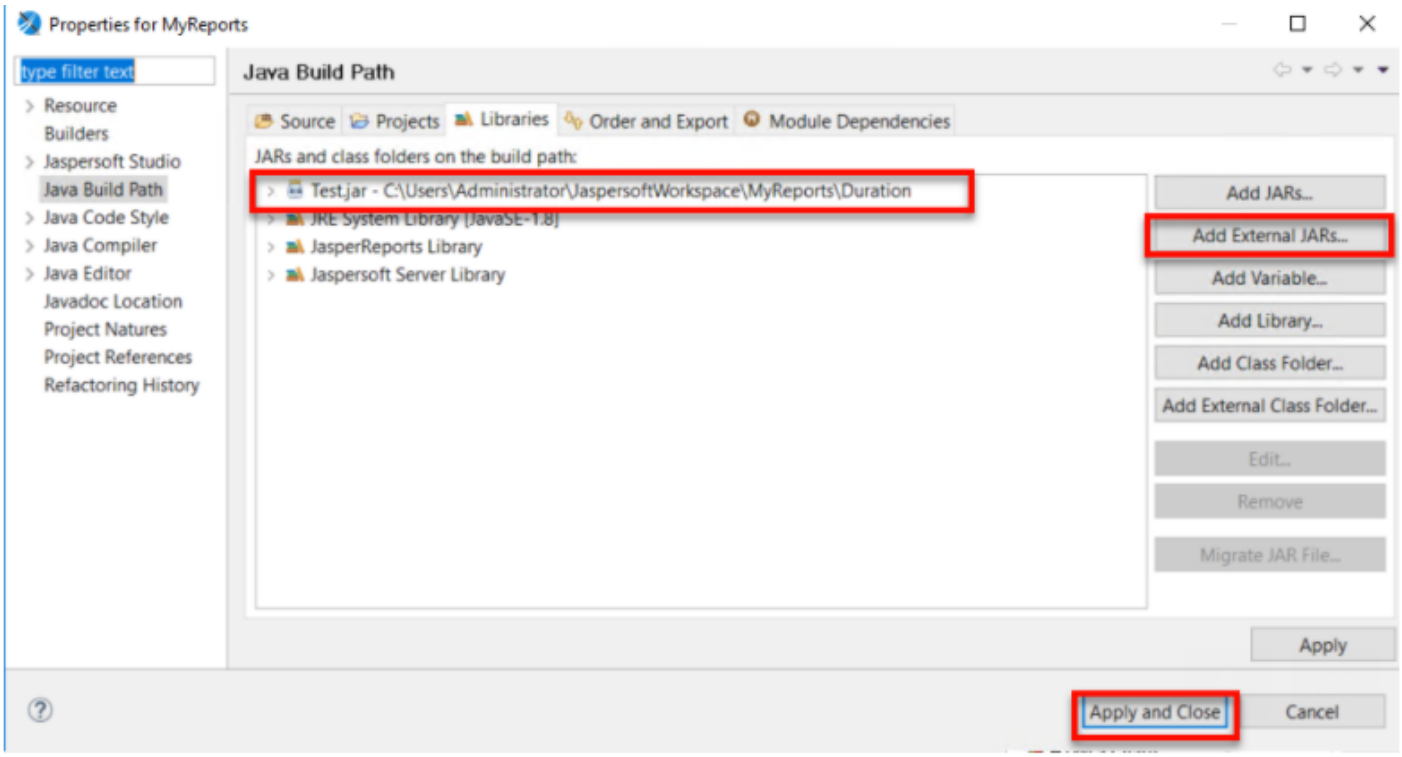
Add the duration fields to the build path of your project in the libraries. Then, import the class: com.duration.converter.

Perform the following steps:

1. Right-click a project folder, select **Build Path**, and **Configure Build Path**.



2. Copy the Jar from the DVD. CASM_17.4.2.0\filestore\Jasper\9.0.0\ExternalAuthJars and, copy it into the jasperserver tomcat lib folder. For eg: *C:\apache-tomcat-9.0.65\webapps\jasperserver-pro\WEB-INF\lib*.
3. Navigate to the **Libraries** tab, click **Add External JARs**, and browse for the above **DurationFormatter.jar** that you copied in Step 1.

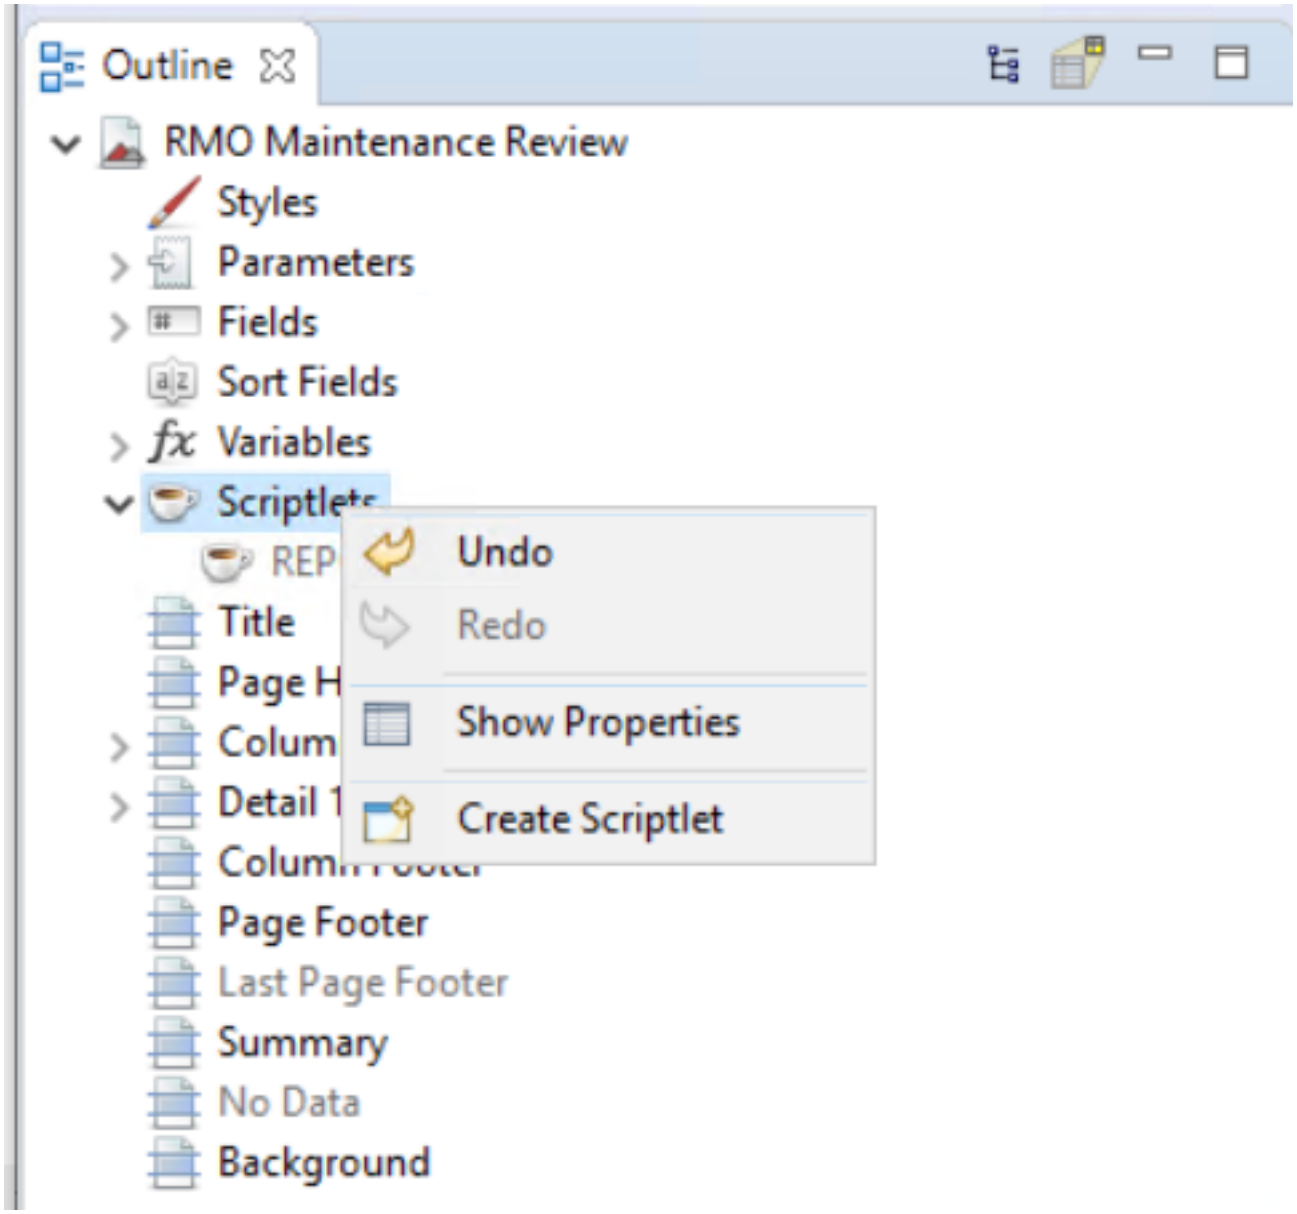


4. Click **Apply and Close**.

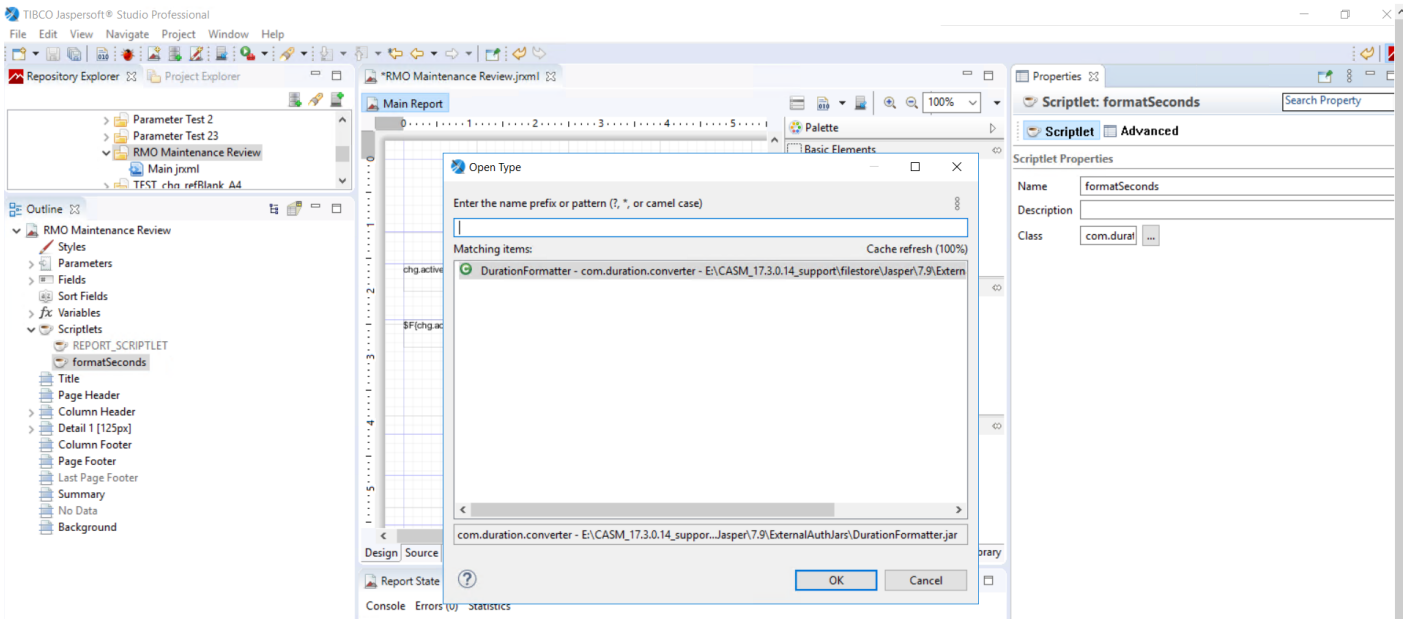
Add Parameter for Scriptlet

Perform the following steps:

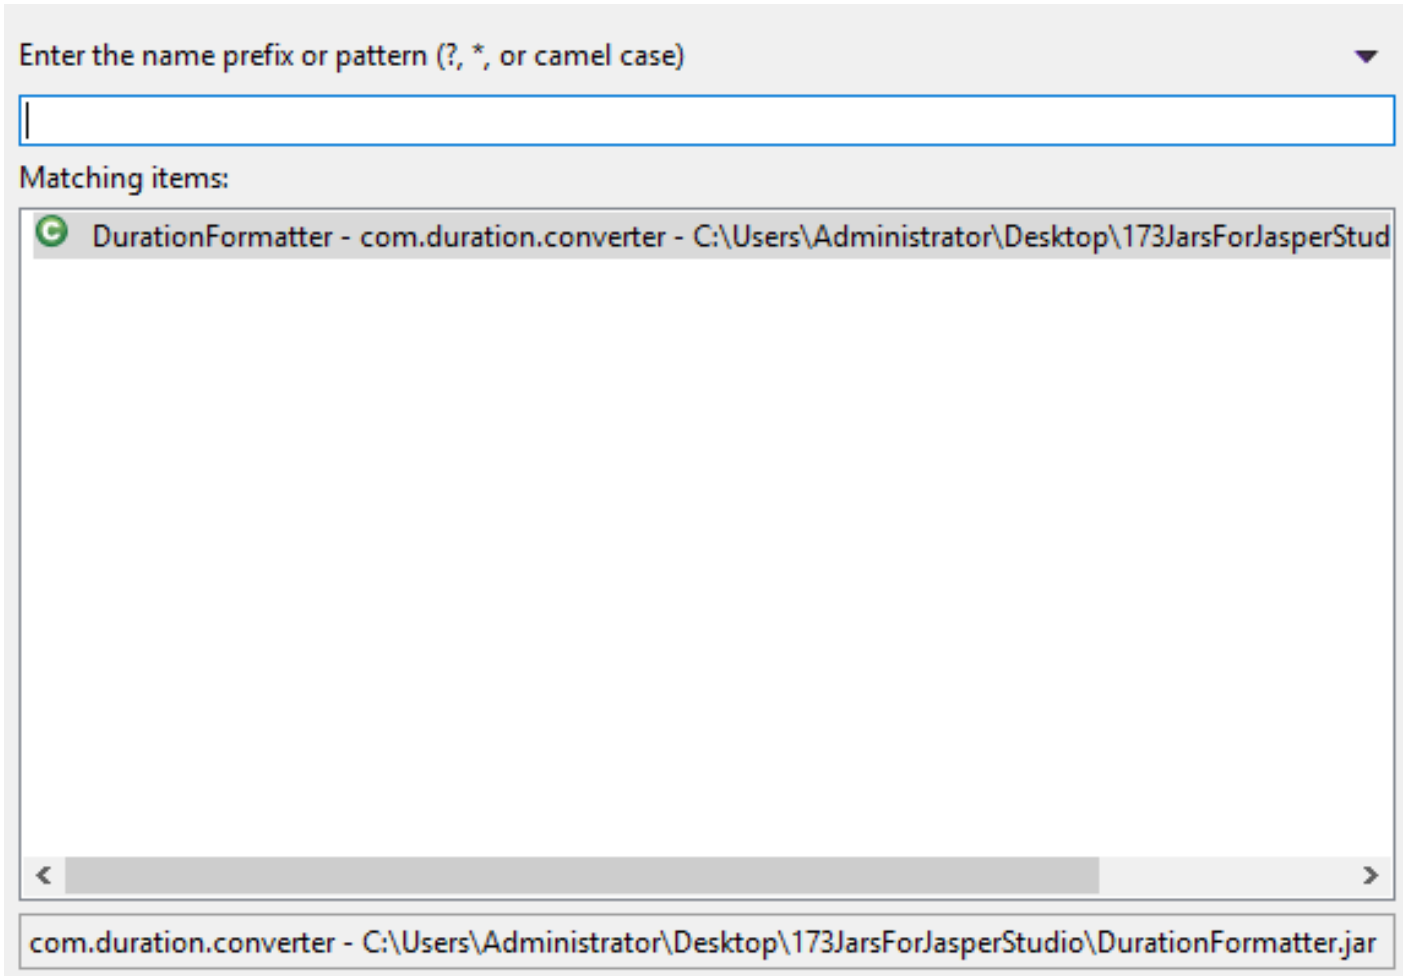
1. Right-click Scriptlets (under the report outline tab), and Click **Create Scriptlet** option.



2. Under the **Properties** tab, give the scriptlet a name: **formatSeconds**
3. Next to the Class field, select the ellipsis (...)



4. Select the **DurationFormatter**.

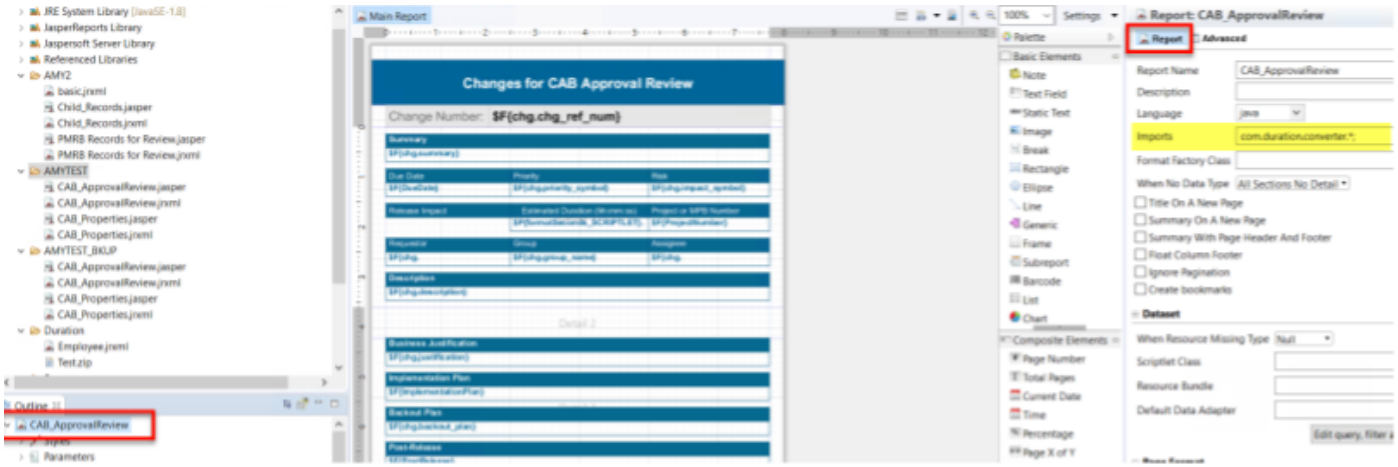


5. Click the Duration field in the report.

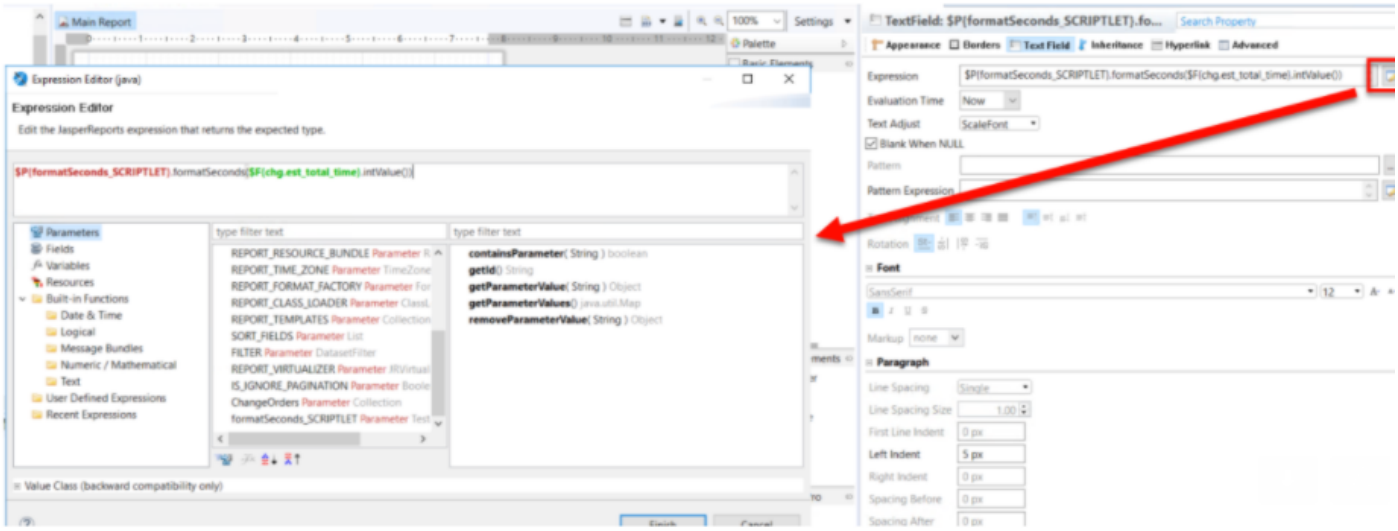
6. Click to add an expression for the Estimated Duration field:

   ```
   $P{formatSeconds_SCRIPTLET}.formatSeconds($F{chg.est_total_time}.intValue())
   ```

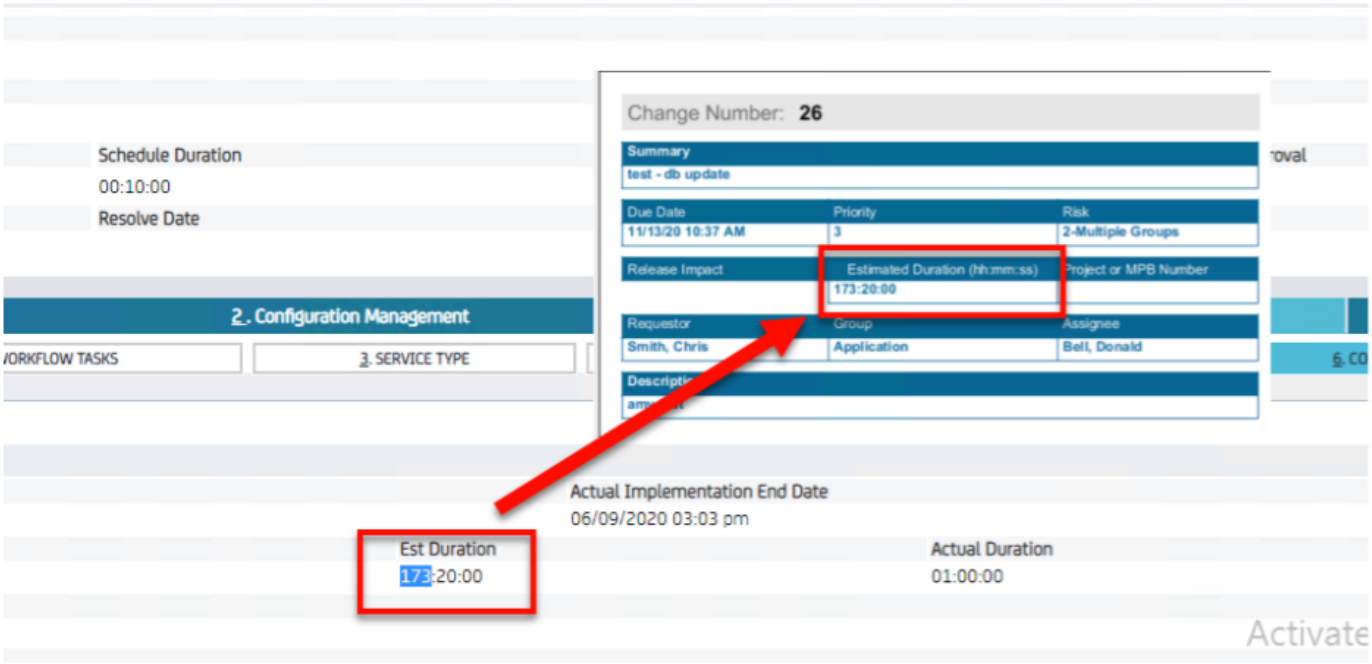
7. Click the report name under Outline Properties and click the dots next to Imports.
8. Select **Add Package**.
9. Select **com.duration.converter**.



10. Click **OK**.



11. Run the Report. It should match as shown in the following screenshot.



NOTE
If you are unable to run the report, ensure that the <import value> and <scriptlet name> parameters in the source tab of the report have the following values

```
<import value="com.duration.converter.*"/> <scriptlet name="formatSeconds"
 class="com.duration.converter.DurationFormatter"/>
```

12. Publish this report in the Jasper Server from the Jasper Studio.
13. Log in to the Jasper Server URL in which the report is published.
14. From the service console, stop the service: *jasperreportsTomcat.*
15. Copy the *DurationFormatter.jar* from CASM_17.4.2.0\filestore\Jasper\9.0.0\ExternalAuthJars and, copy it into the jasperserver tomcat lib folder. For eg: *C:\apache-tomcat-9.0.65\webapps\jasperserver-pro\WEB-INF\lib*.
16. Start the service: *jasperreportsTomcat.*
17. Run the report.
    The duration should match the report and SDM application as mentioned in Step 11.

SQL Queries with Strings

If you are using SQL queries with a string type parameter, ensure that the parameters are enclosed in single quotes. See the following example.

```
For example: select * from cr where cr.ref_num='$P{refNumParam}' Where refNumParam is a string.
```

When using FLOAT/ DOUBLE ATTRIBUTES in JasperStudio

If double type fields are in use, they convert to a String by default in JasperStudio. This string must be manually changed to double type.
For e.g. if field class is java.lang.String, then manually change it to java.lang.double

JasperReports Server

This topic provides complete information about the following releases of JasperReports Server.

- 8.1.1
- 9.0.0

JasperReports Server 9.0.0

- Tutorial for JasperReports Server 9.0.0
- Install JasperReports Server 9.0.0
- Upgrade JasperReports Server to 9.0.0
- Integrate JasperReports Server 9.0.0 with CA Service Management
- Configure JasperReports Server 9.0.0 for High Availability
- Configure JasperReports Server 9.0.0 to Use SSL

Tutorial for JasperReports Server 9.0.0

Learn about JasperReports Server, TIBCO Jaspersoft Online Learning Portal, training, documentation, and the Jaspersoft Community.

TIBCO Jaspersoft Online Learning Portal

Broadcom Inc., in partnership with TIBCO Software, Inc., has authorized its partners and licensed customers to have free access to the TIBCO Jaspersoft Online Learning Portal.

Recommended Jaspersoft Training - TIBCO Software, Inc

Jaspersoft training is available from TIBCO Software, Inc. The following recommended Jaspersoft training courses will help you in your Jaspersoft implementation.

Recommended Training for Analysts and Managers

The following online training and resources are recommended for end users such as Analysts and Managers:

Training Topic	Type	Description	Duration	Video	TIBCO Docs
Ad Hoc Views	Video	This video helps you learn how to create and configure Ad Hoc views using the Ad Hoc Editor.	8 Minutes	Ad Hoc Views Tutorial	Adhoc Views
Reports	Video	This video helps you learn how to create and format reports from existing Ad Hoc views.	9 Minutes	Ad Hoc Reports Tutorial	Reports
Dashboards	Video	This video helps you learn how to create dashboards and dashlets.	9 Minutes	Dashboards Tutorial	Dashboards

Recommended Training for Administrators.

All the training materials covered in online training resources in the following table are recommended for administrators such as SDM administrators:

Training Topic	Type	Description	Duration	Video	Registration Required?	TIBCO Docs
Domains	Video	This video helps you learn how to create domains.	8 Minutes	Domains Tutorial	No	NA
Jasper Reports User Guide	User Guide	Introduction to JasperReports Server and its capabilities.		NA	No	User Guide
JasperReports Administration Guide	Administrative Guide	Overview of JasperReports Server Administration.		NA	No	Admin Guide

Jaspersoft Community

Visit the Jaspersoft Community for related tutorials, tips and tricks, and other helpful information.

Install JasperReports Server 9.0.0

The installation of JasperReports 9.0.0 is supported on Microsoft SQL Server, Oracle, and PostgreSQL databases. The installation is available in English (United States) and is supported only on Windows Operating System.

We recommend using the WAR file distribution for installation or upgrade to JasperReports Server 9.0.0, as the WAR distribution includes customizations needed for SDM integration.

> **NOTE**
> Ensure the supported Java is installed, refer TIBCO Platform Support for JasperReports 9.0.0 Documentation.
> To use TIB_js-jrs_9.0.0_win_x86_64.exe to install JasperReports Server 9.0.0 (**for evaluation purpose only**) and to import an existing repository, refer the KB article.

Download a Vendor JDBC Driver

Pick the following database versions for installation:

Jasper Database	Name of jar to be copied to manually before installation	Sample Location
SQL	mssql-jdbc-12.4.1.jre8	..\js-jrs_9.0.0_bin\jasperreports-server-pro-9.0.0-b server\jdbc
Oracle	Rename ojdbc8.jar with ojdbc8-23.2.0.0.jar	..\js-jrs_9.0.0_bin\jasperreports-server-pro-9.0.0-b cle\jdbc
PostgreSQL	Not required	TIBCO provides a driver by default.

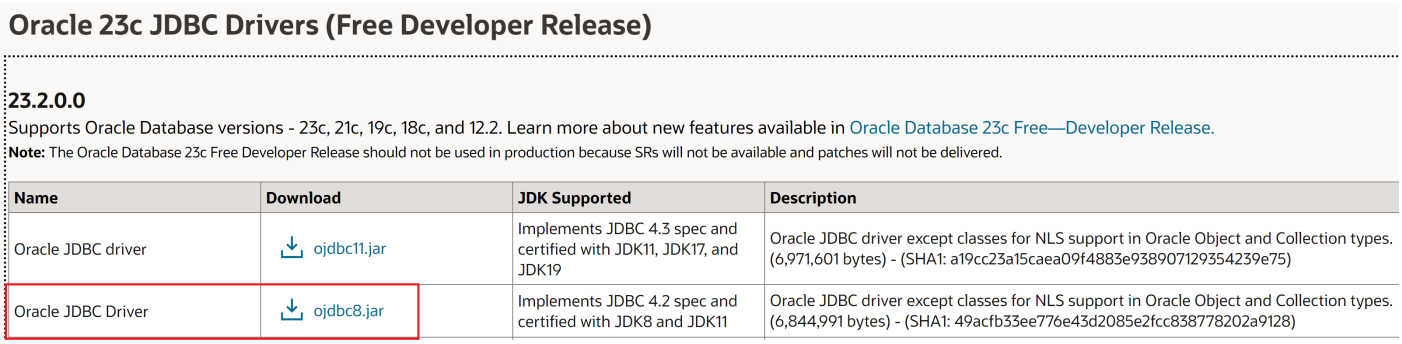
For SQL Installation

1. Go to the Microsoft SQL page search and extract the file: "*Download Microsoft JDBC Driver 12.4.1 for SQL Server (zip)".*

2. Once you unzip the downloaded file, go to the extracted zip file location **>sqljdbc_12.4.1.0_enu> sqljdbc_12.4> enu> jars** and look for the *mssql-jdbc-12.4.1.jre8* file.

For Oracle Installation

1. Go to the Oracle page, and look for "Oracle 23c JDBC Drivers (Free Developer Release)" . Expand the **23.2.0.0** section and download the **ojdbc8.jar.**



Oracle 23c JDBC Drivers (Free Developer Release)

23.2.0.0

Supports Oracle Database versions - 23c, 21c, 19c, 18c, and 12.2. Learn more about new features available in Oracle Database 23c Free—Developer Release.

Note: The Oracle Database 23c Free Developer Release should not be used in production because SRs will not be available and patches will not be delivered.

Name	Download	JDK Supported	Description
Oracle JDBC driver	ojdbc11.jar	Implements JDBC 4.3 spec and certified with JDK11, JDK17, and JDK19	Oracle JDBC driver except classes for NLS support in Oracle Object and Collection types. (6,971,601 bytes) - (SHA1: a19cc23a15caea09f4883e938907129354239e75)
Oracle JDBC Driver	ojdbc8.jar	Implements JDBC 4.2 spec and certified with JDK8 and JDK11	Oracle JDBC driver except classes for NLS support in Oracle Object and Collection types. (6,844,991 bytes) - (SHA1: 49acfb33ee776e43d2085e2fcc838778202a9128)

2. Once the jar is downloaded, rename **ojdbc8.jar** as ***ojdbc8-23.2.0.0.jar***.

For more information, refer "Download a Vendor JDBC Driver" section in TIBCO documentation.

Install Jaspersoft Server 9.0.0 on PostgreSQL, Microsoft SQL Server, or Oracle database using WAR distribution

Perform the following steps to Install JasperReports Server 9.0.0 on PostgreSQL, Microsoft SQL Server or Oracle database.

> **NOTE**
> Before installing, review the TIBCO Platform Support for JasperReports 9.0.0 Documentation, for the supported versions of Apache Tomcat/ Java/ Databases/ Operating systems.

1. From Broadcom support portal, download the JasperReports Server 9.0.0 installer file, search with the name "**CA Business Intelligence JasperReports Server 9.0.0 for CA Service Management.iso**".
2. Mount the JasperReports Server 9.0.0 installer after downloading it to your environment and, ensure you unzip the installer contents in your local system.
3. Now Download a Vendor JDBC Driver for JasperServer.
4. For installation instructions, refer the "*Installing the WAR File for Production"* section in TIBCO documentation.
5. Configure Tomcat as an installed service.

   > **NOTE**
   > The paths shown in the below procedure are given as examples only. The paths may differ based on your environment and installation requirements.

   a. Install a supported Java version. For more information about a supported Java version, see TIBCO Platform Support for JasperReports 9.0.0 Documentation.
   b. Set CATALINA_HOME to the tomcat folder.

c. Set JAVA_HOME to the java folder.

d. From `CATALINA_HOME\bin` , execute the following command to install JasperReports Service.

```
tomcat9.exe //IS//jasperreportsTomcat --DisplayName="Apache Tomcat 9.0 jasperreportsTomcat"
 --Install="C:\JRS9_0_0\tomcat9570\bin\tomcat9.exe" --Jvm=auto --StartMode=jvm --
StopMode=jvm --StartClass=org.apache.catalina.startup.Bootstrap --StartParams=start --
StopClass=org.apache.catalina.startup.Bootstrap --StopParams=stop
```

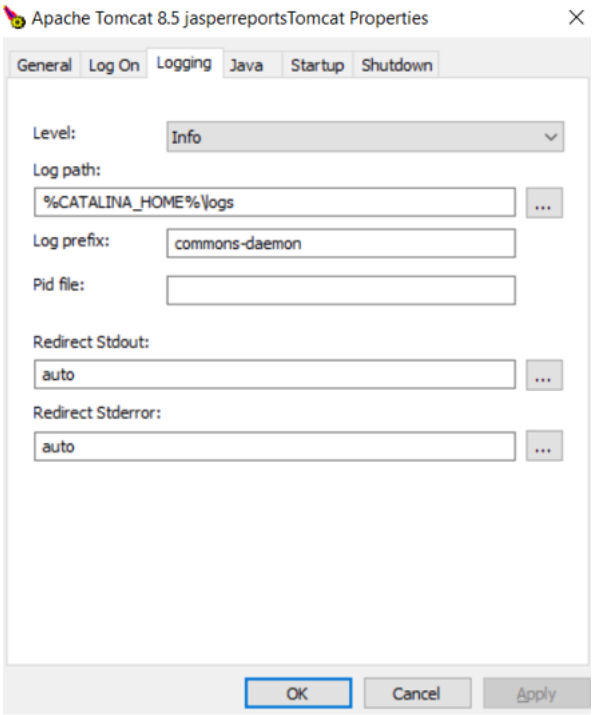
NOTE

- Use the service name **jasperreportsTomcat,** identified by the common installer.
- See the Troubleshooting CA Service Management section, if the following error message is displayed: Failed to grant service user 'NT AUTHORITY\LocalService' write permissions to log path 'C:\Windows \system32\LogFiles\Apache' due to error '19: The media is write protected.'

e. From `CATALINA_HOME\bin` , execute the following command to configure JasperReports Service.

```
tomcat9w.exe //ES//jasperreportsTomcat
```

f. On the UI Window, select the **Logging** tab and set the below settings:



g. On the Java tab, set the below options:

```
JVM------
%JAVA_HOME%\jre\bin\server\jvm.dll
Java Classpath---------
%JAVA_HOME%\lib\tools.jar;%CATALINA_HOME%\bin\bootstrap.jar;%CATALINA_HOME%\bin\tomcat-juli.jar

Java Options-----------
-Djs.license.directory=C:\Users\Administrator
-Djs.license.directory=C:\Users\Administrator
-Dcatalina.home=C:\JRS9_0_0\tomcat9570
-Dcatalina.base=C:\JRS9_0_0\tomcat9570
-Djava.io.tmpdir=C:\JRS9_0_0\tomcat9570\temp
-Djs.license.directory=C:\Users\Administrator
-Djava.util.logging.manager=org.apache.juli.ClassLoaderLogManager
```

```
-Djava.util.logging.config.file=C:\JRS9_0_0\tomcat9570\conf\logging.properties

Java  9 options-----------
--add-opens=java.base/java.lang=ALL-UNNAMED
--add-opens=java.base/java.io=ALL-UNNAMED
--add-opens=java.rmi/sun.rmi.transport=ALL-UNNAMED
-Xdebug
-Xrunjdwp:transport=dt_socket,address=9999,server=y,suspend=n
```

h. Click **Apply** and **OK**.
i. Start Apache Tomcat 9.0 jasperreportsTomcat services from Windows services console.

6. Launch JasperReports Server 9.0.0.
7. If an invalid license error message pops up, follow the steps from 8-11, mentioned below.
8. Stop Tomcat 9.0 jasperreportsTomcat services.
9. Navigate to `CASM_DVD\filestore\Jasper\9.0.0\License` folder and copy the jasperserver.license file.
10. Navigate to the path displayed in the error message and paste the copied file.
11. Start Tomcat 9.0 jasperreportsTomcat services.

Next Step:

- Integrate JasperReports Server 9.0.0 with CA Service Management

Upgrade JasperReports Server to 9.0.0

Review the supported upgrade paths for JasperReports Server and upgrade by following the recommended upgrade procedure. You can upgrade directly to JasperReports Server 9.0.0 from JasperReports Server 8.1.1.

Download a Vendor JDBC Driver
This section provides instructions to upgrade from JasperReports Server 8.1.1 to JasperReports Server 9.0.0.

Download a Vendor JDBC Driver

Pick the following database versions for installation:

Jasper Database	Name of jar to be copied to manually before upgrade	Sample Location
SQL	mssql-jdbc-12.4.1.jre8	..\js-jrs_9.0.0_bin\jasperreports-server-pro-9.0.0-b server\jdbc
Oracle	Rename ojdbc8.jar with ojdbc8-23.2.0.0.jar	..\js-jrs_9.0.0_bin\jasperreports-server-pro-9.0.0-b cle\jdbc
PostgreSQL	Not required	TIBCO provides a driver by default.

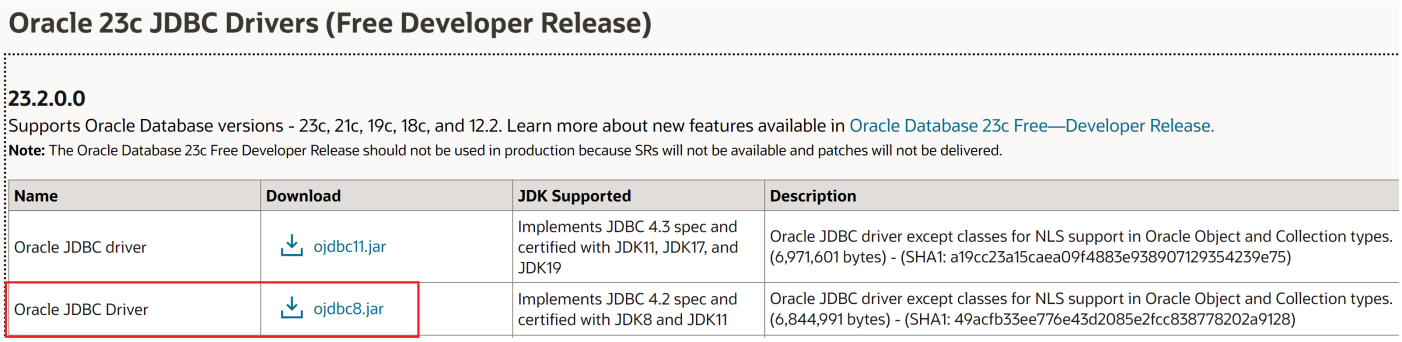
For SQL Installation

1. Go to SQL page search, extract the file: "Download Microsoft JDBC Driver 12.4.1 for SQL Server (zip)".

2. Once you unzip the downloaded file, go to the extracted zip file location **>sqljdbc_12.4.1.0_enu> sqljdbc_12.4> enu> jars** and look for the *mssql-jdbc-12.4.1.jre8* file.

For Oracle Installation

1. Go to the Oracle page, and look for "Oracle 23c JDBC Drivers (Free Developer Release)" . Expand the **23.2.0.0** section and download the **ojdbc8.jar.**



Oracle 23c JDBC Drivers (Free Developer Release)

23.2.0.0

Supports Oracle Database versions - 23c, 21c, 19c, 18c, and 12.2. Learn more about new features available in Oracle Database 23c Free—Developer Release.

Note: The Oracle Database 23c Free Developer Release should not be used in production because SRs will not be available and patches will not be delivered.

Name	Download	JDK Supported	Description
Oracle JDBC driver	ojdbc11.jar	Implements JDBC 4.3 spec and certified with JDK11, JDK17, and JDK19	Oracle JDBC driver except classes for NLS support in Oracle Object and Collection types. (6,971,601 bytes) - (SHA1: a19cc23a15caea09f4883e938907129354239e75)
Oracle JDBC Driver	ojdbc8.jar	Implements JDBC 4.2 spec and certified with JDK8 and JDK11	Oracle JDBC driver except classes for NLS support in Oracle Object and Collection types. (6,844,991 bytes) - (SHA1: 49acfb33ee776e43d2085e2fcc838778202a9128)

2. Once the jar is downloaded, rename **ojdbc8.jar** as ***ojdbc8-23.2.0.0.jar***.

For more information, refer "Download a Vendor JDBC Driver" section in TIBCO documentation.

Upgrade JasperReports Server 8.1.1 to JasperReports Server 9.0.0

This section provides instructions to upgrade from JasperReports Server 8.1.1 to JasperReports Server 9.0.0.
Follow these steps:

1. From Broadcom support portal , download the JasperReports Server 9.0.0 installer file, search with the name **"CA Business Intelligence JasperReports Server 9.0.0 for CA Service Management.iso".**
2. Ensure you Download a Vendor JDBC Driver.
3. Upgrade to JasperReports Server 9.0.0 by performing the tasks listed in the *Upgrading from 8.0.x - 8.1.x to 9.0* section in the TIBCO JasperReports Server 9.0.0 upgrade guide.

   NOTE
   While performing the Jasperreports Server upgrade, if you get an error CATALINA_HOME and CATALINA_BASE are both NOT set, then edit the default_master.properties file for your database; set the CATALINA_HOME and CATALINA_BASE values to Tomcat app server root directory and save the file. Run the Upgrade command again.
4. Database driver prerequisite for JasperReports Integration.

   NOTE
   For this section, use the drivers you have downloaded previously. For more information refer the Download a Vendor JDBC Driver.

Jasper Database	SDM Database	Name of Jar to be copied into jasperserver webapps lib folder before integration	
PostgreSQL	SQL	\jaspertomcatdir\webapps\jasperserver-pro\WEB-INF\lib\mssql-jdbc-12.4.1.jre8.jar\mssql-jdbc-12.4.1.jre8.jar	Jasp
PostgreSQL	Oracle	Not required	
SQL	SQL	Manual copy is not required, Jasper installation on SQL would place the driver.	
SQL	Oracle	Not required	

Jasper Database	SDM Database	Name of Jar to be copied into jasperserver webapps lib folder before integration	
Oracle	SQL	\jaspertomcatdir\webapps\jasperserver-pro\WEB-INF\lib\mssql-jdbc-12.4.1.jre8.jar\mssql-jdbc-12.4.1.jre8.jar	Jasp
Oracle	Oracle	Not required	

NOTE
If Jasperserver service is not restarted here, the integration of Jasperserver with CA SDM will fail.

5. To **Integrate JasperReports Server 9.0.0 with CA Service Management**, launch the CA Service Management common installer on the server where you installed JasperReports Server 9.0.0.
   a. On the **Installer selection** window, select **Integrate CABI JasperReports Server with CA Service Management**.
   b. On the **License Agreement** window, review the license information, accept the agreement, and click **Next**.
   c. On the **Database Configuration** window, in the **Database Type** field, select a database.
   d. Enter the details for CA Service Desk Manager (CA SDM) and click **Next**

Field	Description
Database Server	The location where you've installed the CA SDM database server.
Database Name	The database name on the CA SDM database name.
Database Port	The port number that CA SDM uses.
Database Server Instance	The instance of the database server.
Database Admin User	The database admin user name with permissions to create users and schema. The default user for Microsoft SQL Server.
Database Admin Password	The password to authenticate the database administrator user.
mdbadmin Password	The password for the CA SDM database user.
Confirm mdbadmin Password	Reconfirm the password for the CA SDM database use

   e. On the **CABI JasperReports Server Configuration** window, enter the details for configuring JasperReports Server 9.0.0, and click **Next.**

Field	Description
Server Name	The name of the server where JasperReports Server 9.0.0 is installed.
Organization	The organization name created in JasperReports Server 9.0.0
Port	The port number that JasperReports Server 9.0.0 uses.
Insights Admin User Name	The user name with complete access to all organizations and tenants.
Admin User	The default admin user is superuser.
Insights Admin Password	The admin password with complete access to all organizations and tenants.
Admin Password	The password to authenticate the database administrator user.

Field	Description
Confirm Insights Admin Password	Reconfirm the admin password with complete access to all organizations and tenants.
Server Protocol	The server protocol used during JasperReports Server 9.0.0 installation.
Webapp Directory	The location within the tomcat folder where JasperReports Server 9.0.0 is deployed. Example, <JasperReports Server 9.0.0 installed directory>\apache-tomcat\webapps\jasperserver-pr

f. (Optional) To enable aggregate reports, select the **Aggregate Reports** checkbox.
On the **Aggregate Reports** window, verify the datamart database server details, and click **Next.**

g. (Optional) To enable aggregate reports, select the **Aggregate Reports** checkbox.
On the **Aggregate Reports** window, verify the datamart database server details, and click **Next.**

h. (Optional) To enable transactional reports, select the **Transactional Reports** checkbox.
On the **Transactional Reports** window, verify the transactional database server details, and click **Next.**

i. In the Jasper Database Configuration window, select the required database against Jasper Database Type to automatically increase the password field length of the jijdbcdatasource table on jasperserverdb. If your JasperReports server is deployed on any of the following databases, perform the following steps:
   a. Postgre SQL Database
   b. Microsoft SQL Server Database
   c. Oracle Database

NOTE

- Ensure that you have the required database client installed based on the Jasper database server type.
- The Jasper Database Admin User is the privileged user who can create and update the Jasper database entries.

1. **PostgreSQL Database**

Prerequisites

For successful integration, verify the following.

- Open the pg_hba.conf file under the PostgreSQL directory.
  <jasper-report-server-path>\postgresql\data
  Under # IPv4 local connections, add the following new entry:
  host all all <—IP address-->/32 md5
  IP address of the installed Jasper Server.
- Open the postgresql.conf file under the PostgreSQL directory.
  <jasper-report-server-path>\postgresql\data
  Update the listen_addresses entry from 127.0.0.1 to * as follows and save.
  Example: listen_addresses = '*'

Restart the PostgreSQL database service.

a. Complete the following mandatory fields:
   - Jasper Database Hostname
     Specifies the Jasper Database Hostname.
   - Jasper Database Name
     Specifies the name of the Jasper Database.
     Default: jasperserver
   - Jasper Database Admin User

Specifies the Jasper Database Admin User name.
Default: postgres
- Jasper Database Admin Password
Specifies the Jasper Database Admin Password.
Note: On the PosrgreSQL database page the password is pre populated.
- Jasper Database Port
Specifies the Jasper Database Port number.
Default: 5432
- PostgreSQL Home Path
Specifies the Jasper directory where the Postgres SQL database is installed.

b. Click Next to proceed.

Microsoft SQL Server Database

a. Complete the following mandatory fields:
- Jasper Database Hostname
Specifies the Jasper Database Hostname.
- Jasper Database Name
Specifies the name of the Jasper Database.
Default: jasperserver
- Jasper Database Port
Specifies the Jasper Database Port number.
Default: 1433
- Jasper Database Admin User
Specifies the Jasper Database Admin User name.
Default: sa
- Jasper Database Admin Password
Specifies the Jasper Database Admin Password.

b. Complete the following optional field:
- Jasper Database Server Instance
Specifies the Jasper Database Server Instance.

c. Click Next to proceed.

Oracle Database

a. Complete the following mandatory fields:
- Jasper Database Hostname
Specifies the Jasper Database Hostname.
- Jasper Database Port
Specifies the Jasper Database Port number.
Default: 1521
- Jasper Database Net Service Name
Specifies the Jasper Database Net Service Name.
- Jasper Database Admin User
Specifies the Jasper Database Admin User name.
Default: system
- Jasper Database Admin Password
Specifies the Jasper Database Admin Password
- Jasper Database - SID
Specifies the Jasper Database - SID.

b. Click Next to proceed.

2. Review the information on the **Configuration** window, and click **Next.**

3. Click **Install** to start the integration process.

What's next After integrating JasperReports Server 9.0.0 with CA Service Management, complete the following tasks:

- Post-installation tasks.
- Additional tasks.

Integrate JasperReports Server 9.0.0 with CA Service Management

This article provides an overview of the integration between JasperReports Server 9.0.0 and CA Service Management.

Overview

JasperReports Server is a stand-alone and embeddable reporting software that CA Service Management uses for reporting and analytics purposes. CA Service Management integration with JasperReports Server provides enterprise IT management critical information on a real-time or scheduled basis. The integration offers pre-configured reports, dashboard views, and the ability to create sophisticated layouts containing charts, images, subreports, crosstabs, and more that matter for your business objectives.

CA Service Management integration with JasperReports Server provides the following benefits:

- Visualize data quickly using pre-configured reports and interactive dashboard views.
- Generate reports, and customize them to your needs by going one step further than regular table-based reports: Drag-and-drop report designer supporting interactive tables, charts, crosstabs, and analytic views.
- Drill down into reports and analyze them to enable data-driven decision-making.
- Ability to modify underlying data cube on the fly as part of analysis capabilities.

JasperReports Server 9.0.0 installation is a distinct and separate activity within the overall CA Service Management installation process.

> **NOTE**
> If JasperReports Server 9.0.0 DVD is installed, then ***Allow.jar*** file is visible in the UI.
>
> To eliminate the CVE-2024-10271, apply the hotfix T5UG571.caz with APAR No : 99112250.

You can integrate the JasperReports Server 9.0.0 with CA Service Management using the following information:

Integrate 17.4 RU2 and Later

The following sections help you integrate the JasperReports Server 9.0.0 with CA Service Management 17.4 RU2 and later.

Prerequisites

For successful integration, verify the following.

- Review the JasperReports Server 9.0.0 supportability matrix from TIBCO Software.
- Ensure that JasperReports Server 9.0.0 is installed.

Enable authentication files for communication

Enable authentication files for communication between JasperReports Server 9.0.0 and CA Service Desk Manager (CA SDM).

Follow these steps:

1. Add contactUUID for superuser.
   a. Log in to JasperReports Server 9.0.0 as a superuser.

b. Navigate to **Manage** > **Users**.
c. From the left navigation, select **root**.
d. Select the **superuser**.
e. From the **Properties** pane, click **Edit**.
f. From the **Attributes** tab, click **Add new attribute**.
g. In the Name field, enter `contactUUID`.
h. Click **OK** and **Save**.

NOTE
For this section, use the drivers you have downloaded previously. For more information refer the Download a Vendor JDBC Driver.

Database driver prerequisite for JasperReports Integration

Jasper Database	SDM Database	Name of Jar to be copied into jasperserver webapps lib folder before integration	Notes
PostgreSQL	SQL	\jaspertomcatdir\webapps\jasperserver-pro\WEB-INF\lib\mssql-jdbc-12.4.1.jre8.jar	Jasper server service must be restarted.
PostgreSQL	Oracle	Not required	
SQL	SQL	manual copy is not required, Jasper installation on SQL would place the driver.	
SQL	Oracle	Not required	
Oracle	SQL	\jaspertomcatdir\webapps\jasperserver-pro\WEB-INF\lib\mssql-jdbc-12.4.1.jre8.jar\mssql-jdbc-12.4.1.jre8.jar	Jasper server service must be restarted.
Oracle	Oracle	Not required	

NOTE
If Jasperserver service is not restarted here, the integration of Jasperserver with CA SDM fails.

Integrate using the common installer

To enable integration between JasperReports Server 9.0.0 with CA Service Management, launch the CA Service Management common installer on the server where you installed JasperReports Server 9.0.0.

Follow these steps:

1. On the **Installer selection** window, select **Integrate CABI JasperReports Server with CA Service Management**.
2. On the **License Agreement** window, review the license information, accept the agreement, and click **Next**.
3. On the **Database Configuration** window, in the **Database Type** field, select a database.
4. Enter the details for CA Service Desk Manager (CA SDM) and click **Next**.

Field	Description
Database Server	The location where you've installed the CA SDM database server.
Database Name	The database name on the CA SDM database name.

Field	Description
Database Port	The port number that CA SDM uses.
Database Server Instance	The instance of the database server.
Database Admin User	The database admin user name with permissions to create users and schema. The default user for Microsoft SQL Server is sa.
Database Admin Password	The password to authenticate the database administrator user.
mdbadmin Password	The password for the CA SDM database user.
Confirm mdbadmin Password	Reconfirm the password for the CA SDM database user.

5. On the **CABI JasperReports Server Configuration** window, enter the details for configuring JasperReports Server 9.0.0, and click **Next.**

Field	Description
Server Name	The name of the server where JasperReports Server 9.0.0 is installed.
Organization	The organization name created in JasperReports Server 9.0.0
Port	The port number that JasperReports Server 9.0.0 uses.
Insights Admin User Name	The user name with complete access to all organizations and tenants.
Admin User	The default admin user is superuser.
Insights Admin Password	The admin password with complete access to all organizations and tenants.
Admin Password	The password to authenticate the database administrator user.
Confirm Insights Admin Password	Reconfirm the admin password with complete access to all organizations and tenants.
Server Protocol	The server protocol used during JasperReports Server 9.0.0 installation.
Webapp Directory	The location within the tomcat folder where JasperReports Server 9.0.0 is deployed. Example, <JasperReports Server 9.0.0 installed directory>\apache-tomcat\webapps\jasperserver-pro

6. (Optional) To enable aggregate reports, select the **Aggregate Reports** checkbox.
   On the **Aggregate Reports** window, verify the datamart database server details, and click **Next.**
7. (Optional) To enable transactional reports, select the **Transactional Reports** checkbox.
   On the **Transactional Reports** window, verify the transactional database server details, and click **Next.**
8. In the Jasper Database Configuration window, select the required database against Jasper Database Type to automatically increase the password field length of the jijdbcdatasource table on jasperserverdb.
   If your JasperReports server is deployed on any of the following databases, perform the following steps:
   a. PostgreSQL Database
   b. Microsoft SQL Server Database
   c. Oracle Database

NOTE

- Ensure that you have the required database client installed based on the Jasper database server type.
- The Jasper Database Admin User is the privileged user who can create and update the Jasper database entries.

PostgreSQL Database

Prerequisites

For successful integration, verify the following.

- Open the pg_hba.conf file under the PostgreSQL directory.
  <jasper-report-server-path>\postgresql\data
  Under # IPv4 local connections, add the following new entry:
  host all <—IP address-->/32 md5
  IP address of the installed Jasper Server.
- Open the postgresql.conf file under the PostgreSQL directory.
  <jasper-report-server-path>\postgresql\data
  Update the listen_addresses entry from 127.0.0.1 to * as follows and save.
  Example: listen_addresses = '*'

Restart the PostgreSQL database service.

a. Complete the following mandatory fields:
   - Jasper Database Hostname
     Specifies the Jasper Database Hostname.
   - Jasper Database Name
     Specifies the name of the Jasper Database.
     Default: jasperserver
   - Jasper Database Admin User
     Specifies the Jasper Database Admin User name.
     Default: postgres
   - Jasper Database Admin Password
     Specifies the Jasper Database Admin Password.
     Note: On the PosrgreSQL database page the password is pre- populated.
   - Jasper Database Port
     Specifies the Jasper Database Port number.
     Default: 5432
   - PostgreSQL Home Path
     Specifies the Jasper directory where the Postgres SQL database is installed.
b. Click Next to proceed.

Microsoft SQL Server Database

a. Complete the following mandatory fields:
   - Jasper Database Hostname
     Specifies the Jasper Database Hostname.
   - Jasper Database Name
     Specifies the name of the Jasper Database.
     Default: jasperserver
   - Jasper Database Port
     Specifies the Jasper Database Port number.

Default: 1433

- Jasper Database Admin User
  Specifies the Jasper Database Admin User name.
  Default: sa
- Jasper Database Admin Password
  Specifies the Jasper Database Admin Password.

b. Complete the following optional field:
- Jasper Database Server Instance
  Specifies the Jasper Database Server Instance.

c. Click Next to proceed.

Oracle Database

a. Complete the following mandatory fields:
- Jasper Database Hostname
  Specifies the Jasper Database Hostname.
- Jasper Database Port
  Specifies the Jasper Database Port number.
  Default: 1521
- Jasper Database Net Service Name
  Specifies the Jasper Database Net Service Name.
- Jasper Database Admin User
  Specifies the Jasper Database Admin User name.
  Default: system
- Jasper Database Admin Password
  Specifies the Jasper Database Admin Password
- Jasper Database - SID
  Specifies the Jasper Database - SID.

b. Click Next to proceed.

9. Review the information on the **Configuration** window, and click **Next.**
10. Click **Install** to start the integration process.

NOTE
The required JARS and XML files are copied automatically. On the progress page, you may view the following password increment and copy tasks.

- Password Field Length Increment On JasperReport Server Database
- Copying Custom Files to JasperReport Server

NOTE
JasperReports Server Directory/Path Traversal Vulnerability: A directory traversal vulnerability has been identified that potentially allows unauthenticated users to access sensitive information on the host system. An attacker could send a specially-crafted URL request to view files on the server.
This fix should be applied on the 17.4 RU4 and above, integrated with JasperReports 9.0.0 environment.
To eliminate the CVE-2024-3325, apply the hotfix T5UG584.caz with APAR No : 99112426.

NOTE
For 17.4 RU2 and later, integrated with the JasperReports 9.0.0 environment, apply Hotfix T5UG596.caz with APAR No: 99112519 to resolve a performance issue in ad-hoc views when adding additional fields to crosstab rows.

Post-installation tasks

After integrating JasperReports Server 9.0.0 with CA Service Management, complete the following post-integration tasks to have Insights up and running.

- Enable Insights from the xFlow Interface
- Enable Insights from CA SDM

Enable Insights from the xFlow Interface

An administrator must enable Insights app for it to appear on the xFlow Interface.

Follow these steps:

1. Restart the JasperReports Tomcat Server.
2. Login to CA SDM as an administrator.
3. Navigate to the **Administration** tab, select **xFlow Interface**, **App Configuration**, and **Insights**.
4. Click **Edit**.
5. From the drop-down list, select **Active**, and click **Save**.
6. Restart the xFlow Interface services based on your configuration.
   a. For Advanced Availability: Restart services on the application server.
   b. For Conventional: Restart services on the primary and secondary servers.

Result: Insights app is enabled and available from the xFlow Interface.

Enable Insights from CA SDM

If you have not installed the xFlow Interface or Insights app, you can access Insights directly from CA SDM.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to **Administration**, **Security and Role Management**, **Role Management**, and **Role List.**
3. Select a role.
4. Select the Resources tab and click **Update Tabs** to select the Insights tab.
5. Assign the insights app to the selected role.
6. Log in to CA SDM with the selected role.
7. From the Menu bar, select **Insights** and click **Launch Insights**.

Result: Insights app is enabled and available for use from CA SDM.

Additional tasks

After successfully integrating JasperReports Server 9.0.0 with CA Service Management, review the following additional tasks. You can complete the tasks that you need for your environment.

- Configure the data aggregation date
- Match the duration format

Configure the data aggregation date

Get accurate and consistent reports by configuring the data aggregation date to a date later than that of CA Service Management 17.4 implementation. If the Data Aggregation Date is not configured, inaccurate information is displayed, and the following reports are impacted:

- Incidents Cost for Top Categories (USD)
- Incidents Cost Trend for Top Categories (USD)
- MTTR for Top Categories (In Hours) Report
- MTTR Quarterly Trend for Top Categories (In Hours) Report
- MTTR Weekly Trend for Top Categories (In Hours) Report
- MTTR Yearly Trend for Top Categories (In Hours) Report

Follow these steps:

1. Navigate to the `<datamart installed folder>\config\config.properties` file.
2. Search for the string **trend_start_date='yyyy-mm-dd'**.
3. Replace the **trend_start_date** value with the data aggregation date.
   During the next ETL job, the data older than the data aggregation date is deleted.

   NOTE
   For the vulnerability of ***Log4j1 Removal and adding the log4j2 jars and related dependencies in Datamart Installed location*** apply the patch with APAR No : 99112251

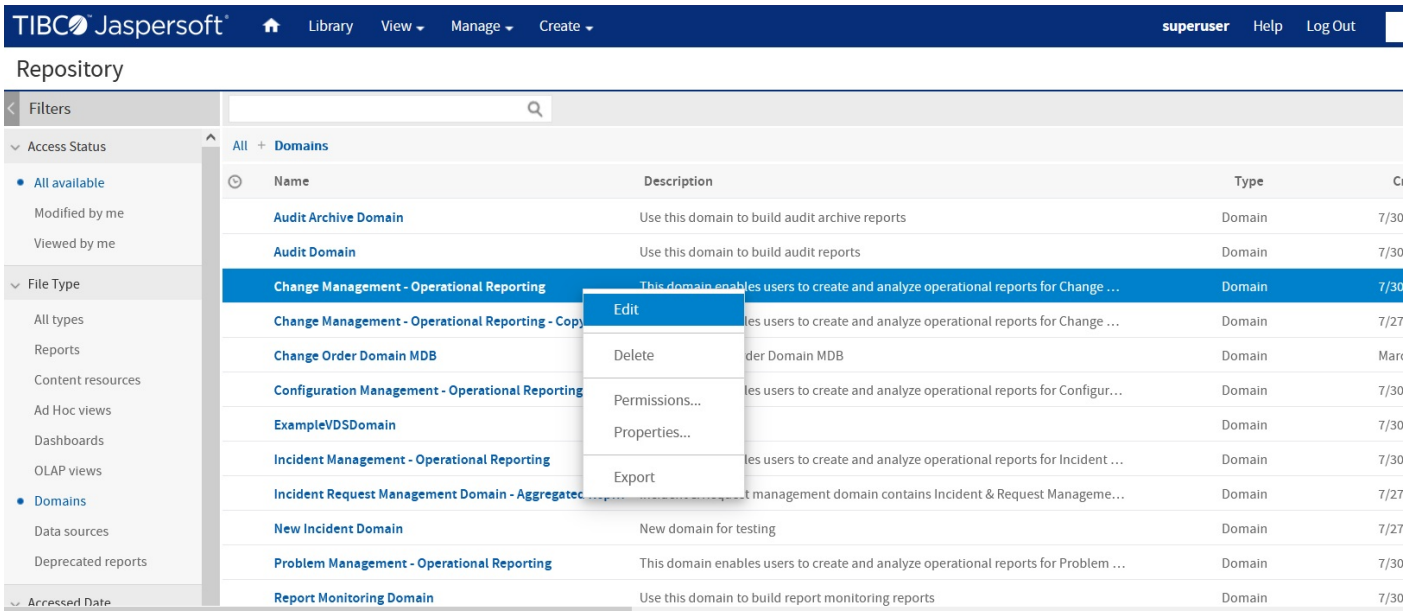
Match the duration format

The duration format is represented differently in CA SDM and Insights. You can match the duration format to appear in HH:MM:SS format in both CA SDM and Insights.

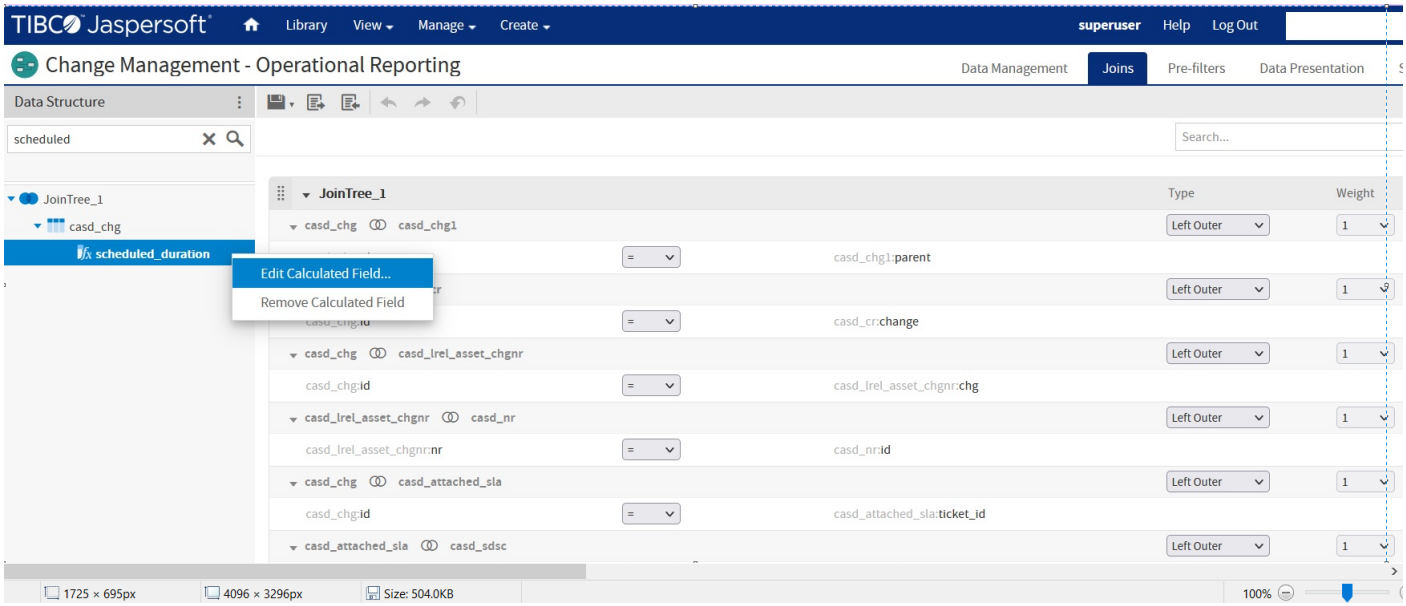
Follow these steps

1. Connect to the Jasper Reports server machine.
2. Copy the *DurationFormatter.jar* from CASM_17.4.2.0\filestore\Jasper\9.0.0\ExternalAuthJars and, copy it into the jasperserver tomcat lib folder. For eg: *C:\apache-tomcat-9.0.65\webapps\jasperserver-pro\WEB-INF\lib*.
3. From the service console, stop the service:*jasperreportsTomcat.*
4. From the folder where you installed JasperReports Server 9.0.0, navigate to the `apache-tomcat\webapps\jasperserver-pro\WEB-INF` folder and back up applicationContext-el-operators.xml file.
5. From the folder where you installed JasperReports Server 9.0.0, navigate to the `apache-tomcat\webapps\jasperserver-pro\WEB-INF\bundles` folder and back up the following files.
   - adhoc_messages.properties
   - adhoc_messages_es.properties
   - adhoc_messages_fr.properties
   - adhoc_messages_ja.properties
   - adhoc_messages_pt_BR.properties
6. Navigate to the DVD `filestore\Jasper\9.0.0\ExternalAuthXMLs` folder and copy the applicationContext-el-operators.xml file.
7. From the folder where you installed JasperReports Server 9.0.0, navigate to the `apache-tomcat\webapps\jasperserver-pro\WEB-INF` folder and paste the copied file.
8. Navigate to the DVD `filestore\Jasper\9.0.0\Bundles` folder and copy the following files.
   - adhoc_messages.properties
   - adhoc_messages_es.properties
   - adhoc_messages_fr.properties
   - adhoc_messages_ja.properties
   - adhoc_messages_pt_BR.properties
9. From the folder where you installed JasperReports Server 9.0.0, navigate to the `apache-tomcat\webapps\jasperserver-pro\WEB-INF\bundles` folder and paste the copied files.
10. Navigate to the DVD `filestore\Jasper\9.0.0\Groovy` folder and copy the BaseGroovyColumn.groovy file.

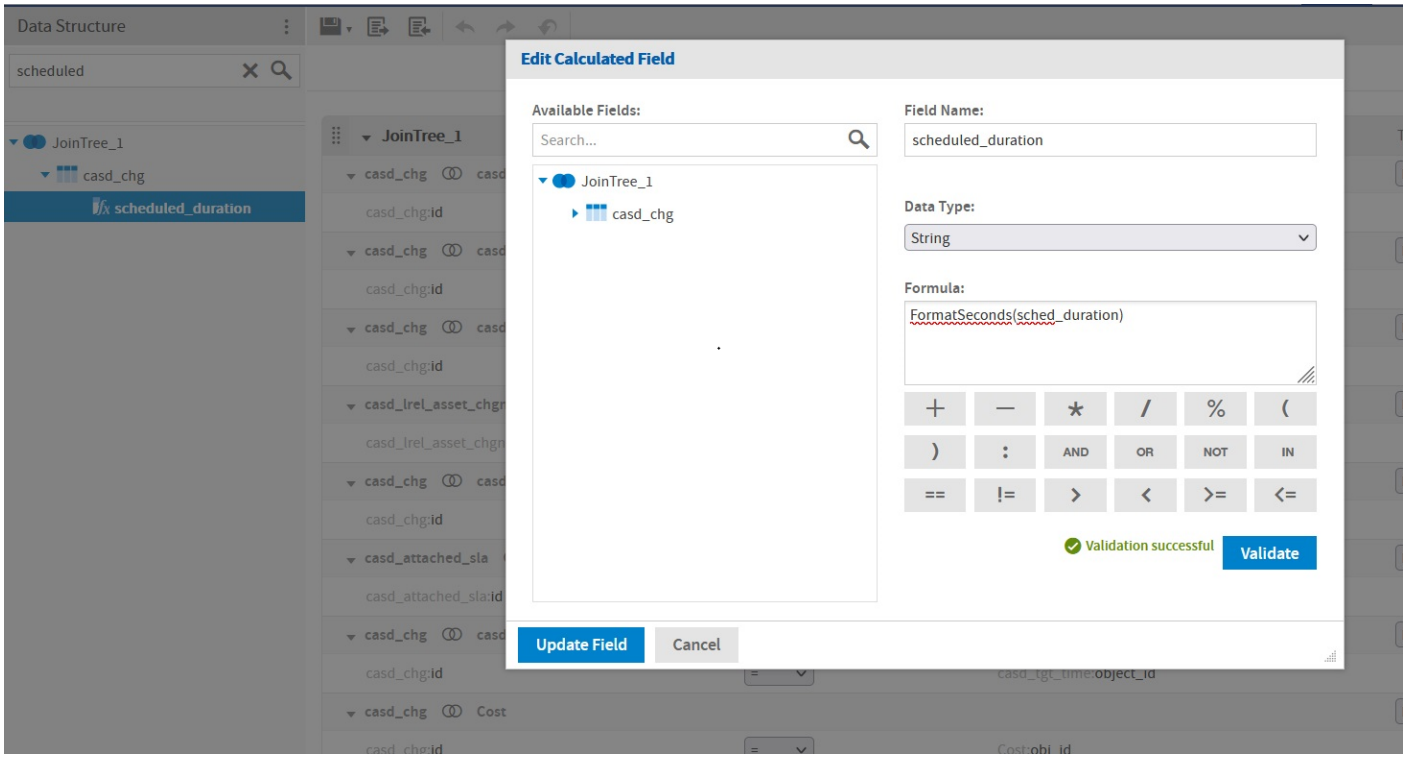
11. From the folder where you installed JasperReports Server 9.0.0, navigate to the `apache-tomcat\webapps\jasperserver-pro\WEB-INF\groovy\groovy_column` folder and paste the copied file.
12. From the folder where you installed JasperReports Server 9.0.0, navigate to the `apache-tomcat\temp` folder and empty the folder.
13. From the folder where you installed JasperReports Server 9.0.0, navigate to the `apache-tomcat\work` folder and empty the folder.
14. From the service console, start the service: *jasperreportsTomcat.*
15. Clear the browser cache.
16. Log in to Jasper UI in the browser, and edit the required domain. This image shows how to edit the Change Management - Operational Reporting domain.



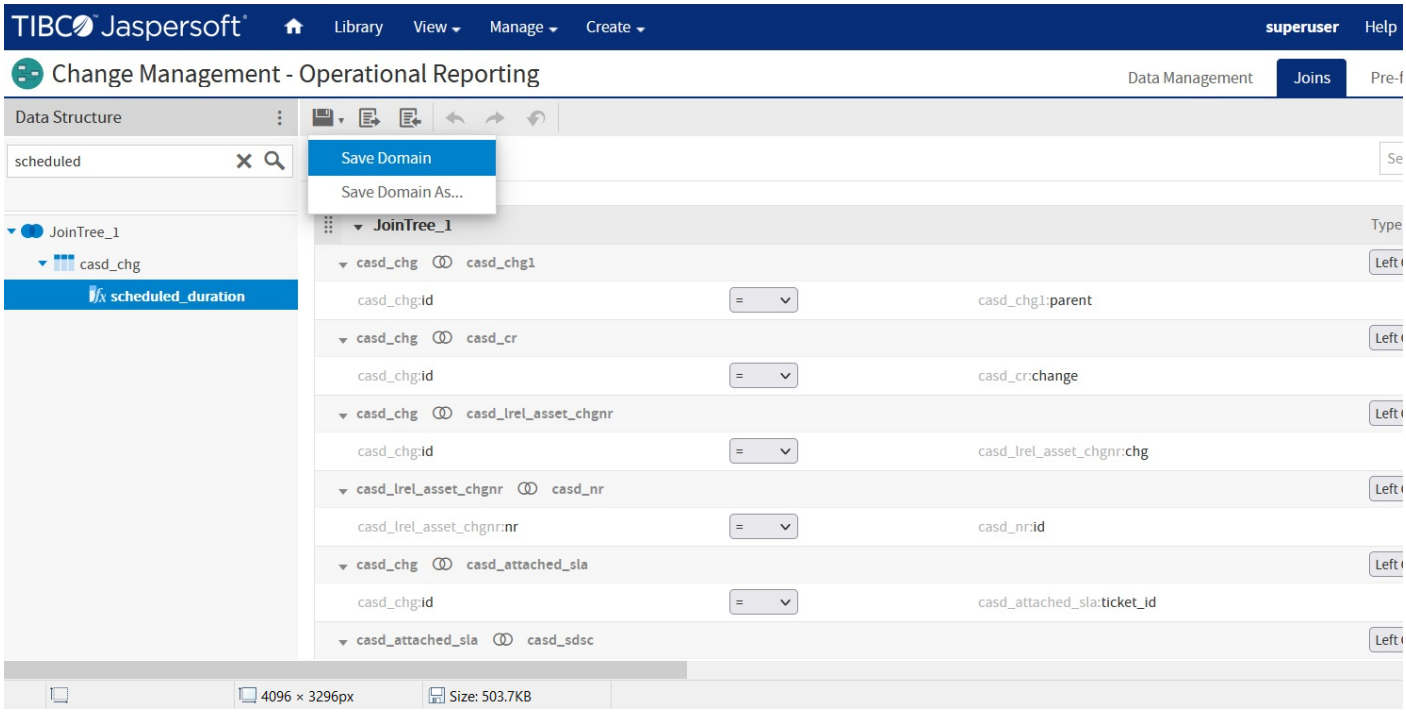
17. Under the Joins tab, search for the required calculated field and right-click the field to edit it. This image shows how to edit the scheduled_duration field.



18. Under Formula, edit the formula for the calculated field. This image shows the formula for the scheduled_duration field.



19. Change the data type to String.
20. Click **Validate**.
21. Click **Update Field**.
22. To save the domain, click the **Save** icon.



23. To verify that the duration value is displayed in HH: MM: SS format, use this field in your reports.

Duration Measure error for default users

Follow these steps:

1. Login to jasperserver application.
2. Click **Domains**.
3. Right click on the required Domain (e.g.: Incident Management- Operational Reporting) to modify and click **Edit.**
4. Click **Joins** and search for the Calculated field (e.g.: Resolution_Time_Hours) that are used for measures.
5. Right click on calculated field and click **Edit Calculated Field**.
6. Remove the SUM from the formula then click **Validate** and **Update Field**.
7. Save the Domain.
8. Restart the Jasperreports Tomcat service.

If CA SDM is on Oracle follow these additional steps

1. Navigate to the location where Jasper server is installed. (e.g.: C:\apache-tomcat-9.0.65\webapps\jasperserver-pro)
2. Under the folder WEB-INF, select and edit *applicationContext-semanticLayer.xml*
3. Search for the tag
   ```
   <bean id="sqlserverGenerator" parent="defaultSQLGenerator" scope="prototype">
   ```
4. Find the entry <entry key ="divide"> under it.
5. For removing the data type *casting of money*, change
   "cast ($top as money) / (case when (($bottom) = 0) then null else ($bottom) end)" as String
   to *"($top) / (case when (($bottom) = 0) then null else ($bottom) end)"* as String.
6. Save the applicationContext-semanticLayer.xml
7. Restart the Jasper server tomcat service.

Supported Languages

JasperReports supports (fr_FR (French), de_DE (German), pt_BR (Brazil- Portuguese), es_ES (spanish), languages, and the reports work as expected.

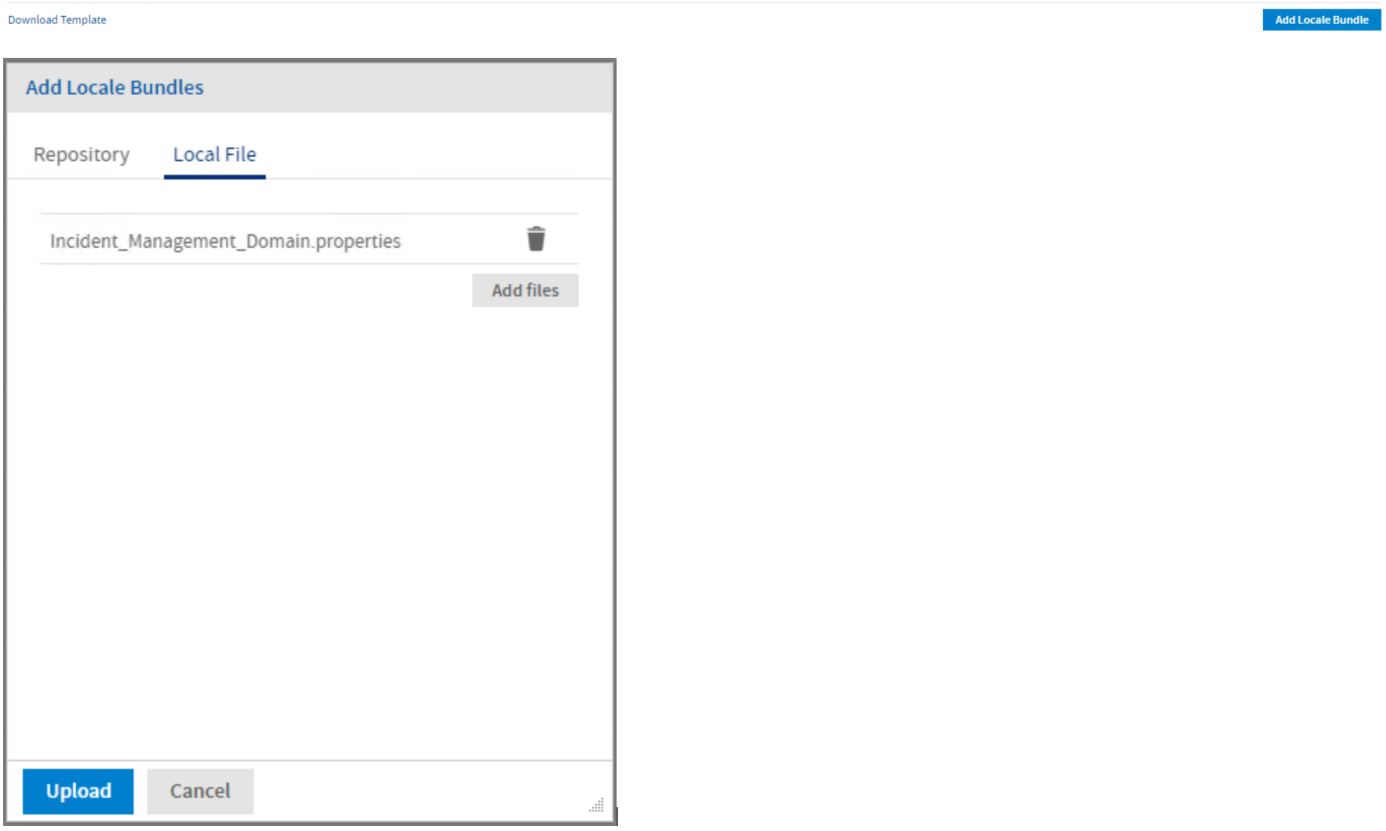
For supported languages:

1. Go to **Browser Settings**> **Languages**, choose a supported language, and clean the browser cache.
2. Restart JasperReports.
3. The Reports/ad hoc views are displayed in the selected language.

For unsupported languages:

1. Login to Jasper UI. Right click on a domain (**for example**: *Incident Management - Operational Reporting*) and choose **Edit** and navigate to **Locales** tab.
2. Download the Incident_Management_Domain_en_US.properties file of the domain.
3. Make a copy of the same locally and rename the file to *Incident_Management_Domain.properties*

4. Go to **Add Locale Bundle**, and click **Local File.** Now **Upload** the Incident_Management_Domain.properties file.



5. Now **Save** the domain.
6. Delete the browser cache and login to Jaspersoft web page and run the report(s).

JasperReports Server 9.0.0 Out-of-the Box Transactional Reports Error.

Problem: In case of SDM installed with Oracle database and integrated with Jasper 9.0.0, you may see an issue while running some of the reports which has bigint datatype.

Solution: Perform the following steps:

1. To resolve this issue, update and modify the applicationcontext-semanticLayer.xml file. Open this file in Jasper installed location: (for example: C:\Jaspersoft\jasperreports-server-7.9.0\apache-tomcat\webapps\jasperserver-pro \WEB-INF) and search for the following:

```
switch (args[0]?.javaType)
{
case 'java.lang.Integer':
case 'java.lang.Short':
return String.format("SUM(cast(%s as bigint))", sqlArgs[0])
default:
return String.format("SUM(%s)", sqlArgs[0])
            }
```

2. Comment the following lines from the above step:

```
<!--case 'java.lang.Integer':
case 'java.lang.Short':
return String.format("SUM(cast(%s as bigint))", sqlArgs[0])-->
```

3. Save the file and restart JasperReports Tomcat services.

Configure JasperReports Server 9.0.0 for High Availability Set Up Cluster

Prerequisites

This document provides updates on how to Configure JasperReports Server 9.0.0 High Availability Set Up Cluster.

Prerequisites

The following are the prerequisites:

- Complete the installation of Jasper 9.0.0 with supported databases. (Call it Node 1)
- Verify the Jasper URL.
- Install ActiveMQ on any one server in the cluster.
- Install JDK (OpenJDK11) and Apache Tomcat (9) on all the nodes
- Integrate SDM or xFlow to the JasperReports Server 9.0.0

EhCache Replication

The repository cache in JasperReports Server is implemented internally through the Ehcache component. Edit the Ehcache configuration files as described below to replicate the repository cache among all instances that share a single repository. You do not have to configure a cluster for cache replication.JMS – Java Message Services can provide cache distribution for nodes in a cloud where IP addresses may change. Jaspersoft provides a configuration for using the Apache ActiveMQ JMS Server. You must first install and configure ActiveMQ on one of the computers in your cluster.

Configure a High Availability Environment on Node 1

Perform the following steps on JasperReports Server, Node 1:**Follow these steps:**

1. Stop the JasperReports Server Apache Tomcat service on Node1.
2. Take a backup of the following files on each node:
   Open the file <web-app>/WEB-INF/classes/ehcache_hibernate.xml and <web-app>/WEB-INF/ehcache.xml on each node.
   Example:C:\Jaspersoft\jasperreports-server-9.0.0\apache-tomcat\webapps\jasperserver-pro
3. In both ehcache_hibernate.xml and ehcache.xml files, comment out or remove the section of the file in between "NO CLUSTERING" and "END of NO CLUSTERING" comments.

```
<!-- ********************************************************************** NO CLUSTERING **********
<!-- START
<cache name="aclCache"
                maxElementsInMemory="100000"
                statistics="false"
                eternal="true"
                overflowToDisk="false"
                timeToIdleSeconds="36000"
                timeToLiveSeconds="180000"
                diskExpiryThreadIntervalSeconds="120"
                diskPersistent="false"/>
END -->
<!-- ********************************************************************** END of NO CLUSTERING *******
```

4. Uncomment the JMS section in <web-app>/WEB-INF/classes/ehcache_hibernate.xml and <web-app>/WEB-INF/ehcache.xml on each node.

Example:

5. Set the providerURL properties in both files to the address of your JMS server.
   It is shown in the following code example:

```
<!-- START
        <cacheManagerPeerProviderFactory
                class="net.sf.ehcache.distribution.jms.JMSCacheManagerPeerProviderFactory"

properties="initialContextFactoryName=com.jaspersoft.jasperserver.api.engine.replication.JRSActiveMQInitialContextF
                providerURL=tcp://ActivemQ_host:61616,
                replicationTopicConnectionFactoryBindingName=topicConnectionFactory,
                replicationTopicBindingName=ehcacheAcl,
                getQueueConnectionFactoryBindingName=queueConnectionFactory,
                getQueueBindingName=ehcacheQueueAcl,
                topicConnectionFactoryBindingName=topicConnectionFactory,
                topicBindingName=ehcacheAcl"
                propertySeparator=","/>
```

6. On each node, edit the file <web-app>/META-INF/context.xml. Locate the Manager pathname near the end, and comment it out as follows:
   C:\Jaspersoft\jasperreports-server-9.0.0\apache-tomcat\webapps\jasperserver-pro

```
<!-- Manager pathname="" -->
```

Configure a High Availability Environment on Node 2

Perform the following steps on JasperReports Server, Node 2:
Follow these steps:

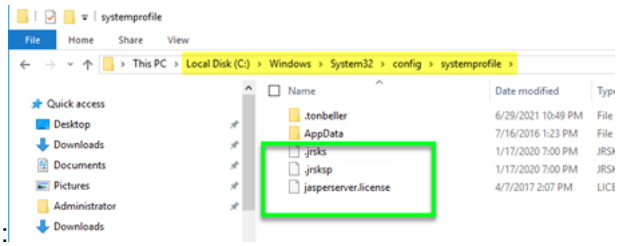
1. Use the same installer that is used in Node 1 (Use original installer).
2. Copy the default_master.properties file from Node 1 to Node 2.
3. Stop Apache Tomcat services.
4. Ensure that Apache Tomcat and Database details are pointing to the correct database.
   Example:
   # Tomcat app server root dir
   appServerDir = C:\\Program Files\\Apache Software Foundation\\Tomcat 9.0
   # appServerDir = /home/devuser/apache-tomcat-9.0
   If it is a Linux package managed Tomcat instance, set the following two properties, for e.g:
   – CATALINA_HOME = C:\\Program Files\\Apache Software Foundation\\Tomcat 9.0
   – CATALINA_BASE = C:\\Program Files\\Apache Software Foundation\\Tomcat 9.0
5. Install only webapp in Node 2.

Navigate to the C:\TIB_js-jrs_9.0.0_bin\jasperreports-server-pro-9.0.0-bin\buildomatic folder and run the following command

```
js-ant deploy-webapp-pro
```

6. Ensure you have a non default port under:
   C:\Program Files\Apache Software Foundation\Tomcat 9.0\webapps\jasperserver-pro\WEB-INF
   diagnostic.port = 10990
   Change the port number.
7. Repeat the steps 3-6 from the above Configure a High Availability Environment on Node 1 section.
8. Copy the following files from NODE1's system user directory from when you installed Jasper 9.0.0, to NODE2's system user directory. For example, C:\Users\Administrator.
   Give full permissions to the following files for Local Service:
   - .jrsks
   - .jrslic
   - .jrsksp
   - Jasperserver.license

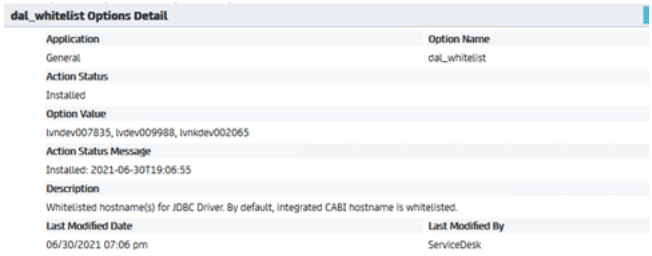
   In some cases, you may need to copy the files to the systemprofile location:



Integrate with CA Service Management Server

To integrate Jasper High Availability servers with CA SDM:

1. Access both Node-1 and Node-2 url's after successful installation.
2. Integrate CASM solution from Node-1 and complete the integration.
3. Configure CA SDM to accept communication from the new node by updating the dal_whitelist Option.
4. Under Options manager> General:



5. Copy the ServiceManagemnt Specific custom libraries /xmls from Node-1 Jasper Installation location to Node-2 location. For e.g: C:\apache-tomcat-9.0.65\webapps\jasperserver-pro\WEB-INF\lib

```
BOPIntegration.jar
cabi-jasperreportsserver-commonutil.jar
cabi-jasperreportsserver-dynamicjdbc.jar
cabi-jasperreportsserver-rolebasedflow.jar
cabi-jasperreportsserver-sso.jar
cabi-jasperreportsserver-userlocale.jar
cabi-jasperreportsserver-versionapi.jar
```

```
domsrvr_utils.jar
sd-utils.jar
slump.jar
```

C:\apache-tomcat-9.0.65\webapps\jasperserver-pro\WEB-INF

```
applicationContext.xml
applicationContext-el-operators.xml
applicationContext-externalAuth-template-mt.xml
applicationContext-jdbc-metadata.xml
applicationContext-rest-services.xml
applicationContext-security.xml
applicationContext-security-web.xml
applicationContext-semanticLayer.xml
```

6. Restart the Tomcat Service's of Node-2 and Node-1
7. Make sure you see your reports from both the URl's. Create a new ad hoc view on NODE2, then log into Jasper-Node1 on NODE1 and make sure you can see and run the report.

Configure JasperReports Server 9.0.0 to Use SSL

You can configure JasperReports Server to use Secure Socket Layer (SSL) and communicate with CA Service Management. SSL establishes an encrypted link between a server and a client. For example, a web server and a browser; or a mail server and a mail client. This link helps ensure that all data passed between the server and client remain private and integral. When you configure JasperReports server to use SSL, you change its communication method from HTTP to HTTPS while integrating with CA Service Management.
Follow these procedures:

Create a Keystore File
A keystore file is required to enable SSL. Create a keystore file if you do not have one already for another CA product that integrates with CA Service Management. You can use a keystore file for a single product or for multiple products. If you must create individual keystores for each product, you can optionally merge your keystore files.**Follow these steps:**

1. Open a command window on the JasperReports server. Navigate to the location where JasperServer is installed.
   Example: C:\Jaspersoft\jasperreports-server-9.0.0\java\bin>
2. Execute the following command:
   ```
   keytool -genkey -alias tomcat -keyalg RSA -keystore <Selected Path>/<filename>.keystore
   ```
   Enter the required information when prompted.
3. Enter the password at the “Enter keystore password” prompt. To make configuring Tomcat easier, you can use “changeit” as the password.
4. Record your password for reference.

Add the Certificate to the Keystore
After creating the keystore file, you must add a CA certificate to the keystore.**Follow these steps:**

1. Execute the following command to add the certificate into the keystore.
   ```
   keytool -importkeystore -srckeystore <Selected Path>/<filename>.keystore -destkeystore <Selected Path>/<filename>.keystore -deststoretype pkcs12
   keytool -export -storepass PASSWORD -alias tomcat -keystore <Selected Path>/<filename>.keystore -file <Selected Path>/<filename>/Jasperssl.crt
   ```
   The certificate is exported to keystore.

Edit the Server.xml File to Support SSL

As part of configuring the JasperReports server to use Secure Socket Layer (SSL), edit the server.xml file to support SSL.**Follow these steps:**

1. Navigate to the JasperServer installed location.
2. Edit the <*Jaspersever Installed Location*>\apache-tomcat\conf**server.xml** file.
3. Search for the <Service name="Catalina"> section.
4. Updated the Connector related information under the <Service name="Catalina"> section:

```
<Connector SSLEnabled="true" maxThreads="200" port="8443"
 protocol="org.apache.coyote.http11.Http11NioProtocol"
 sslImplementationName="org.apache.tomcat.util.net.jsse.JSSEImplementation">
      <SSLHostConfig
 ciphers="TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256,TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384,TLS_DHE_RSA_WITH_AES_128_GCM_S
 TLS_DHE_RSA_WITH_AES_256_GCM_SHA384,TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256,TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA,
 TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384,TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA,TLS_DHE_RSA_WITH_AES_128_CBC_SHA256,
 TLS_DHE_RSA_WITH_AES_128_CBC_SHA,TLS_DHE_RSA_WITH_AES_256_CBC_SHA256,TLS_DHE_RSA_WITH_AES_256_CBC_SHA,
 TLS_RSA_WITH_AES_128_GCM_SHA256,TLS_RSA_WITH_AES_256_GCM_SHA384,TLS_RSA_WITH_AES_128_CBC_SHA256,
 TLS_RSA_WITH_AES_256_CBC_SHA256,TLS_RSA_WITH_AES_128_CBC_SHA,TLS_RSA_WITH_AES_256_CBC_SHA,
 SSL_RSA_WITH_3DES_EDE_CBC_SHA" honorCipherOrder="true" protocols="TLSv1.2" sslProtocol="TLSv1.2">
        <Certificate certificateKeyAlias="<Alias Name>" certificateKeystoreFile="<Selected
 Path>/<filename>.keystore" certificateKeystorePassword="PASSWORD" certificateKeystoreType="PKCS12"/>
      </SSLHostConfig>
    </Connector>
```

   – Default value before making this change.

```
<Connector port="8080" URIEncoding="UTF-8" protocol="HTTP/1.1" connectionTimeout="20000"
 redirectPort="8443"/>
```

5. Save and close the server.xml file.
6. Restart the Tomcat server.
7. Now you can launch the Jaspersoft url using https://HOST_NAME:SSL_PORT/jasperserver-pro/flow.html?_flowId=homeFlow
   Ensure that Jasper URL is accessible.

Integrate CA SDM with the SSL-enabled JasperReports Server

Configure the SSL-enabled JasperReports Server to integrate with CA SDM using the CA Service Management Common Installer.**Follow these steps:**

1. Download the common installer to the required location in the JasperServer.
   Example: C:\Users\Administrator\Downloads\<*RUXXXXX*>
2. Extract the installer and go to the Java folder
   Example: \java\java11
3. To integrate HTTPS enabled Jasper Server with Common Installer, the certificate you exported in the *Add the Certificate to the Keystore* section should be imported by executing the following command:

```
keytool -importcert -alias <aliasname>-file <Selected Path>/<filename>.crt -keystore  ..\lib\security
\cacerts
```

4. Launch the CA Service Management Common Installer.
5. Provide the following mandatory information in the "CABI JasperReports Server Configuration" screen.
   Enter the port number that you have provided in the server.xml file.
   Select HTTPS from the Server Protocol drop-down.
6. Proceed with the next steps in the wizard to complete the integration.

   NOTE
   After the integration is successful, log in to the classic CA SDM, Administration, xFlow Interface, General, and confirm the value *insights.jasper.domain* is populated in the General Configuration List.

Enable JasperServer SSL URL from CA SDM Classic UI

1. Navigate to <jasper_installation_path>\jasperserver-pro\WEB-INF\config and copy the following files.
   - casm_insights.jks
   - casm_insights.properties
2. Paste the copied files from **step 1** to CA SDM Server.**For example**: NX_ROOT\site folder.
3. Restart CA Service Desk Manager Server and JRS services.

NOTE
Integration of CA Service Management Release 17.4 with Jasper Reports Server 9.0.0 is automated.

Add JasperReports Server SSL Certificate to the CA SDM

To launch HTTPS enabled JasperReports server from CA SDM Classic UI, the certificate you exported in the *Add the Certificate to the Keystore* section should be imported.Follow these steps:

1. Navigate to the JRE bin folder in the CA SDM server.
   For example, C:\Program Files (x86)\CA\SC\JRE\11.0.12\bin
2. Import the certificate or any trusted certificate.
   ```
   keytool -importcert -alias <aliasname>-file <Selected Path>/<filename>.crt -keystore  ..\lib\security
   \cacert
   ```
3. You can now launch Insights from CA SDM classic UI.

Adding JasperReports Certificate to Insights Trust Store

For Insights to connect to HTTPS enabled JasperReports server, the certificate you exported in the *Add the Certificate to the Keystore* section should be imported into the Insights trust store.

1. Navigate to <xFlowInstallation Home Dir>\jre\bin
   Example: C:\Program Files\CA\SC\JRE\11.0.3\bin
2. Import the certificate or any trusted certificate.
   ```
   keytool -importcert -alias <aliasname>-file <Selected Path>/<filename>.crt -keystore  ..\lib\security
   \cacert
   ```
3. Restart the CA xFlow Analyst Interface services.

JasperReports Server 8.1.1

This topic provides complete information about JasperReports Server Release 8.1.1.

- Tutorial for JasperReports Server
- Install JasperReports Server 8.1.1
- Upgrade JasperReports Server from 7.9 to 8.1.1
- Integrate JasperReports Server 8.1.1 with CA Service Management
- Configure JasperReports Server 8.1.1 for High Availability
- Configure JasperReports Server 8.1.1 to Use SSL

Tutorial for JasperReports Server

Learn about JasperReports Server, TIBCO Jaspersoft Online Learning Portal, training, documentation, and the Jaspersoft Community.

TIBCO Jaspersoft Online Learning Portal

Broadcom Inc., in partnership with TIBCO Software, Inc., has authorized its partners and licensed customers to have free access to theTIBCO Jaspersoft Online Learning Portal..

Recommended Jaspersoft Training - TIBCO Software, Inc

Jaspersoft training is available from TIBCO Software, Inc. The following recommended Jaspersoft training courses will help you in your Jaspersoft implementation.

Recommended Training for Analysts and Managers

The following online training and resources are recommended for end users such as Analysts and Managers:

Training Topic	Type	Description	Duration	Video	TIBCO Docs
Ad Hoc Views	Video	This video helps you learn how to create and configure Ad Hoc views using the Ad Hoc Editor.	8 Minutes	Ad Hoc Views Tutorial	Adhoc Views
Reports	Video	This video helps you learn how to create and format reports from existing Ad Hoc views.	9 Minutes	Ad Hoc Reports Tutorial	Reports
Dashboards	Video	This video helps you learn how to create dashboards and dashlets.	9 Minutes	Dashboards Tutorial	Dashboards

Recommended Training for Administrators.

All the training materials covered in online training resources in the following table are recommended for administrators such as SDM administrators:

Training Topic	Type	Description	Duration	Video	Registration Required?	TIBCO Docs
Domains	Video	This video helps you learn how to create domains.	8 Minutes	Domains Tutorial	No	
Jasper Reports User Guide	User Guide	Introduction to JasperReports Server and its capabilities.		NA	No	User Guide
JasperReports Administration Guide	Administrative Guide	Overview of JasperReports Server Administration.		NA	No	Admin Guide

Jaspersoft Community

Visit the Jaspersoft Community for related tutorials, tips and tricks, and other helpful information.

Install JasperReports Server 8.1.1

The installation of JasperReports 8.1.1 is supported on Microsoft SQL Server, Oracle, and PostgreSQL databases. The installation is available in English (United States) and is supported only on Windows Operating System.

We recommend using the WAR file distribution for installation or upgrade to JasperReports Server 8.1.1, as the WAR distribution includes customizations needed for SDM integration.

NOTE
To use TIB_js-jrs_8.1.1_win_x86_64.exe to install JasperReports Server 8.1.1 (**for evaluation purpose only**) and to import an existing repository, refer the KB article https://knowledge.broadcom.com/external/article?articleId=263988

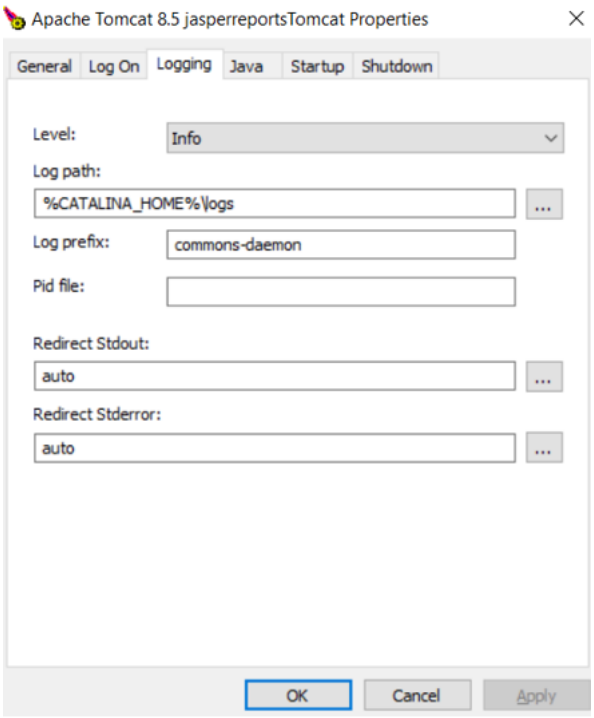
Install Jaspersoft Server 8.1.1 on PostgreSQL, Microsoft SQL Server, or Oracle database using WAR distribution

Perform the following steps to Install JasperReports Server 8.1.1 on PostgreSQL, Microsoft SQL Server or Oracle database.

NOTE
Before installing, review the TIBCO Platform Support for JasperReports 8.0. Documentation.

1. From Broadcom support portal, download the JasperReports Server 8.1.1 installer file **CA Business Intelligence JasperReports Server 8.1.1 for CA Service Management.iso**.
2. Mount the JasperReports Server 8.1.1 installer after downloading it to your environment. Or ensure to unzip the installer contents in your local system.
   NOTE
   TIBCO Release 8.0.0 documentation is applicable for Release 8.1.1 too. For example, though the documentation refers to TIB_js-jrs_8.0.0_bin.zip, you can consider it as TIB_js-jrs_8.1.1_bin.zip.
3. For installation instructions, see the chapter "*Installing the WAR File for Production"* in TIBCO documentation.
4. Configure Tomcat as an installed service.
   NOTE
   The paths shown in the below procedure are given as examples only. The paths may differ based on your environment and installation requirements.
   a. Install a supported Java version. For more information about a supported Java version, see TIBCO Platform Support for JasperReports 8.0 Documentation.
   b. Set CATALINA_HOME to the tomcat folder.
   c. Set JAVA_HOME to the java folder.
   d. From `CATALINA_HOME\bin` , execute the following command to install JasperReports Service.
   ```
   tomcat8.exe //IS//jasperreportsTomcat --DisplayName="Apache Tomcat 8.5 jasperreportsTomcat"
    --Install="C:\JRS8_1_1\tomcat8570\bin\tomcat8.exe" --Jvm=auto --StartMode=jvm --
   StopMode=jvm --StartClass=org.apache.catalina.startup.Bootstrap --StartParams=start --
   StopClass=org.apache.catalina.startup.Bootstrap --StopParams=stop
   ```
   NOTE
   - Use the service name **jasperreportsTomcat,** identified by the common installer.
   - See the Troubleshooting CA Service Management section, if the following error message is displayed: Failed to grant service user 'NT AUTHORITY\LocalService' write permissions to log path 'C:\Windows \system32\LogFiles\Apache' due to error '19: The media is write protected.'

   e. From `CATALINA_HOME\bin` , execute the following command to configure JasperReports Service.
   ```
   tomcat8w.exe //ES//jasperreportsTomcat
   ```
   f. On the UI Window, select the **Logging** tab and set the below settings:



g. On the Java tab, set the below options:

```
JVM------
%JAVA_HOME%\jre\bin\server\jvm.dll
Java Classpath---------
%JAVA_HOME%\lib\tools.jar;%CATALINA_HOME%\bin\bootstrap.jar;%CATALINA_HOME%\bin\tomcat-juli.jar

Java Options-----------
-Djs.license.directory=C:\Users\Administrator
-Djs.license.directory=C:\Users\Administrator
-Dcatalina.home=C:\JRS8_1_1\tomcat8570
-Dcatalina.base=C:\JRS8_1_1\tomcat8570
-Djava.io.tmpdir=C:\JRS8_1_1\tomcat8570\temp
-Djs.license.directory=C:\Users\Administrator
-Djava.util.logging.manager=org.apache.juli.ClassLoaderLogManager
-Djava.util.logging.config.file=C:\JRS8_1_1\tomcat8570\conf\logging.properties

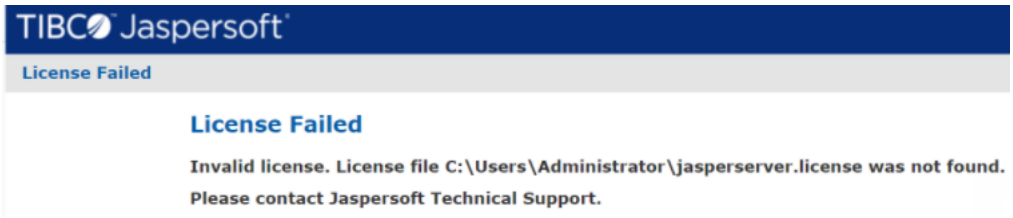
Java  9 options-----------
--add-opens=java.base/java.lang=ALL-UNNAMED
--add-opens=java.base/java.io=ALL-UNNAMED
--add-opens=java.rmi/sun.rmi.transport=ALL-UNNAMED
-Xdebug
-Xrunjdwp:transport=dt_socket,address=9999,server=y,suspend=n
```

h. Click **Apply** and **OK**.

i. Start Apache Tomcat 8.5 jasperreportsTomcat services from Windows services console.

5. Launch JasperReports Server 8.1.1.

If the error message License Failed is displayed, copy the jasperserver.license file and paste it into the folder as follows:



6. Stop Tomcat 8.5 jasperreportsTomcat services.
7. Navigate to `CASM_DVD\filestore\Jasper\8.1.1\License` folder and copy the jasperserver.license file.
8. Navigate to the path displayed in the error message and paste the copied file.
9. Start Tomcat 8.5 jasperreportsTomcat services.

Next Step:

- Integrate JasperReports Server 8.1.1 with CA Service Management

Upgrade JasperReports Server from 7.9 to 8.1.1

Upgrade JasperReports Server from 7.9 to 8.1.1 for CA SDM

Review the supported upgrade paths for JasperReports Server and upgrade by following the recommended upgrade procedure.

You can upgrade directly to JasperReports Server 8.1.1 from JasperReports Server 7.9.

Upgrade JasperReports Server 7.9 to JasperReports Server 8.1.1

This section provides instructions to upgrade from JasperReports Server 7.9 to JasperReports Server 8.1.1.

Follow these steps:

1. From Broadcom support portal, download the JasperReports Server 8.1.1 installer file **CA Business Intelligence JasperReports Server 8.1.1 for CA Service Management.iso**.
2. Upgrade to JasperReports Server 8.1.1 by performing the tasks listed in the *CHAPTER 3 UPGRADING FROM 7.9 TO 8.0 .* section in the TIBCO JasperReports Server 8.0.0 upgrade guide

   NOTE
   TIBCO Release 8.0.0 documentation is applicable for Release 8.1.1 too. For example, though the documentation refers to TIB_js-jrs_8.0.0_bin.zip, you can consider it as TIB_js-jrs_8.1.1_bin.zip.

   NOTE
   While performing the Jasperreports Server upgrade, if you get an error CATALINA_HOME and CATALINA_BASE are both NOT set, then edit the default_master.properties file for your database; set the CATALINA_HOME and CATALINA_BASE values to Tomcat app server root directory and save the file. Run the Upgrade command again.
3. To integrate JasperReports Server 8.1.1 with CA Service Management, launch the CA Service Management common installer on the server where you installed JasperReports Server 8.1.1.
   a. On the **Installer selection** window, select **Integrate CABI JasperReports Server with CA Service Management**.
   b. On the **License Agreement** window, review the license information, accept the agreement, and click **Next**.
   c. On the **Database Configuration** window, in the **Database Type** field, select a database.

d. Enter the details for CA Service Desk Manager (CA SDM) and click **Next**.

Field	Description
Database Server	The location where you've installed the CA SDM database server.
Database Name	The database name on the CA SDM database name.
Database Port	The port number that CA SDM uses.
Database Server Instance	The instance of the database server.
Database Admin User	The database admin user name with permissions to create users and schema. The default user for Microsoft SQL Server is sa.
Database Admin Password	The password to authenticate the database administrator user.
mdbadmin Password	The password for the CA SDM database user.
Confirm mdbadmin Password	Reconfirm the password for the CA SDM database user.

e. On the **CABI JasperReports Server Configuration** window, enter the details for configuring JasperReports Server 8.1.1, and click **Next.**

Field	Description
Server Name	The name of the server where JasperReports Server 8.1.1 is installed.
Organization	The organization name created in JasperReports Server 8.1.1
Port	The port number that JasperReports Server 8.1.1 uses.
Insights Admin User Name	The user name with complete access to all organizations and tenants.
Admin User	The default admin user is superuser.
Insights Admin Password	The admin password with complete access to all organizations and tenants.
Admin Password	The password to authenticate the database administrator user.
Confirm Insights Admin Password	Reconfirm the admin password with complete access to all organizations and tenants.
Server Protocol	The server protocol used during JasperReports Server 8.1.1 installation.
Webapp Directory	The location within the tomcat folder where JasperReports Server 8.1.1 is deployed. Example, <JasperReports Server 8.1.1 installed directory>\apache-tomcat\webapps\jasperserver-pro

f. (Optional) To enable aggregate reports, select the **Aggregate Reports** checkbox.
On the **Aggregate Reports** window, verify the datamart database server details, and click **Next.**

g. (Optional) To enable transactional reports, select the **Transactional Reports** checkbox.
On the **Transactional Reports** window, verify the transactional database server details, and click **Next.**

h. In the Jasper Database Configuration window, select the required database against Jasper Database Type to automatically increase the password field length of the jijdbcdatasource table on jasperserverdb.
If your JasperReports server is deployed on any of the following databases, perform the following steps:
   a. PostgreSQL Database
   b. Microsoft SQL Server Database
   c. Oracle Database

NOTE

- Ensure that you have the required database client installed based on the Jasper database server type.
- The Jasper Database Admin User is the privileged user who can create and update the Jasper database entries.

PostgreSQL Database

Prerequisites

For successful integration, verify the following.

- Open the pg_hba.conf file under the PostgreSQL directory.
  <jasper-report-server-path>\postgresql\data
  Under # IPv4 local connections, add the following new entry:
  host all all <—IP address-->/32 md5
  IP address of the installed Jasper Server.
- Open the postgresql.conf file under the PostgreSQL directory.
  <jasper-report-server-path>\postgresql\data
  Update the listen_addresses entry from 127.0.0.1 to * as follows and save.
  Example: listen_addresses = '*'

Restart the PostgreSQL database service.

a. Complete the following mandatory fields:
   - Jasper Database Hostname
     Specifies the Jasper Database Hostname.
   - Jasper Database Name
     Specifies the name of the Jasper Database.
     Default: jasperserver
   - Jasper Database Admin User
     Specifies the Jasper Database Admin User name.
     Default: postgres
   - Jasper Database Admin Password
     Specifies the Jasper Database Admin Password.
     Note: On the PosrgreSQL database page the password is pre populated.
   - Jasper Database Port
     Specifies the Jasper Database Port number.
     Default: 5432
   - PostgreSQL Home Path
     Specifies the Jasper directory where the Postgres SQL database is installed.

b. Click Next to proceed.

Microsoft SQL Server Database

a. Complete the following mandatory fields:
   - Jasper Database Hostname

Specifies the Jasper Database Hostname.

- Jasper Database Name
  Specifies the name of the Jasper Database.
  Default: jasperserver
- Jasper Database Port
  Specifies the Jasper Database Port number.
  Default: 1433
- Jasper Database Admin User
  Specifies the Jasper Database Admin User name.
  Default: sa
- Jasper Database Admin Password
  Specifies the Jasper Database Admin Password.

b. Complete the following optional field:
- Jasper Database Server Instance
  Specifies the Jasper Database Server Instance.

c. Click Next to proceed.

Oracle Database

a. Complete the following mandatory fields:
- Jasper Database Hostname
  Specifies the Jasper Database Hostname.
- Jasper Database Port
  Specifies the Jasper Database Port number.
  Default: 1521
- Jasper Database Net Service Name
  Specifies the Jasper Database Net Service Name.
- Jasper Database Admin User
  Specifies the Jasper Database Admin User name.
  Default: system
- Jasper Database Admin Password
  Specifies the Jasper Database Admin Password
- Jasper Database - SID
  Specifies the Jasper Database - SID.

b. Click Next to proceed.

i. Review the information on the **Configuration** window, and click **Next.**

j. Click **Install** to start the integration process.

What's next

After integrating JasperReports Server 8.1.1 with CA Service Management, complete the following tasks:

- Post-installation tasks.
- Additional tasks.

Integrate JasperReports Server 8.1.1 with CA Service Management

Overview of the integration between JasperReports Server 8.1.1 and CA Service Management.

This article provides an overview of the integration between JasperReports Server 8.1.1 and CA Service Management.

Overview

JasperReports Server is a stand-alone and embeddable reporting software that CA Service Management uses for reporting and analytics purposes. CA Service Management integration with JasperReports Server provides enterprise IT management critical information on a real-time or scheduled basis. The integration offers pre-configured reports, dashboard views, and the ability to create sophisticated layouts containing charts, images, subreports, crosstabs, and more that matter for your business objectives.

CA Service Management integration with JasperReports Server provides the following benefits:

- Visualize data quickly using pre-configured reports and interactive dashboard views.
- Generate reports, and customize them to your needs by going one step further than regular table-based reports: Drag-and-drop report designer supporting interactive tables, charts, crosstabs, and analytic views.
- Drill down into reports and analyze them to enable data-driven decision-making.
- Ability to modify underlying data cube on the fly as part of analysis capabilities.

JasperReports Server 8.1.1 installation is a distinct and separate activity within the overall CA Service Management installation process.

You can integrate the JasperReports Server 8.1.1 with CA Service Management using the following information:

Integrate 17.4 and Later

The following sections help you integrate the JasperReports Server 8.1.1 with CA Service Management 17.4 and later.

Prerequisites

For successful integration, verify the following.

- Review the JasperReports Server 8.0.0 supportability matrix from TIBCO Software.

  NOTE
  TIBCO Release 8.0.0 documentation is applicable for Release 8.1.1 too. For example, though the documentation refers to TIB_js-jrs_8.0.0_bin.zip, you can consider it as TIB_js-jrs_8.1.1_bin.zip.
- Ensure that JasperReports Server 8.1.1 is installed.

Enable authentication files for communication

Enable authentication files for communication between JasperReports Server 8.1.1 and CA Service Desk Manager (CA SDM).

Follow these steps:

1. Add contactUUID for superuser.
   a. Log in to JasperReports Server 8.1.1 as a superuser.
   b. Navigate to **Manage** > **Users**.
   c. From the left navigation, select **root**.
   d. Select the **superuser**.
   e. From the **Properties** pane, click **Edit**.
   f. From the **Attributes** tab, click **Add new attribute**.
   g. In the Name field, enter `contactUUID`.
   h. Click **OK** and **Save**.

Integrate using the common installer

To enable integration between JasperReports Server 8.1.1 with CA Service Management, launch the CA Service Management common installer on the server where you installed JasperReports Server 8.1.1.

Follow these steps:

1. On the **Installer selection** window, select **Integrate CABI JasperReports Server with CA Service Management**.
2. On the **License Agreement** window, review the license information, accept the agreement, and click **Next**.
3. On the **Database Configuration** window, in the **Database Type** field, select a database.
4. Enter the details for CA Service Desk Manager (CA SDM) and click **Next**.

Field	Description
Database Server	The location where you've installed the CA SDM database server.
Database Name	The database name on the CA SDM database name.
Database Port	The port number that CA SDM uses.
Database Server Instance	The instance of the database server.
Database Admin User	The database admin user name with permissions to create users and schema. The default user for Microsoft SQL Server is sa.
Database Admin Password	The password to authenticate the database administrator user.
mdbadmin Password	The password for the CA SDM database user.
Confirm mdbadmin Password	Reconfirm the password for the CA SDM database user.

5. On the **CABI JasperReports Server Configuration** window, enter the details for configuring JasperReports Server 8.1.1, and click **Next.**

Field	Description
Server Name	The name of the server where JasperReports Server 8.1.1 is installed.
Organization	The organization name created in JasperReports Server 8.1.1
Port	The port number that JasperReports Server 8.1.1 uses.
Insights Admin User Name	The user name with complete access to all organizations and tenants.
Admin User	The default admin user is superuser.
Insights Admin Password	The admin password with complete access to all organizations and tenants.
Admin Password	The password to authenticate the database administrator user.
Confirm Insights Admin Password	Reconfirm the admin password with complete access to all organizations and tenants.
Server Protocol	The server protocol used during JasperReports Server 8.1.1 installation.
Webapp Directory	The location within the tomcat folder where JasperReports Server 8.1.1 is deployed. Example, <JasperReports Server 8.1.1 installed directory>\apache-tomcat\webapps\jasperserver-pro

6. (Optional) To enable aggregate reports, select the **Aggregate Reports** checkbox.
   On the **Aggregate Reports** window, verify the datamart database server details, and click **Next.**
7. (Optional) To enable transactional reports, select the **Transactional Reports** checkbox.

On the **Transactional Reports** window, verify the transactional database server details, and click **Next.**

8. In the Jasper Database Configuration window, select the required database against Jasper Database Type to automatically increase the password field length of the jijdbcdatasource table on jasperserverdb.
   If your JasperReports server is deployed on any of the following databases, perform the following steps:
   a. PostgreSQL Database
   b. Microsoft SQL Server Database
   c. Oracle Database

      NOTE

      - Ensure that you have the required database client installed based on the Jasper database server type.
      - The Jasper Database Admin User is the privileged user who can create and update the Jasper database entries.

PostgreSQL Database

Prerequisites

For successful integration, verify the following.

- Open the pg_hba.conf file under the PostgreSQL directory.
  <jasper-report-server-path>\postgresql\data
  Under # IPv4 local connections, add the following new entry:
  host all all <—IP address-->/32 md5
  IP address of the installed Jasper Server.
- Open the postgresql.conf file under the PostgreSQL directory.
  <jasper-report-server-path>\postgresql\data
  Update the listen_addresses entry from 127.0.0.1 to * as follows and save.
  Example: listen_addresses = '*'

Restart the PostgreSQL database service.

a. Complete the following mandatory fields:
   - Jasper Database Hostname
     Specifies the Jasper Database Hostname.
   - Jasper Database Name
     Specifies the name of the Jasper Database.
     Default: jasperserver
   - Jasper Database Admin User
     Specifies the Jasper Database Admin User name.
     Default: postgres
   - Jasper Database Admin Password
     Specifies the Jasper Database Admin Password.
     Note: On the PosrgreSQL database page the password is pre populated.
   - Jasper Database Port
     Specifies the Jasper Database Port number.
     Default: 5432
   - PostgreSQL Home Path
     Specifies the Jasper directory where the Postgres SQL database is installed.

b. Click Next to proceed.

Microsoft SQL Server Database

a. Complete the following mandatory fields:
   - Jasper Database Hostname

Specifies the Jasper Database Hostname.

- Jasper Database Name
  Specifies the name of the Jasper Database.
  Default: jasperserver
- Jasper Database Port
  Specifies the Jasper Database Port number.
  Default: 1433
- Jasper Database Admin User
  Specifies the Jasper Database Admin User name.
  Default: sa
- Jasper Database Admin Password
  Specifies the Jasper Database Admin Password.

b. Complete the following optional field:

- Jasper Database Server Instance
  Specifies the Jasper Database Server Instance.

c. Click Next to proceed.

Oracle Database

a. Complete the following mandatory fields:

- Jasper Database Hostname
  Specifies the Jasper Database Hostname.
- Jasper Database Port
  Specifies the Jasper Database Port number.
  Default: 1521
- Jasper Database Net Service Name
  Specifies the Jasper Database Net Service Name.
- Jasper Database Admin User
  Specifies the Jasper Database Admin User name.
  Default: system
- Jasper Database Admin Password
  Specifies the Jasper Database Admin Password
- Jasper Database - SID
  Specifies the Jasper Database - SID.

b. Click Next to proceed.

9. Review the information on the **Configuration** window, and click **Next.**
10. Click **Install** to start the integration process.

NOTE
The required JARS and XML files are copied automatically. On the progress page, you may view the following password increment and copy tasks.

- Password Field Length Increment On JasperReport Server Database
- Copying Custom Files to JasperReport Server

Post-installation tasks

After integrating JasperReports Server 8.1.1 with CA Service Management, complete the following post-integration tasks to have Insights up and running.

- Enable Insights from the xFlow Interface
- Enable Insights from CA SDM

Enable Insights from the xFlow Interface

An administrator must enable Insights app for it to appear on the xFlow Interface.

Follow these steps:

1. Restart the JasperReports Tomcat Server.
2. Login to CA SDM as an administrator.
3. Navigate to the **Administration** tab, select **xFlow Interface**, **App Configuration**, and **Insights**.
4. Click **Edit**.
5. From the drop-down list, select **Active**, and click **Save**.
6. Restart the xFlow Interface services based on your configuration.
   a. For Advanced Availability: Restart services on the application server.
   b. For Conventional: Restart services on the primary and secondary servers.

Result: Insights app is enabled and available from the xFlow Interface.

Enable Insights from CA SDM

If you have not installed the xFlow Interface or Insights app, you can access Insights directly from CA SDM.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to **Administration**, **Security and Role Management**, **Role Management**, and **Role List.**
3. Select a role.
4. Select the Resources tab and click **Update Tabs** to select the Insights tab.
5. Assign the insights app to the selected role.
6. Log in to CA SDM with the selected role.
7. From the Menu bar, select **Insights** and click **Launch Insights**.

Result: Insights app is enabled and available for use from CA SDM.

Additional tasks

After successfully integrating JasperReports Server 8.1.1 with CA Service Management, review the following additional tasks. You can complete the tasks that you need for your environment.

- Configure the data aggregation date
- Match the duration format

Configure the data aggregation date

Get accurate and consistent reports by configuring the data aggregation date to a date later than that of CA Service Management 17.4 implementation. If the Data Aggregation Date is not configured, inaccurate information is displayed, and the following reports are impacted:

- Incidents Cost for Top Categories (USD)
- Incidents Cost Trend for Top Categories (USD)
- MTTR for Top Categories (In Hours) Report
- MTTR Quarterly Trend for Top Categories (In Hours) Report
- MTTR Weekly Trend for Top Categories (In Hours) Report
- MTTR Yearly Trend for Top Categories (In Hours) Report

Follow these steps:

1. Navigate to the `<datamart installed folder>\config\config.properties` file.

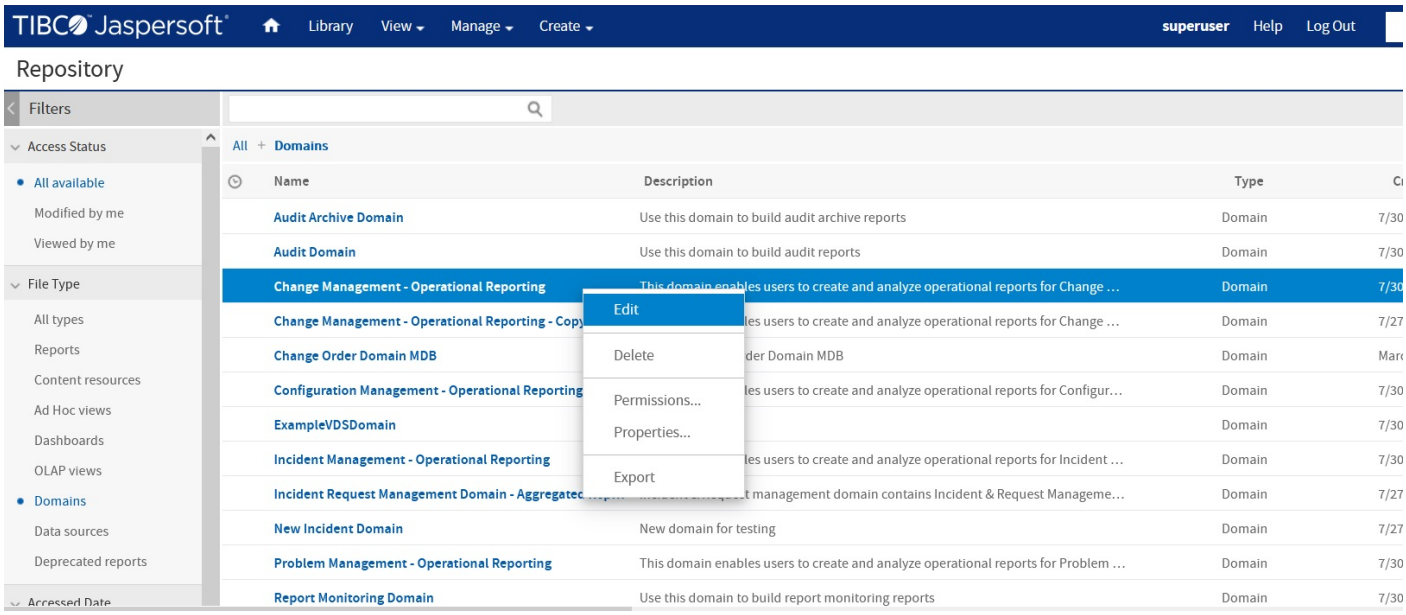
2. Search for the string **trend_start_date='yyyy-mm-dd'**.
3. Replace the **trend_start_date** value with the data aggregation date.
   During the next ETL job, the data older than the data aggregation date is deleted.

Match the duration format

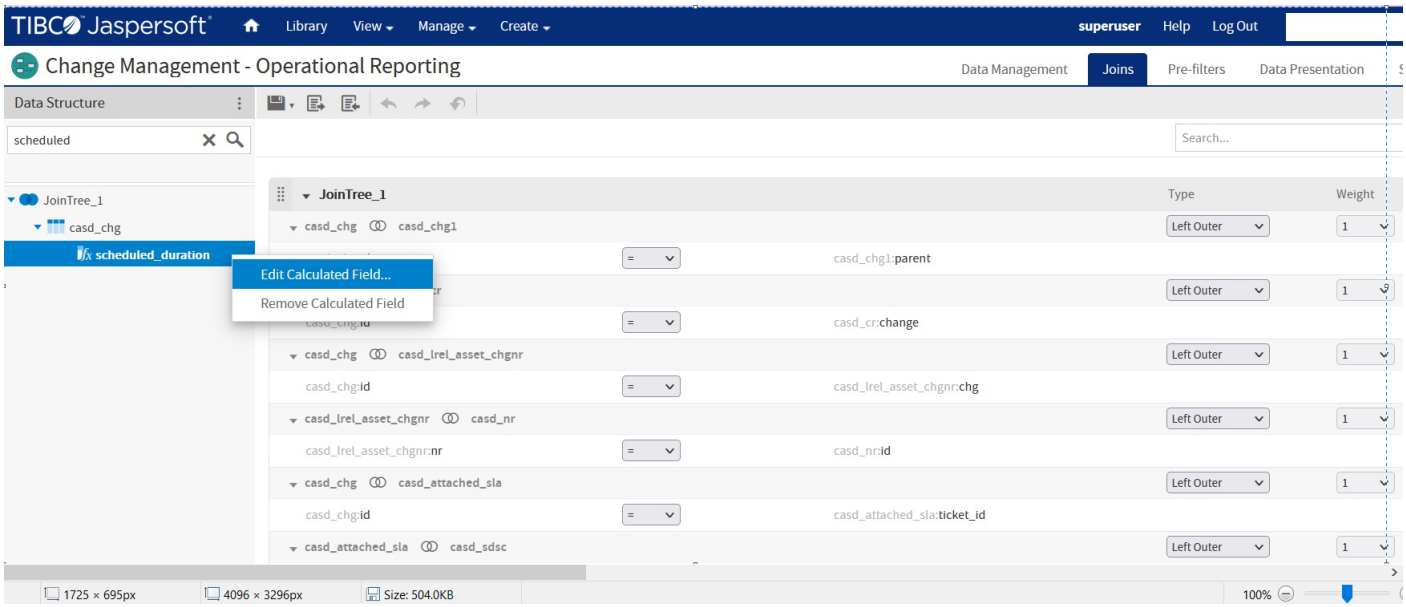
The duration format is represented differently in CA SDM and Insights. You can match the duration format to appear in HH:MM:SS format in both CA SDM and Insights.

Follow these steps

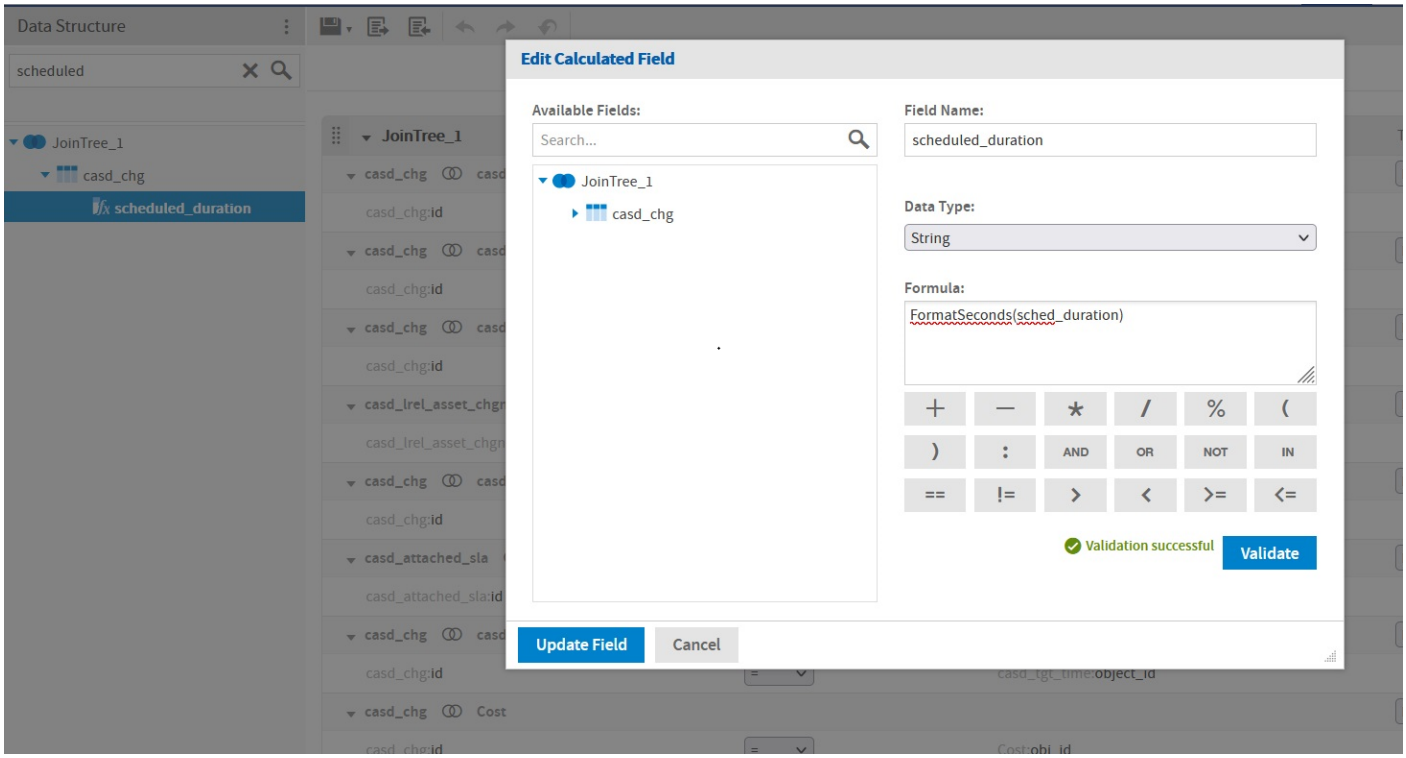
1. Connect to the Jasper Reports server machine.
2. Copy the *DurationFormatter.jar* from CASM_17.4.\filestore\Jasper\8.1.1\ExternalAuthJars and, copy it into the jasperserver tomcat lib folder. For eg: *C:\apache-tomcat-9.0.65\webapps\jasperserver-pro\WEB-INF\lib*.
3. From the service console, stop the service: jasperreportsTomcat.
4. From the folder where you installed JasperReports Server 8.1.1, navigate to the `apache-tomcat\webapps\jasperserver-pro\WEB-INF` folder and back up applicationContext-el-operators.xml file.
5. From the folder where you installed JasperReports Server 8.1.1, navigate to the `apache-tomcat\webapps\jasperserver-pro\WEB-INF\bundles` folder and back up the following files.
   - adhoc_messages.properties
   - adhoc_messages_es.properties
   - adhoc_messages_fr.properties
   - adhoc_messages_ja.properties
   - adhoc_messages_pt_BR.properties
6. Navigate to the DVD `filestore\Jasper\8.1.1\ExternalAuthXMLs` folder and copy the applicationContext-el-operators.xml file.
7. From the folder where you installed JasperReports Server 8.1.1, navigate to the `apache-tomcat\webapps\jasperserver-pro\WEB-INF` folder and paste the copied file.
8. Navigate to the DVD `filestore\Jasper\8.1.1\Bundles` folder and copy the following files.
   - adhoc_messages.properties
   - adhoc_messages_es.properties
   - adhoc_messages_fr.properties
   - adhoc_messages_ja.properties
   - adhoc_messages_pt_BR.properties
9. From the folder where you installed JasperReports Server 8.1.1, navigate to the `apache-tomcat\webapps\jasperserver-pro\WEB-INF\bundles` folder and paste the copied files.
10. Navigate to the DVD `filestore\Jasper\8.1.1\Groovy` folder and copy the BaseGroovyColumn.groovy file.
11. From the folder where you installed JasperReports Server 8.1.1, navigate to the `apache-tomcat\webapps\jasperserver-pro\WEB-INF\groovy\groovy_column` folder and paste the copied file.
12. From the folder where you installed JasperReports Server 8.1.1, navigate to the `apache-tomcat\temp` folder and empty the folder.
13. From the folder where you installed JasperReports Server 8.1.1, navigate to the `apache-tomcat\work` folder and empty the folder.
14. From the service console, start the service: jasperreportsTomcat.
15. Clear the browser cache.
16. Log in to Jasper UI in the browser, and edit the required domain. This image shows how to edit the Change Management - Operational Reporting domain.



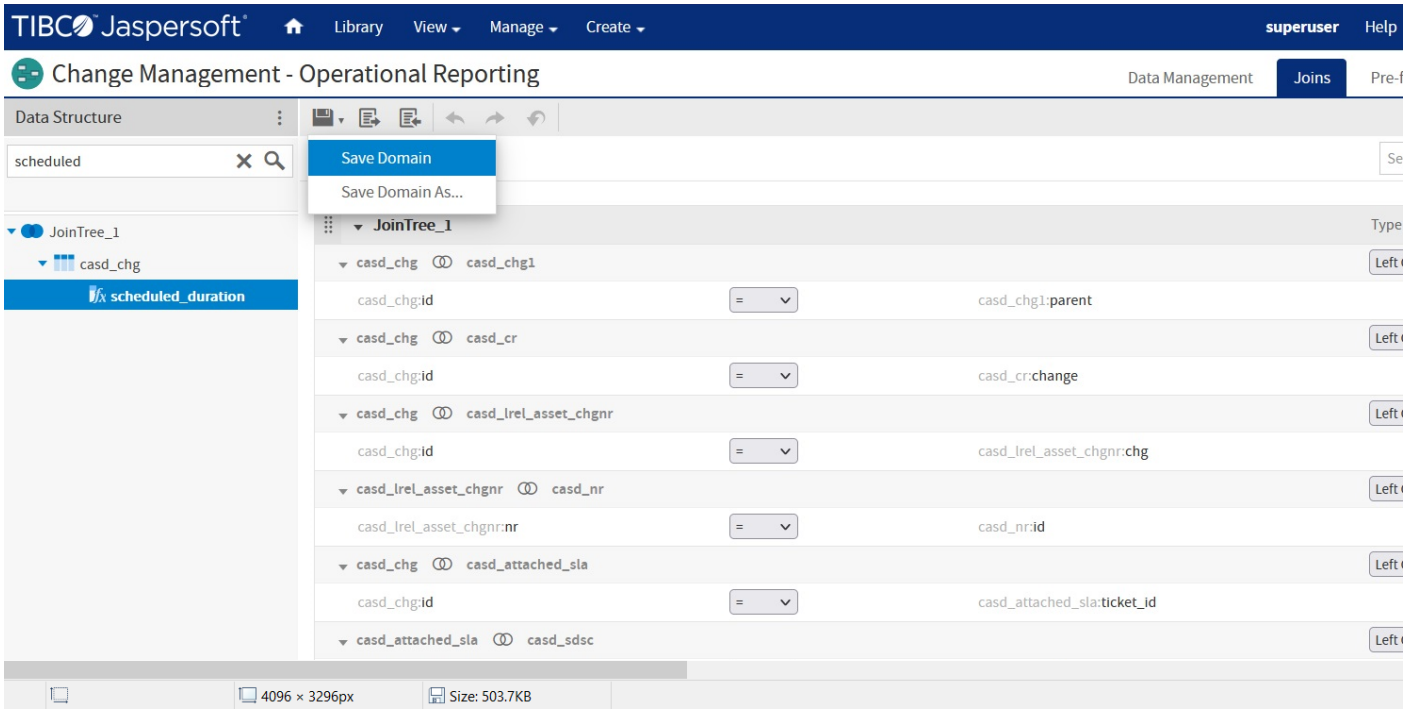
17. Under the Joins tab, search for the required calculated field and right-click the field to edit it. This image shows how to edit the scheduled_duration field.



18. Under Formula, edit the formula for the calculated field. This image shows the formula for the scheduled_duration field.



19. Change the data type to String.
20. Click **Validate**.
21. Click **Update Field**.
22. To save the domain, click the **Save** icon.



23. To verify that the duration value is displayed in HH: MM: SS format, use this field in your reports.

Duration Measure error for default users

Follow these steps:

1. Login to jasperserver application.
2. Click **Domains**.
3. Right click on the required Domain (e.g.: Incident Management- Operational Reporting) to modify and click **Edit.**
4. Click **Joins** and search for the Calculated field (e.g.: Resolution_Time_Hours) that are used for measures.
5. Right click on calculated field and click **Edit Calculated Field**.
6. Remove the SUM from the formula then click **Validate** and **Update Field**.
7. Save the Domain.
8. Restart the Jasperreports Tomcat service.

If CA SDM is on Oracle follow these additional steps

1. Navigate to the location where Jasper server is installed. (e.g.: C:\apache-tomcat-9.0.65\webapps\jasperserver-pro)
2. Under the folder WEB-INF, select and edit *applicationContext-semanticLayer.xml*
3. Search for the tag
   ```
   <bean id="sqlserverGenerator" parent="defaultSQLGenerator" scope="prototype">
   ```
4. Find the entry <entry key ="divide"> under it.
5. For removing the data type *casting of money*, change
   "cast ($top as money) / (case when (($bottom) = 0) then null else ($bottom) end)" as String
   to *"($top) / (case when (($bottom) = 0) then null else ($bottom) end)"* as String.
6. Save the applicationContext-semanticLayer.xml
7. Restart the Jasper server tomcat service.

Configure JasperReports Server 8.1.1 High Availability Set Up Cluster

This document provides updates on how to Configure JasperReports Server 8.1.1 High Availability Set Up Cluster.

Prerequisites

The following are the prerequisites:

- Complete the installation of Jasper 8.1.1 with supported databases. (Call it Node 1)
- Verify the Jasper URL.
- Install ActiveMQ on any one server in the cluster.
- Install JDK (OpenJDK11) and Apache Tomcat (9) on all the nodes
- Integrate SDM or xFlow to the JasperReports Server 8.1.1

EhCache Replication

The repository cache in JasperReports Server is implemented internally through the Ehcache component. Edit the Ehcache configuration files as described below to replicate the repository cache among all instances that share a single repository. You do not have to configure a cluster for cache replication.

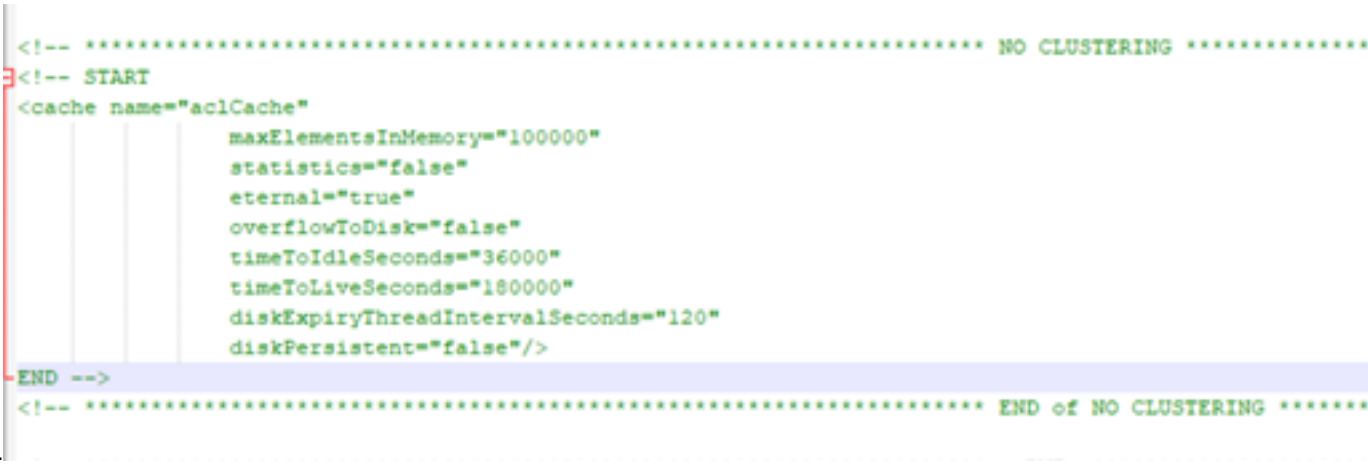
JMS – Java Message Services can provide cache distribution for nodes in a cloud where IP addresses may change. Jaspersoft provides a configuration for using the Apache ActiveMQ JMS Server. You must first install and configure ActiveMQ on one of the computers in your cluster.

Configure a High Availability Environment on Node 1

Perform the following steps on JasperReports Server, Node 1:

Follow these steps:

1. Stop the JasperReports Server Apache Tomcat service on Node1.
2. Take a backup of the following files on each node:
   Open the file <web-app>/WEB-INF/classes/ehcache_hibernate.xml and <web-app>/WEB-INF/ehcache.xml on each node.
   Example:C:\Jaspersoft\jasperreports-server-8.1.1\apache-tomcat\webapps\jasperserver-pro
3. In both ehcache_hibernate.xml and ehcache.xml files, comment out or remove the section of the file in between "NO CLUSTERING" and "END of NO CLUSTERING" comments.



4. Uncomment the JMS section in <web-app>/WEB-INF/classes/ehcache_hibernate.xml and <web-app>/WEB-INF/ehcache.xml on each node.
   Example:

5. Set the providerURL properties in both files to the address of your JMS server.
   For example, there are several providerURL properties to set in each element; only the first one is shown in the following code example:

```
<!-- START
        <cacheManagerPeerProviderFactory
                class="net.sf.ehcache.distribution.jms.JMSCacheManagerPeerProviderFactory"

properties="initialContextFactoryName=com.jaspersoft.jasperserver.api.engine.replication.JRSActiveMQInitialContextF
                providerURL=tcp://ActivemQ_host:61616,
                replicationTopicConnectionFactoryBindingName=topicConnectionFactory,
                replicationTopicBindingName=ehcacheAcl,
                getQueueConnectionFactoryBindingName=queueConnectionFactory,
```

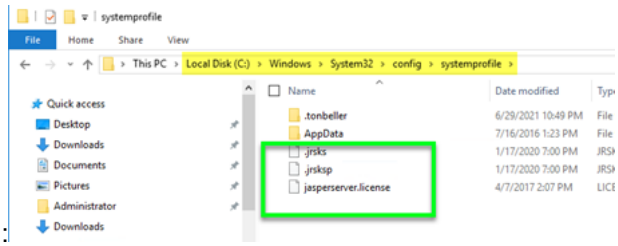
```
getQueueBindingName=ehcacheQueueAcl,
topicConnectionFactoryBindingName=topicConnectionFactory,
topicBindingName=ehcacheAcl"
propertySeparator=","/>
```

6. On each node, edit the file <web-app>/META-INF/context.xml. Locate the Manager pathname near the end, and comment it out as follows:
   C:\Jaspersoft\jasperreports-server-8.1.1\apache-tomcat\webapps\jasperserver-pro
   ```
   <!-- Manager pathname="" -->
   ```

Configure a High Availability Environment on Node 2

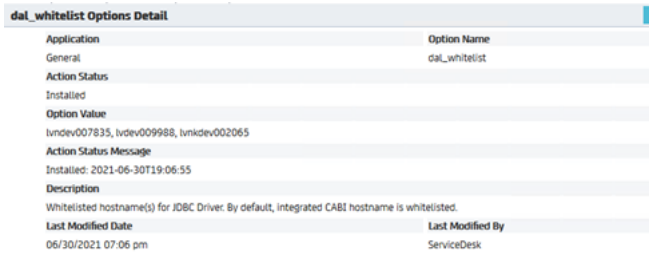
Perform the following steps on JasperReports Server, Node 2:

Follow these steps:

1. Use the same installer that is used in Node 1 (Use original installer).
2. Copy the default_master.properties file from Node 1 to Node 2.
3. Stop Apache Tomcat services.
4. Ensure that Apache Tomcat and Database details are pointing to the correct database.
   Example:
   # Tomcat app server root dir
   appServerDir = C:\\Program Files\\Apache Software Foundation\\Tomcat 9.0
   # appServerDir = /home/devuser/apache-tomcat-9.0
   If it is a Linux package managed Tomcat instance, set the following two properties:
   – CATALINA_HOME = C:\\Program Files\\Apache Software Foundation\\Tomcat 9.0
   – CATALINA_BASE = C:\\Program Files\\Apache Software Foundation\\Tomcat 9.0
5. Install only webapp in Node 2.
   Navigate to the C:\TIB_js-jrs_8.1.1_bin\jasperreports-server-pro-8.1.1-bin\buildomatic folder and run the following command
   ```
   js-ant deploy-webapp-pro
   ```
6. Ensure you have a non default port under:
   C:\Program Files\Apache Software Foundation\Tomcat 9.0\webapps\jasperserver-pro\WEB-INF
   diagnostic.port = 10990
   Change the port number.
7. Repeat the steps 3-6 from the above Configure a High Availability Environment on Node 1 section.
8. Copy the following files from NODE1's system user directory from when you installed Jasper 8.1.1, to NODE2's system user directory. For example, C:\Users\Administrator.
   – .jrsks
   – .jrslic
   – .jrsksp
   – Jasperserver.license
   In some cases, you may need to copy the files to the systemprofile location:
   


9. Start Apache Tomcat services.

10. Configure SDM to accept communication from the new Node by updating the dal_whitelist option.



11. Make sure you can view your reports. Create a new adhoc view on NODE2; log in to JasperReports Server, Node1 and verify you can view and run the report from Node 1.

Configure JasperReports Server 8.1.1 to Use SSL

You can configure JasperReports Server to use Secure Socket Layer (SSL) and communicate with CA Service Management. SSL establishes an encrypted link between a server and a client. For example, a web server and a browser; or a mail server and a mail client. This link helps ensure that all data passed between the server and client remain private and integral. When you configure JasperReports server to use SSL, you change its communication method from HTTP to HTTPS while integrating with CA Service Management.

Follow these procedures:

Create a Keystore File

A keystore file is required to enable SSL. Create a keystore file if you do not have one already for another CA product that integrates with CA Service Management. You can use a keystore file for a single product or for multiple products. If you must create individual keystores for each product, you can optionally merge your keystore files.

Follow these steps:

1. Open a command window on the JasperReports server. Navigate to the location where JasperServer is installed. Example: C:\Jaspersoft\jasperreports-server-8.1.1\java\bin>
2. Execute the following command:

   ```
   keytool -genkey -alias tomcat -keyalg RSA -keystore <Selected Path>/<filename>.keystore
   ```

   Enter the required information when prompted.
3. Enter the password at the “Enter keystore password” prompt. To make configuring Tomcat easier, you can use “changeit” as the password.
4. Record your password for reference.

Add the Certificate to the Keystore

After creating the keystore file, you must add a CA certificate to the keystore.

Follow these steps:

1. Execute the following command to add the certificate into the keystore.

   ```
   keytool -importkeystore -srckeystore <Selected Path>/<filename>.keystore -destkeystore <Selected Path>/<filename>.keystore -deststoretype pkcs12
   keytool -export -storepass PASSWORD -alias tomcat -keystore <Selected Path>/<filename>.keystore -file <Selected Path>/<filename>/Jasperssl.crt
   ```

   The certificate is exported to keystore.

Edit the Server.xml File to Support SSL

As part of configuring the JasperReports server to use Secure Socket Layer (SSL), edit the server.xml file to support SSL.

Follow these steps:

1. Navigate to the JasperServer installed location.
2. Edit the <*Jaspersever Installed Location*>\apache-tomcat\conf**server.xml** file.
3. Search for the <Service name="Catalina"> section.
4. Updated the Connector related information under the <Service name="Catalina"> section:

```
<Connector SSLEnabled="true" maxThreads="200" port="8443"
 protocol="org.apache.coyote.http11.Http11NioProtocol"
 sslImplementationName="org.apache.tomcat.util.net.jsse.JSSEImplementation">
      <SSLHostConfig
 ciphers="TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256,TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384,TLS_DHE_RSA_WITH_AES_128_GCM_S
 TLS_DHE_RSA_WITH_AES_256_GCM_SHA384,TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256,TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA,
 TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384,TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA,TLS_DHE_RSA_WITH_AES_128_CBC_SHA256,
 TLS_DHE_RSA_WITH_AES_128_CBC_SHA,TLS_DHE_RSA_WITH_AES_256_CBC_SHA256,TLS_DHE_RSA_WITH_AES_256_CBC_SHA,
 TLS_RSA_WITH_AES_128_GCM_SHA256,TLS_RSA_WITH_AES_256_GCM_SHA384,TLS_RSA_WITH_AES_128_CBC_SHA256,
 TLS_RSA_WITH_AES_256_CBC_SHA256,TLS_RSA_WITH_AES_128_CBC_SHA,TLS_RSA_WITH_AES_256_CBC_SHA,
 SSL_RSA_WITH_3DES_EDE_CBC_SHA" honorCipherOrder="true" protocols="TLSv1.2" sslProtocol="TLSv1.2">
        <Certificate certificateKeyAlias="<Alias Name>" certificateKeystoreFile="<Selected
 Path>/<filename>.keystore" certificateKeystorePassword="PASSWORD" certificateKeystoreType="PKCS12"/>
      </SSLHostConfig>
   </Connector>
```

   – Default value before making this change.

```
<Connector port="8080" URIEncoding="UTF-8" protocol="HTTP/1.1" connectionTimeout="20000"
 redirectPort="8443"/>
```

5. Save and close the server.xml file.
6. Restart the Tomcat server.
7. Now you can launch the Jaspersoft url using https://HOST_NAME:SSL_PORT/jasperserver-pro/flow.html?_flowId=homeFlow
   Ensure that Jasper URL is accessible.

Integrate CA SDM with the SSL-enabled JasperReports Server

Configure the SSL-enabled JasperReports Server to integrate with CA SDM using the CA Service Management Common Installer.

Follow these steps:

1. Download the common installer to the required location in the JasperServer.
   Example: C:\Users\Administrator\Downloads\<*RUXXXXX*>
2. Extract the installer and go to the Java folder
   Example: \java\java11
3. To integrate HTTPS enabled Jasper Server with Common Installer, the certificate you exported in the *Add the Certificate to the Keystore* section should be imported by executing the following command:

```
keytool -importcert -alias <aliasname>-file <Selected Path>/<filename>.crt -keystore  ..\lib\security
\cacerts
```

4. Launch the CA Service Management Common Installer.
5. Provide the following mandatory information in the "CABI JasperReports Server Configuration" screen.
   Enter the port number that you have provided in the server.xml file.
   Select HTTPS from the Server Protocol drop-down.
6. Proceed with the next steps in the wizard to complete the integration.

NOTE
After the integration is successful, log in to the classic CA SDM, Administration, xFlow Interface, General, and confirm the value *insights.jasper.domain* is populated in the General Configuration List.

Enable JasperServer SSL URL from CA SDM Classic UI

1. Navigate to <jasper_installation_path>\jasperserver-pro\WEB-INF\config and copy the following files.
   – casm_insights.jks
   – casm_insights.properties
2. Paste the copied files from **step 1** to CA SDM Server.**For example**: NX_ROOT\site folder.
3. Restart CA Service Desk Manager Server and JRS services.

NOTE
Integration of CA Service Management Release 17.4 with Jasper Reports Server 8.1.1 is automated.

Add JasperReports Server SSL Certificate to the CA SDM

To launch HTTPS enabled JasperReports server from CA SDM Classic UI, the certificate you exported in the *Add the Certificate to the Keystore* section should be imported.

Follow these steps:

1. Navigate to the JRE bin folder in the CA SDM server.
   For example, C:\Program Files (x86)\CA\SC\JRE\11.0.12\bin
2. Import the certificate or any trusted certificate.
   ```
   keytool -importcert -alias <aliasname>-file <Selected Path>/<filename>.crt -keystore  ..\lib\security
   \cacert
   ```
3. You can now launch Insights from CA SDM classic UI.

Adding JasperReports Certificate to Insights Trust Store

For Insights to connect to HTTPS enabled JasperReports server, the certificate you exported in the *Add the Certificate to the Keystore* section should be imported into the Insights trust store.

1. Navigate to <xFlowInstallation Home Dir>\jre\bin
   Example: C:\Program Files\CA\SC\JRE\11.0.3\bin
2. Import the certificate or any trusted certificate.
   ```
   keytool -importcert -alias <aliasname>-file <Selected Path>/<filename>.crt -keystore  ..\lib\security
   \cacert
   ```
3. Restart the CA xFlow Analyst Interface services.

Install CA Process Automation for CA Service Management

The CA Process Automation integrates with the CA Service Management products to automate the workflow business processes. For more information, see CA Process Automation Documentation.

WARNING

If you use CA Process Automation, we recommend that you do *not* install the CA Process Automation domain orchestrator and CA Process Automation components on the same computer.

CA Process Automation Installation in an HTTPS Environment

Before starting the installation or upgrade process, if your CA Process Automation instance is SSL enabled (configured with https), ensure that you add a CA Process Automation SSL certificate to the Java Run time Environment (JRE) keystore. Without this certificate, JRE, under which the installer is running, does not connect to the CA Process Automation SSL URL and the following SSL validation errors may appear during the installation:

```
2014/11/11 19.04.39.728 DEBUG [AWT-EventQueue-0] [PAMWebserviceManager] Get ITPAM version
2014/11/11 19.04.39.752 ERROR [AWT-EventQueue-0] [PAMValidator] CA PAM validation failed
com.ca.smsi.installcore.webservices.WebserviceException: ; nested exception is:
javax.net.ssl.SSLHandshakeException: sun.security.validator.ValidatorException: PKIX path building failed:
 sun.security.provider.certpath.SunCertPathBuilderException: unable to find valid certification path to
 requested target
at com.ca.smsi.installcore.webservices.PAMWebserviceManager.getITPAMVersion(PAMWebserviceManager.java:265)
```

Complete the following steps to add a CA Process Automation SSL certificate to the JREkeystore:

1. Download the SSL Certificate by accessing the CA Process Automation URL.
   Copy this certificate file to some location. For example, c:\ItpamCert.cer
2. Extract the DVD to a local drive.
3. Import the Process Automation SSL Certificate to a keystore file using the following command:
   ```
   ..\java\jre\bin\keytool -importcert -file c:\ItpamCert.cer -alias somealias -keystore c:/keystore_file -
   storepass somepass\
   ```
4. To enter the keystore and password values to the JRE, open the **setup.lax** file in WordPad from where you have installed CA Service Management or a similar text editor.
   `To avoid any formatting issues, it is recommended that you do not use the Notepad.`
5. Identify the "**lax.nl.java.option.additional**" property.
6. Append the reference to the JAVA keystore and keystorepass entries as follows:
   ```
   -Djavax.net.ssl.trustStore=c:/keystore_file -Djavax.net.ssl.trustStorePassword=somepass
   ```
   After the modification, the line would look like:
   ```
   lax.nl.java.option.additional=-Djava.library.path="\\java\\bin; -DGET_SD_PRESETS=true -
   Djavax.net.ssl.trustStore=c:/keystore_file -Djavax.net.ssl.trustStorePassword=somepass
   ```
7. Save the file and restart the installer by executing a **setup.exe** command.

CA Process Automation Integration with CA Embedded Entitlements Manager (EEM)

If you have installed EEM and Process Automation and have integrated one or more CA Service Management products with Process Automation and EEM, ensure that you provide the same EEM information that you provided while installing Process Automation for the integration to be successful.

You can configure Process Automation to use EEM as an authentication server.

If you have installed CA EEM and CA Process Automation and integrate one or more CA Service Management products with these common components, ensure that you provide the same EEM information that you provided while installing Process Automation for auto-integration to be successful

The Process Automation uses EEM for user authentication and authorization. **CA EEM is a required prerequisite**.

- If you use EEM with CA Service Management, verify that it is a version that CA Process Automation supports. See Platform Support and Requirements.
- If you do not have EEM or your EEM instance is of an earlier version, then download and install EEM.
- Plan how to authenticate CA Process Automation users.
- Gather EEM-related information for the Domain Orchestrator installation.
- To create two EEM instances during the installation (one to use and another for failover). You can complete this optional procedure later.

Installing CA Process Automation

Follow the steps:

1. Launch the CA Service Management Installer by right-click **Setup.exe** to select the **run as administrator** option.
2. Select the language and click **Next**

3. Follow the installation wizard to install or upgrade CA Process Automation.

Generating CASM Reports with APIs

Reporting APIs are supported from CA SDM 17.4.4.0.

This page talks about:

- Overview of Reporting API's
- Deployment
- Getting started with the API's
- Logging
- Limitations

Overview

Reporting is a crucial feature of CA SDM, enabling administrators, service owners, and service delivery managers to analyze service desk performance, ticket management, and workload trends. These reports are key for assessing performance and identifying areas for improvement. Previously, we integrated JasperSoft transactional Reporting to provide visualizations, drill-down capabilities, and custom dashboards. However, as JasperSoft will no longer be supported, we are transitioning to a more flexible and extensible reporting solution based on APIs.

> **NOTE**
>
> The current reporting APIs do not support or expose endpoints for Aggregated Reports. Hence out-of-the-box Aggregated reports will also not be available.
>
> **Custom Reports**
>
> To create custom reports, connect your reporting tool to ***casm_dm*** (datamart) using the appropriate Microsoft SQL driver.

API-Based Transactional Reporting Solution:

The new reporting APIs offer enhanced flexibility by allowing users to select and integrate their preferred Business Intelligence (BI) tools, as long as they are compatible with API integration. This shift provides the ability to create custom dashboards and reports tailored to specific business needs, thus extending the overall reporting functionality of CA SDM.

List of APIs

1. **API Overview**
   - Title: CASM Reports
   - Description: The API allows users to interact with CASM Reports, including accessing reports, designing custom reports, and more.
2. **Available Operations (Endpoints)**
   - **Access Token Operations:**
     - POST /v1/access: Retrieve an access token for the specified user. You must use basic authentication for this.
     - DELETE /v1/access: Delete the access token for the user. Requires the token to be passed in the X-AccessToken header.
   - **Report Operations:**

- GET /v1/getReportCodes: Retrieve a list of available report codes with descriptions.
- GET /v1/getReport: Fetch a predefined report based on the provided report code.
- GET /v1/{factoryName}/: Retrieve a custom list-type report. You can specify the fields, filters, and sorting in headers.
- POST /v1/{factoryName}/createReport: Create a new report based on a specified factory name (in, cr, pr, etc.). The request body should contain the report data in JSON format.
- DELETE /v1/{factoryName}/deleteReport: Delete a report identified by a report code, which must be passed in the header.
- PUT /v1/{factoryName}/updateReport: Updates the existing reports.
- GET /v1/getReportMetaData: Fetch metadata for a report, requiring the report code.

NOTE

- The API "v1/getReport" endpoint gives the report data for a given report code and provides the "createReportMetaData" payload. This payload can be used to customize the OOTB report or creating new report using the "v1/{factoryName}/createReport" API.
- The "/v1/{factoryName}/deleteReport" and "/v1/{factoryName}/updateReport" API endpoints are applicable only for Custom reports. OOTB reports cannot be deleted or updated.

– **ITIL Reports:**
  - GET /v1/itilreport: Retrieve ITIL reports based on various filter options, including report code, ticket type, service, and other parameters.

3. **Parameters and Authentication:**
   – Path Parameters: For example, factoryName is required in many endpoints to specify the type of report or factory (e.g., in, cr).
   – Query Parameters: For e.g.: Use top (pagination) and skip to control the number of results returned.
   – Headers: Headers like X-Report-Code, X-Select, and X-Filter are used to define which report or data is returned and can apply filters and sorting.
4. **Request Body Example for Creating/Updating Reports:**
   – When creating or updating a report, the request body must be in the format of a CASMReport object, which includes:
     - id: A unique identifier for the report.
     - r_name: The name of the report.
     - attributes: A collection of key-value pairs representing the attributes of the report.

   Example of API Usage:
   – **To Create a Report**
     - Endpoint: POST /v1/{factoryName}/createReport
     - Required Header: X-AccessToken (your authentication token)
     - Body: A CASMReport object specifying the report’s details.
   – **To Fetch a Predefined Report by Code:**
     - Endpoint: GET /v1/getReport
     - Required Header: X-Report-Code (the code for the report you are fetching)
5. **Security:**
   – Basic Authentication: Required for accessing the POST /v1/access endpoint.
   – API Key (X-AccessToken): Required for many other endpoints to authorize requests. This is passed in the request header.

Deployment

Enable reporting API services by executing pdm_configure wizard.

1. After the successful installation of 17.4 RU4, perform pdm_configure on the SDM Server (Primary server or APP server or Secondary Server).
2. In the pdm_configure wizard, you can see a new screen **Reporting Services** for enabling the reporting services, with the required ports.

   NOTE

   For Secondary Server:

   1. To run the reporting services on the Secondary server, update the existing configuration under **Administration>> System>> Configurations**.
      In the screen displayed, update the configuration with Current Configuration status as **Yes.** Now click **Additional Processes** tab>>click **Add Process**. In the screen displayed under **Process** drop down, select **Reporting Service Tomcat Server** option.
      Update the **Host Name** with a secondary server(s) hostname.
   2. Run *pdm_configure* on Secondary server(s), followed by Primary server.
3. Click **Configure Reporting Services** check box, and you can see the **Reporting Service Tomcat** port and the **Shutdown** port details. The tomcat ports that are displayed can be modified as per your requirement.
4. Click **Next**, and complete the *pdm_configure*.
5. After the successful completion of pdm_configure, launch the Reporting Services url to view the list of APIs.
   For e.g.: http://HOST_NAME:REPORTING_PORT/CASMReports/api/
6. In the "<NX_ROOT>\bopcfg\CATALINA_BASE_RPT\webapps\CASMReports" location, ensure CASMReports.war is successfully deployed.
7. In case of Advanced Availability configuration, the Reporting Service option is available only in the Application servers, and is not available for both Standby and Background servers.
8. Base URL for Reporting API endpoints: http://HOST_NAME:REPORTING_PORT/CASMReports/reports/<Endpoint>
   For e.g.:
   For access endpoint: http://HOST_NAME:8070/CASMReports/reports/v1/access
   For createReport: http://reportingservername:reportingport/CASMReports/reports/v1/in/createReport

How to Use CASM Reporting APIs with Swagger UI

1. **Security and Authentication:**
   a. All API endpoints are secured and require authentication.
   b. Basic Authentication is only required for the /access endpoint, where you generate an access token.
   c. Once the token is generated, use it to authenticate and try out other APIs.
2. **Swagger UI Usage:**
   a. Swagger UI provides an Authorize button, where you can input your credentials (Basic Authentication and Access Token).
   b. Once authenticated, Swagger automatically includes the provided credentials in all subsequent API requests.
3. **Token Expiration:**
   a. The generated token will expire after one hour (by default).
   b. Once expired, you must generate a new token to continue making requests.
4. **Executing APIs in Other Tools (e.g., Swagger):**
   a. When using tools like Postman, you must explicitly pass the required credentials (Basic Authentication and the Access Token) with each request.
5. Delete Report & Update Report API methods are applicable only for Custom reports. OOTB reports cannot be deleted or updated.

6. **ITIL Reports:**
   a. Swagger UI allows you to dynamically input parameters for ITIL reports.
   b. Depending on the selected report code, you will be prompted to provide the relevant parameters to retrieve the desired data.

Get started with Report API Endpoints

1. The base URL to access the reporting APIs is: *http://<SDM_Reporting_Servername>:ReportingServiceTomacatport/CASMReports/api/.* This page lists out all the supported API endpoints to get, create, update, and delete the reports.
2. In the page displayed, click **Authorize**.
3. In the **Available authorizations** window, enter your Username and Password (the user must have access to Reports), and click **Authorize.** Now close the window.
4. In the **POST /access** method, click **Try it out**>> **Execute.**
5. In the Response body, copy the value of the ***accessToken***, and click **Authorize**.
6. In the Available authorizations window displayed, in **X-AccessToken**, paste the *accessToken* in **Value**, close the window. Now click **Authorize** and close the window.

NOTE

- X-AccessToken is generated based on the Reporting Role of the contact, and insights_reports functional access.
- If you execute the **DELETE /access endpoint**, the authorized access token is deleted.
- If the session is idle for 60 minutes, the access token auto-expires.
- If the session expires when you choose to delete the token, you have to **Authorize** again.

      }
    }
  }
}
```

Sample code snippet to create an incident report:

```
{
    "r_name": "Demo_ListType_ReportName",
    "attributes": {
      "r_code": "Demo_ListType_ReportCode",
      "r_orderby": "ref_num ASC",
      "r_expand": "assignee.organization($select=name)",
      "r_filter": "category.sym eq 'Software'",
      "r_select": "id,ref_num,assignee,description,category",
      "r_type": "List"
    }
}
```

To update a custom report, get the report metadata using /v1/getReportMetaData endpoint, and update it using /v1/{factoryName}/updateReport endpoint.

Logging

1. Check the log information in *reportMS.log* located in NX_ROOT\log.
2. To enable debug logs for Reporting, update the file *logback.properties* present in NX_ROOT\bopcfg\www\CATALINA_BASE_RPT\webapps\CASMReports\WEB-INF\classes to update the value of rootLogger.level. For e,g.: INFO to DEBUG
3. Restart the reporting_server Tomcat_service, with the following commands:

   ```
   pdm_tomcat_nxd -c STOP -t RPT

   pdm_tomcat_nxd -c START -t RPT
   ```

4. Alternatively, to enable the debug logging by using the following command from the command line:

   ```
   nxcd bin

   pdm_log4j_config -f RPT -a -l DEBUG
   ```

5. To check the status of the log level from the cmd prompt, run the following commands:

```
pdm_log4j_config -f RPT -d
```

Limitations

1. ITIL reports are supported only on CA SDM installed using SQL server.
2. Reports created using Reporting APIs are not reflected in Insights App (for both App Launcher and SDM classic UI)

PDM Functions Usage

PdmFunctions are specialized functions within the domsrvr process that can be used to query objects. Currently, 10 functions are supported by domsrvr. This document provides an overview of how these functions can be utilized through the Reporting Service, using version 1 (v1) APIs. Each section in the document includes:

- A description of the function.
- Steps to create a report using the function.
- Instructions to render or retrieve the report.

  NOTE
  Queries must be written in Majic query format and not in standard SQL syntax.

- PdmAddDays
  PdmAddDays(date,count)

```
    When used with one argument, adds the number of days in its argument to today's date and returns the
 result.

When used with two arguments, adds the number of days in its second argument to the value of the date
 column specified in its first argument and returns the result.

This function may be used anywhere in the query.
```

Create

```
POST http://hostname:port/CASMReports/reports/v1/in/createReport
{
"r_name": "PdmAddDays",
"attributes": {
"r_query": "select id, PdmAddDays(2) as aftertwodays, PdmAddDays(last_mod_dt,2) as lastmoddateaftertwodays
 from in where id >= 400001 and id <= 400010",
"r_code": "PdmAddDays",
"r_type": "GroupBy"
}
}
```

Response

```
GET http://hostname:port/CASMReports/reports/v1/getReport
{
"results": [
{
"id": 400001,
"aftertwodays": 1757757527
```

```
},
{
"id": 400002,
"aftertwodays": 1757757527
},
{
"id": 400003,
"aftertwodays": 1757757527
},
{
"id": 400004,
"aftertwodays": 1757757527
}
]
}
```

- PdmAddMonths

PdmAddMonths(date,count)

When used with one argument, adds the number of months in its argument to today’s date and returns the result.

When used with two arguments, adds the number of months in its second argument to the value of the date column specified in it first argument and returns the result.

The single argument form can be used anywhere in the query.

The two-argument form can be used only in the selection list.

Create

```
POST http://hostname:port/CASMReports/reports/v1/in/createReport
{
"r_name": "PdmAddMonths",
"attributes": {
"r_query": "select id, PdmAddMonths(2) as aftertwomonths, PdmAddMonths(last_mod_dt,2) as
 lastmoddateaftertwomonths from in where id >= 400001 and id <= 400010",
"r_code": "PdmAddMonths",
"r_type": "GroupBy"
}
}
```

Response

```
GET http://hostname:port/CASMReports/reports/v1/getReport
{
"results": [
{
```

```
"id": 400001,
"aftertwomonths": 1762757266,
"lastmoddateaftertwomonths": 1762707600
},
{
"id": 400002,
"aftertwomonths": 1762757266,
"lastmoddateaftertwomonths": 1744943008
},
{
"id": 400003,
"aftertwomonths": 1762757266,
"lastmoddateaftertwomonths": 1762706706
},
{
"id": 400004,
"aftertwomonths": 1762757266,
"lastmoddateaftertwomonths": 1744943007
}
]
}
```

- PdmDay

PdmDay(date)

When used with no arguments, returns the current day as an integer.

When used with one argument, returns the day associated with the value of the date column specified in its argument.

The zero argument form can be used anywhere in the query. The one-argument form can be used only in the selection list.

Create

```
POST http://hostname:port/CASMReports/reports/v1/in/createReport
{
"r_name": "PdmDay",
"attributes": {
"r_query": "select id, PdmDay() as currentday, PdmDay(last_mod_dt) as lastmodsday from in where id >=
 400001 and id <= 400010",
"r_code": "PdmDay",
"r_type": "GroupBy"
}
}
```

Response

```
GET http://hostname:port/CASMReports/reports/v1/getReport
```

```
{
"results": [
{
"id": 400001,
"currentday": 10,
"lastmodsday": 9
},
{
"id": 400002,
"currentday": 10,
"lastmodsday": 18
},
{
"id": 400003,
"currentday": 10,
"lastmodsday": 9
},
{
"id": 400004,
"currentday": 10,
"lastmodsday": 18
}
]
}
```

- PdmMonth

PdmMonth(date)

When used with no arguments, returns the current month as an integer from 1 to 12.

When used with one argument, returns the month associated with the value of the date column specified in its argument.

The zero argument form can be used anywhere in the query.

The one-argument form can be used only in the selection list.

Create

```
POST http://hostname:port/CASMReports/reports/v1/in/createReport                          {
                                                                                  "r_name": "PdmMonth",
                                                                "attributes": {"r_query": "select id, PdmMonth() as
 currentmonth, PdmMonth(last_mod_dt) as lastmodsmonth from in where id >= 400001 and id <= 400010",
                            "r_code": "PdmMonth",
      "r_type": "GroupBy"                                                                 }
                                                                          }
```

Response

```
GET http://hostname:port/CASMReports/reports/v1/getReport
{
"results": [
{
```

```
"id": 400001,
"currentmonth": 9,
"lastmodsmonth": 9
},
{
"id": 400002,
"currentmonth": 9,
"lastmodsmonth": 2
},
{
"id": 400003,
"currentmonth": 9,
"lastmodsmonth": 9
},
{
"id": 400004,
"currentmonth": 9,
"lastmodsmonth": 2
}
]
}
```

- PdmMonthName
  PdmMonthName(date)

When used with no arguments, returns the localized name of the current month (“January”, “February”, etc) .

When used with one argument, returns the localized name of the value of the date column specified in its argument.

The zero argument form can be used anywhere in the query.

The one-argument form can be used only in the selection list.

Create

```
POST http://hostname:port/CASMReports/reports/v1/in/createReport
{
"r_name": "PdmMonthName",
"attributes": {
"r_query": "select id, PdmMonthName() as currentmonthname, PdmMonthName(last_mod_dt) as lastmodsmonthname
 from in where id > 400001 and id < 00010",
"r_code": "PdmMonthName",
"r_type": "GroupBy"
}
}
```

Response

```
GET http://hostname:port/CASMReports/reports/v1/getReport
{
"results": [
{
"id": 400001,
"currentmonthname": "September",
"lastmodsmonthname": "September"
},
{
"id": 400002,
"currentmonthname": "September",
"lastmodsmonthname": "Febrary"
},
{
"id": 400003,
"currentmonthname": "September",
"lastmodsmonthname": "September"
},
{
"id": 400004,
"currentmonthname": "September",
"lastmodsmonthname": "Febrary"
}
]
}
```

- PdmSeconds

PdmSeconds(date)

Returns the value of the date column specified in its argument in its raw form as the number of seconds from midnight January 1, 1970.

This function can be used only in the selection list.

Note that the argument is required.

Create

```
POST http://hostname:port/CASMReports/reports/v1/in/createReport
{
"r_name": "PdmSeconds",
"attributes": {"r_query": "select id, PdmSeconds(last_mod_dt) as utcseconds from in where id >= 400001 and id <= 400010","r_code": "PdmSeconds",
"r_type": "GroupBy"
}
}
```

Response

```
GET http://hostname:port/CASMReports/reports/v1/getReport
```

```
{
"results": [
{
"id": 400001,
"utcseconds": 1757522726
},
{
"id": 400002,
"utcseconds": 1739845408
},
{
"id": 400003,
"utcseconds": 1757522706
},
{
"id": 400004,
"utcseconds": 1739845407
}
]
}
```

- PdmString
  PdmString(column)

```
Returns the string equivalent of value of the column specified in its argument.

This function can be used with UUID or string columns.

It can be used only in the selection list.
```

Create

```
POST http://hostname:port/CASMReports/reports/v1/in/createReport
{
"r_name": "PdmString",
"attributes": {
 "r_query"
:
"select id, PdmString(ref_num) as strrefnum, PdmString(last_mod_by) as strlastmodby
 from in where id >= 400001 and id <= 400010"
,

"r_code": "PdmString",
"r_type": "GroupBy"
}
}
```

Response

```
GET http://hostname:port/CASMReports/reports/v1/getReport
{
"results": [
{
"id": 400001,
"strrefnum": "22",
"strlastmodby": "73AC2369BB0C9145BC1A84975FD1AE65"
},
{
"id": 400002,
"strrefnum": "23",
"strlastmodby": "73AC2369BB0C9145BC1A84975FD1AE65"
},
{
"id": 400003,
"strrefnum": "24",
"strlastmodby": "73AC2369BB0C9145BC1A84975FD1AE65"
},
{
"id": 400004,
"strrefnum": "25",
"strlastmodby": "73AC2369BB0C9145BC1A84975FD1AE65"
}
]
}
```

- PdmToday
  PdmToday()

  Returns the current date.

  This function may be used anywhere in the query.

  Create

```
POST http://hostname:port/CASMReports/reports/v1/in/createReport
{
"r_name": "PdmToday",
"attributes": {

"r_query"
:
"select id, PdmToday() as today from in where id >= 400001 and id <= 400010"
,

"r_code": "PdmToday",
"r_type": "GroupBy"
```

```
}
}
```

Response

```
GET http://hostname:port/CASMReports/reports/v1/getReport
{
"results": [
{
"id": 400001,
"today": 1757573981
},
{
"id": 400002,
"today": 1757573981
},
{
"id": 400003,
"today": 1757573981
},
{
"id": 400004,
"today": 1757573981
}
]
}
```

- PdmYear

PdmYear(date)

When used with one argument, returns the year associated with the value of the date column specified in its argument.

The zero argument form can be used anywhere in the query.

The one-argument form can be used only in the selection list.

Create

```
  POST http://hostname:port/CASMReports/reports/v1/in/createReport
{
"r_name": "PdmYear",
"attributes": {
 "r_query"
:
"select id, PdmYear() as currentyear, PdmYear(last_mod_dt) as lastmoddtyear from in
 where id >= 400001 and id <= 400010"
```

```
,

 "r_code": "PdmYear",
"r_type": "GroupBy"
}
}
```

Response

```
GET http://hostname:port/CASMReports/reports/v1/getReport
{
"results": [
{
"id": 400001,
"currentyear": 2025,
"lastmoddtyear": 2025
},
{
"id": 400002,
"currentyear": 2025,
"lastmoddtyear": 2025
},
{
"id": 400003,
"currentyear": 2025,
"lastmoddtyear": 2025
},
{
"id": 400004,
"currentyear": 2025,
"lastmoddtyear": 2025
}
]
}
```

- PdmDownTime
  PdmDownTime(slaName, workshift, startDate, endDate)

```
    Calculates the downtime between two dates under the specified SLA and workshift.

This function can be used only in the selection list.
```

Create

```
POST http://hostname:port/CASMReports/reports/v1/in/createReport
{
"r_name": "PdmDownTime",
"attributes": {"r_query": "select id, PdmDownTime('TestSLA', 'Mon - Fri { 9:00 am - 5:00 pm }',
 open_date,resolve_date) as downtime from in where id >= 400001 and id <= 400010","r_code": "PdmDownTime",
"r_type": "GroupBy"
```

```
}
}
```

Response

```
    GET http://hostname:port/CASMReports/reports/v1/getReport
{
"results": [
{
"id": 400001,
"downtime": "26289"
},
{
"id": 400002,
"downtime": "24387"
},
{
"id": 400003,
"downtime": "22134"
},
{
"id": 400004,
"downtime": "19359"
}
]
}
```

Install CA EEM for CA Service Management

CA Service ManagementEmbedded Entitlements Manager (CA EEM) enables you to secure objects such as jobs, calendars, cycles, global variables, machines, and resources, and delegate role-based access to the users in your enterprise. EEM provides authentication and authorization capability. EEM eliminates plain text user names and passwords from being passed for authentication purposes.

Required for CA Service Catalog and CA Asset Portfolio Management. Install CA EEM 12.6.6 using the CA Service Management Installation Media or upgrade an earlier installed version of EEM to EEM 12.6.6. Note the details of the server where you have installed EEM. EEM authenticates users during login and authorizes users to access CA Service Catalog.

NOTE

- If you plan to implement CA SDM and EEM on the same server, you must install CA EEM 12.6.6 version.
- The CA Service Catalog and all products that integrate with it must share CA EEM.

You can install CA EEM using CA Service Management installation media. Review the following information:

1. The CA Service Management installer launches the CA EEM installer based on the system architecture. The CA Service Management installer launches the 64-bit CA EEM installer.
2. For better performance, we recommend that you install CA EEM on a different server than the DBMS server.
   Make a note of your CA EEM administration password that you provide during the CA EEM installation. You have to use this password while integrating CA Service Management products with CA EEM.

If you have a clustered environment, ensure that all the nodes in the CA EEM cluster are up and running before you install any of the CA Service Management products.

NOTE

If you are installing EEM on Linux, ensure to launch the EEM installer from Linux Terminal using the install path for Linux: SMSDMLINUXP990*/product/EEM*

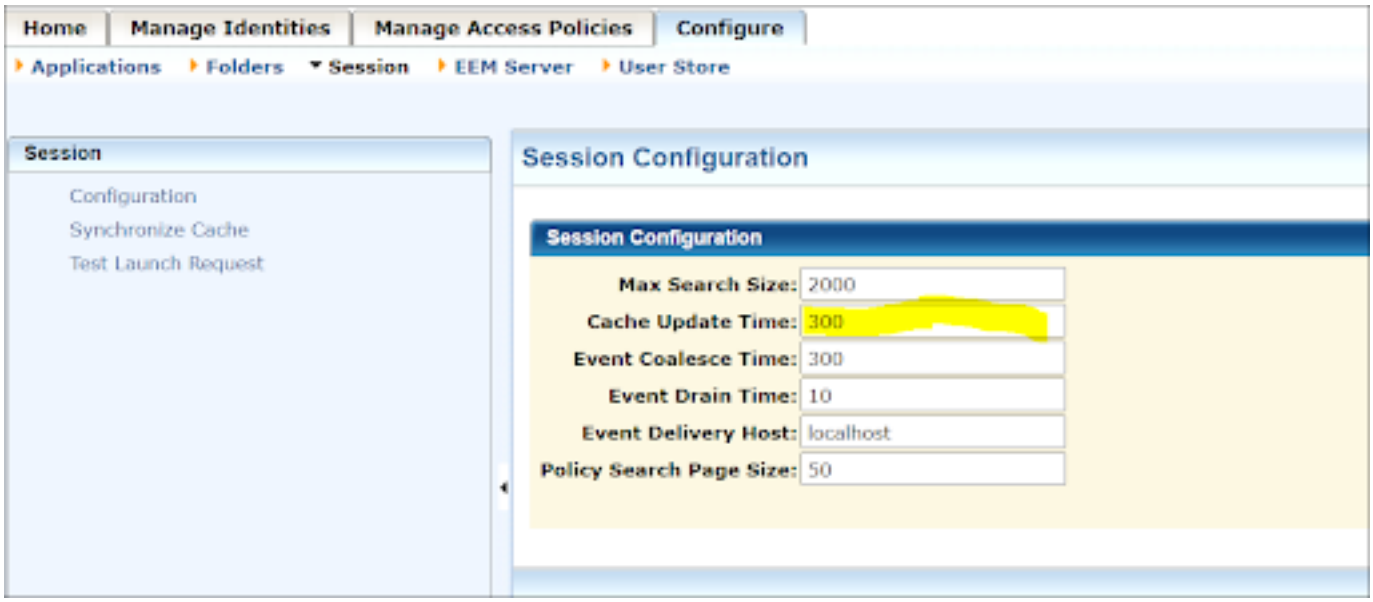
On Linux, do not launch CA EEM using the CA Service Management Common Installer wizard.

Perform the following steps to install CA EEM:

1. Download the CA Service Management installer 17.4 DVD from Broadcom Suopport.
2. Copy and extract the files from the installation media on the servers.
3. Launch the CA Service Management 17.4 installer by right-click **Setup.exe** to select the **run as administrator** option.
4. Select the language and click **Next**.
5. Select **CA Embedded Entitlements Manager (CA EEM)**.
   The wizard guides you through the installation or upgrade process.
   `The CA EEM and CA Service Catalog each installs and uses its own JRE. Therefore, the JRE version of each product can be different.`
   CA EEM is installed in your environment.

   NOTE
   While installing EEM, a popup screen appears asking, **Would you like to enable Cyberark support for EiamAdmin account?** Choose "**No**."
6. Navigate to **Start**, **All Programs**, **CA**, **Embedded Entitlements Manager**, **Admin UI** on the EEM server. Log in to the application to ensure that the CA EEM installation was successful.
   `If CA EEM is configured to use an external LDAP data store, the privileged user must be created in the LDAP Directory.`
   You can optionally install one or more instances of CA EEM. To obtain high availability and failover protection for EEM, cluster all EEM servers. For more information about EEM Failover configuration, see the CA EEM installation documentation.
7. (Optional) EEM Cache Timeout Configuration Update.

   NOTE
   If you are using EEM and SDM, set the EEM cache timeout same as SDM cache timeout.
   You can optionally set the EEM cache timeout configuration as mentioned in the following screenshot.



You may face issues while logging in to EEM or SDM using the EEM user accounts due to session cache timeout mismatch between EEM and SDM. Starting from 17.4, you can update the EEM cache timeout configuration by adding a new NX variable, "NX_EEM_CACHE_UPDATE_TIME" in SDM.

To set the EEM cache update time to 300 seconds, perform the following steps:

To add the variable in the nx.env file, run the following command:

```
pdm_options_mgr -c -s  EEM_CACHE_UPDATE_TIME  -v 300 -a pdm_option.inst
```

To add the variable in the nxenv_nt.tpl file, run the following command:

```
pdm_options_mgr -c -s  EEM_CACHE_UPDATE_TIME  -v 300 -a pdm_option.inst -t
```

Enable and Configure Telemetry Services

As per the new Portfolio License Agreement (PLA) model initiated by Broadcom Inc, Telemetry Services will collect and report CA Service Management product(s)-specific monthly consumption. The product consumption metrics captured for CA Service Management product(s) will vary depending on the number of installation/upgrade instances, number of users, number of authentications, and so on.

NOTE

PLA Customers are required to upgrade product versions within a time frame as specified in their PLA agreement. PLA and Non-PLA Customers are expected to collect the product telemetry metrics and report it quarterly to Broadcom via Cloud Services.

Perform the following steps to enable and configure Telemetry Services

1. Launch the CA Service Management Installer to initiate and configure Telemetry services. Monthly usage calculation is handled in-product.
2. To enable Telemetry Service Settings in your environment, select “**Configure Telemetry Service**” from the Product and Integrations Selection Page as shown in the figure below:

3. Click **Next** to provide Telemetry Service Setting values for selected CA Service Management Products as shown below:

Field	Description
Enterprise Site ID	This is a mandatory field. Your Enterprise Site ID is listed on your PLA program and the Broadcom Support (Login to Support Portal. Navigate to **My Account**, **Profile**, **Site ID**).
Environment Type	This is a mandatory field. Specify whether you are deploying the selected CA Service Management product(s) on a Production or a Non-Production Environment.
Internal Identifier	Indicate the department or cost center used for internal tracking of product consumption metrics.
Company Domain	Specify the last part of your company or organization's email address.
Proxy Server URL	If your network is secured by a firewall, or if you do not have direct access to internet, specify the proxy server details for connecting to Telemetry Services.
Proxy User	Enter the Proxy Server User name.
Proxy Password	Enter the proxy server password.

4. Click **Save & Close** to enable Telemetry Service Settings for selected CA Service Management product(s).

Installing CA Service Desk Manager

Ensure that you have reviewed the Pre-Installation Considerations before proceeding with the installation.

NOTE
Before you install CA Service Desk Manager 17.4 on Oracle Database, ensure that the Oracle PATH environment variable refers to 32-bit oracle client first, and then, to 64-bit Oracle client. To change the sequence, navigate to Environment Variables, System Variables, Path, Edit.

The CA Service Management installer performs prerequisite checks and mandatory validations before installing CA Service Desk Manager.

If you are upgrading from CA SDM 17.3 and later version of CA SDM:

- Stop the Search service, xFlow Interface Service from Windows **Control Panel, Administrative Tools, Services**.
- Back up the system database (MDB). The system database (MDB) backup is mandatory and ensures safe data recovery if any problems are encountered during the installation process.

NOTE

In Advanced Availability mode, the xFlow Interface can only be installed on an Application Server. If you have converted CA SDM conventional to advanced availability configuration, and you have a previously installed version of xFlow Interface, ensure that you uninstall the xFlow Interface and reinstall the xFlow Interface on an Application server.

NOTE

If in a case of a Conventional configuration if the Primary and Secondary servers are on separate nodes, and the xFlow Interface is deployed on the Secondary server, it is observed that a Database Client is needed on the Secondary Server for the installation to complete successfully.

NOTE

Whenever you restart the CA Service Desk Manager Services due to environment/other requirements, ensure that you restart the xFlow Analyst Interface Services too.

NOTE
SUSE Linux Enterprise Server 15.6 supports 17.4 GA, and 17.4.3.0 and above.

Follow these pre-requisite steps for SUSE Linux Enterprise 15.6 and RHEL 9.4:

1. Download the latest applyPTF tool for SUSE with APAR No. 99112268 from Broadcom Support, and extract the T5UG572.tar.Z file.
2. Download the CA Service Desk Manager 17.4 installer DVD from Broadcom Support, and extract "**CA SERVICE DESK MANAGER 17.4 FOR LINUX.iso**"
3. Paste the file **applyptf.linux** in the path:
   ```
   <extracted "CA SERVICE DESK MANAGER 17.4 FOR LINUX.iso">\filestore\utils\ApplyPTF\
   ```
4. Before you start the 17.4GA SDM Installation, ensure you create a soft link using the command mentioned below:

   NOTE
   For SUSE 15.6, before you start the 17.4GA SDM Installation, ensure you create a soft link using the command mentioned below:
   ```
   ln -s /usr/bin/ifconfig /sbin/ifconfig
   ```
   SUSE Linux Enterprise Server 15.6 supports 17.4.3.0 and above.

   NOTE
   For RHEL 9.4, before you start the 17.4GA SDM Installation, ensure you create soft links using the commands mentioned below:

   ```
   yum install libnsl
    yum install libnsl2
    ln -s /usr/bin/ifconfig /sbin/ifconfig
    sudo ln -s /lib64/libnsl.so.3 /lib64/libnsl.so.2
   ```

   RHEL 9.4 supports **17.4.5.0** and above.
5. For the remaining process, follow from Step 2 mentioned in the below section.

Follow these steps:

1. Download the CA Service Desk Manager 17.4 installer DVD from Broadcom Support.
   - **CA SERVICE MANAGEMENT SDM PACKAGE 17.4 FOR WINDOWS (WITH CATALOG).iso**
   - **CA SERVICE DESK MANAGER 17.4 FOR WINDOWS (WITHOUT CATALOG).iso**
   - **CA SERVICE DESK MANAGER 17.4 FOR LINUX.iso**
2. The installer installs the following products in your environment:
   - Server Installation
   - xFlow Interface
   - Search Server
   - Datamart (Aggregate Data for JasperReports Server)
3. Mount or extract the files from the installation media on the server.
4. Based on the operating system you are using, do the following:
   a. **Windows**
      a. Navigate to the folder where you have copied the installation files and *r*ight-click on the **Setup.exe** file and select **run as administrator**.
         ```
         You must be logged in to the server as a local admin to install CA SDM.
         ```
   b. **Linux**
      a. Ensure that you have exported Oracle variables on the server where you want to install CA SDM.
      b. Navigate to the root directory of the installation media and start the installation by running the following command:
         ```
         ./setup.sh
         ```

To install CA Service Management from the **non-root** user on Unix or Linux, you must have the permissions to execute the sudo command.

WARNING

To install CA Service Management from the **non-root** user on Unix or Linux, you must have the permissions to execute the sudo command.

Follow these steps:

1. Export the appropriate oracle variables and library paths.
2. Navigate to where you have downloaded the CA Service Management installer DVD and execute the below command:
   sudo -E PATH=$PATH ./setup.sh

5. Select the language and click **Next**.
6. Select **CA Service Management** .
7. Review and Accept the License Agreement Information and click **Next**.
8. Select **Microsoft SQL Server** or **Oracle** as the database type in the Database Configuration screen.
   For the Windows Microsoft SQL Server database, **mdbadmin** is the default user.
   For the Oracle database, verify that you are providing a valid tablespace path. If this path is invalid, the database installation fails. The following path is an example of a valid Oracle tablespace path:
   ```
   C:\app\Administrator\oradata\Oracle_Service_Name.
   ```
9. Provide the database details:
   a. If you have **a Microsoft SQL Server** database, provide the following field information:
      - **Database Server**: Enter the hostname of the database server.
        If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
      - **Database Name**: Enter the Database name (MDB), the name of the target DBMS. The default value ismdb.
      - **Database Port**: Provide the port identifier for the target DBMS.
      - **Database Server Instance**: The database instance name. Leave this field blank if you are using the *default instance* and *default port*.
        - If you are using the *SQL default instance* and *non-default port number*, the Database Server Instance field should look like this:
          <database default instance name>,<non-default port number>
          For example:
          ```
          mssqlserver,10555
          ```
        - If you are using the *SQL named instance* and *default port number*, the Database Server Instance field should look like this: <database named instance name>,<default port number>
          For example:
          ```
          sdmcasmqa,1433
          ```
        - If you are using the *SQL named instance* and *non-default port number*, the Database Server Instance field should look like this: <database named instance name>,<non-default port number>
          For example:
          ```
          sdmcasmqa,10555
          ```
      - **Database Admin User**: For Microsoft SQL Server, **sa** is the default value.
        The **sa** user is the admin user with permission to create a user and schema.
      - **Database Admin Password**: Enter the database password of the user specified by a database admin user. No default value is assigned to this parameter.
      - **mdbadmin Password**: Enter the password for the user specified for the MDB admin user.
      - **Confirm mdbadmin Password**: Confirm the password.
   b. If you have the **Oracle** database, provide the following field information:

- **Database Server**: Enter the host name of the Oracle database server.
  If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
- **Oracle Service Name**: Enter the Oracle Service name.
- **Listener Port**: Enter the listener port for the database.
- **Net Service Name**: Enter the Net Service Name of Oracle database where the database resides.
  If the database is remote, use the Net Service Name that is defined in the Oracle client on the local computer. CA SDM has access to the database through a local installation of the Oracle client.
- **DBA User Name**: Provide the name of an Oracle user with DBA access. The default value for DBA user is **SYS**.
- **DBA User Password**: Enter the password for the DBA user.
- **mdbadmin Password**: Enter the password for MDB admin.
- **Confirm mdbadmin Password**: Confirm the password.
- **Tablespace Path (on DB Server)**: Provide the tablespace path on the database server.
- **Oracle Home Path**:
  - Provide the Oracle Client 64-bit path.

    NOTE
    After successful installation, CA Service Desk Manager 17.4 will use Oracle Client 64-bit architecture.
  - Oracle client 32-bit path for fresh installation.
- **Data Tablespace Name**: Provide the name of the data tablespace. The default value is MDB_DATA.
- **Index Tablespace Name**: Provide the index Tablespace Name: The default value is MDB_INDEX.

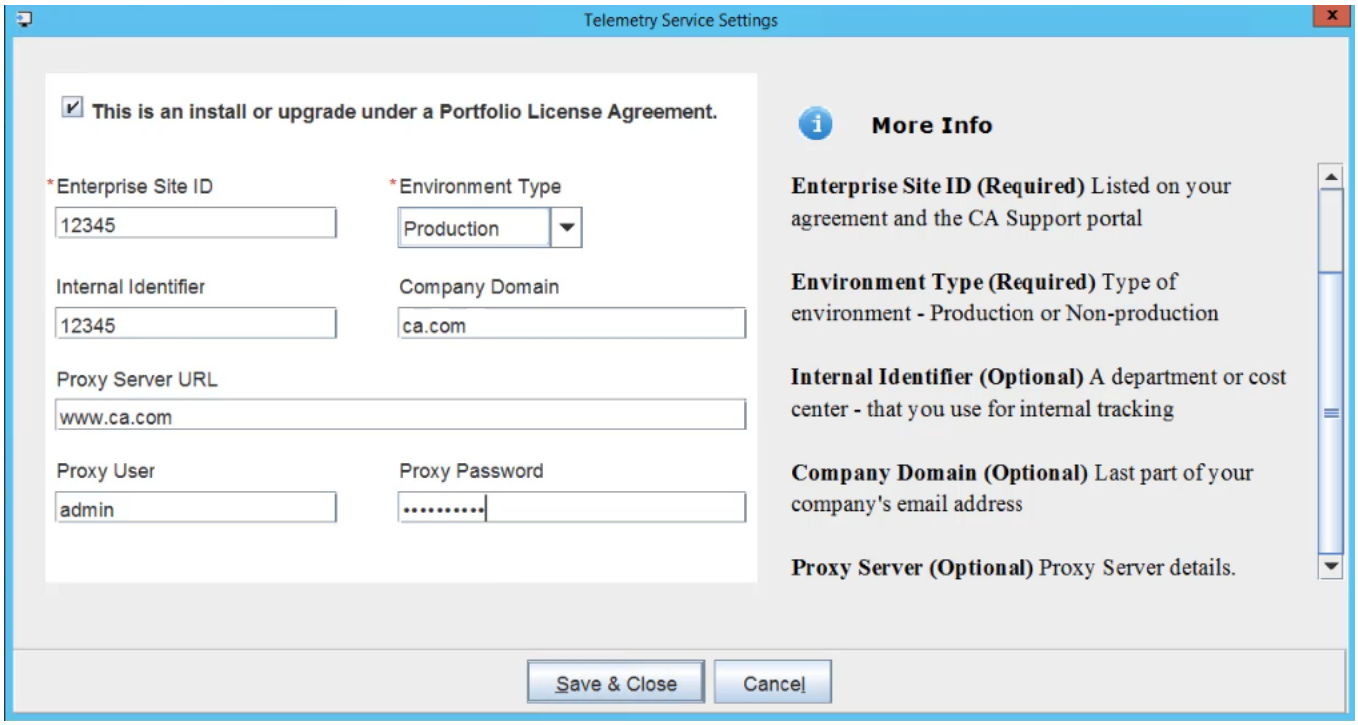
Click **Next**.

10. Select **CA Service Desk Manager** from Select the Products and Integrations screen. Select the following product options as per your environment and integration requirement:
    a. **Server Installation**
    b. **CA xFlow Interface**
    The xFlow Interface provides analysts the ability to understand the IT environment, prioritize work and make decisions.Data driven intelligence improves the productivity of the analyst and enables them to understand the workload for the day and the list of activities to be completed.
    The CA xFlow Interface server is deployed only if you have installed CA Service Desk Manager in your environment.
    For **conventional configuration**, it is recommended that you install the xFlow Interface server on a secondary server.
    Advanced Availability users can only install the xFlow Interface server on an application server.
    c. **Search Server**
    Search Server facilitates CA SDM Analysts to search from the xFlow Interface for users, tickets (including incidents and requests), configuration items (CIs), and knowledge base articles.
    - Search Server can be deployed as a standalone setup in your environment. Search server currently supports the following server:
      - Microsoft Windows Server 2016/2019/2022 (64-bit)
      - Red Hat Linux 7.2/8.1(64-bit)
    - If you install Search Server after installing the xFlow Interface, you must restart the xFlow Interface services again to perform searches in the xFlow Interface. The restart is needed because a table - **usp_es_servers** needs to have the CA Search Server information populated in it before the Search functionality can be used. Without this table, the Search functionality will not work as the initial data load into the Search server does not recognize the table contents and will quit the process.

    d. **Datamart**
    The Datamart server stores the data that is required by the Advanced Reporting engine to render the report data on the xFlow Interface.
    Click **Next.**

11. Select **This is an install or upgrade under a Portfolio License Agreement** on Telemetry Service Settings page. Provide the following field information:
    - **Enter Site ID :** Listed on your agreement and the CA Support portal
    - **Environment type:** Type of Environment Production or Non-Production
    - **Internal Identifier (optional):** A department or cost center- that you use for internal tracking
    - **Company Domain (optional):** Last part of your company email address
    - **Proxy Server URL (optional):** Proxy server details
    - **Proxy User:** Proxy server username
    - **Proxy Password:** Proxy server password

    Click **Save & Close**.



12. Review the Installation Prerequisites page and click **Next.**
13. The **CA Service Desk Manager Product Configuration** screen shows the server configuration details options as per the server component opted by you in **step 7**. The installer wizard guides you through the following configuration details screen. As per the selected component by you in **step 7**, complete the following configuration details screens:
    a. Advanced Availability Configuration
    b. Conventional Configuration Details
    c. Search Server Configuration Details
    d. xFlow Interface Configuration Details
    e. Install and Integrate CABI JasperReports Server with CA Service Management.
14. Click **Next**.
15. Review the Pre-Installation Configuration page. Click **Next**.
16. Select **YES** to automatically execute the CA SDM mandatory post-install steps or select **NO**.
17. Click **Install**. Review the Installation progress and when the installation is complete, click **Next.**
18. Review the Post Deployment summary page.
19. Select **Finish** to exit the installer.
    If the installation fails for a product, retry the installation by using the **Retry** option in the wizard where it fails. If retry does not work, exit the installer and relaunch it. If the problem persists, contact Broadcom Support.

20. Complete the Post-Instalation Tasks.
21. After installing the xFlow Interface, you must start the **CA** xFlow Interface **Server** service as this is not started by default. Perform the following steps to start the xFlow Interface Server services:
    a. **Windows**
    Start the **CA xFlow Interface service**, **Collaboration Server service**, and **CA Service Management Search Server service** from Windows Services (**Control Panel, Administrative Tools, Services**).
    b. **Linux**

    NOTE
    In case of Linux Search Server environment, ensure to run the following commands on the terminal:

    ```
    sysctl -w vm.max_map_count=262144
    ulimit -Hn 65535
    ```

    c. a. Navigate to */opt/CA/xFlow/Apps* and run the below command from command prompt window:

    ```
    ./xFlowServer start
    ```

    If you want to stop the server, run the below command:

    ```
    ./xFlowServer Stop.sh
    ```

    b. Navigate to */opt/CA/SC/SearchServer/elasticsearch-7.17.6/bin*and run the below command from command prompt window:

    ```
    ./ServicesStart.sh
    ```

    If you want to stop the server, run the below command:

    ```
    ./ServicesStop.sh
    ```

After installing the xFlow Interface and Search Server, you can configure the cache size for the xFlow Interface. For more information about how to configure cache size, see Configure the xFlow Interface Server Services.

Complete the CA SDM Post Installation Tasks.

CA SDM Advanced Availability Server Configuration Details

If you have opted for CA SDM Advanced Availability configuration, complete the following options as displayed on the installer:

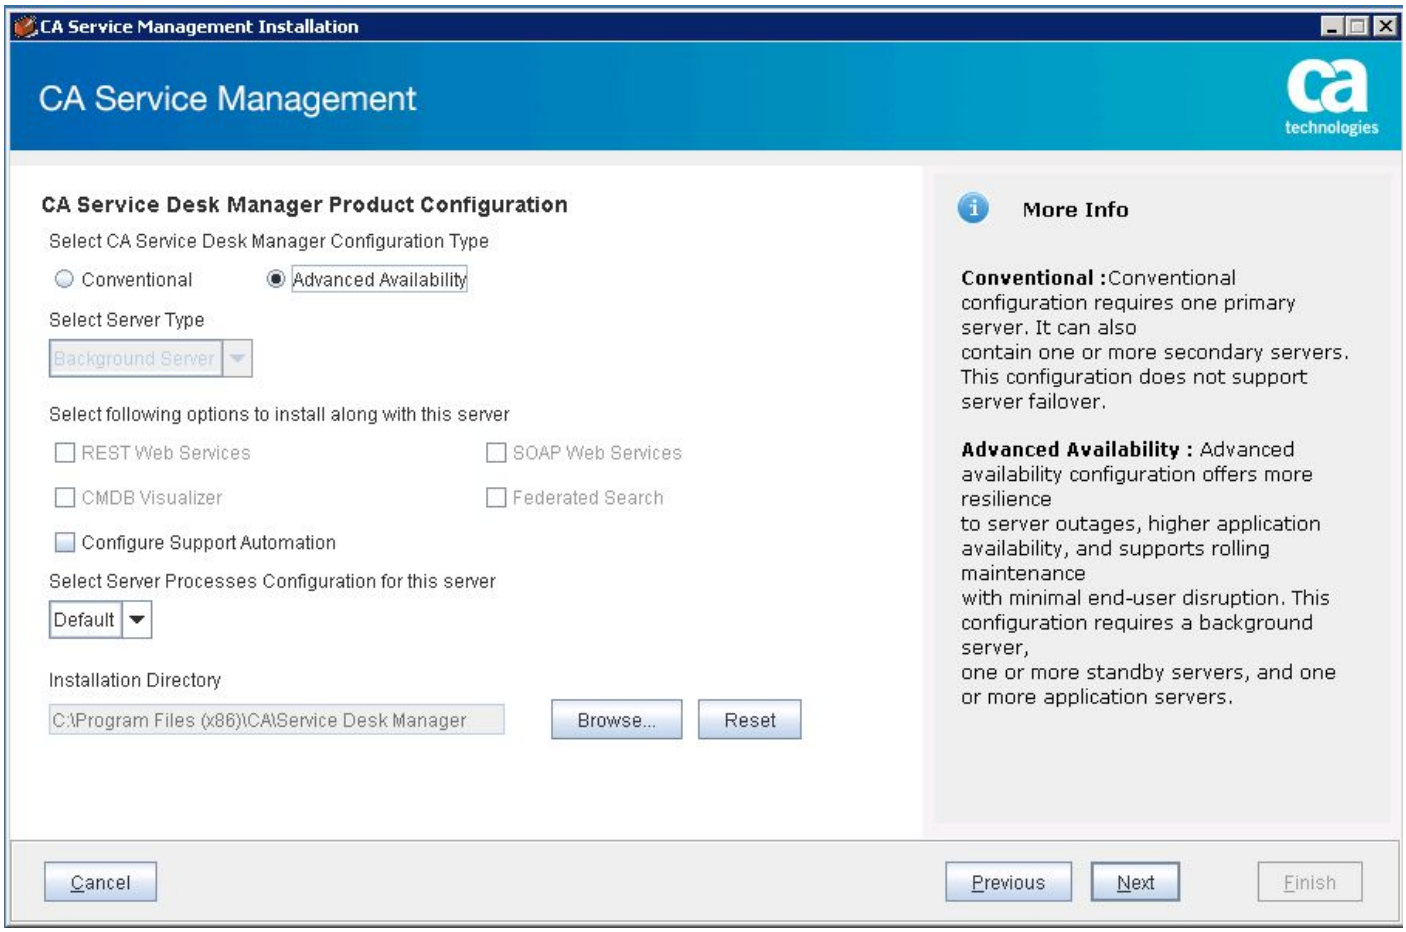
NOTE

Create the **CA Service Desk Manager Server Privileged** user before you begin the CA SDM installation.

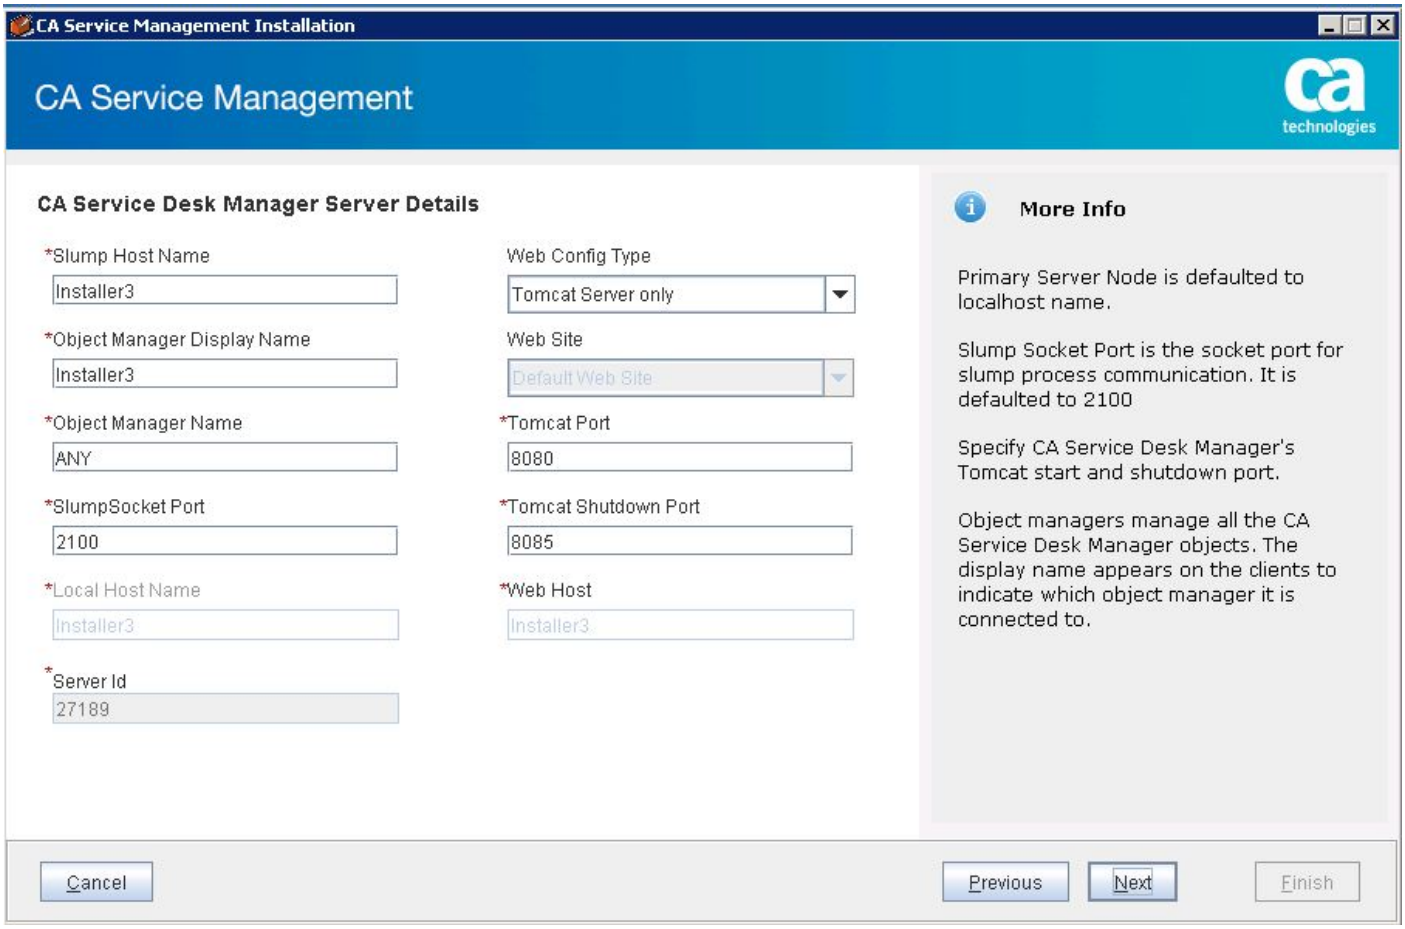
Advanced Availability Server

Perform the following steps:

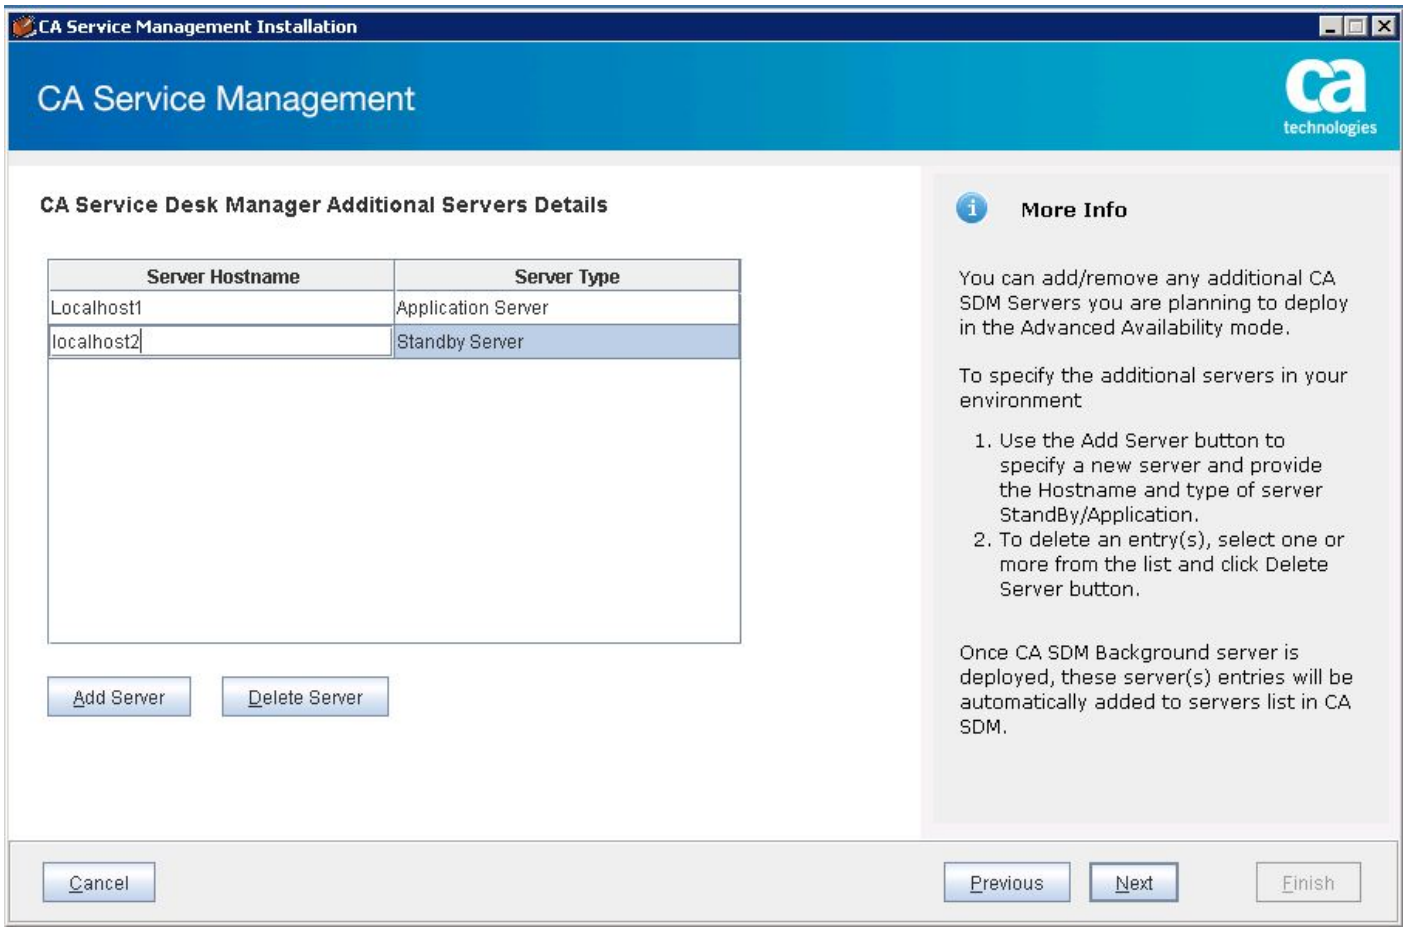
1. Navigate to **CA Service Desk Manager Product Configuration** screen.
    a. Select the **Advanced Availability** radio button.
    The background server option is selected by default.
    b. Keep the **Default** option selected.
    c. Click **Browse** to select the installation directory and click **Next**.
    d. Select **Advanced Availability** from the CA SDM Product Configuration Screen:



2. Enter the following information in the **CA Service Desk Manager Server Details** screen:



3. On the **CA Service Desk Manager Server Privileged User Details** screen, select the **Load Default Data** check box to load on the predefined data and enter the privileged user details.
4. On the **CA Service Desk Manager Additional Server Details** screen, enter the following information of the servers that you want to add:



CA SDM Conventional Server Configuration Details

If you have opted for CA SDM conventional configuration, complete the following options that are displayed on the CA SDM Installer:

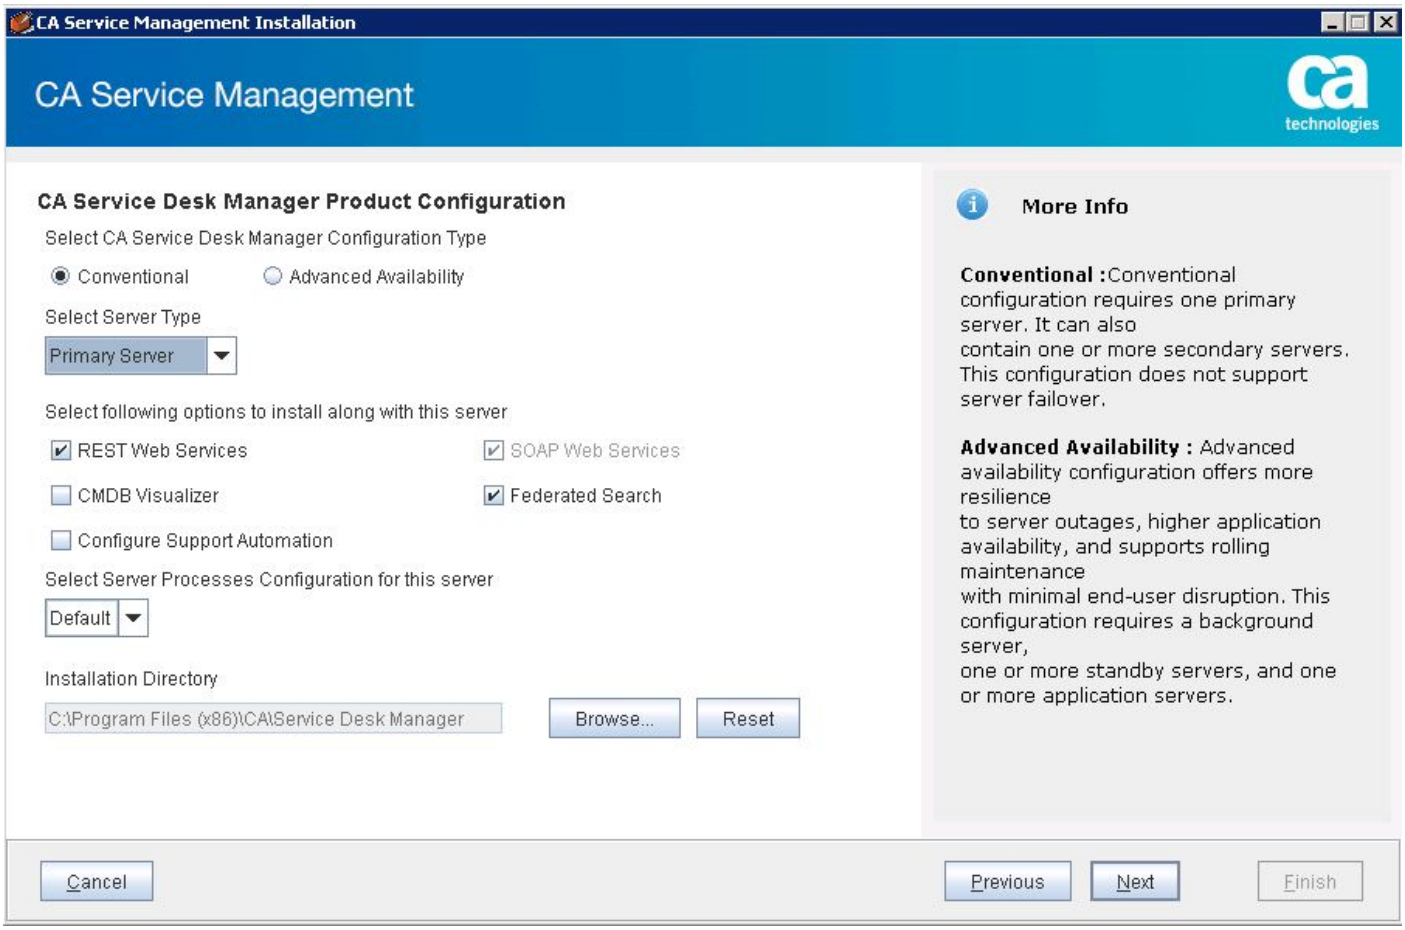
NOTE

Create the **CA Service Desk Manager Server Privileged** user before you begin the installation.

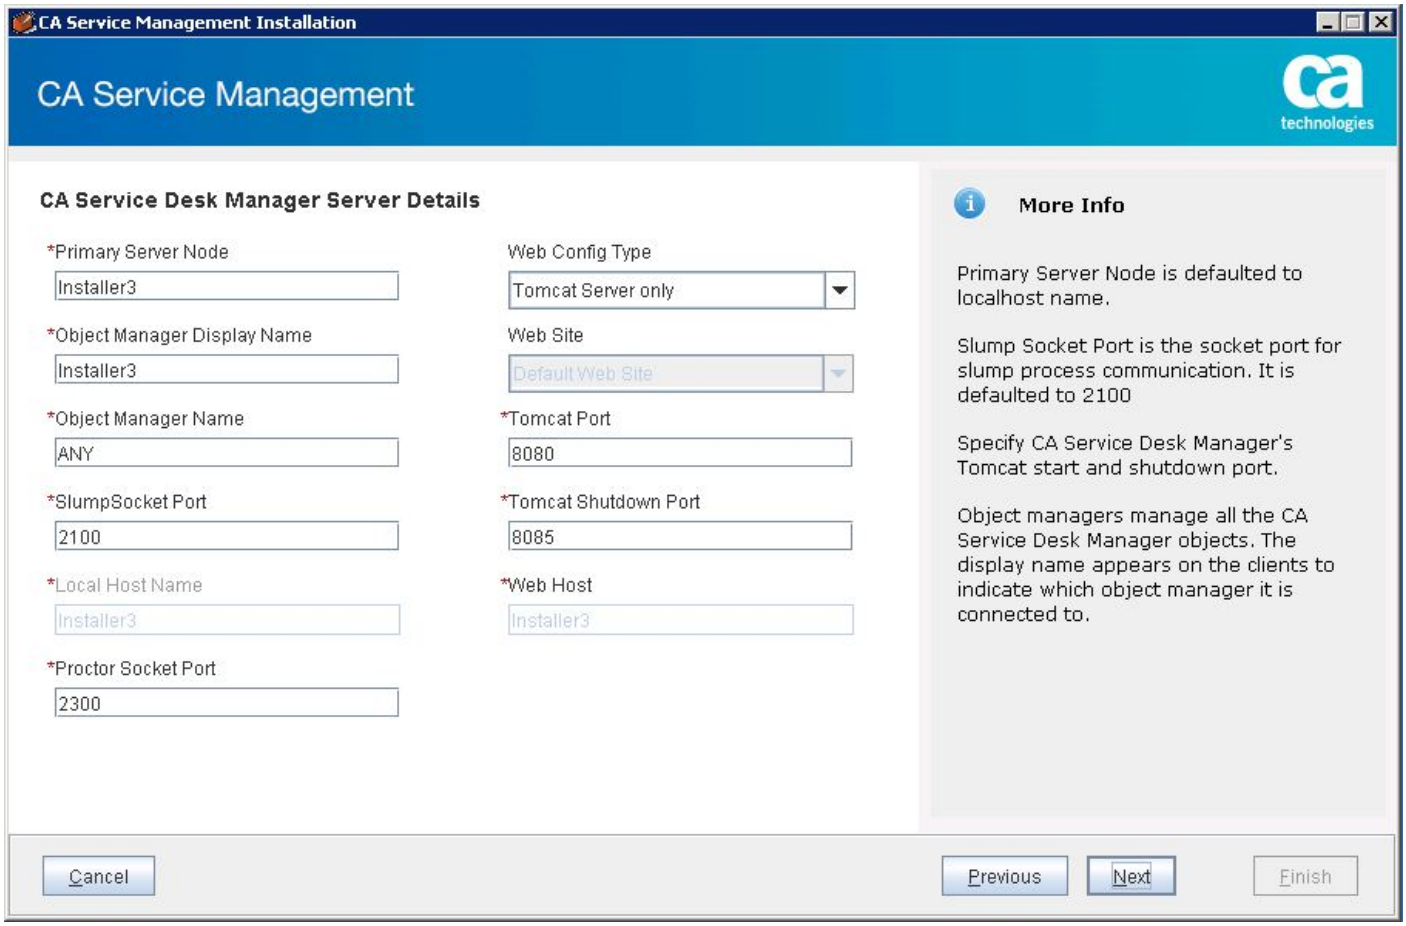
Conventional Server

Primary Server Configuration

1. Navigate to **CA Service Desk Manager Product Configuration** screen.
   a. Select the **Conventional** option**.**
   b. Select **Primary Server** from the **Select Server Type** drop-down.
   c. Select the other components that you want to install on this server. For example, Federated Search
   d. If you have already created server process configuration, then select the configuration or else keep the **Default** option selected.
   e. Click **Browse** to select the installation directory and click **Next**. The following screenshot corresponds to the installation on Windows.



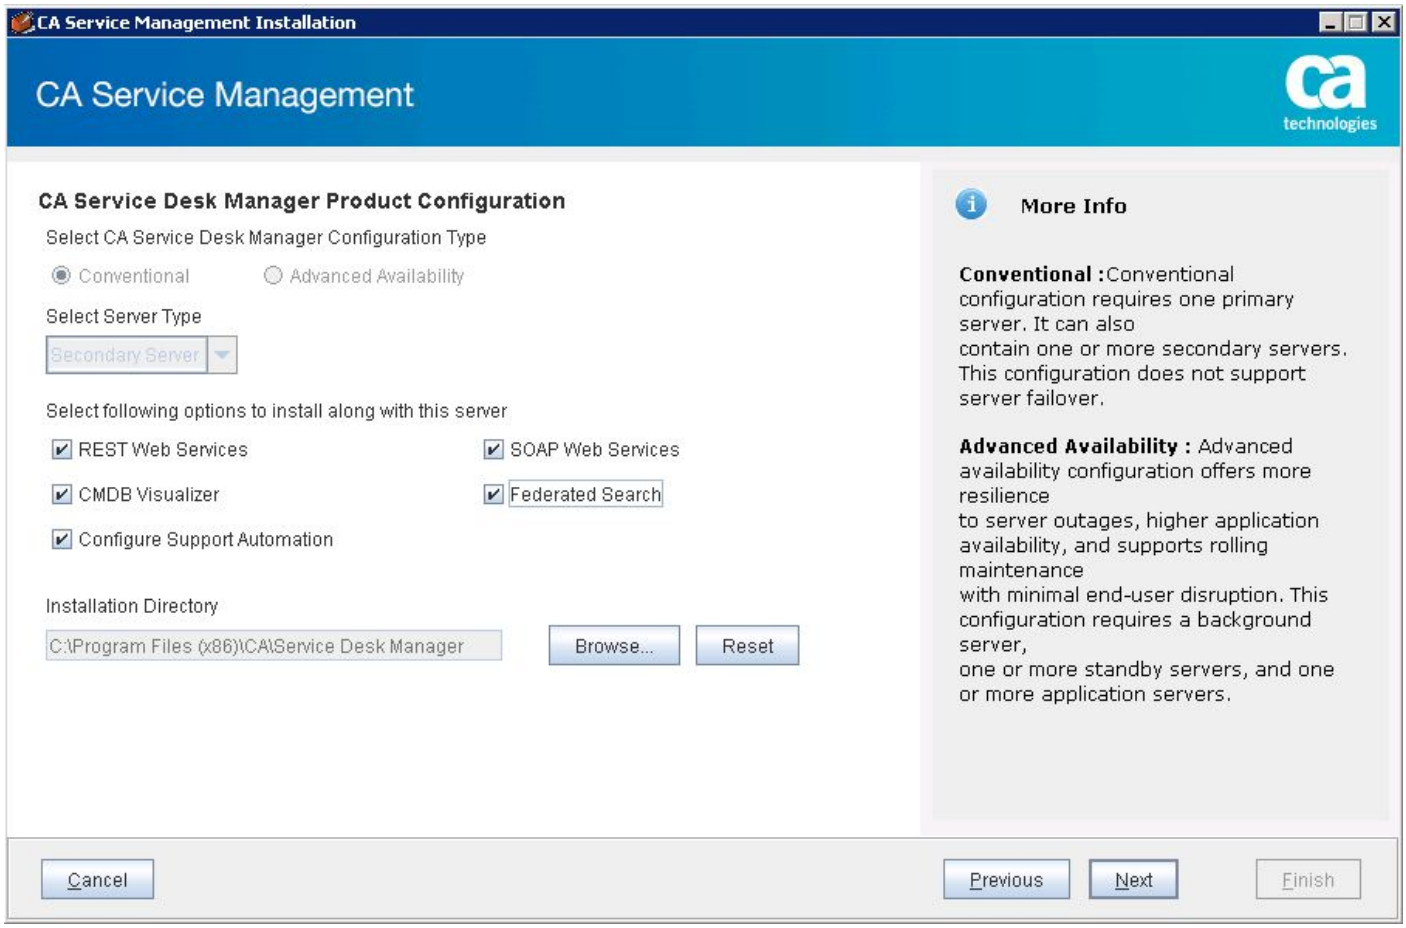
2. Enter the following information in the **CA Service Desk Manager Server Details** screen:
   a. Enter the primary server host name in the **Primary Server Node** field (defaulted to the localhost name).



3. On the **CA Service Desk Manager Server Privileged User Details** screen, select the **Load Default Data** check box to load on the predefined date and enter the privileged user details.
4. On the **CA Service Desk Manager Optional Component Details** screen, enter the port numbers to install the components that you have selected.
   CA

Secondary Server Configuration

1. After installing CA SDM on the primary server, create the server process configuration for the secondary server.
2. Log in to the secondary server and start the CA Service Management installation.
   You can skip the Database Configuration screen to go to the **CA Service Desk Manager Product Configuration** screen.
   - If you skip the Database Configuration screen (recommended in DMZ installations where you need SDM only), you can install SDM secondary server but you cannot add xFlow Interface.
   - If you want to install SDM secondary server and the xFlow component, enter the database server details to which the primary server is pointing to.



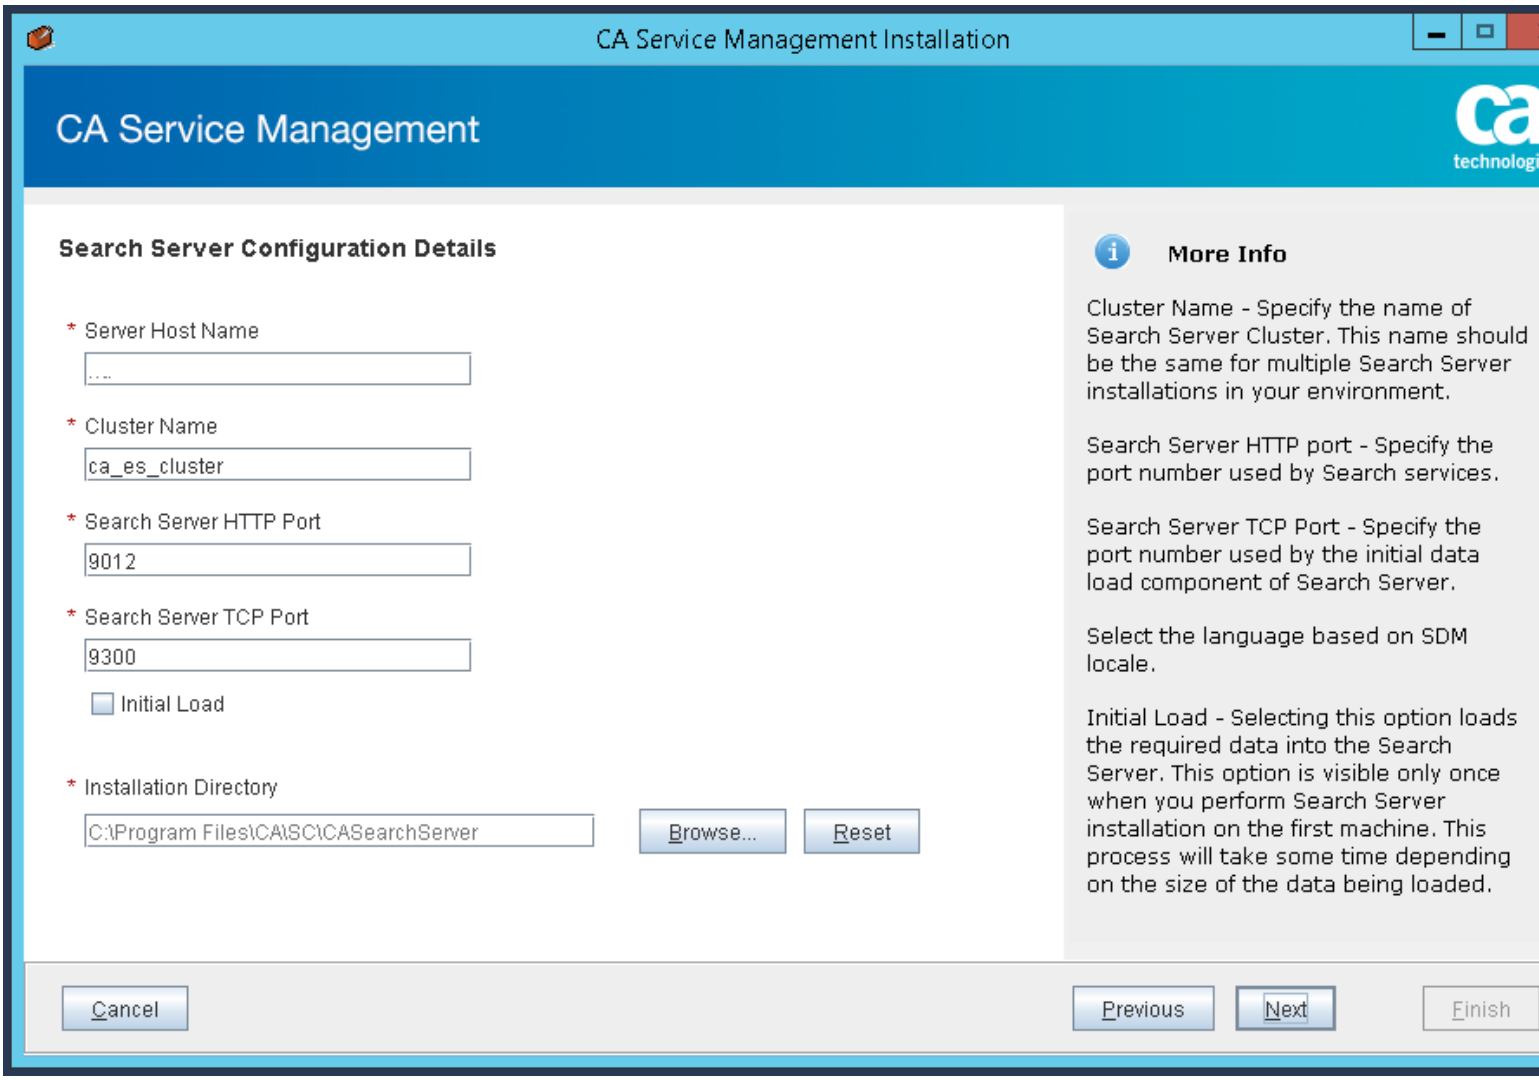
3. Do one of the following on the Database Configuration screen.
4. After you install CA SDM (or migrate to CA SDM from a CMDB standalone system), run the *cmdb_update_ambiguity* utility. Use the -h command to view the mandatory options.

NOTE

If configuration fails during the Validate Extension Tables step, database connectivity can be an issue. Retry the installation and verify that you provided the correct database connectivity information.

Search Server Configuration Details

If you opted to install Search server while installing CA SDM, complete the following search server configuration details:



Field Options	Description
Server Host Name	Provide the system name or IP address where you have installed search server.
Search Server HTTP Port	Provide the search server port details. The default value is 9012.
(Optional) Initial Data	Selecting this option loads the required data into the Search Server. This option is visible only when you perform the search server installation for the first time in your implementation. This process takes some time to complete depending on the size of the data being loaded and may slow down the performance during peak hours. We recommend that you perform the initial load task during off peak hours as it affects the CA SDM server performance. When initial load is checked, the pdm_es_rebuild will run by default. when initial load is not checked, you need manually execute the pdm_es_rebuild command. For more information, see the Perform Initial Load and Refresh Index and Data on Search Server.

Installation Directory	By default, the search server is installed in *C:\Program Files\CA \SC\SearchServer*. Click **Browse** to change the default install location.

Click **Next**.

xFlow Interface Configuration Details

If you have opted to install the xFlow Interface, complete the xFlow Interface Configuration installation screen options and click **Next**. Ensure that the ports are open before configuring the port information.

NOTE

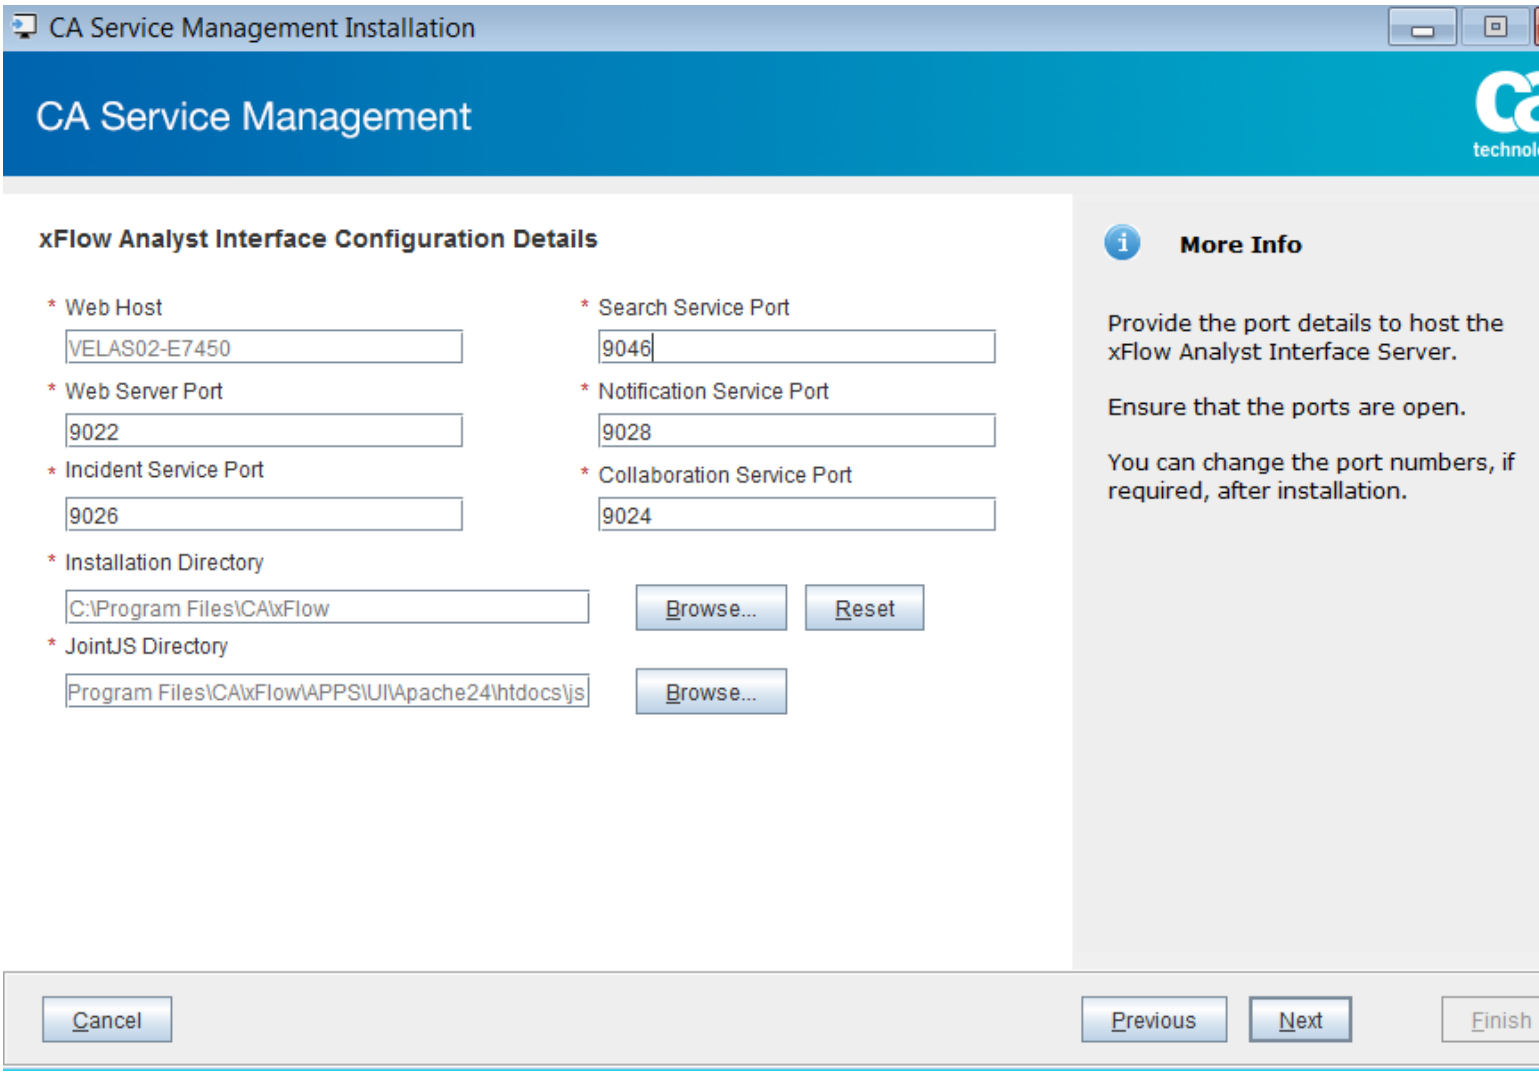
Service Point App is available with the xFlow Interface installation and can be launched from the xFlow Interface App Launcher.

WARNING

Jointjs is a JavaScript library which helps to visualize the SDM classic workflow as a graphical representation. The xFlow Interface uses Jointjs and requires certain files for successful installation. You must download the required Jointjs files before starting the installation.

Follow these steps:

1. Download the **CA SERVICE MANAGEMENT 17.4 3RD PARTY COMPONENTS.iso** from Broadcom Support.
2. Extract the Jointjs folder from the Jointjs.zip file.
3. Verify that Jointjs folder includes the following files:
   a. **joint.min.js**
   b. joint.min.css
4. Note the path where you placed the Jointjs folder that includes the files.
   When you run the installer, on the screens corresponding to the xFlow Interface installation you must provide the path for the Jointjs folder you saved.



Field Options	Description
Web Host	Specify the system that hosts the web server. By default, your web host is your local system.
Search Service Port	Specify the port number of the Search Service. The default value is 9046.
Web Server Port	Specify the port number of the web server. The default value is 9002.
Notification Service Port	Specify the port number for the Notification Services. The default value is 9008.
Collaboration Service Port	Specify the port number for the Collaboration Server Service. The default value is 9016.
Installation Directory	By Default, the xFlow Interface Interface is installed in *C:\Program Files\CA\xFlow*. Click **Browse** if you want to change the default install location.

Workflow JointJS Directory	Click Browse and select the path of the folder which contains the Jointjs files. The specified folder must include the following files: • – joint.min.js – joint.min..css

NOTE

After completing the installation, the xFlow Interface UI files are available under the path *C:\Program Files\CA\xFlow\Apps\Services\incidentmicroservice<version>\public*. If you are upgrading from an earlier version to CA Service Management 17.4, the xFlow Interface UI files are moved to the preceding path from the formerly installed (Apache/IIS) location.

Verify CA Service Desk Manager Installation

After you complete the installation process for CA SDM, perform the following to verify that the installation was successful:

1. Verify that a system environment variable for the path is set for the product installation directory that you specified. The default install home directory is ***\Program Files\CA\Service Desk Manager*** . For a 64-bit Windows operating system, the path is ***\Program Files (x86)\CA\Service Desk Manager*** . For a non-Windows operating system, the path is **/opt/CAisd/**.
2. Verify the following information:

1. a. In the Control Panel (Add or Remove Programs), verify that an entry appears for CA SDM.
   b. From the Start menu, verify that the following options appear:
      - Start the Configuration Wizard.
      - Start the Web Interface
      - Start the Web Screen Painter
      - Contact Technical Support.
      - Uninstall CA Service Desk Manager.
2. From the Windows Start menu, click Start, CA, Service Desk Manager, Service Desk Manager Web Client. If the Web Interface starts properly, then your installation is successful. For more information about the default user accounts created at the time of installation, see the CA SDM Default User List topic. If you cannot verify this information, the product has not been installed correctly. In this case, start the CA SDM installation again to modify the installation.
3. When CA SDM is up and running, it is recommended to check the process memory. For optimal performance, we recommend the following method:
   a. Set a notification when the process memory exceeds 1.25 GB and begin a check on the processes that are running.
   b. Set a warning notification when the process memory exceeds 1.5 GB and take corrective actions to check the memory usage.
4. The default tenant Home Page is displayed.
5. Check the Status of the Required Ports.

Securing CA SDM from Cross-Site Scripting Vulnerabilities

The CA SDM installation is susceptible to reflected cross-site scripting vulnerabilities, which might result in the infected URL being reflected back to the user. To secure CA SDM from such vulnerabilities, validation parameters exist in the web.cfg file. These parameters perform a white list validation in the webengine. Also, install the NX option on the primary and secondary servers to secure CA SDM.

Points to consider before you proceed with securing CA SDM:

- The SDM URL parameters that are defined in the web.cfg file are validated for securing CA SDM.

- You can add SDM URL parameters in the web.cfg file with required validation pattern. You can also add validation patterns, if necessary.

Secure CA SDM from Cross-Site Scripting Vulnerabilities in Conventional and Advanced Availability Mode

Follow these steps:

1. Stop the CA SDM services.
2. On the primary server, execute the following command to install the NX option.
   ```
   pdm_options_mgr -c -a pdm_option.inst -s VALIDATE_REQUEST_PARAMETER -v 1
   ```

   NOTE

   For each secondary server, manually add or update the NX option in the *NX.env* file that is located in *$NX_ROOT* directory.
3. (Optional) To avoid losing the changes when you run the *pdm_configure* command with the *-t* flag.
   ```
   pdm_options_mgr -c -a pdm_option.inst -s VALIDATE_REQUEST_PARAMETER -v 1 -t
   ```
4. Restart the CA SDM services.
5. (Optional) In Advanced Availability mode, perform rolling maintenance to apply the NX option on all servers.

How to Map a Parameter to an Existing White List Pattern

When you identify a parameter to be vulnerable, in the *web.cfg* file, you can map the parameter to a white list pattern against which the parameter is validated. For example, *CONTACT_ID* is the parameter that is vulnerable and you want to map the *AlphaNumericOnly* white list pattern to the parameter, which means the CONTACT_ID parameter can accept only alphanumeric characters.

Follow the steps:

1. Edit the *web.cfg* file, and in the *XSS Vulnerability* section, add the parameter that you want to validate against a pattern in the following way:
   ```
   SecureParameter.CONTACT_ID AlphaNumericOnly
   ```
2. *Edit the web.cfg.tpl file and update the same parameter.*
3. Restart the CA SDM services.

How to Create a White List Pattern

Apart from the out-of-the-box patterns, you can add or edit existing patterns to the web.cfg file.

Edit an Existing Pattern

For example, edit the following pattern to add colon as the allowable character: *AlphaNumericOnly ^[A-Za-z0-9]*$* to *AlphaNumericOnly ^[A-Za-z0-9:]*$*

Non-Windows

Edit the *web.cfg* file, locate **Patterns for Non-Windows** section and add the allowable character in the following way:

```
Non_windows_SecureValidator.AlphaNumericColonOnly ^[A-Za-z0-9:]*$
```

Windows

Edit the *web.cfg* file, locate **Patterns for Windows** section and add the allowable character in the following way:

```
Windows_SecureValidator.AlphaNumericColonOnly ^[A-Za-z0-9:]*$
```

After you add the patterns in the *web.cfg* file, perform the following steps:

1. *Edit the web.cfg.tpl file and update the same pattern.*
2. Restart the CA SDM services.

Installing Web Screen Painter

Web Screen Painter helps you to modify the CA Service Desk Manager schema and web interface. We recommend you to install the Web Screen Painter on a different server from where you have installed CA Service Desk Manager.

Perform the following steps:

1. Log in to the server. The following CA SDM configuration applies:
   – Primary or secondary server or any remote computer, if you have installed CA SDM with Conventional Configuration.
   – Background server, if you have installed CA SDM with Advanced availability.

   WARNING
   Web Screen Painter can only run on the background server. The Web Screen Painter installer does not stop you from installing it on any other server in the Advanced Availability configuration. For example, if you install the Web Screen Painter on a server other than the background server, it prevents you from running on a standalone, or on the standby server and application server. The Web Screen Painter shortcuts appear on the Start menu and but on clicking the shortcut, an error message is displayed.
2. Launch the installer.
3. Select CA Web Screen Painter for Service Desk Manager.
4. Follow the on-screen instructions to complete the Web Screen Painter installation.
   Web Screen Painter is installed.
   In a Web Screen Painter preview session in test mode, search filters are ignored on new tables that are not published.

Installing CA Service Catalog

Ensure that you have reviewed the Pre-Installation Considerations before proceeding with the installation.

Ensure that you have reviewed the Integrate the CA Service Management Products.

NOTE

- By default, the Service Catalog Content Pack is skipped as the parameter `slcm.skip.import.contentpack` is set to 1 in the **common_config.properties** file.

Perform the following steps:

1. Download the CA Service Management installer 17.4 from Broadcom Support.
   – **CA SERVICE MANAGEMENT SDM PACKAGE 17.4 FOR WINDOWS (WITH CATALOG).iso**
   – **CA SERVICE CATALOG 17.4.iso**
   – **CA SERVICE MANAGEMENT APM PACKAGE 17.4 FOR WINDOWS (WITH CATALOG).iso**
2. Copy and extract the files from the installation media on all servers in your environment.
3. Navigate to the folder where you have copied the installation files and right-click **Setup.exe** to select the **run as administrator** option.
4. Select the language and click **Next**.
5. Select **CA Service Management** and click **Next**.
6. Review and Accept the License Agreement Information and click **Next**.
7. Select **Microsoft SQL Server** or **Oracle** as the database type in the Database Configuration screen.

For the Windows Microsoft SQL Server database, **mdbadmin** is the default user.

For the Oracle database, verify that you are providing a valid tablespace path. If this path is invalid the database installation fails. The following path is an example of a valid Oracle tablespace path:

```
C:\app\Administrator\oradata\Oracle_Service_Name.
```

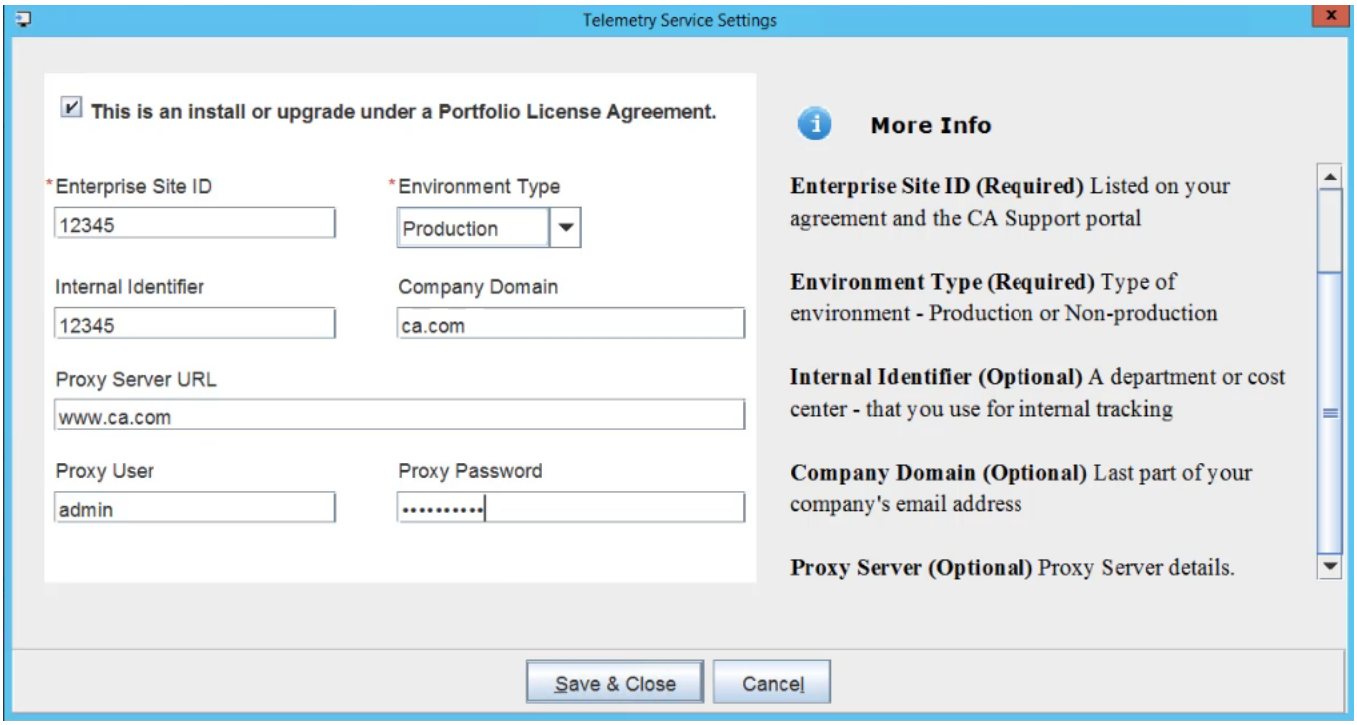
a. If you have **the Microsoft SQL Server** database, provide the following field information:
   - **Database Server**: Enter the hostname of the database server.
     If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
   - **Database Name**: Enter the Database name (MDB), the name of the target DBMS. The default value ismdb.
   - **Database Port**: Provide the port identifier for the target DBMS.
   - **Database Server Instance**: The database instance name. Leave this field blank if you are using the default instance.
   - **Database Admin User**: For Microsoft SQL Server, **sa** is the default value.
     The **sa** user is the admin user with permission to create a user and schema.
   - **Database Admin Password**: Enter the database password of the user specified by a database admin user. No default value is assigned to this parameter.
   - **mdbadmin Password**: Enter the password for the user specified for the MDB admin user.
   - **Confirm mdbadmin Password**: Confirm the password.

b. If you have the **Oracle** database, provide the following field information:

– • **Database Server**: Enter the host name of the Oracle database server.
  If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
  - **Oracle Service Name**: Enter the Oracle Service name.
  - **Listener Port**: Enter the listener port for the database.
  - **Net Service Name**: Enter the Net Service Name of Oracle database where the database resides.
    If the database is remote, use the Net Service Name that is defined in the Oracle client on the local computer. CA SDM has access to the database through a local installation of the Oracle client.
  - **DBA User Name**: Provide the name of an Oracle user with DBA access. The default value for DBA user is **SYS**.
  - **DBA User Password**: Enter the password for the DBA user.
  - **mdbadmin Password**: Enter the password for MDB admin.
  - **Confirm mdbadmin Password**: Confirm the password.
  - **Tablespace Path (on DB Server)**: Provide the tablespace path on the database server.
  - **Oracle Home Path**: Provide the Oracle client 32-bit path.
  - **Data Tablespace Name**: Provide the name of the data tablespace. The default value is MDB_DATA.
  - **Index Tablespace Name**: Provide the index Tablespace Name: The default value is MDB_INDEX.

  Click **Next**.

8. Select **CA Service Catalog** from Select the Products and Integrations screen and click **Next**.
9. Select **This is an install or upgrade under a Portfolio License Agreement** on Telemetry Service Settings page. Provide the following field information:
   – **Enter Site ID :** Listed on your agreement and the CA Support portal.
   – **Environment type:** Type of Environment Production or Non-Production.
   – **Internal Identifier (optional):** A department or cost center- that you use for internal tracking.
   – **Company Domain (optional):** Last part of your company email address.
   – **Proxy Server URL (optional):** Proxy server details.
   – **Proxy User:** Proxy server username.
   – **Proxy Password:** Proxy server password.
   Click **Save & Close**.



10. Review the Installation Prerequisites page and click **Next**.
11. Enter the **CA Service Management Administrator (CASMAdmin)** credentials for CA Service Management Click **Next**.
12. Select the services to configure in the **CA Service Catalog Configuration Details** page and click **Next**.
13. Enter the **CA Embedded Entitlements Manager (CA EEM)** details and click **Next**.
14. Review the **Pre-Installation Configuration Summary** page and click **Next**.
15. Click **Install**. Review the Installation progress and when the installation is complete, click **Next**.
16. Review the Post Deployment summary page and click **Finish** to exit the installer.
17. Review the log files **stdout.txt and stderr.txt** in the C:\ directory or the location where you have installed CA Service Catalog if the installation failed. Fix the errors and click **Retry Install**.
18. After the installation is complete, verify the CA Service Catalog installation by logging into the following URL as a Catalog administrator to view the CA Service Catalog User Interface:
    `http://<CA_Service_Catalog_Server_Name>:<Port_Number>/usm/`
19. Complete the CA Service Catalog Post Installation Tasks.

Installing CA Asset Portfolio Management

CA Service Management installer performs prerequisite checks and mandatory validations before installing CA Asset Portfolio Management. Ensure that you have reviewed the Pre-Installation Considerations topics before proceeding with the installation.

Follow these procedures:

Install CA Asset Portfolio Management

NOTE

CA Asset Portfolio Management App Server uses the reserved port 99 and CA Service Catalog uses the reserved port 7777. Reserved ports are set internally and are not configurable during CA Service Management installation. Do not configure any other services on these reserved ports.

NOTE
For installing CA APM on Oracle 21c database, add a new system environment variable "TNS_ADMIN" on the CA APM Web / Application servers. This variable value must point to the Oracle 21c 32-bit client installed location. Set the variable value, for example <oracle32bit_client_installed_location>\product \21.0.0\client32bit_1\NETWORK\ADMIN

- Refer Operating System Requirements for CA Asset Portfolio Manager ITAM

Follow these steps:

1. Download the CA Service Management 17.4 DVD from Broadcom Support.
   – CA ASSET PORTFOLIO MANAGEMENT 17.4 FOR WINDOWS DVD (WITHOUT CATALOG).ISO
   – CA SERVICE MANAGEMENT APM PACKAGE 17.4 FOR WINDOWS (WITH CATALOG).ISO
2. Copy and extract the files from the installation media on the servers in your environment.
3. Right-click **Setup.exe** to select the **run as administrator** option.
4. Select the language and click **Next**.
5. Select CA Service Management.
6. Review and Accept the License Agreement Information and click **Next**.
7. Select **Microsoft SQL Server** or **Oracle** as the database type in the Database Configuration screen:
   For Windows Microsoft SQL Server database, **mdbadmin** is the default user.
   Verify that you are providing a valid tablespace path if you have an Oracle database. If this path is invalid the database installation fails. The following path is an example of a valid Oracle tablespace path:
   `C:\app\Administrator\oradata\Oracle_Service_Name.`
8. Provide the database details:
   a. If you have **a Microsoft SQL Server** database, provide the following field information:
      - **Database Server**: Enter the hostname of the database server.
        If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
      - **Database Name**: Enter the Database name (MDB), the name of the target DBMS. The default value is mdb.
      - **Database Port**: Provide the port identifier for the target DBMS.
      - **Database Server Instance**: The database instance name. Leave this field blank if you are using the default instance.
      - **Database Admin User**: For Microsoft SQL Server, **sa** is the default value.
        The **sa** user is the admin user with permission to create a user and schema.
      - **Database Admin Password**: Enter the database password of the user specified by a database admin user. No default value is assigned to this parameter.
      - **mdbadmin Password**: Enter the password for the user specified for the MDB admin user.
      - **Confirm mdbadmin Password**: Confirm the password.
   b. If you have the **Oracle** database, provide the following field information:
      NOTE
      For Oracle database in CA Service Management Solution deployment, ensure that the Oracle-32 bit path is set on top of the Environment path variable list for CA APM. CA APM installation does not require the 64-bit path, ignore this field while performing CA APM installation.
      - **Database Server**: Enter the host name of the Oracle database server.
        If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
      - **Oracle Service Name**: Enter the Oracle Service name.
      - **Listener Port**: Enter the listener port for the database.
      - **Net Service Name**: Enter the Net Service Name of Oracle database where the database resides.

If the database is remote, use the Net Service Name that is defined in the Oracle client on the local computer. CA SDM has access to the database through a local installation of the Oracle client.

- **DBA User Name**: Provide the name of an Oracle user with DBA access. The default value for DBA user is **SYS**.
- **DBA User Password**: Enter the password for the DBA user.
- **mdbadmin Password**: Enter the password for MDB admin.
- **Confirm mdbadmin Password**: Confirm the password.
- **Tablespace Path (on DB Server)**: Provide the tablespace path on the database server.
- **Oracle Home Path**: Provide the Oracle client 32-bit path.
- **Data Tablespace Name**: Provide the name of the data tablespace. The default value is MDB_DATA.
- **Index Tablespace Name**: Provide the index Tablespace Name: The default value is MDB_INDEX.
  Click **Next**

WARNING

CA Service Management does not support the un-installation of the CA Asset Portfolio Management. Uninstalling CA APM does not uninstall CA MDB, as there is no rollback mechanism for the same. For more information, see CA Asset Portfolio Manager Considerations.

9. Select **CA Asset Portfolio Management** and click **Next**.
10. Select **This is an install or upgrade under a Portfolio License Agreement** on Telemetry Service Settings page. Provide the following field information:
    - **Enter Site ID :** Listed on your agreement and the CA Support portal
    - **Environment type:** Type of Environment Production or Non-Production
    - **Internal Identifier (optional):** A department or cost center- that you use for internal tracking
    - **Company Domain (optional):** Last part of your company email address
    - **Proxy Server URL (optional):** Proxy server details
    - **Proxy User:** Proxy server username
    - **Proxy Password:** Proxy server password
    - Click **Save & Close**.
11. Review the Installation Prerequisites page and click **Next.**
12. Enter the **CA Service Management Administrator (CASMAdmin)** credentials for CA Service Management Click **Next.**
13. Enter the **CA Asset Portfolio Management Server Details** and click **Next**.
14. Enter the **CA Embedded Entitlements Manager (CA EEM)** details and click **Next.**
15. Review the **Pre-Installation Configuration Summary** page and click **Next**.
16. Click **Install**. Review the Installation progress and when the installation is complete, click **Next**.
17. Review the Post Deployment summary page and click **Finish** to exit the installer.
18. Complete the CA Asset Portfolio Management Post Installation Tasks

Start the CA APM Services

After the installation is complete, start all services. Perform the following steps:

1. Navigate to **Start**, **Settings**, **Control Panel**.
2. Double-click **Administrative** Tools.
3. Double-click **Services**.
4. Locate and start each of the following services:

- – Apache Tomcat 9.0 AMS Service
  – CA Asset Portfolio Management - Data Importer Engine
  – CA Asset Portfolio Management - Event Service
  – CA Asset Portfolio Management - Export Service
  – CA Asset Portfolio Management - Registration Service
  – CA Asset Portfolio Management - HW Reconciliation Engine
  – CA Asset Portfolio Management - LDAP Import Service
  – CA CASM

    `For performance reasons, it is recommended that you do not start the CA CASM service when you are not using multi-tenancy.`
  – CA iTechnology iGateway 4.7

Start the Web Interface for CA APM

After installing CA APM, start the web interface to verify that CA APM is ready to use. Provide the login credentials and web interface URL to users. As an Administrator you can configure security, user interface, set up hardware, and, if necessary, configure the product components.

1. Start the web interface using one of the following methods:
   a. Open a supported Web browser and enter the appropriate URL in the following format:

      `http://servername:port/itam`
   b. Replace server name and port with the name of the server and the port that are hosting the CA APM web servers.
   c. A Start menu shortcut is created on your web server that references the URL location. Click **Start**, **Programs**, **CA**, **Asset Portfolio Management**.
   d. To log in to CA APM, enter the credentials provided during the installation.

      NOTE

      If you changed the password during the installation, use the password that you created.

   A browser error or a user name error can appear in certain cases. You can resolve these errors by following the troubleshooting instructions that are given in the error message. For more information, see: Troubleshooting CA Asset Portfolio Management

Verify the CA APM Installation

After you have completed all installation procedures, you can verify that CA APM was installed successfully. Perform the following steps:

1. Log in to the servers where you installed CA APM.
2. Click **Start**, **Control Panel**, **Programs**.
3. Verify that the following component is available on all applicable servers:
   CA Asset Portfolio Management
   You have completed the installation verification.

   NOTE

   If you backed up the Storage folder contents before installing, restore the contents now. Use the Storage folder contents that you copied and paste them into the following location:

   [ITAM Root Path]/Storage/

   If you receive a prompt about folders that already exist, merge the folders.

   NOTE

   After installing CA APM 17.4, the release version is shown as **17.0.0.1034** on the application user interface.

The env.info file for CA APM 17.4 in the CA APM installed folder includes the following information:

- product=ITAM
- major=17
- minor=4
- cum=0
- roll-up=0

Other Products Installed with CA APM

The following products are installed when you install CA APM:

- Common Asset Viewer
- CORA 17.4.0.57
- Common Administration for Service Management (CASM)

NOTE
The only supported ITAM WCF service is the WSDL, which can be downloaded from the ITAM Web UI by navigating to the Administration tab >> Web Services tab >> WSDL Download.

Post Installation Tasks

Post installation tasks for CASM 17.4.

After successful installation, CA Service Management products (CA SDM, CA Service Catalog, and CA Asset Portfolio Management require specific configurations. Review the following to understand the mandatory and optional post-installation tasks.

- CA Service Desk Manager Post Installation Tasks
- CA Service Catalog Post Installation Tasks
- CA Asset Portfolio Management Post Installation Tasks

CA Service Desk Manager Post Installation Tasks

The CA Service Management provides an option in the installer to automate the post-install tasks.

CA Service Management provides an option in the installer to automate the post-install tasks. If you have selected **Yes** to automate the post-installation steps while running the CA Service Management Installer Wizard, you are not required to perform any manual post-install steps for CA Service Desk Manager (SDM).

If you have selected **No** for automating the post-install steps while running the installer wizard, perform manually the following post-install tasks as per your deployment requirement.

- Post-Installation Tasks After Installing CA SDM 17.4
- Post-Installation Tasks After Installing CA SDM 17.4 on CA SDM 17.1

- Post-Installation Tasks After Installing CA SDM 17.4 on CA SDM 17.3

Post-Installation Tasks After Installing CA SDM 17.4

CA Service Desk Manager

If you have selected **No** for automating the post-install steps while running the installer wizard, perform manually the following post-install tasks as per your deployment requirement.

NOTE

For **Advance Availability Mode**: Perform the following steps sequentially on Background, Standby, and Application servers.
For **Conventional Mode**: Perform the following steps sequentially on Primary and Secondary Servers.

Update the Minor Version in Nx.Env file

The help option (Help Option on this Window) from the CA SDM User Interface provides context-sensitive product documentation. Perform the following steps to view the Help Window:

Perform the following steps:

1. Navigate to the `$NX_ROOT\site` folder.
   a. Open the `install.properties` in a text editor.
   b. Find the parameter: `genfact.gx_minor_ver`
   c. Modify the value to **4**
   d. genfact.gx_copyright_year=2023
2. Navigate to *NX_ROOT/site/config.properties* file and ensure that the value of ***resources.created parameter*** is set to 0.
3. Navigate to the NX_ROOT/bin and open the command prompt and run the below commands:

```
pdm_options_mgr -c -s attach_force_save_dialog -v 1 -a pdm_option.inst -t
pdm_options_mgr -c -s doc_url -v "https://docops.ca.com/rest/ca/product/latest/topic" -a pdm_option.ins -
tt
pdm_options_mgr -c -s doc_default_hid -v "HID_Service_Management_Home_Page" -a pdm_option.inst
pdm_options_mgr -c -s doc_space_prefix -v "CASM" -a pdm_option.inst
```

4. For conventional mode and all application servers and stand-by servers for advanced availability, run:

```
pdm_configure
```

   Advanced availability on the BG Server run:

```
pdm_configure -S
```

5. Change the directory to **NX_ROOT/data**, and execute the following command:

   NOTE

   Apply the *pdm_load* command once on Primary Server in Conventional mode or Background Server in Advance Availability mode.

```
pdm_load -f r17_1_insert.dat
pdm_load -u -f r17_1_update.dat
pdm_load -r -f r17_1_delete.dat
pdm_load -f r17_2_insert.dat
pdm_load -u -f r17_2_update.dat
pdm_load -f r17_3_insert.dat
pdm_load -u -f r17_3_update.dat
pdm_load -f r17_4_insert.dat
pdm_load -u -f r17_4_update.dat
```

6. Clear the browser cache by running the following command:

```
pdm_webcache -H
pdm_webcache -b
```

7. Restart the CA SDM Services.

Remote Web Screen Painter (WSP) and Java Update

If you have installed Remote Web Screen Painter in your environment, perform the following steps:

1. Log in to the server where CA SDM is installed:
   a. Navigate to the `$NX_ROOT/java/lib` folder.
   b. Copy the following jar files:
      1. WebScreenPainter.jar
      2. sd-utils.jar
      3. domsrvr_utils.jar
      4. slump.jar
      5. log4j-api-2.17.1.jar
      6. log4j-core-2.17.1.jar
      7. log4j-jcl-2.17.1.jar
      8. bc-fips-1.0.2.1.jar
      9. bctls-fips-1.0.12.2.jar
2. Log in to the server where remote WSP is installed:
   a. Navigate to the `$NX_ROOT/java/lib` folder and paste the jar files that you copied in Step 1.
3. Log in to the server where CA SDM is installed:
   a. Navigate to the shared JRE folder `ex: C:\Program Files (x86)\CA\SC\JRE` folder.
   b. Copy the `11.0.18` folder.
4. Log in to the server where remote WSP is installed:
   a. Navigate to the shared JRE folder `ex: C:\Program Files (x86)\CA\SC\JRE` folder.
   b. Paste the `11.0.18` folder.
   c. Navigate to the `$NX_ROOT` folder.
   d. Open the `NX.env` file in a text editor.
   e. Find the parameter `NX_JRE_INSTALL_DIR=`
   f. Modify the parameter value from 1.8.0_112 to **11.0.18**
   g. On the next line, add the following:
   `@NX_LOG=C:/PROGRA~2/CA/SERVIC~1/log`
   a. Save the `NX.env` file.
   Remote WSP is upgraded to AdoptOpenJDK 11.0.18
5. Log in to the server where CA SDM is installed and copy the following files to the same folder location in the remote WSP server:
   a. $NX_ROOT/bin/pdm_wsp.exe
   b. $NX_ROOT/bin/bop_sinfo.frg
   c. $NX_ROOT/site/ddict.sch
   d. $NX_ROOT/site/cfg/log4j2.properties
   e. $NX_ROOT/site/cfg/log4j2.properties.tpl
6. Launch remote WSP to verify that you are able to design and customize CA SDM forms.

Manual Post-Installation Task for CMDB

To run CA Service Management 17.4 in SSL environment, CA SDM Administrators must perform the following post-installation steps for CMDB Visualizer Interface to open using the **HTTPS** protocol when launching from CA SDM UI:

1. In the NX.env file, change the **NX_CMDB_VISUALIZER** entry to provide **HTTPS protocol** and **HTTPS port**.
   For example: @NX_CMDB_VISUALIZER=https://sdmurl:<VIZ_SSL_PORT>/CMDBVisualizer
2. In **casm.conf.js** file from NX_root\bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\viz-ux\conf, provide the HTTPS as protocol and HTTP port.
   For example:

```
sdm: {

      vizserver: 'https://sdmurl:<VIZ_SSL_PORT>/CMDBVisualizer/viz',
      server: 'https:// sdmurl:<SDM_SSL_PORT>/CAisd/pdmweb.exe'
    }
```

Manual Post-Installation Task for CMDB

Manual Post-Installation Task for OAuth 2.0 (Maileater/Mailer)

After generating an access token for OAuth 2.0 to connect to a mail server, perform the mandatory post-install tasks on all servers in your environment:

1. Create a backup of web.xml from NX_ROOT\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF in your local directory to perform backout if required.
2. Open the web.xml file from NX_ROOT\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF.
3. Search for the following statement:
   ```
   <!--USD servlet mappings start-->
   ```
4. Copy and paste the following configuration under the statement:

   ```
   <servlet>
     <servlet-name>OAuthProcessor</servlet-name>
     <servlet-class>com.broadcom.oAuth.OAuthProcessor</servlet-class>
    </servlet>
   ```
5. Copy and paste the following configuration after any <servlet-mapping>:

   ```
   <servlet-mapping>
     <servlet-name>OAuthProcessor</servlet-name>
     <url-pattern>/OAuthProcessor</url-pattern>
   </servlet-mapping>
   ```
6. Save and close the web.xml file.
7. For OAuth servlet preservation in a primary and secondary environment, the secondary server must also have the OAuth processor entries in the following file: *<NX_ROOT>\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF\web.xml.last*.
8. Repeat Steps 1-8 to update **web.xml.tpl** file in the NX_ROOT\samples\pdmconf\web.xml.tpl folder to avoid losing these changes when pdm_configure is run at a later point of time.
9. Run the following command:
   ```
   pdm_tomcat_nxd -c STOP command
   ```
10. Wait for some time (a minute or so) and run the following command:
    ```
    pdm_tomcat_nxd -c START command
    ```

For more information, see Define a mailbox.

Manual Post-Installation Task for Excel file (.xlsx) export*

1. Execute the following command:
   ```
   pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst
   ```
2. Execute the following command to add the new NX variable to NX.env.tpl file.
   ```
   pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst -t
   ```
3. Restart CA SDM services.

(Optional) Manual Post-Installation Task for Knowledge Document export with German fields

If you are exporting Knowledge Document with German Fields (included in the export field list), then perform the below post-install steps for successful export of knowledge documents:

1. Take the backup of NX_ROOT\NX.env file (NX_ROOT is the installation directory for CA Service Desk Manager).
2. Open NX_ROOT\pdmconf\NX.env_nt.tpl file using any text editor and take the value of NX variable @NX_KEIT_AVAILABLE_FIELDS which is COPIED_DATA and update Nx.env in NX_ROOT by executing below command:

   ```
   pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <COPIED_DATA>  -a  pdm_option.inst
   ```

   Where COPIED_DATA is the value copied from NX.env_nt.tpl (step 2).
   For example, " pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <provide the exact string here> -a pdm_option.inst "
   Note to avoid losing the updated changes when you run pdm_configure, execute the above command with the '-t' flag as follows:

   ```
   pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <COPIED_DATA> -a pdm_option.inst -t
   ```

(Optional)Manually added NX variables need to be merged, after upgrading to 17.4.0.0

Manually updated NX variables are lost when a GA release or RU patch delivers a new `NX.env_nt.tpl` file (located in `NX_ROOT/pdmconf`). This necessitates an additional manual step to merge the custom values from the backup file of `NX.env_nt.tpl` created by `pdm_configure`.

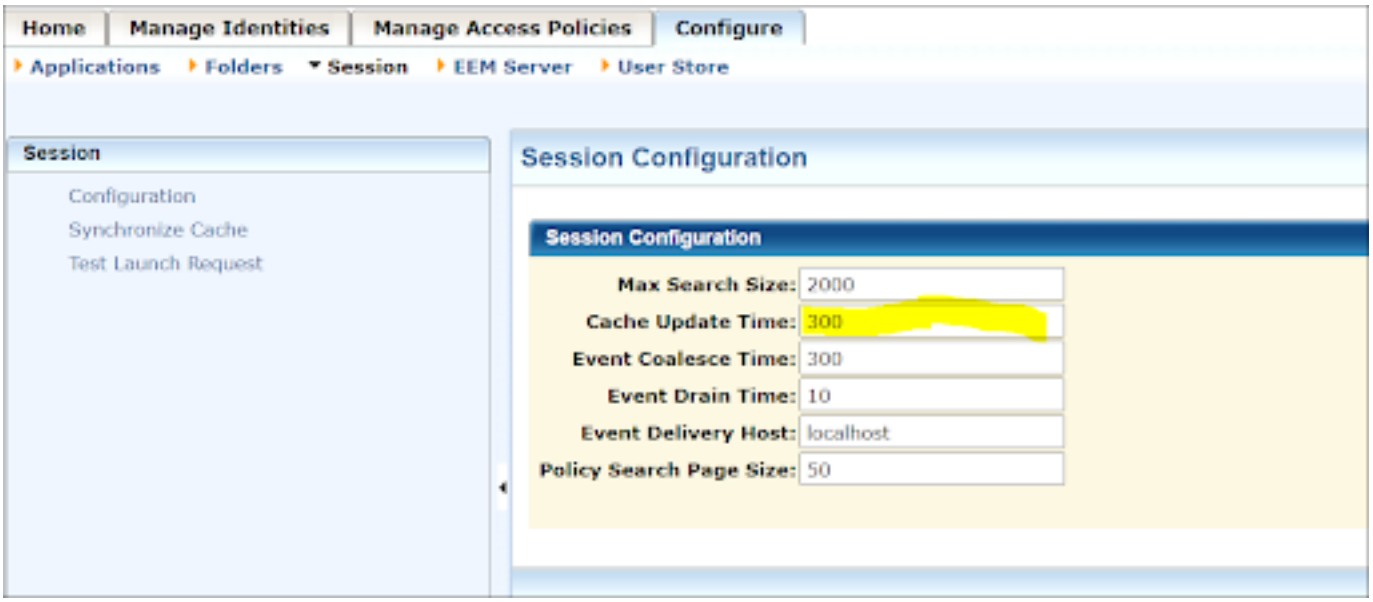
- Manually merge the required changes into the NX.env_nt.tpl file located in NX_ROOT\pdmconf from the backup file at NX_ROOT\REPLACED\GOL-78_EN_US.OLD\pdmconf\NX.env_nt.tpl.
- Restart the SDM services.
- **For Conventional Mode**: Restart the SDM services on all secondary servers.
- **For Advanced Availability Mode**: Restart the SDM services on all standby servers and application servers.

(Optional) Manual Post-Installation Task for EEM Cache Timeout Configuration Update

You may face issues while logging in to EEM or SDM using the EEM user accounts due to a session cache timeout mismatch between EEM and SDM.

In 17.4, you can update the EEM cache timeout configuration by adding a new NX variable, "NX_EEM_CACHE_UPDATE_TIME" in SDM.

Keep the value the same as the EEM cache timeout configuration value mentioned in the following screenshot.



To set the EEM cache update time to 300 seconds, perform the following steps:

To add the variable in the **nx.env** file, run the following command:

```
pdm_options_mgr -c -s  EEM_CACHE_UPDATE_TIME  -v 300 -a pdm_option.inst
```

To add the variable in the **nxenv_nt.tpl** file, run the following command:

```
pdm_options_mgr -c -s  EEM_CACHE_UPDATE_TIME  -v 300 -a pdm_option.inst -t
```

If 17.4 xFlow/ Service Point is installed

After succesful installation of 17.4 xFlow/ Service Point refresh index and data on the Search Server, then perform the following steps:

Run the PDM_ES_REBUILD_INDEX Command Utility

To view the Service Catalog data (Service request and Service offering) in the Service Point, execute one of the files based on your operating system:

- $ES_HOME/search/bin/pdm_es_rebuild_index.bat (Windows)
- $ES_HOME/search/bin/pdm_es_rebuild_index.sh (Linux)

NOTE
In case of Linux Search Server environment, ensure to run the following commands on the terminal:

```
sysctl -w vm.max_map_count=262144
ulimit -Hn 65535
```

WARNING
We recommend that you execute the pdm_es_rebuild_index command during off-peak hours as it affects the CA Service Catalog server performance.

(Optional) Manual Post-Installation Task for Rebuild Index

If you have upgraded or are planning to install CA EEM 12.6 with Service Point and CA Service Catalog, ensure that you rebuild the CA Service Catalog index after completing the CA EEM upgrade/installation process. For more information, see Perform Initial Load and Refresh Index Data on Search Server.
Run the following command to rebuild the index:

```
$ES_HOME/search/bin/pdm_es_rebuild_index.bat index=catalog_index
```

Display CA Service Catalog Featured Offerings in Service Point

After successful installation or after upgrading to CA Service Management 17.4, perform the following mandatory steps if you have an integrated environment of CA SDM and CA Service Catalog and you want to display Service Catalog Featured Offerings in Service Point. Before performing the following steps, ensure that you execute the "*pdm_es_rebuild_index.bat*" from where you have installed Search Server <*SearchServer_Installed_location>/search/bin*.

There are two ways to perform these mandatory steps, you can select one of these approaches as per your environmental requirements:

Approach 1

1. Navigate to the where you have installed xFlow Interface <*xFlow_Installed_location>/APPS/Services/searchmicroservice-<xx.x.xxx>/conf*> and edit the ***eiam.config*** file.
2. Search for *Logger Configuration* and comment it.
3. After commenting *Logger Configuration*, add the following step right after *Logger Configuration*:
   ```
   <LoggerConfiguration file="<xFlow_Installed_Location>\APPS\Services\searchmicroservice-.<xx.x.xxx>\conf
   \eiam.log4j.config"/>
   ```
4. Save the file.
5. Restart the xFlow Interface Services.

OR

Approach 2

1. After successful installation or after upgrading to CA Service Management 17.4, relaunch the CA Service Management 17.4 Installer wizard.
2. Select and select "**Integrate pre-installed solution components**" and continue with the installation process to complete integrating the solution components.

Update the Federated Search Configuration File

These steps are mandatory if you have configured Federated Search for CA Service Management 17.4. These steps must be performed for Advanced Availability and Conventional Configurations.

1. Shut down the Federated Search Tomcat server if CA SDM Services are up and running by executing the following command:
   ```
   pdm_tomcat_nxd -c stop -t FS
   ```
2. Update the *catalina.properties* file (*bopcfg\www\CATALINA_BASE_FS\conf\catalina.properties)*
   Search for *"common.loader=*" and replace it with the following:
   ```
   common.loader="${catalina.base}/lib/axis2/*.jar","${catalina.base}/lib","${catalina.base}/lib/
   *.jar","${catalina.home}/lib","${catalina.home}/lib/*.jar","${catalina.base}/../../../java/lib/CXF/*.jar"
   ```
3. Start the Federated Search Tomcat Server by executing the following command:
   ```
   pdm_tomcat_nxd -c start -t FS
   ```

Post-Installation Tasks After Installing CA SDM 17.4 on CA SDM 17.1

Post-Installation Tasks After Installing CA SDM 17.4 on CA SDM 17.1

CA Service Desk Manager

If you have selected **No** for automating the post-install steps while running the installer wizard, perform manually the following post-install tasks as per your deployment requirement.

> **NOTE**
>
> For **Advance Availability Mode**: Perform the following steps sequentially on Background, Standby, and Application servers.
> For **Conventional Mode**: Perform the following steps sequentially on Primary and Secondary Servers.

Update the Minor Version in Nx.Env file

The help option (Help Option on this Window) from the CA SDM User Interface provides context-sensitive product documentation. Perform the following steps to view the Help Window:

Perform the following steps:

1. Navigate to the `$NX_ROOT\site` folder.
   a. Open the `install.properties` in a text editor.
   b. Find the parameter: `genfact.gx_minor_ver`
   c. Modify the value to **4**
   d. genfact.gx_copyright_year=2023
2. Navigate to *NX_ROOT/site/config.properties* file and ensure that the value of ***resources.created parameter*** is set to 0.
3. Navigate to the NX_ROOT/bin and open the command prompt and run the below commands:

```
pdm_options_mgr -c -s attach_force_save_dialog -v 1 -a pdm_option.inst -t
pdm_options_mgr -c -s doc_url -v "https://docops.ca.com/rest/ca/product/latest/topic" -a pdm_option.ins -
tt
pdm_options_mgr -c -s doc_default_hid -v "HID_Service_Management_Home_Page" -a pdm_option.inst
pdm_options_mgr -c -s doc_space_prefix -v "CASM" -a pdm_option.inst
```

4. For conventional mode and all application servers and stand-by servers for advanced availability, run:

```
pdm_configure
```

   Advanced availability on the BG Server run:

```
pdm_configure -S
```

5. Change the directory to **NX_ROOT/data**, and execute the following command:

> **NOTE**
>
> Apply the *pdm_load* command once on Primary Server in Conventional mode or Background Server in Advance Availability mode.

```
pdm_load -f r17_2_insert.dat
pdm_load -u -f r17_2_update.dat
pdm_load -f r17_3_insert.dat
pdm_load -u -f r17_3_update.dat
pdm_load -f r17_4_insert.dat
pdm_load -u -f r17_4_update.dat
```

6. Clear the browser cache by running the following command:

```
pdm_webcache -H
pdm_webcache -b
```

7. Restart the CA SDM Services.

Remote Web Screen Painter (WSP) and Java Update

If you have installed Remote Web Screen Painter in your environment, perform the following steps:

1. Log in to the server where CA SDM is installed:
   a. Navigate to `$NX_ROOT/java/lib` folder.
   b. Copy the following jar files:
      1. WebScreenPainter.jar
      2. sd-utils.jar
      3. domsrvr_utils.jar
      4. slump.jar
      5. log4j-api-2.17.1.jar
      6. log4j-core-2.17.1.jar
      7. log4j-jcl-2.17.1.jar
2. Log in to the server where remote WSP is installed:
   a. Navigate to `$NX_ROOT/java/lib` folder and paste the jar files that you copied in Step 1.
3. Log in to the server where CA SDM is installed:
   a. Navigate to `$NX_ROOT/SC/JRE` folder.
   b. Copy the `11.0.18` folder.
4. Log in to the server where remote WSP is installed:
   a. Navigate to `$NX_ROOT/SC/JRE` folder.
   b. Paste the `11.0.18` folder.
   c. Navigate to the `$NX_ROOT` folder.
   d. Open the `NX.env` file in a text editor.
   e. Find the parameter `NX_JRE_INSTALL_DIR=`
   f. Modify the parameter value from 1.8.0_112 to **11.0.18**
   a. Save the `NX.env` file.
   Remote WSP is upgraded to AdoptOpenJDK 11.0.18
5. Launch remote WSP to verify that you are able to design and customize CA SDM forms.

Manual Post-Installation Task for CMDB

To run CA Service Management 17.4 in SSL environment, CA SDM Administrators must perform the following post-installation steps for CMDB Visualizer Interface to open using the **HTTPS** protocol when launching from CA SDM UI:

1. In the NX.env file, change the **NX_CMDB_VISUALIZER** entry to provide **HTTPS protocol** and **HTTPS port**.
   For example: @NX_CMDB_VISUALIZER=https://sdmurl:<VIZ_SSL_PORT>/CMDBVisualizer
2. In **casm.conf.js** file from NX_root\bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\viz-ux\conf, provide the HTTPS as protocol and HTTP port.
   For example:

```
sdm: {

      vizserver: 'https://sdmurl:<VIZ_SSL_PORT>/CMDBVisualizer/viz',
      server: 'https:// sdmurl:<SDM_SSL_PORT>/CAisd/pdmweb.exe'
    }
```

Manual Post-Installation Task for OAuth 2.0 (Maileater/Mailer)

After generating an access token for OAuth 2.0 to connect to a mail server, perform the mandatory post-install tasks on all servers in your environment:

1. Create a backup of web.xml from NX_ROOT\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF in your local directory to perform backout if required.
2. Open the web.xml file from NX_ROOT\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF.
3. Search for the following statement:
   ```
   <!--USD servlet mappings start-->
   ```
4. Copy and paste the following configuration under the statement:

   ```
   <servlet>
     <servlet-name>OAuthProcessor</servlet-name>
     <servlet-class>com.broadcom.oAuth.OAuthProcessor</servlet-class>
    </servlet>
   ```
5. Copy and paste the following configuration after any <servlet-mapping>:

   ```
    <servlet-mapping>
      <servlet-name>OAuthProcessor</servlet-name>
      <url-pattern>/OAuthProcessor</url-pattern>
    </servlet-mapping>
   ```
6. Save and close the web.xml file.
7. For OAuth servlet preservation in a primary and secondary environment, the secondary server must also have the OAuth processor entries in the following file: *<NX_ROOT>\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF\web.xml.last*.
8. Repeat Steps 1-8 to update **web.xml.tpl** file in the NX_ROOT\samples\pdmconf\web.xml.tpl folder to avoid losing these changes when pdm_configure is run at a later point of time.
9. Run the following command:
   ```
   pdm_tomcat_nxd -c STOP command
   ```
10. Wait for some time (a minute or so) and run the following command:
    ```
    pdm_tomcat_nxd -c START command
    ```

For more information, see Define a mailbox.

Manual Post-Installation Task for Excel file (.xlsx) export*

1. Execute the following command:
   ```
   pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst
   ```
2. Execute the following command to add the new NX variable to NX.env.tpl file.
   ```
   pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst -t
   ```
3. Restart CA SDM services.

(Optional) Manual Post-Installation Task for Knowledge Document export with German fields

If you are exporting Knowledge Document with German Fields (included in the export field list), then perform the below post-install steps for successful export of knowledge documents:

1. Take the backup of NX_ROOT\NX.env file (NX_ROOT is the installation directory for CA Service Desk Manager).
2. Open NX_ROOT\pdmconf\NX.env_nt.tpl file using any text editor and take the value of NX variable @NX_KEIT_AVAILABLE_FIELDS which is COPIED_DATA and update Nx.env in NX_ROOT by executing below command:
   ```
   pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <COPIED_DATA>  -a  pdm_option.inst
   ```
   Where COPIED_DATA is the value copied from NX.env_nt.tpl (step 2).

For example, " pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <provide the exact string here> -a pdm_option.inst "

Note to avoid losing the updated changes when you run pdm_configure, execute the above command with the '-t' flag as follows:

```
pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <COPIED_DATA> -a pdm_option.inst -t
```

(Optional)Manually added NX variables need to be merged, after upgrading to 17.4.0.0

Manually updated NX variables are lost when a GA release or RU patch delivers a new `NX.env_nt.tpl` file (located in `NX_ROOT/pdmconf`). This necessitates an additional manual step to merge the custom values from the backup file of `NX.env_nt.tpl` created by `pdm_configure`.

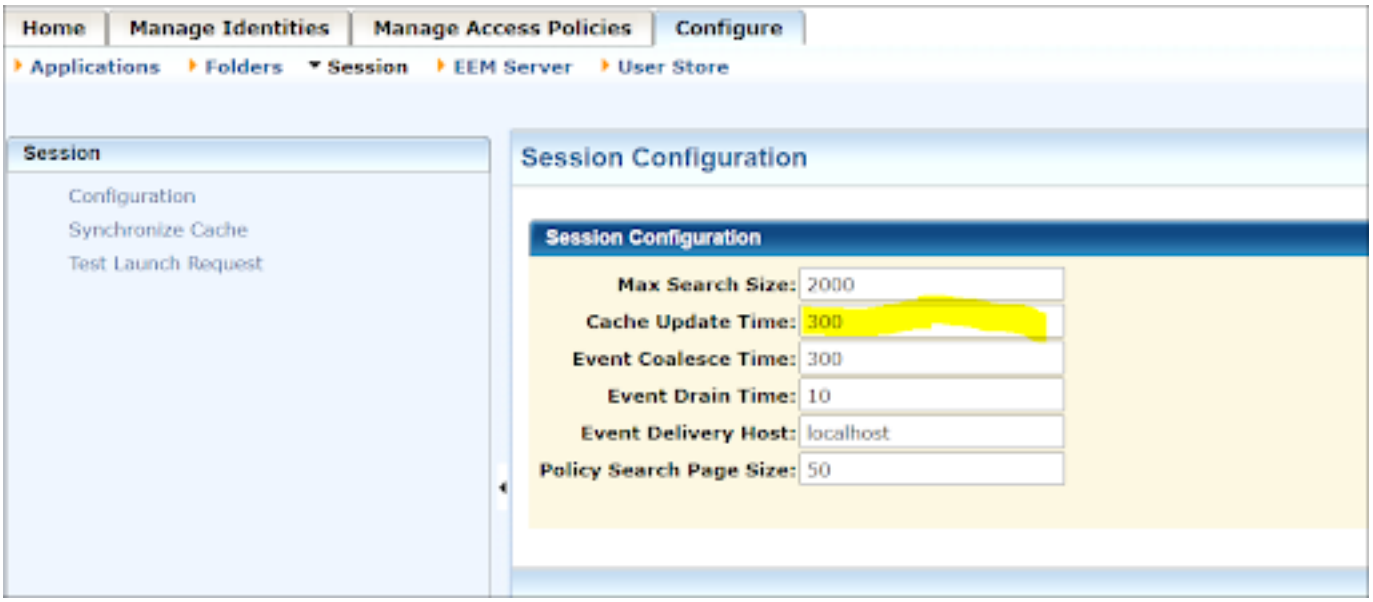
- Manually merge the required changes into the NX.env_nt.tpl file located in NX_ROOT\pdmconf from the backup file at NX_ROOT\REPLACED\GOL-78_EN_US.OLD\pdmconf\NX.env_nt.tpl.
- Restart the SDM services.
- **For Conventional Mode**: Restart the SDM services on all secondary servers.
- **For Advanced Availability Mode**: Restart the SDM services on all standby servers and application servers.

(Optional) Manual Post-Installation Task for EEM Cache Timeout Configuration Update

You may face issues while logging in to EEM or SDM using the EEM user accounts due to a session cache timeout mismatch between EEM and SDM.

In 17.4, you can update the EEM cache timeout configuration by adding a new NX variable, "NX_EEM_CACHE_UPDATE_TIME" in SDM.

Keep the value the same as the EEM cache timeout configuration value mentioned in the following screenshot.



To set the EEM cache update time to 300 seconds, perform the following steps:

To add the variable in the **nx.env** file, run the following command:

```
pdm_options_mgr -c -s  EEM_CACHE_UPDATE_TIME  -v 300 -a pdm_option.inst
```

To add the variable in the **nxenv_nt.tpl** file, run the following command:

```
pdm_options_mgr -c -s  EEM_CACHE_UPDATE_TIME  -v 300 -a pdm_option.inst -t
```

If 17.4 xFlow/ Service Point is installed

After succesful installation of 17.4 xFlow/ Service Point refresh index and data on the Search Server, then perform the following steps:

Run the PDM_ES_REBUILD_INDEX Command Utility

To view the Service Catalog data (Service request and Service offering) in the Service Point, execute one of the files based on your operating system:

- $ES_HOME/search/bin/pdm_es_rebuild_index.bat (Windows)
- $ES_HOME/search/bin/pdm_es_rebuild_index.sh (Linux)

NOTE
In case of Linux Search Server environment, ensure to run the following commands on the terminal:

```
sysctl -w vm.max_map_count=262144
ulimit -Hn 65535
```

WARNING
We recommend that you execute the pdm_es_rebuild_index command during off-peak hours as it affects the CA Service Catalog server performance.

(Optional) Manual Post-Installation Task for Rebuild Index

If you have upgraded or are planning to install CA EEM 12.6 with Service Point and CA Service Catalog, ensure that you rebuild the CA Service Catalog index after completing the CA EEM upgrade/installation process. For more information, see Perform Initial Load and Refresh Index Data on Search Server.
Run the following command to rebuild the index:

```
$ES_HOME/search/bin/pdm_es_rebuild_index.bat index=catalog_index
```

Display CA Service Catalog Featured Offerings in Service Point

After successful installation or after upgrading to CA Service Management 17.4, perform the following mandatory steps if you have an integrated environment of CA SDM and CA Service Catalog and you want to display Service Catalog Featured Offerings in Service Point. Before performing the following steps, ensure that you execute the "*pdm_es_rebuild_index.bat*" from where you have installed Search Server <*SearchServer_Installed_location*>*/search/bin*.

There are two ways to perform these mandatory steps, you can select one of these approaches as per your environmental requirements:

Approach 1

1. Navigate to the where you have installed xFlow Interface <*xFlow_Installed_location*>*/APPS/Services/searchmicroservice-*<*xx.x.xxx*>*/conf*> and edit the ***eiam.config*** file.
2. Search for *Logger Configuration* and comment it.
3. After commenting *Logger Configuration*, add the following step right after *Logger Configuration*:

```
<LoggerConfiguration file="<xFlow_Installed_Location>\APPS\Services\searchmicroservice-.<xx.x.xxx>\conf
\eiam.log4j.config"/>
```

4. Save the file.
5. Restart the xFlow Interface Services.

OR

Approach 2

1. After successful installation or after upgrading to CA Service Management 17.4, relaunch the CA Service Management 17.4 Installer wizard.
2. Select and select "**Integrate pre-installed solution components**" and continue with the installation process to complete integrating the solution components.

Update the Federated Search Configuration File

These steps are mandatory if you have configured Federated Search for CA Service Management 17.4. These steps must be performed for Advanced Availability and Conventional Configurations.

1. Shut down the Federated Search Tomcat server if CA SDM Services are up and running by executing the following command:
   ```
   pdm_tomcat_nxd -c stop -t FS
   ```
2. Update the *catalina.properties* file (*bopcfg\www\CATALINA_BASE_FS\conf\catalina.properties)*
   Search for *"common.loader=*" and replace it with the following:
   ```
   common.loader="${catalina.base}/lib/axis2/*.jar","${catalina.base}/lib","${catalina.base}/lib/
   *.jar","${catalina.home}/lib","${catalina.home}/lib/*.jar","${catalina.base}/../../../java/lib/CXF/*.jar"
   ```
3. Start the Federated Search Tomcat Server by executing the following command:
   ```
   pdm_tomcat_nxd -c start -t FS
   ```

Post-Installation Tasks After Installing CA SDM 17.4 on CA SDM 17.2

Post-Installation Tasks After Installing CA SDM 17.4 on CA SDM 17.2

CA Service Desk Manager

If you have selected **No** for automating the post-install steps while running the installer wizard, perform manually the following post-install tasks as per your deployment requirement.

> **NOTE**
>
> For **Advance Availability Mode**: Perform the following steps sequentially on Background, Standby, and Application servers.
> For **Conventional Mode**: Perform the following steps sequentially on Primary and Secondary Servers.

Update the Minor Version in Nx.Env file

The help option (Help Option on this Window) from the CA SDM User Interface provides context-sensitive product documentation. Perform the following steps to view the Help Window:

Perform the following steps:

1. Navigate to the `$NX_ROOT\site` folder.
   a. Open the `install.properties` in a text editor.
   b. Find the parameter: `genfact.gx_minor_ver`
   c. Modify the value to **4**
   d. genfact.gx_copyright_year=2023
2. Navigate to *NX_ROOT/site/config.properties* file and ensure that the value of ***resources.created parameter*** is set to 0.
3. Navigate to the NX_ROOT/bin and open the command prompt and run the below commands:
   ```
   pdm_options_mgr -c -s attach_force_save_dialog -v 1 -a pdm_option.inst -t
   pdm_options_mgr -c -s doc_url -v "https://docops.ca.com/rest/ca/product/latest/topic" -a pdm_option.ins -
   tt
   pdm_options_mgr -c -s doc_default_hid -v "HID_Service_Management_Home_Page" -a pdm_option.inst
   pdm_options_mgr -c -s doc_space_prefix -v "CASM" -a pdm_option.inst
   ```
4. For conventional mode and all application servers and stand-by servers for advanced availability, run:
   ```
   pdm_configure
   ```
   Advanced availability on the BG Server run:
   ```
   pdm_configure -S
   ```

5. Change the directory to **NX_ROOT/data**, and execute the following command:

   NOTE

   Apply the *pdm_load* command once on Primary Server in Conventional mode or Background Server in Advance Availability mode.

```
pdm_load -f r17_3_insert.dat
pdm_load -u -f r17_3_update.dat
pdm_load -f r17_4_insert.dat
pdm_load -u -f r17_4_update.dat
```

6. Clear the browser cache by running the following command:

```
pdm_webcache -H
pdm_webcache -b
```

7. Restart the CA SDM Services.

Remote Web Screen Painter (WSP) and Java Update

If you have installed Remote Web Screen Painter in your environment, perform the following steps:

1. Log in to the server where CA SDM is installed:
   a. Navigate to `$NX_ROOT/java/lib` folder.
   b. Copy the following jar files:
      1. WebScreenPainter.jar
      2. sd-utils.jar
      3. domsrvr_utils.jar
      4. slump.jar
      5. log4j-api-2.17.1.jar
      6. log4j-core-2.17.1.jar
      7. log4j-jcl-2.17.1.jar
2. Log in to the server where remote WSP is installed:
   a. Navigate to `$NX_ROOT/java/lib` folder and paste the jar files that you copied in Step 1.
3. Log in to the server where CA SDM is installed:
   a. Navigate to `$NX_ROOT/SC/JRE` folder.
   b. Copy the `11.0.18` folder.
4. Log in to the server where remote WSP is installed:
   a. Navigate to `$NX_ROOT/SC/JRE` folder.
   b. Paste the `11.0.18` folder.
   c. Navigate to the `$NX_ROOT` folder.
   d. Open the `NX.env` file in a text editor.
   e. Find the parameter `NX_JRE_INSTALL_DIR=`
   f. Modify the parameter value from 1.8.0_112 to **11.0.18**
   a. Save the `NX.env` file.
   Remote WSP is upgraded to AdoptOpenJDK 11.0.18
5. Launch remote WSP to verify that you are able to design and customize CA SDM forms.

Manual Post-Installation Task for CMDB

To run CA Service Management 17.4 in SSL environment, CA SDM Administrators must perform the following post-installation steps for CMDB Visualizer Interface to open using the **HTTPS** protocol when launching from CA SDM UI:

1. In the NX.env file, change the **NX_CMDB_VISUALIZER** entry to provide **HTTPS protocol** and **HTTPS port**.

For example: @NX_CMDB_VISUALIZER=https://sdmurl:<VIZ_SSL_PORT>/CMDBVisualizer

2. In **casm.conf.js** file from NX_root\bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\viz-ux\conf, provide the HTTPS as protocol and HTTP port.
   For example:

```
sdm: {

      vizserver: 'https://sdmurl:<VIZ_SSL_PORT>/CMDBVisualizer/viz',
      server: 'https:// sdmurl:<SDM_SSL_PORT>/CAisd/pdmweb.exe'
    }
```

Manual Post-Installation Task for OAuth 2.0 (Maileater/Mailer)

After generating an access token for OAuth 2.0 to connect to a mail server, perform the mandatory post-install tasks on all servers in your environment:

1. Create a backup of web.xml from NX_ROOT\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF in your local directory to perform backout if required.
2. Open the web.xml file from NX_ROOT\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF.
3. Search for the following statement:
   ```
   <!--USD servlet mappings start-->
   ```
4. Copy and paste the following configuration under the statement:

```
<servlet>
  <servlet-name>OAuthProcessor</servlet-name>
  <servlet-class>com.broadcom.oAuth.OAuthProcessor</servlet-class>
 </servlet>
```

5. Copy and paste the following configuration after any <servlet-mapping>:

```
<servlet-mapping>
  <servlet-name>OAuthProcessor</servlet-name>
  <url-pattern>/OAuthProcessor</url-pattern>
</servlet-mapping>
```

6. Save and close the web.xml file.
7. For OAuth servlet preservation in a primary and secondary environment, the secondary server must also have the OAuth processor entries in the following file: *<NX_ROOT>\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF\web.xml.last*.
8. Repeat Steps 1-8 to update **web.xml.tpl** file in the NX_ROOT\samples\pdmconf\web.xml.tpl folder to avoid losing these changes when pdm_configure is run at a later point of time.
9. Run the following command:
   ```
   pdm_tomcat_nxd -c STOP command
   ```
10. Wait for some time (a minute or so) and run the following command:
    ```
    pdm_tomcat_nxd -c START command
    ```

For more information, see Define a mailbox.

Manual Post-Installation Task for Excel file (.xlsx) export*

1. Execute the following command:
   ```
   pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst
   ```
2. Execute the following command to add the new NX variable to NX.env.tpl file.

```
pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst -t
```

3. Restart CA SDM services.

(Optional) Manual Post-Installation Task for Knowledge Document export with German fields

If you are exporting Knowledge Document with German Fields (included in the export field list), then perform the below post-install steps for successful export of knowledge documents:

1. Take the backup of NX_ROOT\NX.env file (NX_ROOT is the installation directory for CA Service Desk Manager).
2. Open NX_ROOT\pdmconf\NX.env_nt.tpl file using any text editor and take the value of NX variable @NX_KEIT_AVAILABLE_FIELDS which is COPIED_DATA and update Nx.env in NX_ROOT by executing below command:

   ```
   pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <COPIED_DATA>  -a  pdm_option.inst
   ```

   Where COPIED_DATA is the value copied from NX.env_nt.tpl (step 2).
   For example, " pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <provide the exact string here> -a pdm_option.inst "
   Note to avoid losing the updated changes when you run pdm_configure, execute the above command with the '-t' flag as follows:

   ```
   pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <COPIED_DATA> -a pdm_option.inst -t
   ```

(Optional)Manually added NX variables need to be merged, after upgrading to 17.4.0.0

Manually updated NX variables are lost when a GA release or RU patch delivers a new `NX.env_nt.tpl` file (located in `NX_ROOT/pdmconf`). This necessitates an additional manual step to merge the custom values from the backup file of `NX.env_nt.tpl` created by `pdm_configure`.

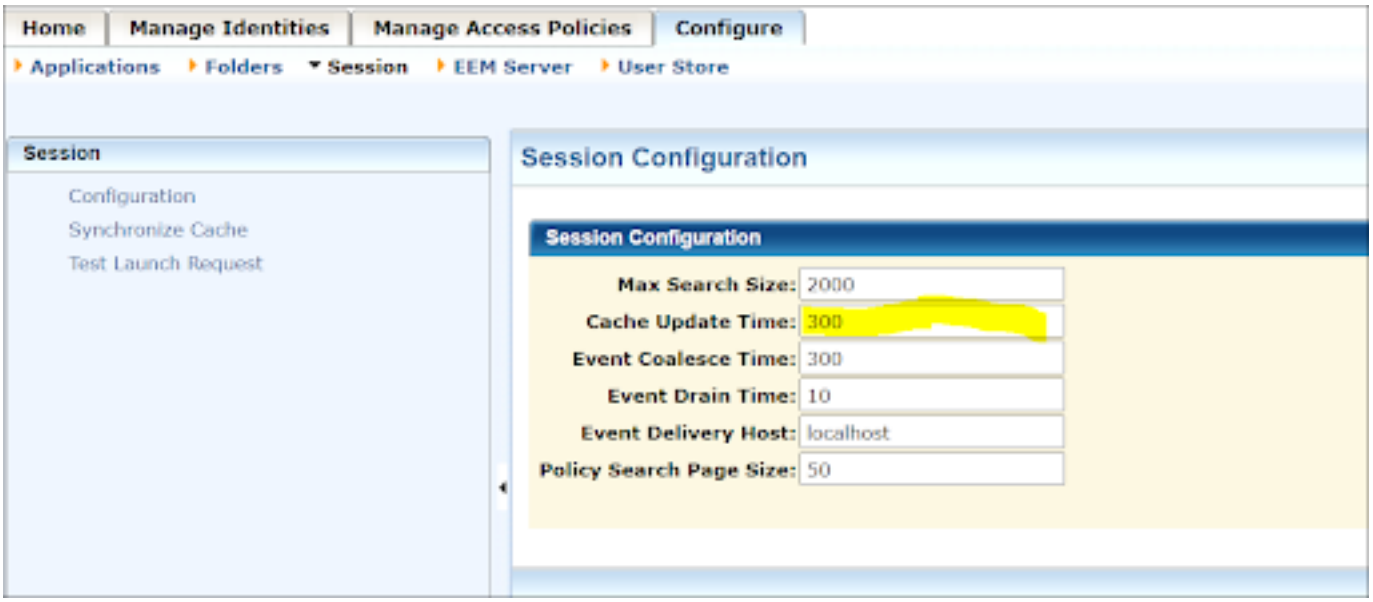
- Manually merge the required changes into the NX.env_nt.tpl file located in NX_ROOT\pdmconf from the backup file at NX_ROOT\REPLACED\GOL-78_EN_US.OLD\pdmconf\NX.env_nt.tpl.
- Restart the SDM services.
- **For Conventional Mode**: Restart the SDM services on all secondary servers.
- **For Advanced Availability Mode**: Restart the SDM services on all standby servers and application servers.

(Optional) Manual Post-Installation Task for EEM Cache Timeout Configuration Update

You may face issues while logging in to EEM or SDM using the EEM user accounts due to a session cache timeout mismatch between EEM and SDM.

In 17.4, you can update the EEM cache timeout configuration by adding a new NX variable, "NX_EEM_CACHE_UPDATE_TIME" in SDM.

Keep the value the same as the EEM cache timeout configuration value mentioned in the following screenshot.



To set the EEM cache update time to 300 seconds, perform the following steps:

To add the variable in the **nx.env** file, run the following command:

```
pdm_options_mgr -c -s  EEM_CACHE_UPDATE_TIME  -v 300 -a pdm_option.inst
```

To add the variable in the **nxenv_nt.tpl** file, run the following command:

```
pdm_options_mgr -c -s  EEM_CACHE_UPDATE_TIME  -v 300 -a pdm_option.inst -t
```

If 17.4 xFlow/ Service Point is installed

After succesful installation of 17.4 xFlow/ Service Point refresh index and data on the Search Server, then perform the following steps:

Run the PDM_ES_REBUILD_INDEX Command Utility

To view the Service Catalog data (Service request and Service offering) in the Service Point, execute one of the files based on your operating system:

- $ES_HOME/search/bin/pdm_es_rebuild_index.bat (Windows)
- $ES_HOME/search/bin/pdm_es_rebuild_index.sh (Linux)

NOTE
In case of Linux Search Server environment, ensure to run the following commands on the terminal:

```
sysctl -w vm.max_map_count=262144
ulimit -Hn 65535
```

WARNING
We recommend that you execute the pdm_es_rebuild_index command during off-peak hours as it affects the CA Service Catalog server performance.

(Optional) Manual Post-Installation Task for Rebuild Index

If you have upgraded or are planning to install CA EEM 12.6 with Service Point and CA Service Catalog, ensure that you rebuild the CA Service Catalog index after completing the CA EEM upgrade/installation process. For more information, see Perform Initial Load and Refresh Index Data on Search Server.
Run the following command to rebuild the index:

```
$ES_HOME/search/bin/pdm_es_rebuild_index.bat index=catalog_index
```

Display CA Service Catalog Featured Offerings in Service Point

After successful installation or after upgrading to CA Service Management 17.4, perform the following mandatory steps if you have an integrated environment of CA SDM and CA Service Catalog and you want to display Service Catalog Featured Offerings in Service Point. Before performing the following steps, ensure that you execute the "*pdm_es_rebuild_index.bat*" from where you have installed Search Server <*SearchServer_Installed_location>/search/bin*.

There are two ways to perform these mandatory steps, you can select one of these approaches as per your environmental requirements:

Approach 1

1. Navigate to the where you have installed xFlow Interface <*xFlow_Installed_location>/APPS/Services/searchmicroservice-<xx.x.xxx>/conf*> and edit the ***eiam.config*** file.
2. Search for *Logger Configuration* and comment it.
3. After commenting *Logger Configuration*, add the following step right after *Logger Configuration*:
   ```
   <LoggerConfiguration file="<xFlow_Installed_Location>\APPS\Services\searchmicroservice-.<xx.x.xxx>\conf
   \eiam.log4j.config"/>
   ```
4. Save the file.
5. Restart the xFlow Interface Services.

OR

Approach 2

1. After successful installation or after upgrading to CA Service Management 17.4, relaunch the CA Service Management 17.4 Installer wizard.
2. Select and select "**Integrate pre-installed solution components**" and continue with the installation process to complete integrating the solution components.

Update the Federated Search Configuration File

These steps are mandatory if you have configured Federated Search for CA Service Management 17.4. These steps must be performed for Advanced Availability and Conventional Configurations.

1. Shut down the Federated Search Tomcat server if CA SDM Services are up and running by executing the following command:
   ```
   pdm_tomcat_nxd -c stop -t FS
   ```
2. Update the *catalina.properties* file (*bopcfg\www\CATALINA_BASE_FS\conf\catalina.properties)*
   Search for *"common.loader=*" and replace it with the following:
   ```
   common.loader="${catalina.base}/lib/axis2/*.jar","${catalina.base}/lib","${catalina.base}/lib/
   *.jar","${catalina.home}/lib","${catalina.home}/lib/*.jar","${catalina.base}/../../../java/lib/CXF/*.jar"
   ```
3. Start the Federated Search Tomcat Server by executing the following command:
   ```
   pdm_tomcat_nxd -c start -t FS
   ```

Post-Installation Tasks After Installing CA SDM 17.4 on CA SDM 17.3

CA Service Desk Manager

If you have selected **No** for automating the post-install steps while running the installer wizard, perform manually the following post-install tasks as per your deployment requirement.

> **NOTE**
>
> For **Advance Availability Mode**: Perform the following steps sequentially on Background, Standby, and Application servers.

For **Conventional Mode**: Perform the following steps sequentially on Primary and Secondary Servers.

Update the Minor Version in Nx.Env file

The help option (Help Option on this Window) from the CA SDM User Interface provides context-sensitive product documentation. Perform the following steps to view the Help Window:

Perform the following steps:

1. Navigate to the `$NX_ROOT\site` folder.
   a. Open the `install.properties` in a text editor.
   b. Find the parameter: `genfact.gx_minor_ver`
   c. Modify the value to **4**
   d. genfact.gx_copyright_year=2023
2. Navigate to *NX_ROOT/site/config.properties* file and ensure that the value of ***resources.created parameter*** is set to 0.
3. Navigate to the NX_ROOT/bin and open the command prompt and run the below commands:

```
pdm_options_mgr -c -s attach_force_save_dialog -v 1 -a pdm_option.inst -t
pdm_options_mgr -c -s doc_url -v "https://docops.ca.com/rest/ca/product/latest/topic" -a pdm_option.ins -
tt
pdm_options_mgr -c -s doc_default_hid -v "HID_Service_Management_Home_Page" -a pdm_option.inst
pdm_options_mgr -c -s doc_space_prefix -v "CASM" -a pdm_option.inst
```

4. For conventional mode and all application servers and stand-by servers for advanced availability, run:

```
pdm_configure
```

   Advanced availability on the BG Server run:

```
pdm_configure -S
```

5. Change the directory to **NX_ROOT/data**, and execute the following command:

   NOTE

   Apply the *pdm_load* command once on Primary Server in Conventional mode or Background Server in Advance Availability mode.

```
pdm_load -f r17_4_insert.dat
pdm_load -u -f r17_4_update.dat
```

6. Clear the browser cache by running the following command:

```
pdm_webcache -H
pdm_webcache -b
```

7. Restart the CA SDM Services.

Remote Web Screen Painter (WSP) and Java Update

If you have installed Remote Web Screen Painter in your environment, perform the following steps:

1. Log in to the server where CA SDM is installed:
   a. Navigate to `$NX_ROOT/java/lib` folder.
   b. Copy the following jar files:
      1. WebScreenPainter.jar
      2. sd-utils.jar
      3. domsrvr_utils.jar
      4. slump.jar
      5. log4j-api-2.17.1.jar
      6. log4j-core-2.17.1.jar

7. log4j-jcl-2.17.1.jar

2. Log in to the server where remote WSP is installed:
   a. Navigate to `$NX_ROOT/java/lib` folder and paste the jar files that you copied in Step 1.
3. Log in to the server where CA SDM is installed:
   a. Navigate to `$NX_ROOT/SC/JRE` folder.
   b. Copy the `11.0.18` folder.
4. Log in to the server where remote WSP is installed:
   a. Navigate to `$NX_ROOT/SC/JRE` folder.
   b. Paste the `11.0.18` folder.
   c. Navigate to the `$NX_ROOT` folder.
   d. Open the `NX.env` file in a text editor.
   e. Find the parameter `NX_JRE_INSTALL_DIR=`
   f. Modify the parameter value from **11.0.3** to **11.0.18**
   a. Save the `NX.env` file.
   Remote WSP is upgraded to AdoptOpenJDK 11.0.18
5. Launch remote WSP to verify that you are able to design and customize CA SDM forms.

Manual Post-Installation Task for CMDB

To run CA Service Management 17.4 in SSL environment, CA SDM Administrators must perform the following post-installation steps for CMDB Visualizer Interface to open using the **HTTPS** protocol when launching from CA SDM UI:

1. In the NX.env file, change the **NX_CMDB_VISUALIZER** entry to provide **HTTPS protocol** and **HTTPS port**.
   For example: @NX_CMDB_VISUALIZER=https://sdmurl:<VIZ_SSL_PORT>/CMDBVisualizer
2. In **casm.conf.js** file from NX_root\bopcfg\www\CATALINA_BASE_VIZ\webapps\CMDBVisualizer\viz-ux\conf, provide the HTTPS as protocol and HTTP port.
   For example:

```
sdm: {

      vizserver: 'https://sdmurl:<VIZ_SSL_PORT>/CMDBVisualizer/viz',
      server: 'https:// sdmurl:<SDM_SSL_PORT>/CAisd/pdmweb.exe'
    }
```

Manual Post-Installation Task for OAuth 2.0 (Maileater/Mailer)

After generating an access token for OAuth 2.0 to connect to a mail server, perform the mandatory post-install tasks on all servers in your environment:

1. Create a backup of web.xml from NX_ROOT\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF in your local directory to perform backout if required.
2. Open the web.xml file from NX_ROOT\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF.
3. Search for the following statement:

```
<!--USD servlet mappings start-->
```

4. Copy and paste the following configuration under the statement:

```
<servlet>
  <servlet-name>OAuthProcessor</servlet-name>
  <servlet-class>com.broadcom.oAuth.OAuthProcessor</servlet-class>
 </servlet>
```

5. Copy and paste the following configuration after any <servlet-mapping>:

```
<servlet-mapping>
  <servlet-name>OAuthProcessor</servlet-name>
  <url-pattern>/OAuthProcessor</url-pattern>
</servlet-mapping>
```

6. Save and close the web.xml file.
7. For OAuth servlet preservation in a primary and secondary environment, the secondary server must also have the OAuth processor entries in the following file: *<NX_ROOT>\bopcfg\www\CATALINA_BASE\webapps\CAisd\WEB-INF\web.xml.last*.
8. Repeat Steps 1-8 to update **web.xml.tpl** file in the NX_ROOT\samples\pdmconf\web.xml.tpl folder to avoid losing these changes when pdm_configure is run at a later point of time.
9. Run the following command:
   ```
   pdm_tomcat_nxd -c STOP command
   ```
10. Wait for some time (a minute or so) and run the following command:
    ```
    pdm_tomcat_nxd -c START command
    ```

For more information, see Define a mailbox.

Manual Post-Installation Task for Excel file (.xlsx) export*

1. Execute the following command:
   ```
   pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst
   ```
2. Execute the following command to add the new NX variable to NX.env.tpl file.
   ```
   pdm_options_mgr -c -s use_legacy_export -v "No" -a pdm_option.inst -t
   ```
3. Restart CA SDM services.

(Optional) Manual Post-Installation Task for Knowledge Document export with German fields

If you are exporting Knowledge Document with German Fields (included in the export field list), then perform the below post-install steps for successful export of knowledge documents:

1. Take the backup of NX_ROOT\NX.env file (NX_ROOT is the installation directory for CA Service Desk Manager).
2. Open NX_ROOT\pdmconf\NX.env_nt.tpl file using any text editor and take the value of NX variable @NX_KEIT_AVAILABLE_FIELDS which is COPIED_DATA and update Nx.env in NX_ROOT by executing below command:
   ```
   pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <COPIED_DATA>  -a  pdm_option.inst
   ```
   Where COPIED_DATA is the value copied from NX.env_nt.tpl (step 2).
   For example, " pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <provide the exact string here> -a pdm_option.inst "
   Note to avoid losing the updated changes when you run pdm_configure, execute the above command with the '-t' flag as follows:
   ```
   pdm_options_mgr -c -s KEIT_AVAILABLE_FIELDS -v <COPIED_DATA> -a pdm_option.inst -t
   ```

(Optional)Manually added NX variables need to be merged, after upgrading to 17.4.0.0

Manually updated NX variables are lost when a GA release or RU patch delivers a new `NX.env_nt.tpl` file (located in `NX_ROOT/pdmconf`). This necessitates an additional manual step to merge the custom values from the backup file of `NX.env_nt.tpl` created by `pdm_configure`.

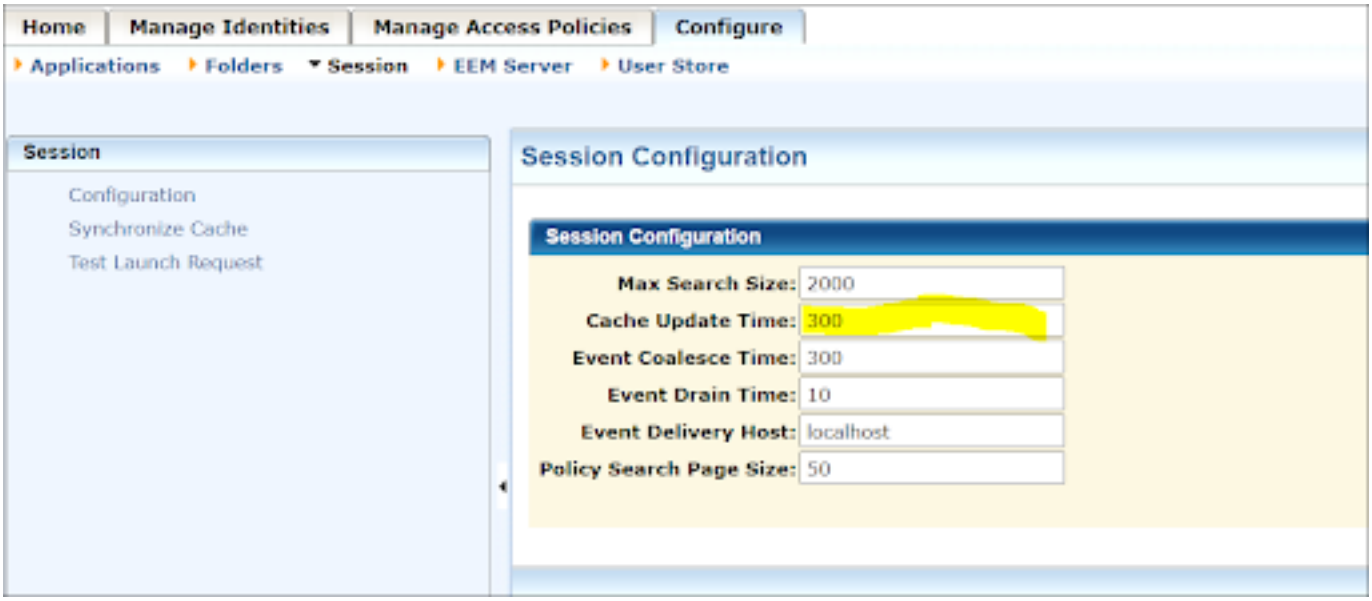
- Manually merge the required changes into the NX.env_nt.tpl file located in NX_ROOT\pdmconf from the backup file at NX_ROOT\REPLACED\GOL-78_EN_US.OLD\pdmconf\NX.env_nt.tpl.
- Restart the SDM services.
- **For Conventional Mode**: Restart the SDM services on all secondary servers.
- **For Advanced Availability Mode**: Restart the SDM services on all standby servers and application servers.

(Optional) Manual Post-Installation Task for EEM Cache Timeout Configuration Update

You may face issues while logging in to EEM or SDM using the EEM user accounts due to a session cache timeout mismatch between EEM and SDM.

In 17.4, you can update the EEM cache timeout configuration by adding a new NX variable, "NX_EEM_CACHE_UPDATE_TIME" in SDM.

Keep the value the same as the EEM cache timeout configuration value mentioned in the following screenshot.



To set the EEM cache update time to 300 seconds, perform the following steps:

To add the variable in the **nx.env** file, run the following command:

```
pdm_options_mgr -c -s  EEM_CACHE_UPDATE_TIME  -v 300 -a pdm_option.inst
```

To add the variable in the **nxenv_nt.tpl** file, run the following command:

```
pdm_options_mgr -c -s  EEM_CACHE_UPDATE_TIME  -v 300 -a pdm_option.inst -t
```

If 17.4 xFlow/ Service Point is installed

After succesful installation of 17.4 xFlow/ Service Point refresh index and data on the Search Server, then perform the following steps:

Run the PDM_ES_REBUILD_INDEX Command Utility

To view the Service Catalog data (Service request and Service offering) in the Service Point, execute one of the files based on your operating system:

- $ES_HOME/search/bin/pdm_es_rebuild_index.bat (Windows)
- $ES_HOME/search/bin/pdm_es_rebuild_index.sh (Linux)

NOTE
In case of Linux Search Server environment, ensure to run the following commands on the terminal:

```
sysctl -w vm.max_map_count=262144
ulimit -Hn 65535
```

WARNING
We recommend that you execute the pdm_es_rebuild_index command during off-peak hours as it affects the CA Service Catalog server performance.

(Optional) Manual Post-Installation Task for Rebuild Index

If you have upgraded or are planning to install CA EEM 12.6 with Service Point and CA Service Catalog, ensure that you rebuild the CA Service Catalog index after completing the CA EEM upgrade/installation process. For more information, see Perform Initial Load and Refresh Index Data on Search Server.
Run the following command to rebuild the index:

```
$ES_HOME/search/bin/pdm_es_rebuild_index.bat index=catalog_index
```

Display CA Service Catalog Featured Offerings in Service Point

After successful installation or after upgrading to CA Service Management 17.4, perform the following mandatory steps if you have an integrated environment of CA SDM and CA Service Catalog and you want to display Service Catalog Featured Offerings in Service Point. Before performing the following steps, ensure that you execute the "*pdm_es_rebuild_index.bat*" from where you have installed Search Server <*SearchServer_Installed_location*>*/search/bin*.

There are two ways to perform these mandatory steps, you can select one of these approaches as per your environmental requirements:

Approach 1

1. Navigate to the where you have installed xFlow Interface <*xFlow_Installed_location*>*/APPS/Services/searchmicroservice-*<*xx.x.xxx*>*/conf*> and edit the ***eiam.config*** file.
2. Search for *Logger Configuration* and comment it.
3. After commenting *Logger Configuration*, add the following step right after *Logger Configuration*:

   ```
   <LoggerConfiguration file="<xFlow_Installed_Location>\APPS\Services\searchmicroservice-.<xx.x.xxx>\conf
   \eiam.log4j.config"/>
   ```
4. Save the file.
5. Restart the xFlow Interface Services.

OR

Approach 2

1. After successful installation or after upgrading to CA Service Management 17.4, relaunch the CA Service Management 17.4 Installer wizard.
2. Select and select "**Integrate pre-installed solution components**" and continue with the installation process to complete integrating the solution components.

Update the Federated Search Configuration File

These steps are mandatory if you have configured Federated Search for CA Service Management 17.4. These steps must be performed for Advanced Availability and Conventional Configurations.

1. Shut down the Federated Search Tomcat server if CA SDM Services are up and running by executing the following command:

   ```
   pdm_tomcat_nxd -c stop -t FS
   ```
2. Update the *catalina.properties* file (*bopcfg\www\CATALINA_BASE_FS\conf\catalina.properties)*
   Search for *"common.loader=*" and replace it with the following:

   ```
   common.loader="${catalina.base}/lib/axis2/*.jar","${catalina.base}/lib","${catalina.base}/lib/
   *.jar","${catalina.home}/lib","${catalina.home}/lib/*.jar","${catalina.base}/../../../java/lib/CXF/*.jar"
   ```
3. Start the Federated Search Tomcat Server by executing the following command:

   ```
   pdm_tomcat_nxd -c start -t FS
   ```

CA Service Catalog Post Installation Tasks

WARNING

If the CA Service Catalog is installed after installing CA SDM and xFlow Interface, then run 'Integrate Pre-installed Solution Components.'

NOTE
If you install CA Service Catalog 17.4, follow these post- installation tasks.

As part of implementing CA Service Catalog, review the following manual post-installation tasks and perform the tasks that apply:

- Post installation tasks after installing CA Service Catalog 17.4 on 17.3.0.1 or later versions
- After Upgrading to CA Service Catalog 17.4 from 17.1/17.2/17.3

After Installing CA Service Catalog 17.4 on 17.3.0.1 or later versions

Post installation tasks after installing CA Service Catalog 17.4 on 17.3.0.1 or later versions.

Review and perform the post-installation steps based on your deployment requirements.

NOTE
If any SSL certificate(s) chain was imported to the Oracle Java's JAVA_HOME\lib\security\cacerts Keystore, those certificate(s) chain again need to be exported explicitly and imported properly into the new AdoptOpenJDK's %USM_HOME%\embedded\jdk\lib\security\cacerts Keystore.

Follow these steps

- (Optional) If Service Catalog is accessed from applications like Service Point, SharePoint and so on, then you must perform this step. Open the "**web.xml**" file located at *USM_HOME%\view\webapps\usm\WEB-INF* and update the respective parameter values for the parameter name "cors.allowed.origins" and "cors.support.credentials".
  For example, if you are using Catalog Widgets in Service Point:
  - Search the parameter name "**cors.allowed.origins**" and update the respective parameter value as shown here.

    ```
    <param-name>cors.allowed.origins</param-name>
    <param-value>http://servicepointhostname:servicepointport</param-value>
    ```

    NOTE
    If you have to add multiple entries, use "," (comma) as a separator.
  - Search the parameter name "**cors.support.credentials**" and update the respective parameter value to true as shown here.

    ```
    <param-name>cors.support.credentials</param-name>
    <param-value>true</param-value>
    ```

    Retain the default configuration in web XML, if no other application is accessing catalog:

    ```
    <param-name>cors.allowed.origins</param-name>
    <param-value>*</param-value>
    <param-name>cors.support.credentials</param-name>
    <param-value>false</param-value>
    ```
- Restart the CA Service Catalog services.
- (Optional) Unable to approve any workflow requests through email. The email sent for approvals is corrupted with special characters. Follow the KB article steps.

After Upgrading to CA Service Catalog 17.4 from 17.1/17.2/17.3

Post Installation tasks after installing CA Service catalog 17.4

Review and perform the post-installation steps based on your deployment requirements:

Update configuration files

After upgrading to CA Service Catalog 17.4, perform the following post-install steps:

1. (Mandatory) Update the **server.xml** file in USM_HOME\view\conf location. Add the below attributes to **HTTP** and **HTTPS** connector tags to allow below characters which are mandatory for the application to work.

   ```
   relaxedPathChars="[]|{}^&#x5c;&#x60;&quot;&lt;&gt;" relaxedQueryChars="[]|{}^&#x5c;&#x60;&quot;&lt;&gt;"
   ```

   For example:

   ```
   <!-- Define a HTTP/1.1 Connector on port XXXX -->
   <Connector port="XXXX" disableUploadTimeout="true" URIEncoding="UTF-8"
   ..
   ..
   relaxedPathChars="[]|{}^&#x5c;&#x60;&quot;&lt;&gt;" relaxedQueryChars="[]|{}^&#x5c;&#x60;&quot;&lt;&gt;"
   />

   <!-- Define a SSL HTTP/1.1 Connector on port XXXX -->
   <Connector port="XXXX" disableUploadTimeout="true" URIEncoding="UTF-8"
   ..
   ..
   relaxedPathChars="[]|{}^&#x5c;&#x60;&quot;&lt;&gt;" relaxedQueryChars="[]|{}^&#x5c;&#x60;&quot;&lt;&gt;"
   />
   ```

   Tomcat **server.xml** allows special characters in Hex code format in **relaxedPathChars** and **relaxedQueryChars**. For more information, see the special characters and their respective Hex codes:

Special Character Name	Special Character	Hex Code
Backslash	\	\
Grave accent	`	`
Double quotes	"	"
Less than	<	<
Greater than	>	>

2. Open USM_HOME\view\conf\viewService.conf file to edit as an Administrator and search for: **wrapper.java.additional.23=-Xverify:none**
   a. Add the following entries after **wrapper.java.additional.23=-Xverify:none**

      ```
      #trust these packages for serialize for upgraded activemq
      wrapper.java.additional.24=-
      Dorg.apache.activemq.SERIALIZABLE_PACKAGES=java.lang,javax.security,java.util,org.apache.activemq,org.fusesource
      ```

      NOTE
      While adding the entry "wrapper.java.additional.**24**", maintain the step sequence.

   b. Save the file.
   c. Restart the CA Service Catalog services.
3. (Optional) If Service Catalog is accessed from applications like ServicePoint, SharePoint, and so on, you must perform this step. Open the "**web.xml**" file that is located at *USM_HOME%\view\webapps\usm\WEB-INF* and update the respective parameter values for the parameter name "cors.allowed.origins" and "cors.support.credentials". For example, if you are using Catalog Widgets in ServicePoint:
   – Search the parameter name "**cors.allowed.origins**" and update the respective parameter value as shown here.

      NOTE
      Hostname in the below URL address must be provided in lower case.

      ```
      <param-name>cors.allowed.origins</param-name>
      ```

```
<param-value>http://<servicepointhostname>:<servicepointport></param-value>
```

– Search the parameter name "**cors.support.credentials**" and update the respective parameter value to true as shown here.

```
<param-name>cors.support.credentials</param-name>
<param-value>true</param-value>
```

Retain the default configuration in web XML, if no other application is accessing catalog:

```
<param-name>cors.allowed.origins</param-name>
<param-value>*</param-value>

<param-name>cors.support.credentials</param-name>
<param-value>false</param-value>
```

NOTE
If CA Service Catalog and CA Service Point are installed in two different machines (cross domain), then it is mandatory to enable SSL and setting Service Catalog Cookie to crossdomain. Follow the steps mentioned in this page.

Update the Login Logo file for Shared Filestore

After successful installation of CA Service Catalog 17.4, if you have a shared filestore, you must merge the **logon.css** file from USM_HOME\ filestore\themes\common\css\ to your filestore location. Changes for logo are found in **.loginlogoimage class**. This is required to avoid multiple overlaps of login logo files.

NOTE
In case, if you notice overlapping of login logo files after making the above changes, try clearing your browser cache.

Change Your Password

Changing the password is especially recommended for the user named spadmin (the Service Delivery administrator). In addition, you can also change it at any time, for various security-related reasons.

Follow these steps:

1. Log in to CA Service Catalog with your current user name and password.
2. Click **Profile**.
3. Click the **Change Password** button at the top right of the page.
4. Enter your old and new passwords in the fields provided.
5. Click **OK**.

You have changed your password.

Assign the Service Delivery Administrator Role to a User

Typically, the CA Service Catalog installation creates a user who is named *spadmin* and assigns it the Service Delivery administrator role. This user has complete control of the Catalog system. By default, the user name and the password are the same.

However, if *all* of the following conditions exist, then the installation *cannot* create this user.

- You have installed CA Service Catalog for the first time (*not* upgraded).
- CA EEM is already installed.
- CA EEM is already configured to use an external store, such as Microsoft Active Directory.

In this case, assign the Service Delivery Administrator role to another user. Doing so enables this user to log in to CA Service Catalog using the Service Delivery Administrator role. You can also assign the Service Delivery Administrator role to other users. Doing so is optional but is beneficial if redundancy is important in your organization.

Follow these steps:

1. Open the CA Service Catalog command prompt by clicking Start, Programs, CA, Service Catalog, Service Catalog Command Prompt.
2. Enter the following command at the CA Service Catalog command prompt:
   ```
   ant add-spadmin-user
   ```
   NOTE
   For a list of ant commands and their descriptions, open a command window and enter **ant -p**.
3. Follow the prompts to add the spadmin administrator role to a specific user, using the following information:
   - If CA EEM *is* configured to use an external directory (such as Microsoft Active Directory), specify an existing user name.
   - The command utility creates the user in the CA Service Catalog user database if both of the following conditions exist:
     - CA EEM is *not* configured to use an external directory.
     - The user name that you specify is new.
   - The command utility does *not* prompt you for the password of the new or updated user.
   - If CA EEM *is* configured to use an external directory, the password is defined and stored in the external directory.
   - The new password is the same as the user name, if both of the following conditions exist:
     - CA EEM is *not* configured to use an external directory.
     - The user name that you specify is new.
4. If necessary, cancel and rerun the ant add-spadmin-user command to correct any errors.
5. Verify that the new or updated user can log in to CA Service Catalog as a Service Delivery Administrator and can perform the spadmin functions.
6. (Optional) Instruct the new user to change the password.

You have assigned the Service Delivery Administrator role to a user.

(Optional) Apache Tomcat Server – AJP Connector Configuration

Perform the following steps if you have configured CA Service Catalog with Apache Tomcat Load balancer:

1. Navigate to where Apache Tomcat is installed and open the **worker.properties** file.
2. Add secret to each worker node in the **worker.properties** file as shown below:
   ```
   worker.<JVMRoute>.secret= <Secret_value>
   ```
   For example: **worker.COMPUTER2_USMView.secret= <xxxx>**
   NOTE
   This attribute must be specified with a **non-null**, **non-zero length** value. For more details, refer to APJ Connector.
3. Restart Apache Tomcat server.

Update MaxKeepAliveRequests

If you installed CA EEM 12.6.6 in a clustered setup and have updated the MaxKeepAliveRequests property in the Apache proxy.conf file to meet the CA EEM installation requirements. Now, reset the MaxKeepAliveRequests property to its original value.

NOTE

The installation or upgrade program backs up your existing CA EEM data to the following location:

***USM_HOME*\conf-backup\upgrade-eem-backup.xml**

Integrate Pre-Installed Solution Components

This article is applicable only if you have installed the CA Service Management 17.4 for the first time and followed the sequence of the product installation as shown below:

1. CA Service Desk Manager
2. xFlow Interface
3. CA Service Catalog
4. Other Components

If you have installed CA Service Management 17.4 products in above sequence, run the "**Integrate Pre-Installed Solution Components**" on the server in which **CA SDM/xFlow Interface** is installed.

Follow these steps:

1. Launch the CA Service Management 17.4 installer on the server where you have installed CA Service Desk Manager. Right-click the **Setup.exe** file to select the **run as administrator** option.
2. Select the language and click **Next**.
3. Select **Integrate Pre-installed solution components**.
4. Review and Accept the License Agreement Information and click **Next**.
5. Select **Microsoft SQL Server** or **Oracle** as the database type in the Database Configuration screen.
   For the Windows Microsoft SQL Server database, **mdadmin** is the default user.
   For the Oracle database, verify that you are providing a valid tablespace path. If this path is invalid, then the database installation fails. The following path is an example of a valid Oracle tablespace path: `C:\app\Administrator\oradata\Oracle_Service_Name.`
6. Provide the database details:
   a. If you have **a Microsoft SQL Server** database, provide the following field information:
      - **Database Server**: Enter the hostname of the database server.
        If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
      - **Database Name**: Enter the Database name (MDB), the name of the target DBMS. The default value is mdb.
      - **Database Port**: Provide the port identifier for the target DBMS.
      - **Database Server Instance**: The database instance name, Leave this field blank if you are using the default instance.
      - **Database Admin User**: For Microsoft SQL Server, **sa** is the default value.
        The **sa** user is the admin user with permission to create a user and schema.
      - **Database Admin Password**: Enter the database password of the user specified by a database admin user. No default value is assigned to this parameter.
      - **mdbadmin Password**: Enter the password for the user specified for the MDB admin user.
      - **Confirm mdbadmin Password**: Confirm the password.
   b. If you have the **Oracle** database, provide the following field information:
      - **Database Server**: Enter the host name of the Oracle database server.
        If the target instance is part of a clustered instance, the virtual hostname of the cluster must be used.
      - **Oracle Service Name**: Enter the Oracle Service name.
      - **Listener Port**: Enter the listener port for the database.
      - **Net Service Name**: Enter the Net Service Name of Oracle database where the database resides.

If the database is remote, use the Net Service Name that is defined in the Oracle client on the local computer. CA SDM has access to the database through a local installation of the Oracle client.

- **DBA User Name**: Provide the name of an Oracle user with DBA access. The default value for DBA user is **SYS**.
- **DBA User Password**: Enter the password for the DBA user.
- **mdbadmin Password**: Enter the password for MDB admin.
- **Confirm mdbadmin Password**: Confirm the password.
- **Tablespace Path (on DB Server)**: Provide the tablespace path on the database server.
- **Oracle Home Path**: Provide the Oracle client 32-bit path.
- **Data Tablespace Name**: Provide the name of the data tablespace. The default value is MDB_DATA.
- **Index Tablespace Name**: Provide the index Tablespace Name: The default value is MDB_INDEX.

Click **Next**.

7. On ''Select the Products and Integrations'' page, configure common components is already selected. Click **Next**.
8. Review Product Endpoint and click **Next**.
9. Provide the CA EEM and click **Next**.
10. Provide the CA Process Automation Details and click **Next**.
11. Review the Pre-Installation Configuration page. Click **Next**.
12. Click **Install**. Review the integration progress and when complete, click **Next**.
13. Click **Finish** to exit the installer.

CA Asset Portfolio Management Post Installation Tasks

Post installation taks for CA Asset Portfolio Management.

After installing CA Asset Portfolio Management, perform the following post-installation tasks:

- Post-Installation Tasks After Installing CA APM on SQL Database
- Post-Installation Tasks After Installing CA APM on Oracle Database
- Additional Components Configuration
- Apache Tomcat Configuration
- (Optional) Configure Secure Network Communication
- (Optional) Config File Changes in WCF Service to Address Security vulnerabilities

Post-Installation Tasks After Installing CA APM on SQL Database

Manual Post-Installation Task for Removing jQuery, log4net, and log4j Vulnerabilities

After installing 17.4, delete jquery-1.3.2.min.js, jquery-ui-1.7.2.custom.min.js , log4net.dll, and log4j from their respective installed folders.
Perform the following steps:

1. Log on to CA APM Web Server, navigate to the <ITAM_install_dir>\ITAM\Web Server\castylesr5\javascript.
   Example: C:\Program Files (x86)\CA\ITAM\Web Server\castylesr5\javascript
   Locate and delete the jquery-1.3.2.min.js and jquery-ui-1.7.2.custom.min.js files from the directory.
2. Navigate to the ITAM_install_dir\CA\ITAM\Data Importer.
   Locate and delete the log4net.dll file from the directory.
3. Navigate to the C:\Program Files (x86)\CA\SC\CORA.
   Locate and delete the log4j-1.2.15.jar, log4j.properties, and ojdbc6.jar files from the directory.
4. Navigate to the ITAM_install_dir\CA\ITAM.
   Backup the following folders and manually delete them:

- CDB
- MDB
- jre8

5. Delete the *roslyn* folder from *<ITAM_intsalled_dir>\ITAM RestApi Service\bin* on the CA APM Application Server host, and Web Server host.
6. Perform an IISRESET and delete the browser's cache to load the upgraded files. Restart all CA APM services, AMS, and CA CASM services.

Post-Installation Tasks After Installing CA APM on Oracle Database

Perform the following manual post-install steps if you installed CA APM 17.4 on any Oracle database.

1. Open the **<<INSTALL_DIR>>\ITAM\Storage Manager Service\web.config** file and add the following entries inside the <configuration> element.

```
<system.data>
 <DbProviderFactories>
<!-- Remove in case this is already defined in the machine.config -->
<remove invariant="Oracle.ManagedDataAccess.Client" />
<add name="Oracle Data Provider for .NET" invariant="Oracle.ManagedDataAccess.Client" description="Oracle
 Data Provider for .NET, Managed Driver" type="Oracle.ManagedDataAccess.Client.OracleClientFactory,
 Oracle.ManagedDataAccess, Version=4.122.19.1, Culture=neutral, PublicKeyToken=89b483f429c47342" />
</DbProviderFactories>
</system.data>
```

   For example:

```
<configuration>
-----------------
<system.data>
<DbProviderFactories>
<!-- Remove in case this is already defined in the machine.config -->
<remove invariant="Oracle.ManagedDataAccess.Client" />
<add name="Oracle Data Provider for .NET" invariant="Oracle.ManagedDataAccess.Client" description="Oracle
 Data Provider for .NET, Managed Driver" type="Oracle.ManagedDataAccess.Client.OracleClientFactory,
 Oracle.ManagedDataAccess, Version=4.122.19.1, Culture=neutral, PublicKeyToken=89b483f429c47342" />
</DbProviderFactories>
</system.data>
----------------
</configuration>
```

2. Search the entry

```
<add assembly="System.Data.OracleClient, Version=4.0.0.0, Culture=neutral,
 PublicKeyToken=B77A5C561934E089"/>
```

   and replace with the following entry. Save the file.

```
<!--<add assembly="System.Data.OracleClient, Version=4.0.0.0, Culture=neutral,
 PublicKeyToken=B77A5C561934E089"/>-->
```

3. Open the **<<INSTALL_DIR>>\ITAM\WCF Service\web.config** file and add the following entries inside the <configuration> element.

```
<system.data>
<DbProviderFactories>
<!-- Remove in case this is already defined in the machine.config -->
<remove invariant="Oracle.ManagedDataAccess.Client" />
```

```
<add name="Oracle Data Provider for .NET" invariant="Oracle.ManagedDataAccess.Client" description="Oracle
 Data Provider for .NET, Managed Driver" type="Oracle.ManagedDataAccess.Client.OracleClientFactory,
 Oracle.ManagedDataAccess, Version=4.122.19.1, Culture=neutral, PublicKeyToken=89b483f429c47342" />

</DbProviderFactories>
</system.data>
```

For example:

```
<configuration>
-----------------
<system.data>
<DbProviderFactories>
<!-- Remove in case this is already defined in the machine.config -->
<remove invariant="Oracle.ManagedDataAccess.Client" />

<add name="Oracle Data Provider for .NET" invariant="Oracle.ManagedDataAccess.Client" description="Oracle
 Data Provider for .NET, Managed Driver" type="Oracle.ManagedDataAccess.Client.OracleClientFactory,
 Oracle.ManagedDataAccess, Version=4.122.19.1, Culture=neutral, PublicKeyToken=89b483f429c47342" />

</DbProviderFactories>
</system.data>
----------------
</configuration>
```

4. Search for the entry **<compilation debug="true" targetFramework="4.5"/>** in **<system.web>** element. Replace with the following:

```
<compilation debug="true" targetFramework="4.5">
<assemblies>
<add assembly="CA.Common.Transactions, Version=12.9.0.0, Culture=neutral, PublicKeyToken=null"/>
</assemblies>
</compilation>
```

5. Open the **<<INSTALL_DIR>>\ITAM\Import Processor\ImportProcessor.exe.config** file and add the following entries inside the configuration element.

```
<system.data>
<DbProviderFactories>
<!-- Remove in case this is already defined in the machine.config -->
<remove invariant="Oracle.ManagedDataAccess.Client" />

<add name="Oracle Data Provider for .NET" invariant="Oracle.ManagedDataAccess.Client" description="Oracle
 Data Provider for .NET, Managed Driver" type="Oracle.ManagedDataAccess.Client.OracleClientFactory,
 Oracle.ManagedDataAccess, Version=4.122.19.1, Culture=neutral, PublicKeyToken=89b483f429c47342" />

</DbProviderFactories>
</system.data>
```

For example:

```
<configuration>
-----------------
<system.data>
<DbProviderFactories>
<!-- Remove in case this is already defined in the machine.config -->
```

```
<remove invariant="Oracle.ManagedDataAccess.Client" />
<add name="Oracle Data Provider for .NET" invariant="Oracle.ManagedDataAccess.Client" description="Oracle
 Data Provider for .NET, Managed Driver" type="Oracle.ManagedDataAccess.Client.OracleClientFactory,
 Oracle.ManagedDataAccess, Version=4.122.19.1, Culture=neutral, PublicKeyToken=89b483f429c47342" />
</DbProviderFactories>
</system.data>
----------------
</configuration>
```

Manual Post-Installation Task for Removing jQuery, log4net, and log4j Vulnerabilities

After installing 17.4, delete jquery-1.3.2.min.js, jquery-ui-1.7.2.custom.min.js , log4net.dll, and log4j from their respective installed folders..

Perform the following steps:

1. Log on to CA APM Web Server, navigate to the <ITAM_install_dir>\ITAM\Web Server\castylesr5\javascript.
   Example: C:\Program Files (x86)\CA\ITAM\Web Server\castylesr5\javascript
   Locate and delete the jquery-1.3.2.min.js and jquery-ui-1.7.2.custom.min.js files from the directory.
2. Log on to CA APM Application Server and navigate to the ITAM_install_dir\CA\ITAM\Data Importer.
   Locate and delete the log4net.dll file from the directory.
3. Log on to CA APM Application Server and navigate to the C:\Program Files (x86)\CA\SC\CORA.
   Locate and delete the log4j-1.2.15.jar, log4j.properties, and ojdbc6.jar files from the directory.
4. Navigate to the ITAM_install_dir\CA\ITAM.
   Backup the following folders and manually delete them:
   - CDB
   - MDB
   - jre8
5. Delete the *roslyn* folder from *<ITAM_intsalled_dir>\ITAM RestApi Service\bin* on the CAAPM Application Server host, and Web Server host.
6. Perform an IISRESET and delete the browser's cache to load the upgraded files. Restart all CA APM services, AMS, and CA CASM services.

Additional Components Configuration

After installing CA APM, you can change the component configurations and can configure additional product components.

Follow these steps:

1. Log in to CA APM as an administrator.
2. Click **Administration**, **System Configuration**.
3. Click the product component that you want to configure.
4. Configure the settings. Click **Save**.
5. Do the following steps to recycle the settings in the application pool:
   a. Click **Start** menu, **Control Panel**.
   b. Double-click **Administrative Tools.**
   c. Double-click **Internet Information Services (IIS) Manager**.
   d. In the Connections pane, expand the server name, click **Application Pools,** select ITAM.
   e. In the Actions Pane, click **Stop** and then, click **Start**.
6. Restart the services.
7. For more information, see **Start the Services**.

NOTE
You cannot configure the database server from the System Configuration page. Update the corresponding configuration files for any database server configuration settings.

For more information about changing the component configurations and adding servers, see Manage Product Components.

Following components are configurable in the CA APM product:

Database Server

The database server is a product component that hosts the Oracle or SQL Server database management system for CA APM. The CA MDB is installed on the database server. The application server, Hardware Reconciliation Engine, and other product components retrieve data from and store data in the CA MDB.

The following fields require explanation:

- **MS SQL Server Instance**
  Defines the name of the MS SQL Server instance that is being configured. Enter the instance name only when multiple SQL Servers named instances exist. Leave the field blank if there is only one (default) instance.

  NOTE

  You can change the component configurations and can configure additional components for your enterprise after you install the product. For more information about changing the component configurations and adding servers, see Managing Product Components.

Web Server

The web server is the main server that hosts the web application and builds the CA APM user interface. This server communicates with the user, the application server, and the database server. The following fields require explanation:

- **Web Server or Load Balancer IP/Host**
  The CA APM installation, by default, sets this field to the web server host name. In a single web server environment, you can enter the web server host name, or the web server IP address. In a multiple web server environment, you can enter either the web server host name, or the IP address of the Load Balancer.

  NOTE
  The web server can be registered with a different name in the Domain Name System (DNS) than what is registered as the web server host name. In this situation, specify the different name in this field.

  You can configure additional web server components after you install the product.

Application Server

The application server is the server that connects the database server and the web server for CA APM. The business and data access logic reside on the application server. To allow for scalability, the application server and web server are on two distinct servers.

You can have more than one application server. The Export Service component and the Storage Management Service component must be installed on one of the application servers, but not necessarily on the same server.

The following fields require explanation:

- **Application Server or Load Balancer IP/Host**
  The CA APM installation, by default, sets this field to the application server host name. In a single application server environment, you can enter the application server host name, or the application server IP address. In a multiple application server environment, you can enter either the application server host name, or the IP address of the Load Balancer.

NOTE
The application server can be registered with a different name in the Domain Name System (DNS) than what is registered as the application server host name. In this situation, specify the different name in this field.

You can configure more application server components after you install the product.

Hardware Reconciliation Engine

The Hardware Reconciliation Engine is the service that matches discovered assets to their corresponding owned assets from different logical repositories. You can manage the assets based on your business practices. The Hardware Reconciliation Engine retrieves data from and stores the results in the CA MDB. You can install the Hardware Reconciliation Engine on one or more servers.

You can configure more Hardware Reconciliation Engine components after you install the product.

CA EEM

CA APM uses CA EEM for authentication. Other products that need CA EEM for authentication can use the same CA EEM server that CA APM uses.

- To manage security centrally for multiple CA Technologies products, specify the name, location, and login credentials for the existing CA EEM server.
- To manage CA APM security independently from other CA Technologies products, install CA EEM on any single application or web server other than the one where the existing CA EEM is installed.

CA Business Intelligence JasperSoft Reports

CA Business Intelligence JasperSoft administers, monitors, and configures the reporting environment. CA APM uses CA Business Intelligence to integrate, analyze, and present information required for effective enterprise IT management.

For more information, see **Install CABI JasperReports Server.**

CA Process Automation Manager

CA Process Automation can be integrated with CA Asset Portfolio Management to automate workflow business processes. For more information, see Install CA Process Automation.

Export Service

The Export Service exports data from CA APM and saves the results in formats such as a comma-separated value (CSV) file. To accomplish this task, the Export Service interacts with the Storage Manager Service so that you can specify where the exported files are stored.

Data Importer Engine Service

The Data Importer Engine Service imports bulk product information into the CA MDB through column and field mapping.

Import Driver

The Import Driver processes discovered hardware data exports from CA SAM. CA APM uses the discovered hardware data to link ownership and discovery data. CA APM exports ownership data back to CA SAM.

LDAP Data Import and Sync Service

The LDAP Data Import and Sync Service imports data into CA APM from CA EEM or external data sources (LDAP or CA SiteMinder). Install the LDAP Data Import and Sync Service on one of the Data Importer servers.

Storage Manager Service

The Storage Manager Service stores exported files, attachment files, data import data and map files, and log files for data import and mass change.

CA APM Registration Service

The CA APM Registration Service consolidates individual CA APM CORA services into one main service. You can have installations of other CA Technologies products that also use the CORA API. The changes that you make to the CORA API in your CA APM environment do not affect the use of the CORA API by other CA Technologies products.

Common Administration for Service Management (CASM)

The Common Administration for Service Management (CASM) provides administrative functionality, such as multi-tenancy administration, to CA APM. Multi-tenancy is the ability for multiple independent tenants (and their users) to share a single implementation of CA APM.

NOTE
For more information about implementing multi-tenancy, see How to Implement Multi-Tenancy.

Event Service

The Event Service manages the events and notifications process in CA APM. Events are important activities or data changes that you want to track and that you define in CA APM. After a defined event has occurred, notifications are sent to alert appropriate users and administrators about the event.

To perform the notification function, the Event Service interacts with a workflow provider (for example, CA Process Automation) using the Web Service. A workflow provider manages automated processes. If your workflow provider is CA Process Automation, you can specify the existing instance of CA Process Automation during the installation. You can also share CA Process Automation with CA Service Desk Manager and CA Service Catalog.

Common Asset Viewer

The Common Asset Viewer lets you view discovered and owned data for an asset that has been linked through reconciliation, including system configuration, operating system, system devices, and file systems. You can view this data on the Asset Details page by clicking the Owned Information or Discovered Information link.

The Common Asset Viewer requires the following components to install and execute successfully:

- Apache Tomcat server, which is included with the CA APM installation. The default value for the Apache Tomcat server port is 9080. You can change this value after the installation. You first update the port in the Apache Tomcat configuration file. Then, you change the port in the product (Administration tab, System Configuration, Common Asset Viewer).

After you install the Common Asset Viewer, the component is configured for non-secure network communication (http). You can configure the component for secure network communication (https) by first configuring the Apache Tomcat server (where the Common Asset Viewer is installed) to support the Secure Socket Layer (SSL) protocol. Then you need to change a setting for the Common Asset Viewer component in the web configuration file.

WARNING

The Tomcat port number for CA APM defaults to 9080. If another product that is integrated with CA APM uses this port number, change the port number in CA APM so that you do not have a conflict.

WCF Service

The Windows Communications Foundation (WCF) service implements the web services in CA APM. The web services let you use a standards-based interface to build client applications that integrate with CA APM.

The web services let you create, search, update, copy, and delete CA APM objects from your external client application. Your assigned user role determines whether you have permission to access the web services in CA APM. Your role also restricts the objects and data (classes and attributes) that you can view or modify.

Specify the server name for the WCF Service component. You can modify the WCF Service protocol setting. You can change the configuration of the WCF Service component after you install the product.

NOTE

You can change the component configurations and can configure additional components for your enterprise after you install the product. For more information about changing the component configurations and adding servers, see Managing Product Components.

CA Service Desk Manager

CA Service Desk Manager component is used for integrating CA APM and CA SDM. Refer to Integrating CA APM and CA Service Desk Manager.

Apache Tomcat Configuration

This article explains how to update the port in the Apache Tomcat configuration file.

This is an optional step and is required only when you want to change the AMS port. The Common Asset Viewer lets you view discovered and owned data for an asset that has been linked through reconciliation. This data includes system configuration, operating system, system devices, and file systems. The Common Asset Viewer requires the Apache Tomcat server, which is included with the CA APM installation. You first update the port in the Apache Tomcat configuration file. Then, you change the port in the product (**Administration** tab, **System Configuration**, **Common Asset Viewer**).

NOTE

The Tomcat port number for CA APM defaults to 9080. If another product that is integrated with CA APM uses this port number, change the port number in CA APM so that you do not have a conflict.

Perform the following steps:

1. On the application server where the Common Asset Viewer is installed, navigate to one of the following folders, depending on your server:
   a. C:\Program Files\CA\SC\AMS\TomCat\conf (for 32-bit operating systems)
   b. C:\Program Files (x86)\CA\SharedComponents\AMS\TomCat\conf (for 64-bit operating systems)
2. Select and open the **server.xml** file.
3. Navigate to the following section of the server.xml file:

```
<Connector port="9080" protocol="HTTP/1.1"connectionTimeout="20000" redirectPort="8443" />
```

4. Update the Tomcat port number with the same number that CA APM uses (**Administration** tab, **System Configuration**, **Common Asset Viewer**).
5. Save the server.xml file.

(Optional) Configure Secure Network Communication

After the installation is complete, configure CA APM for non-secure or secure network communication. For secure network communication (https), first configure IIS on the product servers to support the Secure Socket Layer (SSL) protocol. Then, set the CA APM configuration parameters for secure network communication.

Configure IIS for Secure Network Communication

Configure IIS on the product servers to support the Secure Socket Layer (SSL) protocol. Perform the following steps:

1. Launch the Internet Information Services (IIS) Manager on the CA APM web server.
2. Select **Server Certificates**.
3. Click **Create Self-Signed Certificate** and specify a certificate name.
4. Select the website (on the left) where CA APM is installed.
5. Click **Bindings** under **Actions** on the right.
6. Click **Add**.
7. Select **https** for the Type.
8. Specify the port and the SSL certificate name.
9. Perform these (1-8) steps on the CA APM application server.

Configure CA APM for Secure Network Communication

Configure CA APM on the product servers to support the Secure Socket Layer (SSL) protocol. Perform the following steps:

1. Log in to CA APM and navigate to **Administration**, **System Configuration**.
2. Click **Web Server** on the left.
3. Change the server protocol to **https** and click **Save**.
4. Click **WCF Service** on the left.
5. Change the server protocol to **https** and click **Save**.
6. Click **Application Server** on the left and select the **Show Advanced Options** checkbox to see all configuration parameters.
7. Change the server protocol to **https**.
8. Change the **server port** and the **component server port** to the port of the https protocol (by default, **443**) and click **Save**.
9. Execute the following query on your database tp update the webserver SSL port (by default, **443**).
   ```
   update al_cdb_configurationparameters set configvalue=443 where configkey = 'ServerPort' and
    componentkey='Web_Server'
   ```
10. Reset IIS on the web server and the application server.
    You can now start the product web interface using secure network communication. Open a supported web browser and enter the following URL:
    ```
    https://servername/ITAM/Pages/UserLogin.aspx
    ```
    Replace *server name* with the name of the server that is hosting the CA APM web server.

Configure AMS for Secure Network Communication

Configure AMS on the product servers to support the Secure Socket Layer (SSL) protocol. Perform the following steps:

Create a Keystore File

A keystore file is required to enable SSL. Create a keystore file if you do not have one already for another CA product that integrates with CA Service Management. **Follow these steps:**

1. Create “certificates" folder in the C drive of AMS server.
2. Open a command window.
   Example: C:\Program Files (x86)\CA\SharedComponents\AMS\OpenJdk11\bin> <Installed location of AMS>
3. Enter the following command:
   ```
   keytool -genkey -alias tomcat -keyalg RSA -keystore c:/certificates/AMS.keystore
   ```
   alias_name

Specifies the logical name for the certificate that you are using for CA Service Catalog and possibly for other products. Record this alias name for reference.

4. Enter the password at the “Enter keystore password” prompt. To make configuring Tomcat easier, you can use “changeit” as the password.
5. Record your password for reference.
6. Enter your password at the prompt.
7. Run the following command to add the certificate into the keystore.

```
keytool -importkeystore -srckeystore c:/certificates/AMS.keystore -destkeystore c:/certificates/
AMS.keystore -deststoretype pkcs12
```

Edit the Server.xml File to Support SSL

As part of configuring AMS server to use Secure Socket Layer (SSL), edit the server.xml file to support SSL. **Follow these steps:**

1. Open the C:\Program Files (x86)\CA\SharedComponents\AMS\TomCat\conf file.
2. Search for the <Service name="Catalina"> section.
3. Updated the Connector related information under the <Service name="Catalina"> section:

```
<Connector SSLEnabled="true" maxThreads="200" port="8443"
 protocol="org.apache.coyote.http11.Http11NioProtocol"
 sslImplementationName="org.apache.tomcat.util.net.jsse.JSSEImplementation">
      <SSLHostConfig
 ciphers="TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256,TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384,TLS_DHE_RSA_WITH_AES_128_GCM_S
 TLS_DHE_RSA_WITH_AES_256_GCM_SHA384,TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256,TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA,
 TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384,TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA,TLS_DHE_RSA_WITH_AES_128_CBC_SHA256,
 TLS_DHE_RSA_WITH_AES_128_CBC_SHA,TLS_DHE_RSA_WITH_AES_256_CBC_SHA256,TLS_DHE_RSA_WITH_AES_256_CBC_SHA,
 TLS_RSA_WITH_AES_128_GCM_SHA256,TLS_RSA_WITH_AES_256_GCM_SHA384,TLS_RSA_WITH_AES_128_CBC_SHA256,
 TLS_RSA_WITH_AES_256_CBC_SHA256,TLS_RSA_WITH_AES_128_CBC_SHA,TLS_RSA_WITH_AES_256_CBC_SHA,
 SSL_RSA_WITH_3DES_EDE_CBC_SHA" honorCipherOrder="true" protocols="TLSv1.2" sslProtocol="TLSv1.2">
        <Certificate certificateKeyAlias="tomcat" certificateKeystoreFile="C:/certificates/AMS.keystore"
 certificateKeystorePassword="N0tallowed" certificateKeystoreType="PKCS12"/>
      </SSLHostConfig>
   </Connector>
```

   – Default value before making this change.

```
<Connector port="8080" URIEncoding="UTF-8" protocol="HTTP/1.1" connectionTimeout="20000"
 redirectPort="8443"/>
```

4. Save and close the server.xml file.

Enable SSL for AMS

To enable SSL for AMS, **follow these steps:**

1. Login to CA APM (ITAM).
2. Navigate to **Administration**, **System**, **Configuration**, **Common Asset Viewer**.
3. From the Common Asset View page, provide the AMS Web Server URL as (use HTTPS) and the port as 8443. For example: `https://<hostname>:8443/AMS/login.do`
4. Restart the AMS service.
5. Restart IIS.

Configure CA CASM for Secure Network Connection

1. Stop CA CASM Services
2. Connect to ITAM database
3. Run the following query:

```
select * from ca_application_registration where product_code=2070 and product_name='CACASM'
Update ca_application_registration set product_specific_data='https://ApplicationServerHostName:9060/itsm/
itsm.html'
where product_code=2070 and product_name='CACASM'
```

NOTE
Make sure to replace ApplicationServerHostName with the correct value of the ITAM Application Server HostName

4. Navigate to C:\Program Files (x86)\CA\SharedComponents\CASM\apache-tomcat\conf' and take a backup of the existing Server.xml file. Open Server.xml file in Edit mode.
5. Search for Connector port as mentioned and delete it:

```
<Connector port="9060" protocol="HTTP/1.1"   connectionTimeout="20000"    redirectPort="8443" />
```

Use the following tags instead:

```
<Connector SSLEnabled="true" maxThreads="200" port="9060" protocol="HTTP/1.1"
 sslImplementationName="org.apache.tomcat.util.net.jsse.JSSEImplementation">

<SSLHostConfig
 ciphers="TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256,TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384,TLS_DHE_RSA_WITH_AES_128_GCM_S
 TLS_DHE_RSA_WITH_AES_256_GCM_SHA384,TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256,TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA,
 TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384,TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA,TLS_DHE_RSA_WITH_AES_128_CBC_SHA256,
 TLS_DHE_RSA_WITH_AES_128_CBC_SHA,TLS_DHE_RSA_WITH_AES_256_CBC_SHA256,TLS_DHE_RSA_WITH_AES_256_CBC_SHA,
 TLS_RSA_WITH_AES_128_GCM_SHA256,TLS_RSA_WITH_AES_256_GCM_SHA384,TLS_RSA_WITH_AES_128_CBC_SHA256,
 TLS_RSA_WITH_AES_256_CBC_SHA256,TLS_RSA_WITH_AES_128_CBC_SHA,TLS_RSA_WITH_AES_256_CBC_SHA,
 SSL_RSA_WITH_3DES_EDE_CBC_SHA" honorCipherOrder="true" protocols="TLSv1.2"
 sslProtocol="TLSv1.2"><Certificate certificateKeyAlias="<cert_Alias>"
 certificateKeystoreFile="<cert_location>" certificateKeystorePassword="<cert_password>"
 certificateKeystoreType="PKCS12"/> </SSLHostConfig>

 </Connector>
```

6. Start the CA CASM services.
7. Reset IIS.

Verify the Installation

After you have completed all installation procedures, you can verify that CA APM was installed successfully. To start the web interface, open a web browser and enter the following URL:

```
https://servername/itam
```

Update the SSL ports for patch installations

In the integrated environment of CA APM and SDM, SSL is enabled on both the products. Follow these steps when any patch of 17.4 is installed:

1. product_specific_data column value is reset to default in ca_application_registration table. So you must update the value to https manually, along with its port by executing the below query against the mdb

```
UPDATE ca_application_registration SET product_specific_data='https://<SDMHost>:<port>/CAisd/pdmweb.exe'
 where product_code = 2003 and major_version = 17 and minor_version = 4
```

2. Open the AMS.properties file under AMS directory (For example C:\Program Files (x86)\CA\SharedComponents\AMS \TomCat\webapps\AMS\WEB-INF\classes) and update the value of the entry 'appreg.2003.product_specific_data', it should refer to https and SSL port in the SDM URL.

```
https://<hostname>:<port>/CAisd/pdmweb.exe
```

3. On the CA APM application server, restart the AMS Service and perform the iisreset.
4. Perform iisreset on CA APM Web Server

NOTE
When Secure Socket Layer (SSL) is configured on the CA APM, additional configuration is required for the Windows Communication Foundation services (WCF services).
Follow the steps mentioned in the KB Article 36958.

Secure Cookies

The RequireSSL property enables or disables output of the secure cookie attribute as described in RFC 2109. When used by compliant browsers, the cookie will only be sent back over a connection using SSL/TLS.

To secure the cookies, it is recommended to follow these steps:

- The default value is false.

On ITAM web server, navigate to the web server folder, for example:

```
<ITAM_installed_drive>\CA\ITAM\Web Server
```

- Edit web.config file, and you will see the following entry:

```
<httpCookies requireSSL="false" />
```

- Manually change the value to **true**:

```
<httpCookies requireSSL="true" />
```

- Perform IIS Reset.

(Optional) Config File Changes in WCF Service to Address Security vulnerabilities

WCF service response returns full stack trace incase of a service fault exception.

Perform the following steps to turn off exception details in any fault response:

1. Open your CA APM installed directory and navigate to the WCF service folder, for example C:\Program Files (x86)\CA \ITAM\WCF Service.
2. Open web.config file and search for **serviceDebug** element and set the **includeExceptionDetailInFaults** attribute to false, for e.g:

```
<serviceBehaviors>
    <behavior name="CA.Applications.Web.WCF.IServiceBehavior">
      <!-- To avoid disclosing metadata information,
      set the value below to false and remove the metadata endpoint above before deployment -->
      <serviceMetadata httpGetEnabled="false"/>
      <!-- To receive exception details in faults for debugging purposes,
      set the value below to true.  Set to false before deployment
      to avoid disclosing exception information -->
      <serviceDebug includeExceptionDetailInFaults="false"/>
      <ITAMServiceBehavior/>
    </behavior>
</serviceBehaviors>
```

3. Perform IISReset.

CA Service Management Solution Integration

If you want to integrate one or more CA Service Management Products (CA SDM, CA Service Catalog, and CA APM) with CA Common Components (CA EEM, CA Process Automation, and CABI Jaspersoft Reports), consider the following integration requirements that may require manual intervention.

NOTE

CA Service Management Installer automates the integration process. The procedures that are described in this article must be performed manually only if the automation of the integration process fails or does not work for some unforeseen reason.

For more information about the CA Common component release versions that are supported for CA Service Management, see Supportability Matrix.

Integrate CA Service Management with CA Common Components

Consider the following items, if you are integrating the following products:

- **CA EEM and CA Process Automation Considerations:** If you have installed CA EEM and CA Process Automation and integrated one or more CA Service Management products with CA EEM and CA Process Automation, ensure that you provide the same CA EEM information that you provided while installing CA Process Automation for auto-integration to be successful.
- **CASM_Policy File**: Do not modify or edit the **CASM_Policy** file from **CA SDM**, **Administration**, **SOAP Web Services Policy**, **Policies**, **CASM_Policy File**. If you modify the file, generate a new **CASM_policy** file and manually copy this file from the CA SDM installation directory to the installation directory of all CA Service Management products. For more information, see Use the Web Service Access Policy File.

Integrate CA Service Management Product(s)

You can integrate the following CA Service Management Products or Products in these combinations:

- Integrate CA Asset Portfolio Management with CA Service Catalog
- Integrate CA Service Desk Manager with CA Asset Portfolio Management
- Integrate CA Service Catalog with CA Service Desk Manager

For more information about how to troubleshoot an integration, see Troubleshooting the Integration.

CA Service Desk Manager and Common Components

Perform the following after installation is complete to integrate CA Service Management products with CA Common Components (CA EEM, CA Process Automation, and CABI JasperSoft Reports Server).

Integrate CA Service Desk Manager with CABI JasperSoft

WARNING

Customers purchasing CA Service Management products on or after April 1, 2016 are only eligible to use CABI JasperReports® Server r6.4.3 or later. We will continue to support CABI 4.x for customers who purchased CA Service Management, CA IT Asset Manager, or CA Service Catalog products prior to April 1, 2016.

CABI JasperReports® Server r.6.4.3 requires that you import the CA Service Management CABI content, to deliver the CA Service Management reports. Also, you need to configure the data source and user permissions. For more information, see CABI JasperReports® Server r6.2.0 for CA Service Management.

Integrate CA Service Desk Manager with CA EEM (Solaris)

NOTE

If you plan to implement CA SDM and CA EEM on the same server, you must install the **CA EEM 12.51 CR05** version.

If you are planning to auto-integrate CA SDM with CA EEM on Solaris, install the CA SDM Secondary or Application Server on Windows or any other Operating System other than Solaris. If you are planning to upgrade CA SDM on Solaris to CA Service Management, upgrade the CA SDM Primary or Background server. Move the bopuath_nxd authentication module daemon to the Secondary Server. Complete the following based on your CA SDM configuration:

Move the Authentication Module Daemon for CA SDM Conventional Configuration

On the CA SDM Conventional Setup, complete the following steps:

1. Upgrade CA SDM Primary Server to CA Service Management.*Or*
   Install CA SDM Secondary on Windows.
   You can perform a fresh CA SDM Installation or can upgrade an earlier CA SDM release to CA Service Management.
2. Log in to the CA SDM web user interface as an administrator on the Primary server with **srvcdesk** credentials of the local host.
3. Navigate to System, Configurations on the Administration tab.
4. Click Create New to add the primary server details.
5. In the Host Name field, specify the primary host name for the configuration. Click Save.
6. On the Configuration Detail page, select the Additional Processes tab.
7. Select and edit the Login User Authentication and in the Update Process page provide the secondary server name.
8. Launch the ***pdm_configure*** on the Primary Server.
   The Config Options page drop-down has the last configuration that you created. Select the configuration and click Finish.
   After successful configuration, user login is successfully authenticated by CA EEM.

Move the Authentication Module Daemon for CA SDM Advanced Availability Configuration

For CA SDM Advanced Availability, move the bopauth_nxd authentication daemon from the background server to any other server (such as application server). Perform the following steps:

1. Log in to the CA SDM background server web interface as an administrator.
2. Select the Administration tab. Expand Options Manager, Security.
3. Click *the bopauth_nxd_host* entry in the Options List. Click Edit.
4. Select the host name of the target server from the Option Value drop-down list. Click Save.
5. Restart the background server after changing the default value of *bopauth_host*.
6. Start version control as a client on the application server using the following command:
   pdm_ver_nxd -c
7. Restart the application server.
   You have successfully configured the redirection of authentications requests to an external server.**Note:** By default, the authentication module runs on the background server.

Integrate CA SDM with CA EEM Manually

If you are not able to integrate CA SDM and CA EEM through the CA Service Management installer, perform the following steps:

1. Ensure that you have installed CA EEM.
2. Depending on the CA SDM configuration, log in to the following server:
   - Conventional: **Primary server**
   - Advanced availability: **Background server**
3. Install the following options:
   - **use_eiam_authentication**
     Allows use of EEM authentication when users log in to CA SDM / Knowledge Management and the access type authentication is set to the operating system.
   - **use_eiam_artifact**

Allows EEM artifact to be used when users log in to CA SDM / Knowledge Management using URL.

– **eiam_hostname**
Specifies the hostname of the server where EEM is running. Required for CA EEM user name and password or artifact authentication.

4. Restart CA SDM services and add the CA SDM privileged user in EEM.

You have successfully integrated CA EEM with CA SDM.

Integrate CA SDM with CA Process Automation Manually

CA Process Automation is a stand-alone CA product with features for automating and tracking hardware and software administration tasks in enterprise IT environments. CA Process Automation automates tasks and manages user interactions, such as approvals and notifications for compliance and accuracy within production environments.

When you integrate CA SDM and CA Process Automation, you can use/leverage the benefits of CA Process Automation workflow capabilities from key points within CA SDM. An effective integration between CA SDM and CA Process Automation requires you to understand both products.

CA Process Automation Components

CA Process Automation offers multiple capabilities and structures that facilitate a wide range of activities as part of CA Process Automation process management. For the integration with CA SDM, however, only the following CA Process Automation components are critical for CA Process Automation integration:

- **Process Definition --** Identifies a collective series of tasks, steps, and conditions that are structured in a specific order to be initiated, and completed by various individuals or parties. This component is the central building block of all CA Process Automation content.
- **Start Request Form --** An object containing descriptive information for end users. The Start Request Form presents a process definition to users while hiding the technical details of the process definition.
- **Keywords --** A list of pre-defined words or phrases to attach to Start Request Forms.
- **Automation Library --** An area within CA Process Automation that stores and shows Process Definitions and Start Request Forms.
- **Library Path or Reference Path --** A folder structure that organizes and describes Process Definitions and Start Request Forms within the automation library.
- **Process Instance --** An active entity that executes the rules that are defined in a process definition. The process instance progresses until the process definition state is complete.
- **Process Instance Log Messages --** A configurable, running record that details the progression of activities of the process instance. Log message categories are useful to the CA SDM integration with CA Process Automation.

Note: The scope of the definitions of CA Process Automation components is limited to the usage within CA SDM. For information about CA Process Automation components and capabilities, see the CA Process Automation documentation.

Complete the following steps only if you are not able to integrate CA Process Automation and CA SDM through the CA Service Management installer:

Verify the Integration Requirements

You can integrate CA Process Automation and CA SDM to coexist on a single server when the server architecture supports both products. When CA Process Automation or CA SDM components cannot integrate on the same server, consider installing each product on separate servers.

WARNING
If CA Process Automation is configured in FIPS mode, you must also configure CA EEM server and CA EEM SDK in FIPS mode. For more information about configuring the EEM SDK in FIPS mode, see the CA EEM Documentation.

Before you configure CA Process Automation and CA SDM, confirm that both products are installed and are working independently. Perform the following steps:

1. Open a browser on the server that hosts CA SDM and verify that a CA Process Automation user can log in to CA Process Automation. Change the place holders to match the target CA Process Automation installation.
   `http(s)://<server>:CA Portal/itpam`
2. Enter the following URL. Change the place holders to match the target CA Process Automation installation.
   `http(s)://<server>:CA Portal/itpam/JNLPRequestProcessor?processType=startUI`

   The CA Process Automation product is accessible from the CA SDM host.

Install the CA Process Automation Workflow Options

When you install the CA Process Automation Workflow options, you specify connectivity between CA SDM and CA Process Automation. If you are using CA EEM for authentication, you also specify the CA EEM host name. Perform the following steps:

1. On the Administration Tab, select Options Manager, CA Process Automation Workflow.
   The Option List appears.
2. Right-click the name of each option and select Edit from the context menu. Install the following options:
   - **caextwf_eem_hostname**
     Specifies the name of the CA EEM server. For example, *<wf_hostname>* identifies the authentication host. You install caextwf_eem_hostname only if you configured CA Process Automation to use CA EEM as an authentication server. CA SDM uses this value to transform a user name and password into a CA EEM token. Then, the user name and password do not pass in plain text over HTTP.

     NOTE
     If the CA Process Automation installation is not using CA EEM, do not place a value in the caextwf_eem_hostname option, and do not install the **caextwf_eem_hostname**. Placing a false value or installing caextwf_eem_hostname when it is not necessary causes the integration to fail.
   - **caextwf_endpoint**
     Specifies the URL that points to the CA Process Automation web services by including the CA Process Automation host name, port, and the mandatory /itpam/soap path. For example, http://<wf_hostname>:<wf_tomcat_port>/itpam/soap identifies the endpoint. If your implementation uses CA EEM, installing the **caextwf_eem_hostname** option is required for the integration between CA Process Automation and CA SDM to operate properly.
   - **caextwf_log_categories**
     Specifies a comma-separated list of CA Process Automation process instance log category names to appear on the CA SDM Request, Change Order, and Issue Workflow Tasks tab. For example, *Operator,Response,MyOwnCategory* supplies three-log categories.
     You install caextwf_log_categories based on business decisions from the CA SDM and CA Process Automation process design personnel. This option adjusts the default data that appears on the Workflow Tasks tab for requests, change orders, and issues.
     When you install the caextwf_log_categories option, all CA Process Automation process instance log messages from the Process category and the categories that you specify appear on the Workflow Tasks tab. When you do not install caextwf_log_categories, only the CA Process Automation process instance log messages from the Process category appear on the Workflow Tasks tab.
   - **caextwf_processdisplay_url**
     Specifies how to launch a graphical snapshot of a CA Process Automation process instance by supplying the host name and the mandatory */itpam/Web.jsp?page=runtimeeditor&ROID* path. For example, *http://<wf_hostname>:<wf_tomcat_port>/itpam/Web.jsp?page=runtimeeditor&ROID=* launches a snapshot of a process instance. On the Workflow Tasks tab of a request, change order or issue, the user selects View Process to see the snapshot.
     Installing the caextwf_processdisplay_url option is required for the integration between CA Process Automation and CA SDM to operate appropriately.
   - **caextwf_worklist_url**

Specifies the process instance path by supplying the host name and the mandatory */itpam?Page=tasklist* path. For example, *http://<wf_hostname>:<wf_tomcat_port>/itpam?page=tasklist* enables CA SDM users to see a list of CA Process Automation process instances that require attention. The list appears in CA Process Automation when the CA SDM user selects a link associated with any listed task in the request, change order, or issue Workflow Tasks tab.
Installing the caextwf_worklist_url option is required for the integration between CA Process Automation and CA SDM to operate properly.

- **caextwf_ws_password**
  Specifies the administrative password associated with the CA Process Automation user name from the caextwf_ws_user option. CA SDM uses the user name and password to access the CA Process Automation web service functions to perform integration activities such as selecting start request forms, process definition information, and process instance information.
  Installing the caextwf_ws_password option is required for the integration between CA Process Automation and CA SDM. The password and user name that you specify requires the appropriate access to CA Process Automation. However, it is not necessary the CA Process Automation user name and password to exist within the CA SDM contact records.
- **caextwf_ws_user**
  Specifies the CA Process Automation administrative user name associated with the CA Process Automation user name from the caextwf_ws_password option. CA SDM uses the user name and password to access the CA Process Automation web service functions. These services perform integration activities such as selecting start request forms, selecting process definition information, selecting process instance information, or launching process instances.
  Installing the caextwf_ws_user option is required for the integration between CA Process Automation and CA SDM to operate. The user name and password that you specify requires the appropriate access to CA Process Automation. However, it is not necessary the CA Process Automation user name and password to exist within the CA SDM contact records.
- **caextwf_retry_count**
  Specifies the number of times an event is triggered if CA Process Automation is unavailable. CA Process Automation Workflows can be attached to CA SDM tickets (for example,Change Orders) through CA SDM Events and Macros. The attached events are triggered by CA SDM at the specified retry interval duration. During retry, if the CA Process Automation is unavailable, the attached event is marked as Unknown and the process is not executed. CA SDM retry mechanism automatically re-triggers the attached Unknown events when CA Process Automation is unavailable. Default value is 3 and can be set in the range [1 – 20].
- **caextwf_retry_interval**
  Specifies time interval after which the event is again triggered in case CA Process Automation is unavailable.

3. Click Install.
4. Restart the CA SDM service.
   The CA SDM and CA Process Automation can communicate even though there is no process instance data. CA SDM and CA Process Automation are ready for you to create CA Process Automation process definitions and CA Process Automation start request forms.

Set Up SSL Communications with CA Process Automation

For security reasons, CA Process Automation implementers can install or reconfigure CA Process Automation to require SSL communications. If CA Process Automation is configured to require SSL communications, integrated applications such as CA SDM require a certificate from the CA Process Automation keystore for communication. Perform the following steps:

1. Configure CA SDM options to use the CA Process Automation HTTPS address.
2. Export the CA Process Automation keystore certificate to a file and copy the file to CA SDM.
3. Load the certificate file into CA SDM using the CA SDM pdm_keystore_mgr utility.
4. If applicable to your CA SDM architecture, update the version control files to deliver the CA SDM keystore to all secondary servers.

5. Restart CA SDM.

Enable Communications When CA Process Automation is SSL Enabled

When CA Process Automation communicates with SSL, configure the CA SDM servers to communicate with CA Process Automation.

To enable communications when CA Process Automation is SSL enabled, do the following tasks:

1. Verify that you can use CA Process Automation in a browser, without launching CA SDM. Record the CA Process Automation URL and use it for reference when you configure the CA Process Automation Workflow options in Options Manager.
2. Log in to CA SDM and install or modify the CA Process Automation Workflow options in Options Manager. For each of the following options, use the syntax *https://server:8443/* instead of http://server:8080/ for reaching the SSL enabled CA Process Automation application. If the CA Process Automation installation uses another port instead of the 8443 SSL port, specify the appropriate port number.
   - caextwf_endpoint
   - caextwf_processdisplay_url
   - caextwf_worklist_url

     NOTE
     If the values do not match the actual CA Process Automation installation values, CA SDM cannot communicate with CA Process Automation. A runtime error occurs. Verify that the values match the actual CA Process Automation installation values, because the CA Process Automation installer might have selected a different port instead of port 8443.
3. On the CA Process Automation server, locate the KEYSTOREID and itpam.web.keystorealias entries in the following file:

   ```
   C:\Progra~1\ITPAM\server\c2o\.config\OasisConfig.properties
   ```

4. Copy the KEYSTOREID. Be prepared to paste the KEYSTOREID value as the password after you issue the keytool command.
5. On the CA Process Automation server, issue the following keytool command as one line on the command line:

   ```
   C:\Progra~1\ca\sc\jre\1.6.0_00\bin\keytool.exe -keystore C:\Progra~1\ITPAM\server\c2o\.config\c2okeystore
    -export -alias <keystorealias> -file itpam.cer
   ```

   The keytool utility prompts you for a password.
6. Paste or type the KEYSTOREID value as the password.
   The keytool utility uses the final parameter (-file itpam.cer) to create a file that is named *itpam.cer*. The *itapm.cer* file contains the necessary certificate information for communications with CA SDM.
7. Move the *itpam.cer* file to one of the following locations on the CA SDM server:
   - (Windows) %NX_ROOT%\bin
   - (UNIX) $NX_ROOT/bin
8. Import the CA Process Automation certificate information into CA SDM by entering the following command:

   ```
   (Windows) pdm_perl %NX_ROOT%\bin\pdm_keystore_mgr.pl -import %NX_ROOT%\bin\itpam.cer
   (UNIX) pdm_perl $NX_ROOT/bin/pdm_keystore_mgr.pl -import $NX_ROOT/bin itpam.cer
   ```

   The *pdm_keystore_mgr.pl* script generates the keystore file in the following locations:
   - (Windows) %NX_ROOT%\pdmconf\nx.keystore
   - (UNIX) $NX_ROOT/pdmconf/nx.keystore
9. The *nx.keystore* must be delivered to the following CA SDM servers, depending on the CA SDM configuration:
   - Conventional: **Secondary server**
   - Advanced Availability: **Application and Standby server**

   Open the *server_secondary.ver* file from one of the following locations:

- (Windows): *%NX_ROOT%\site\server_secondary.ver*
- (UNIX): *$NX_ROOT/site/server_secondary.ver*

10. Modify the *server_secondary.ver* for version control by adding the following information:

```
[SSL_Keystore]
filename = "nx.keystore"
directory = "$NX_ROOT/pdmconf"
component_type = "file"
O_mode = "RW"
g_mode = "RW"
w_mode = "RW"
file_ctl
```

11. Restart CA SDM.
    The CA SDM server can communicate with the SSL enabled CA Process Automation application.

Configure the Integration (CA SDM and CA Process Automation)

Both CA Process Automation and CA SDM, as stand-alone products, have individual requirements for authentication and authorization. To support a unified Service Oriented Architecture (SOA) strategy, you can configure both products to use CA EEM for authentication.

When you install CA Process Automation with CA EEM as the authentication server, the installer creates several policies and eight essential entities by default:

- Four Application Users: pamadmin, pamuser, pamproduser, and pamdesigner.
- Four application groups: PAMAdmins, PAMUsers, Designers, and Production Users.

CA SDM users who also use CA Process Automation can be divided between PAMAdmins and PAMUsers as follows:

- CA SDM analysts must be members of PAMUsers when their duties entail:
  - Approving, rejecting, or otherwise responding to CA Process Automation Interaction Request Forms.
  - Listing CA Process Automation process instances assigned to the user.
  - View the graphical display, click the **View Process** button of CA Process Automation process status screen. The CA Process Automation PAMUsers group requires an additional CA Process Automation policy to grant access the graphic.
- CA SDM analysts are members of PAMAdmins when their duties entail:
  - Creating and checking in CA Process Automation process definitions and/or start request forms.
  - Terminating process instances directly within CA Process Automation. Terminating process instances are an administrative exception to expected integration procedures.
  - Delegating CA Process Automation process instance tasks.
  - If the user is the user name defined in CA SDM Options Manager.
- CA SDM users require no access to CA Process Automation when their duties entail:
  - Creating requests, change orders, and issues that launch CA Process Automation instances.
  - Reviewing the Workflow tab which shows CA Process Automation process instance status and task information.
  - Changing the status of a request, change order, or issue which causes the termination of a CA Process Automation process (such as canceling a change order).
  - Selecting a CA Process Automation process definition on a CA SDM request area, change category, issue category.

Finalize the Integration (CA SDM and CA Process Automation)

If you have CA SDM and CA Process Automation integration, set up the Single Sign-On (SSO). Perform the following steps:

1. Verify that the following requirements have been met:

- CA SDM and CA Process Automation are configured to use the same CA EEM installation.
- The user that logs in to CA SDM is also a user in CA Process Automation.
- When CA EEM uses the internal database as a user store, the users must have either global permissions or must belong to the same folder. If CA EEM references an external user store like an external directory or CA SiteMinder, the users must be of the same store to access Single Sign-On.

2. Install CA EEM or use any existing CA EEM installation (for example, CA EEM for CA Process Automation).
3. On the CA SDM Administration tab, install the following options from under the Options Manager, Security folder:
   - eiam_hostname
   - use_eiam_authentication

   NOTE
   You do not need to install the option caextwf_eem_hostname under Options Manager, CA Process Automation folder. But if you do install it, the value must be the same as eiam_hostname option.
4. Restart CA SDM.
5. To create a user in CA Process Automation, perform the following steps:
   a. Log in to CA EEM using the CA Process Automation application context using the **EiamAdmin** userid or any other administration user.
   b. Select the Manage Identities tab and click the icon next to the Users folder.
   c. On the New User page, the Name field at the top is the userid that must match the userid in the CA SDM contact table.
   d. Click the Add Application User Details button and complete the following steps:
      - Add any of the groups that are listed. Add at least one of these groups to be able to log in to CA Process Automation.
      - Complete the New User fields, such as the First Name, Last Name, Display, and Password.
6. Create a user in the CA SDM contact table with the same userid. Verify that the Access Type Validation Type field for the user is set to CA EEM.
   You can log in to CA EEM and CA SDM with this user and the password specified in CA EEM.

CA Process Automation Integration with CA SDM at Run Time

When you enable the integration, CA SDM users experience the following:

- On a new Request, Change Order, or Issue, a CA Process Automation process instance initiates based on the ticket category or area. Summary information immediately appears on the Workflow Tasks tab.
- When a Request Area, Change Category, or Issue Category changes, an attached CA Process Automation process instance terminates and a new process instance initiates.
- When a CA SDM user attempts to close a Request, Change Order, or Issue where the CA Process Automation process instance is not yet complete, the user cannot close the ticket. Instead, the user must first cancel the ticket. The Cancel status terminates the CA Process Automation process instance before the ticket closes.
- When a user wants to understand the state of the process instance without navigating away from the ticket, the user can click the ticket Workflow Tasks tab. The Workflow Tasks tab shows the process instance start date, end date, current state, and a current audit trail of messages indicating the path of the process instance.
- When a user wants to see the current path of the process instance relative to the entire process, the user selects the View Process button on the Workflow Tasks tab. The View Process button launches a graphical snapshot of the entire process instance, and shows the current path.
- When a user wants to see CA Process Automation interaction request forms that are waiting for user action, the user can select any entry in the Workflow Tasks tab. The Workflow Tasks tab contains an audit trail of process instance messages that appear on the CA Process Automation task list.

NOTE
When a user selects the CA SDM View Process button or CA Process Automation process instance messages, the system prompts for a CA Process Automation user name and password for a single browser session. After the initial prompt, the system does not prompt the user again until the CA SDM browser closes.

How to Create a Process Definition

When you create the process definition, you populate CA Process Automation with content to appear in CA SDM. You use the CA Process Automation graphical process designer to create, test, and check in a process definition. From CA SDM, you can also create macros to initiate CA Process Automation processes. To create a process definition in CA Process Automation, perform the following steps:

1. Log in to the CA Process Automation client as an administrative user.
2. Use the CA Process Automation graphical process designer to create, test, and check in a process definition. When you work with the process definition, use the instructions in the CA Process Automation user documentation.

   NOTE
   If you fail to check in the process definition before attempting to use it, the workflow cannot operate properly in CA SDM.

   The following process definition items are available in CA SDM:
   - **Process Name**
     Appears on the Request Area, Change Category, and Issue Detail page. The process name also appears on the Workflow Tasks tab of a ticket. The process name describes the process definition to CA SDM to Analysts and other users who manage tickets.
   - **Process Reference Path**
     Appears on the Request Area, Change Category, and Issue Detail pages. The Process Reference Path also appears on the ticket Workflow Tasks tab. The Process Reference Path can be useful to describe the purpose of the process to end users. For example, "/Processes/Approval" is not helpful. Instead, a reference path like "/Office Supplies/Approvals/Over-200-CA SDM" describes the workflow to manage orders that exceed $200 US dollars.
   - **Process Log Messages**
     Appears on the CA SDM ticket Workflow Tasks tab. By default, a record of activities stores with the process instance. Process log messages have the Process category. A process designer can create custom messages to appear on the Workflow Tasks tab of a CA SDM ticket.

Create a Start Request Form

When you create a Start Request Form, you associate it with the process definition and check it in. You include the appropriate keywords in the Start Request Form properties. If the appropriate keyword is missing from the Start Request Form properties, the Start Request Form and its associated process definition fail to appear in CA SDM. Perform the following steps:

1. Log in to the CA Process Automation client as an administrative user.
2. Open the CA Process Automation Library and navigate to the path Start Request Form.
   The Start Request Form appears in the right pane of the CA Process Automation library.
3. Select the Start Request Form from the list.
   A shortcut menu appears.
4. Select Properties.
   The Library Object Properties page appears.
5. (Optional) Click the General tab and modify the description of the Start Request Form. Add a description that identifies the proper usage of the Start Request Form and the associated Process Definition to the CA SDM Administrator.
6. Click the Keywords tab.
   The Keywords tab is active.
7. Click the ab+ icon.
   A row adds to the empty list.

8. Click the row.
   A blinking cursor highlights the row and indicates the row is ready for typing.
   a. Enter one of the following values to associate a keyword to the appropriate ticket area or category.
      For example, to make a Start Request Form available for a CA SDM request area, enter the **pcat** keyword.
   b. Add a row to the list for each applicable keyword.
      For example, to make the Start Request Form appear on both request areas and change categories, add one row for the **chgcat** keyword and another row for the **pcat** keyword.
   c. Click **OK**.
      CA Process Automation saves the keywords and description and closes the Library Object Properties dialog.
   d. Check in the Start Request Form.

Ticket	Use Keyword
Request Area	pcat
Change Category	chgcat
Issue Category	isscat

NOTE

If you fail to check in the Start Request Form, the form fails to appear in CA SDM.

The CA Process Automation Start Request Form information appears on the CA SDM Start Request Form List. The CA SDM administrator can associate the CA SDM Start Request Form with the Process Definition, on a Request Area, Change Category, or Issue Category Detail page.
The following Start Request Form items appear in CA SDM:

1. – **Start Request Form Name**
   Appears on the Request Areas, Change Categories, and Issue Categories list pages.
   – **Start Request Form Reference Path**
   Appears on the Request Areas, Change Categories, and Issue Categories list pages.
   – **Start Request Form Description**
   Appears on the Request Areas, Change Categories, and Issue Categories list pages. The text in this field describes how the Start Request Form is appropriate for selection on a particular Request Area, Change Category, or Issue Category.

CA Service Catalog and Common Components

After you install CA Service Catalog, perform the following to complete the integration:

NOTE

Note: CA EEM is a mandatory component for CA Service Catalog. Hence, CA EEM is automatically integrated with CA Service Catalog. After the CA Process Automation processes are loaded and configured, update the CA Service Catalog login credentials in the CA Process Automation Dataset, to complete the integration between the two products. For more information, see the Integrate CA Service Desk Manager with CA Service Catalog topic.

CA Asset Portfolio Management and Common Components

The integration of CA Asset Portfolio Management with CA EEM, CA Process Automation, and/or CABI Jaspersoft is a completely automated process that is performed by the CA Service Management Installer.

You are not required to perform any manual steps to finalize the integration. However, if you are migrating CA Asset Portfolio Manager from CA Business Intelligence 3.3 to 4.1 SP3 , you must manually update the custom universe as follows:

WARNING

This step applies only if you are migrating from CA Business Intelligence 3.3 to CA Business Intelligence 4.1 SP3. For more information, see CABI Documentation.

If you have Custom Universe based on the OOTB Universe, refresh the link with CA Service Management Universe.

1. Launch Universe Design Tool from the machine where CA Business Intelligence Release 4.1 SP3 client tools are installed.
2. Copy the backup Custom Universe to this machine.
3. Click **File**, **Open**.
4. Click **File**, **Parameters**.
5. Click the **Links** Tab
6. From the Name column, click the universe of your product,
7. Click the **Change Source** button.
8. Select the location of the universe file.

   NOTE

   The .unv file is typically located in the CA Universes folder.
9. Click Open, OK.
   The universe link is updated.
10. Export the custom universe.

CA Service Desk Manager and CA Service Catalog

Ensure that you have selected both CA SDM and CA Service Catalog during the CA Service Management installation. After the successful installation of CA Service Management, perform the following manual steps to ensure that CA SDM and CA Service Catalog are integrated successfully.

Update Login Credentials in CA Process Automation Dataset

WARNING

Ensure that you have CA SDM Connector installed before you proceed with the following procedure.

Follow these steps:

1. Log in to CA Process Automation as an Administrator.
2. Click Library from the Home page.
3. Select the CA SDM folder and double click SDM_GlobalDataset.
4. Click Check out and enter the CA Service Catalog user credentials.
5. Click Save.
6. Click Check in and Close.
7. From the CA SDM SRF folder, double click HWSW_FilledFormInventory.
8. Click Check Out from the Common menu.
9. On the properties tab, enter the details of Tags field as chgcat and save.
10. Click Check in and Close.
11. From the CA Service Catalog folder, double click CA SLCM.
12. Click Check out and enter the CA Service Catalog user credentials
13. Click Save.

14. Click on Check in and close.

    WARNING

    Ensure that you have CA SDM connector installed to complete steps 15 and 16.
15. On the **Configuration** tab, click **Domain**, **Modules**.
16. Click **Lock** from the title bar of the configuration panel to lock the domain. Double-click **CA ServiceDesk**.
17. Give the CA SDM Host name In the Default ServiceDesk WebService URL.
18. Enter the password for Default User.
19. Save and close.
20. Click **Unlock**.

Create Groups in CA Service Desk Manager

Follow these steps:

1. Log in to CA SDM as an Administrator.
2. From the Administrator tab select Security and Role Management, Groups.
3. Click Create New and enter the group name for CA Service Catalog
4. Click Members, Service contracts, Auto Assignment.
5. Click Update Members.
6. Search and update the members.
7. Click OK and Save.
8. Associate this group with the following categories, and add CA SDM administrator as the assign of these categories:
   - SLCM.HWFFI
   - SLCM.SWFFI

   WARNING

   Ensure that you restart CA SDM and CA Service Catalog services after performing all the steps.

At the end of this topic, you have successfully integrated CA Service Catalog with CA Service Desk Manager.

In the rare event that the integration between the two products fail, see integrate CA Service Catalog with CA Service Desk Manager manually to troubleshoot the integration.

How to Handle Enabled Rules Defined in the Event-Rule-Action Page

When you auto-integrate CA Service Management components, some of the rules that are defined in the Event-Rule-Action page of CA Service Catalog are enabled. The rules that are enabled are required for the common administration components and for the integration to work properly. The rules are enabled in the following scenarios:

- When you install CA Service Management for the first time and auto-integrate the components
- When you upgrade from a standalone CA Service Catalog to the integrated environment
- When you upgrade from a standalone CA SDM to the integrated environment

  NOTE

  When you upgrade to the integrated environment, some of the rules that you had disabled may also be enabled. We recommend that you do not disable such rules, as disabling them may cause the common administration and the integration to not work properly.

The following table gives the list of rules that are enabled. Rules with filter that are triggered once for each hardware request item when status goes from approval range to Pending Fulfillment:

Rule	Description
Common Administration and Content Pack Related Rules	
CASM Auto Integration Rule	Rule with filter that fires once for CASM Auto Integration service
CASM Common Configuration Rule	Rule with filter that fires once for CASM Common Configuration service
CASM Contact Sync Rule	Rule with filter that fires once for each CASM Contact Sync service
CASM Create LDAP Rule	Rule with filter that fires once for each CASM add LDAP service
CASM Create Role Rule	Rule with filter that fires once for each CASM Custom Role service
CASM Custom Role Mapping Rule	Rule with filter that fires once for each CASM Custom Role Mapping service
CASM Custom Tenant Mapping Rule	Rule with filter that fires once for each CASM Custom Tenant Mapping service
CASM Import LDAP Users Rule	Rule with filter that fires once for each CASM import LDAP users service
CASM Manage LDAP Rule	Rule with filter that fires once for each CASM manage LDAP service
CASM Tenant Mapping Rule	Rule with filter that fires once for each CASM tenant onboarding service
CASM Tenant Onboarding Rule	Rule with filter that fires once for each CASM tenant onboarding service
CASM Update MT Options	Enable Multi Tenancy Options for Common Administration
CASM Update Role Rule	Rule with filter that fires once for each CASM Create Role Service
CASM Update Tenant	Rule with filter that fires once for each CASM tenant update service
CASM Update User Rule	Rule with filter that fires once for each CASM update user service
CASM User Onboarding Rule	Rule with filter that fires once for each CASM user onboarding service
When Category is Service Management Content and Status is Canceled	Rule with filter that fires once for each service option of Service Management Content category when status updates to Canceled
When Category is Service Management Content and Status is Completed	Rule with filter that fires once for each service option of Service Management Content category when status updates to Completed
When Category is Service Management Content and Status is Pending Fulfillment	Rule with filter that fires once for each service option of Service Management Content category when status updates to Pending Fulfillment
Out-of-The-Box rules The out-of-the-box rules include multiple actions and only the actions mentioned here are enabled.	
When Category is Hardware and Status is Filled from Inventory Action: Launch HWSWFilledFromInv_SDM_SYNC SRF	Rule with filter that fires once for each HW request item when status goes to Filled From Inventory (WFHWFulfillment)

When Category is Hardware and Status is Pending Fulfillment Actions: Launch CheckAvailability SRF for Hardware Auto assign the selected asset to the user	Rule with filter that fires once for each HW request item when status goes from approval range to Pending Fulfillment (WFHWCheckAvailability)
When Category is Software and Status is Filled from Inventory Action: Launch HWSWFilledFromInv_SDM_SYNC SRF for Software	Rule with filter that fires once for each SW request item when status goes to Filled From Inventory (WFSWFulfillment)
When Category is Software and Status is Pending Fulfillment Action: Launch CheckAvailability SRF for Software availability	Rule with filter that fires once for each SW request item when status goes from approval range to Pending Fulfillment (WFSWCheckAvailability)
When Status is Submitted and Approval Process is driven by Workflow Action: Launch Approval SRF	Rule with filter that fires once for each service when a request is submitted for approval (WFAllSubmit)
Notes and Attachment Synchronization Rules	
When notes is added to Service Catalog request	When notes are added to CA Service Catalog request, add them to the corresponding CA Service Desk ticket
When attachment is added to Service Catalog request	When attachment is added to CA Service Catalog request, add it as a link to the corresponding CA Service Desk ticket

CA Service Desk Manager and CA Asset Portfolio Management

The integration between CA Service Desk Manager and CA Asset Portfolio Management is completely automated. You do not have to perform any manual steps to finalize this integration.

In the rare event that the integration between the two products fail, see integrate CA Service Desk Manager with CA Asset Portfolio Management manually to troubleshoot the integration manually:

To manually integrate CA APM and CA SDM, perform the following steps:

1. Enable SSO from CA APM to CA SDM
2. Verify Single Sign-On
3. Launch the CA APM in context from CA SDM

WARNING

Ensure that CA APM and CA Service Desk Manager are installed on the same database.

NOTE

CA APM uses the fallback mechanism during the Single-Sign On process. If both the mechanisms are configured, the Policy File mechanism is used. If the Policy file does not work, then CA Service Desk Manager Administrator credentials are used. If neither of these are successful, then the CA Service Desk Manager login screen is displayed on clicking the respective hyperlink in CA APM. If the CA APM user does not have valid access rights (role/group) in CA Service Desk Manager, the Single Sign-On login screen is displayed on clicking the CA Service Desk Manager links on the CA APM page.

Enable SSO from CA APM to CA SDM

CA Service Management provides the following ways to enable SSO from CA Asset Portfolio Management (CA APM) to CA Service Desk Manager.

Use the Web Server Access Policy File

You create the Access Policy file in CA Service Desk Manager and then use this file in CA APM. The Access Policy file contains encrypted policy details that are assigned to a CA Service Desk Manager user who has access to various capabilities in the CA SDM application.

Follow these steps:

1. Log in to the CA Service Desk Manager as an Administrator. Use the Administration tab to perform the following tasks:
   a. Create the Web Services Access Policy using the SOAP Web Services Policy option. Complete the following:
      a. Assign a name. The default name and code are CASM_POLICY; however, you can use any name as per your requirements.
      b. Assign a proxy user to this policy.

         NOTE

         This proxy user must have administrative access to CA Service Desk Manager.
      c. Verify that the Allow Impersonate property of CA Service Desk Manager is set to Yes.
      CA Service Desk Manager checks the access type of the CA APM user to be impersonated against the access type of the proxy user of the policy. If the access level of the CA APM user access type is less than or equal to the grant level of the proxy user access type, CA SDM replaces the CA APM user with the proxy user.
   b. Generate the policy key file with the help of pdm_pki tool for the Web Services policy that you created.
   In the Service Desk environment, open the Command Prompt and enter:
   ```
   C:>pdm_pki -p CASM_POLICY -f
   ```
   The policy file CASM_POLICY.p12 is generated in the same folder.
   The default/recommended name is CASM_POLICY.p12, but you can use any name as per your requirement.
   c. Verify that the HashKey property is set to Yes in the newly created Web Services access policy. The system typically configures this setting automatically when you generate the policy key file.
   d. Copy and save the policy key file to the CA APM default installation directory of the CA APM Web Server.
   ```
   C:\Program Files (x86)\CA\ITAM
   ```

      NOTE
      If you are using application clustering, copy the policy key file to the CA APM installation directory of every CA APM Webserver Component cluster node. If you re-configure the Policy in CA SDM, then you must re-generate the policy file and copy it to CA APM Web Server installed directory.
2. Log in to CA APM as an Administrator.
   Default: *uapmadmin*.
3. Click Administration, System Configuration, Service Desk Manager.
4. Enter the complete URL for CA Service Desk Manager SOAP Web Services in the following format:
   ```
   http://<ServiceDeskHostName>:<PortNum>/axis/services/USD_R11_WebService.
   ```
5. Copy the CA Service Desk Manager SOAP Policy file from CA Service Desk Manager Server to the CA APM web server installation folder. Default installation directory :
   ```
   C:\Program Files (x86)\CA\ITAM
   ```
6. Enter the file name of CA Service Desk Manager policy file that is copied on the CA APM Web server component installation folder.
7. Enter the CA Service Desk Manager policy code that is the policy name as configured in the CA Service Desk Manager Administration SOAP Web Services policy configuration page.
8. Click Save.

   NOTE
   Do not perform IISReset on the CA APM Web Server or CA APM Application Server.

Both the mechanisms internally use the CA Service Desk Manager SOAP Web Services to achieve the SSO from CA APM to CA SDM. You can configure either one or both the mechanisms to achieve SSO from CA APM to CA SDM.

WARNING
Ensure that CA APM and CA Service Desk Manager are installed on the same database.

NOTE
CA APM uses the fallback mechanism during the Single-Sign On process. If both the mechanisms are configured, the Policy File mechanism is used. If the Policy file does not work, then CA Service Desk Manager Administrator credentials are used. If neither of these are successful, then the CA Service Desk Manager login screen is displayed on clicking the respective hyperlink in CA APM. If the CA APM user does not have valid access rights (role/group) in CA Service Desk Manager, the Single Sign-On login screen is displayed on clicking the CA Service Desk Manager links on the CA APM page

Use the CA Service Desk Manager Administrator Credentials

The CA Service Desk Manager admin credentials are used from CA APM to login to CA Service Desk Manager through the CA Service Desk Manager Web Services:
Perform the following steps:

1. Log in to CA APM as an Administrator. Default user name is *uapmadmin*.
2. Click Administration, System Configuration, Service Desk Manager.
3. Enter the complete URL for CA Service Desk Manager SOAP Web Services in the following format:
   `http://<ServiceDeskHostName>:<PortNum>/axis/services/USD_R11_WebService`
4. Enter the CA Service Desk Manager Administrator login user name and password.
5. Click Save.

NOTE
Do not perform IISReset on the CA APM Web Server or CA APM Application Server.

Verify Single Sign-On

To verify that Single Sign-On from CA APM to CA Service Desk Manager has been enabled, click on any *one* of the following CA Service Desk Manager hyperlinks in the CA APM page:

- Log in to CA APM, Asset Details page and click on the CA Service Desk Manager link on the top
- Click Asset Relationships (menu on the left), CA Service Desk Manager Tickets links. A Criteria and Results page with Service Desk Ticket ID Column values in hyperlink is displayed in the results section. The hyperlinks are the entry point to CA SDM and display ticket details after you have successfully logged into CA SDM.
- Click on the Launch CA Service Desk Manager link in the Asset Viewer page. This launches the CA Service Desk Manager application.

View the Contact Update Details

You can view the contact update details for existing or new assets (known as configuration items in CA Service Desk Manager) in the following ways:

- Contact Update Details for existing Contacts in CA APM
  Ensure that you have enabled Single Sign-On from CA APM to CA Service Desk Manager as shown above for existing contact details to be updated and reflected in CA Service Desk Manager Contact's Quick Profile.
- Contact Update Details for new Assets in CA APM
  In this release, if you have integrated CA APM and CA Service Desk Manager, new Assets that are created have the Contact details automatically saved and reflected in CA Service Desk Manager Contact's Quick Profile.

Launch the CA APM in context from CA SDM

To launch CA APM in context from CA SDM, you need to add a Management Data Repository (MDR) in CA SDM to point to the proper CA APM URL.

Perform the following steps:

1. Create an MDR in CA SDM with the following properties:
   a. Button Name: CA APM
   b. MDR Name: CA APM
   c. MDR Class: GLOBAL
   d. Hostname: CA APM Server Name
   e. Path: ITAM/Pages/Asset.aspx
   f. Parameters: assetid={federated_asset_id}
2. Click the CA APM button.
   The corresponding asset record opens in CA APM.

CA Service Catalog and CA Asset Portfolio Management

The integration between CA Asset Portfolio Management and CA Service Catalog is completely automated. You do not have to perform any manual steps to finalize this integration.

In the rare event that the integration between the two products fail, see integrate CA Asset Portfolio Management with CA Service Catalog manually to troubleshoot the integration.

> **WARNING**
>
> Review the following section only if you want to manually integrate CA Asset Portfolio Management with CA Service Catalog when the automatic integration between the two has failed.

CA Service Catalog integrates with CA Asset Portfolio Management in several areas, including these areas:

- Requested items can be associated with CA Asset Portfolio Management Assets. Asset managers can associate CA Asset Portfolio Management assets with items requested from the catalog during request fulfillment.
- Catalog entries can be associated with CA Asset Portfolio Management Models. CA Service Catalog catalog administrators can associate one or more CA Asset Portfolio Management models with a service option. This association can assist with automated asset creation and association during request fulfillment using a workflow process and the CA Service Catalog web services.

> **WARNING**
> CA Service Catalog and CA Asset Portfolio Management must share the same MDB and the same CA EEM for this integration to work properly.

Requirements for the integration:

- You must have a role defined in CA Asset Portfolio Management.
- Verify that CA Asset Portfolio Management supports your internet browser.
- Check whether the CA Asset Portfolio Management application and web servers reside on the same computer or different computers. If they reside on different computers, complete the CA Asset Portfolio Management web services section in the administration configuration settings on the CA Service Catalog GUI.
- Authorized CA Service Catalog users use the CA Asset Portfolio Management Model Assignments window to assign eligible assets during the fulfillment of a request.

You can assign the assets through CA Service Catalog services if the following requirements are met:

- The assets must be active.
- The assets must not be assigned to any user.

You can associate one or more CA APM models with a service option, if the following requirements are met.

CA Service Catalog and CA Asset Portfolio Management administrators work together to use one of the following methods to authorize CA Service Catalog users (typically request managers) to assign assets:

1. Assign to the user the Fulfiller role in CA Asset Portfolio Management.
2. Assign to the user another role in CA Asset Portfolio Management that can update the Asset Fulfillment object. If you use another role, it must have the same Asset Fulfillment security settings as the CA Asset Portfolio Management Fulfiller role.
3. Specify a proxy user for CA Asset Portfolio Management in CA Service Catalog. To specify this proxy user, select **Administration**, **CA APM Web Services**, and complete the fields. Specify this CA Asset Portfolio Management user in the **User ID** field.
   In this case, CA Service Catalog users inherit the authority of the proxy user to assign assets.

   NOTE

   For information about fulfilling requests from inventory, see How to Fulfill Requests from Inventory.

Perform the following steps:

Step 1 - Create Users in CA Service Catalog

Step 2 - Create or Update Administrator in CA EEM

Step 3 - Update CA APM Web Services in CA Service Catalog Configuration

Step 4 - (Optional) Create New Rules and Actions

Step 5 - Create a Service and Request

Step 6 - Configure for Single Sign-On

Verify the CA Asset Portfolio Management - CA Service Catalog Integration

Uninstalling CA Service Management

How to Uninstall the xFlow Interface

Uninstall the xFlow Interface (Windows)

Perform the following steps to uninstall the xFlow Interface (Windows):

1. Click **Start**, **Control Panel**, **Uninstall a Program** to uninstall xFlow Interface.
   Or
2. Navigate to where you have installed the xFlow Interface (for example, *C:/Program Files/CA/xFlow)* and do the following:
   – Select **xFlow Interface_installation** and click **Change xFlow Interface Installation.exe** to complete the uninstallation process.

Uninstall the xFlow Interface (Non-Windows)

To uninstall the xFlow Interface, complete the following steps on Linux or Solaris as per your implementation:

1. Navigate to where you have installed the xFlow Interface server.
2. For example: */opt/CA/xFlow/_xFlow Interface 17.4.0.0_installation*
3. Execute the following command to uninstall:
   ```
   ./ Change xFlow Interface 17.4.0.0 Installation
   ```
4. Click **Finish** to complete the uninstallation process.

How to Uninstall the Search Server

Uninstall the Search Server

- Perform the following steps to uninstall the search server (Windows):
  a. Stop the CA Service Management Search Server service.

     NOTE
     Back up the search server folder. For example, back up the search server folder at C:/Program Files/CA/SC/CASearchServer
  b. Click **Start**, **Control Panel**, **Uninstall a Program and** right-click **SearchServer** to uninstall the Search Server.
     Or
  c. Navigate to where you have installed Search Server (for example, *C:/Program Files/CA/SC).*
  d. *Open* the **SearchServer** folder and select **SearchServer_Installation.** Click **Change SearchServer Installation.exe** to complete the uninstallation process.
- Perform the following steps to uninstall the search server (Linux):
  a. Stop the CA Service Management Search Server service.
  b. Navigate to /opt/CA/SC/SearchServer/elasticsearch-x.xx.x/bin on terminal using the following command
     ```
     ./ServiceStop.sh
     ```

     NOTE
     Back up the search server folder. For example, back up the search server folder at /opt/CA/SC/SearchServer
  c. Navigate to where you have installed Search Server (for example, /opt/CA/SC/SearchServer_Search Server 17.4.0.xx_installation) on the terminal and run the following command:
     ```
     ./Change\ Search\ Server\ 17.4.0.xx\ Installation
     ```
     Example:
     ```
     ./Change\ Search\ Server\ 17.4.0.0\ Installation
     ```
     The Uninstall Search Server window opens. Follow the on screen instructions.

Unable to run pdm_rebuild_index in Search Server after rolling back to previous 17.3 version from current RU version.

Perform the following steps to run pdm_rebuild_index:

1. Check the Java version present in <Search Server Install location>/search/bin/java_home.txt.
2. Check the Java version is available in the following locations:
   – **Windows:** C:\Program Files\CA\SC\JRE
   – **Linux:** /opt/CA/SC/JRE
3. Copy the specified JRE from jre_backup and place it in the above mentioned location in Step 2.
4. Run pdm_rebuild_index.

Uninstall DataMart

Perform the following steps to uninstall DataMart:

1. Navigate to the location where you have installed DataMart.
   For example,*C:\Program Files\CA\Datamart_CA Datamart_installation*
2. Run **Uninstall CA Datamart.exe**
3. Click **Next**
4. Click **Finish** to exit the wizard.
5. Navigate to *DVD1\DBCleanupUtility* directory.
6. Double-click the **DBCleanupUtility.bat** to launch the DBCleanup utility.
7. Enter the following details:
   a. **Database Server Type**: Specify the type of server, MS SQL or Oracle.

b. **Database Host Name:** Enter the host name of the server where the database resides.
c. **Database User Name**:
   • **SQL Server**: Enter the privileged user detail that has permission to create and modify schema.
d. **Database Password**:
   • **MS SQL**: Enter the database password used by the database admin user.
e. **Database Port Number:** Provide the database port number.
f. **Enter Database Name :** Enter the database name. For example, mdb.
g. **System Name**: Provide the host name of the system to cleanup the database.

8. On the product selection screen, select **DataMart**.
9. Launch MS SQL Server Management Studio.
10. As an administrator connect to the MS SQL Server where datamart DB is created.
11. Delete the DataMart schema.

Uninstall CA Service Desk Manager

To uninstall CA Service Desk Manager, perform the following steps:

1. Depending upon the operating system,
   – **Windows**:
      • Copy SDUninstall folder from NX_ROOT\REPLACED\sduninstall_backup folder to NX_ROOT.
      • Copy JDK folder 1.8.0_112 from SC\REPLACED\jre_old to CA\SC\JRE. Example: C:\Program Files(x86)\CA\SC \REPLACED\jre_old to C:\Program Files (x86)\CA\SC\JRE.
      • Stop the ServiceDesk Manager Services.
      • Run SDUninstall.exe from NX_ROOT\SDUninstall folder.
   – **Linux:**
      • Copy SDUninstall folder folder from NX_ROOT/REPLACED/sduninstall_backup folder to NX_ROOT.
      • Copy JDK folder 1.8.0_112 from SC/REPLACED/jre_old to CA/SC/JRE. Example: From /opt/CA/SC/ REPLACED/jre_old to /opt/CA/SC/JRE.
      • Stop the ServiceDesk Manager Services.
      • Run SDUninstall from NXROOT/SDUnistall folder.

   A message window appears.
2. Select the option to restart the system (recommended for Windows). Click **Done**.
   You have successfully uninstalled CA SDM.

Uninstall CA Service Catalog

You can uninstall CA Service Catalog and CA EEM from one or more computers, if you want to at some point of time. Perform the following steps:

1. Stop all CA Service Catalog Windows services on all computers.
2. Open the Windows Control Panel, select **CA Service Catalog**, and click **Uninstall**.

   NOTE

   The CA Service Catalog data in MDB is saved for any future CA Service Catalog installations in your enterprise. If you delete MDB data, you cannot recover it.
3. If no other CA Technologies products in your enterprise use CA EEM, use the Windows Control Panel to uninstall it.

   WARNING
   Before you uninstall CA EEM, unregister all registered applications.
4. (Optional) Review the uninstallation log files in the Windows Temp directory:

- **CA_Service_Catalog_view.log**
- **CA_Service_Catalog_Uninstall.log**

NOTE

Tomcat and the JRE are installed automatically during CA Service Catalog installation and are uninstalled automatically when you uninstall CA Service Catalog. After Uninstalling Service Catalog, you must uninstall CA Service Management Administration.

NOTE

If the uninstallation fails for any reason, perform the following actions and uninstall again:

- Install JRE 1.7.51 or later.
- Set JAVA_HOME to the JRE path and add JAVA_HOME in the Environment PATH variable.

Run the Database Cleanup Utility

During the installation of CA Service Management products, each of the installed product is registered in a common mdb table that is reflected in the deployment summary of the selected environment. These entries must be cleared in the following cases:

- Uninstallation of any CA Service Management products
- Moving Database or migration from one server to another

Run the CA Service Management database cleanup utility on a Windows or a Non-Windows environment. The database cleanup utility removes the entries and adds these to the following tables:

Table Name from where the entries are removed	Table Name to which the removed entries are added
al_cdb_componentinstallstate	al_cdb_comp_installstate_bkup
al_cdb_configurationparameters	al_cdb_config_params_backup

NOTE

On a Non-Windows Platform, before running the **DBCleanup.sh** Utility, you must export the Oracle Environment variables on the terminal.

Follow these steps:

1. Navigate to *DVD1\DBCleanupUtility* directory.
2. For Windows, double-click the **DBCleanupUtility.bat** to launch the DBCleanup utility.
   On a Non-Windows platform, you must run the **DBCleanupUtility.sh** file.
3. Enter the following details:
   a. **Database Server Type**: Specify the type of server, MS SQL or Oracle.
   b. **Database Host Name:** Enter the host name of the server where the database resides.
   c. **Database User Name**:
      - **SQL Server**: Enter the privileged user detail that has permission to create and modify schema.
      - **Oracle**: Provide the mdbadmin user name.
   d. **Database Password**:
      - **MS SQL**: Enter the database password used by the database admin user.
      - **Oracle**: Enter the password for the Oracle database user.
   e. **Database Port Number:** Provide the database port number.
   f. **Enter Database Name :** Enter the database name. For example, mdb.

g. **System Name**: Provide the host name of the system from where you want to uninstall the CA Service Management product or products.

4. Select any of the following products that you want to uninstall:
   - **SDM -** CA Service Desk Manager.
   - **SLCM-** CA Service Catalog.
   - The utility cleans up the database and removes the entries of the selected product installed on the server.

Post-Backout Tasks

This article explains the steps to perform after CA Service Management is uninstalled, and then roll back to a previous version.

Roll Back Java Update

CA Service Management 17.3 is shipped with Java 11. To revert to an older version of Java (1.8.0_112), follow the steps:

CA SDM

For CA SDM, perform the following steps:

1. Stop the `CA Service Desk Manager` service.
2. Navigate to the `$NX_ROOT` folder.
   a. Open the `NX.env` file in a text editor.
   b. Find the parameter `NX_JRE_INSTALL_DIR=C:/Program Files (x86)/CA/SC/JRE/11.0.3`
   c. Modify the value from **11.0.3** to **1.8.0_112**
   d. Save the `NX.env` file.
3. Restart the `CA Service Desk Manager` service.

For remote Web Screen Painter, perform the following steps:

1. On the system where CA SDM is installed, navigate to `$NX_ROOT/java/lib` folder.
2. Copy the `sd-utils.jar` file.
3. On the remote WSP server, paste the .jar file on `$NX_ROOT/java/lib` folder.
4. Execute the jar file.
5. Launch the remote WSP.
6. Copy Java 11 folder from the above path (java) on the remote WSP
7. Open the `NX.env` file in a text editor.
8. Modify the value from **11.0.3** to **1.8.0_112.**

Upgrading

As you prepare to upgrade to CA Service Management 17.4, consider the value of the new features added in the latest release. Based on these assessments, you can plan and make effective decisions toward a successful upgrade.

Review the following before you upgrade to CA Service Management 17.4:

Getting Started

- Review the CA Service Management 17.4 Release Notes.
- Review the Supportability Matrix.

Upgrade Planning

For more information, see Pre-Planning for an Upgrade.

Prerequisites and Considerations

Review and verify the upgrade prerequisites and planning consideration for the following CA Service Management products:

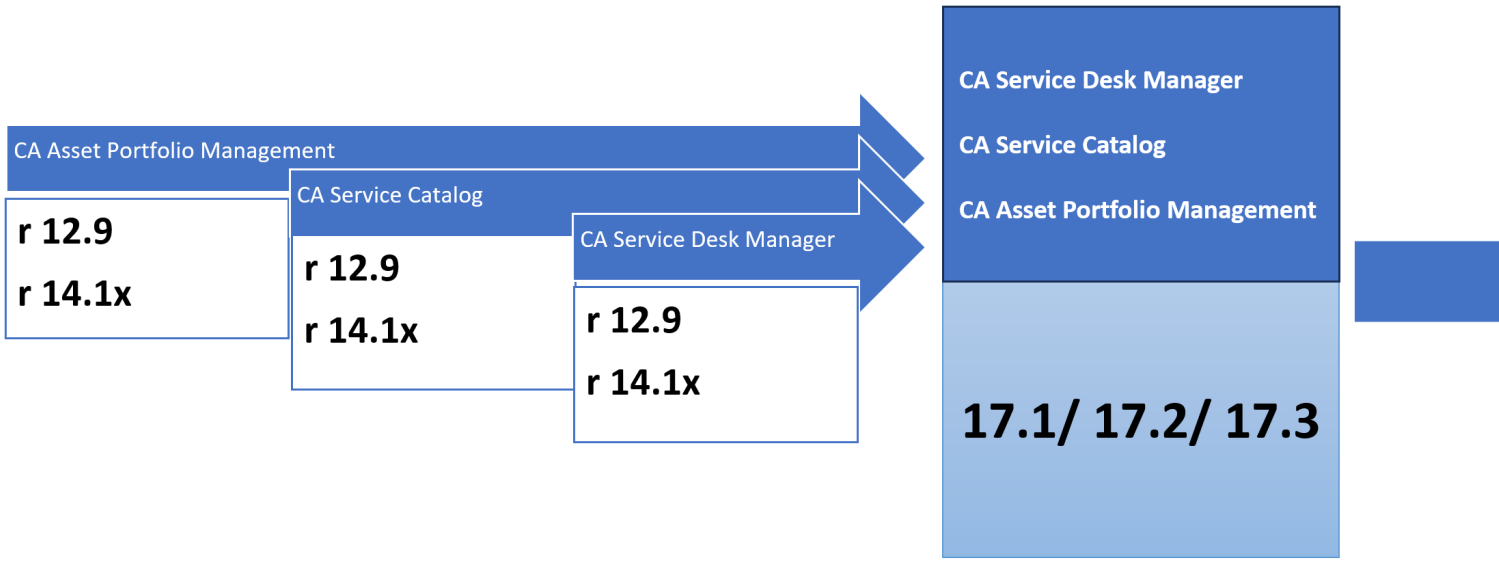
1. Upgrading to CA Service Desk Manager 17.4
2. Upgrading to CA Service Catalog 17.4
3. Upgrading to CA Asset Portfolio Management 17.4

NOTE

If you are planning to upgrade a product that is integrated and configured with Active Directory, ensure to create the **CasmAdmin** user and **OpenSpaceAdminGroup** before upgrading to CA Service Management 17.4. Associate the **CasmAdmin** to **OpenSpaceAdminGroup** in the Active Directory.

NOTE

Insights - Aggregate Reports are currently supported only on Microsoft SQL Server Database and not on Oracle Database.



Supported Upgrade Paths

The following table lists the earliest version from which a CA Service Management product can be migrated to the current version of CA Service Management:

CA Service Management Products	Supported Upgrade Paths
CA Service Desk Manager	Upgrade from **17.1/17.2/17.3** release is supported. CA Service Desk Manager provides the xFlow Interface, App Launcher with Service Point App/Insights App for CABI JasperReports Server, and search server capabilities.
CA Service Catalog	Upgrade from CA Service Catalog **17.1/17.2/17.3** release is supported.
CA Asset Portfolio Management	Upgrade from **CA Asset Portfolio Management (CA ITAM) 17.1/17.2/17.3** release is supported. **Note:** If you are upgrading CA Asset Portfolio Management from an earlier release to 17.4, the changes you made to configuration files from an earlier release are not automatically merged with CA Service Management 17.4. Refer to the backup files located in the ***%Temp%\ITAM*** directory and manually merge these changes with the currently installed version.

How to Upgrade

Launch the CA Service Management installer on the systems/servers that you want to upgrade. The installer automatically detects the installed CA Service Management version in your environment and upgrades it to 17.4.

For more information about how the upgrade process works, see Upgrade to CA Service Management 17.4.

Integrations

Integrations After completing the upgrade process, perform integration to integrate one or more CA Service Management products in your environment. For example, you can integrate CA Service Desk Manager with CA Service Catalog. For more information see, Integrate CA Service Management Solution.

Why Upgrade to CA Service Management 17.4

Timely upgrades help improve ROI both quantitatively and qualitatively. It ensures business continuity and avoids unnecessary failures. An older product version may lack important security updates, new features, and the ability to integrate with current technology trends and advancements. Unsupported software also poses serious security risks for an Enterprise. Timely upgrades verify that you are using an improved and enhanced product to increase productivity and usability. Being on a current release also helps to protect your systems and applications against virus, spyware, and/or other malicious software attack.

Some upgrades can be easily handled in-house with the right resources, while others require external support. As you complete your assessment and build your strategy, consider your options for assistance and map out your upgrade requirements and timing. CA Services and Support help with your upgrade plan and provide resources, options, and expertise to ensure that you get the most from your software investment. You can access resources that are provided by CA Support for a hassle-free upgrade experience from start to finish. For more information, contact Broadcom Support.

Benefits of Upgrading

Upgrading to the latest release version of CA Service Management gives you the following benefits:

- Improved application with new features and enhancements
- Mobility
- Out-of-the box services
- Availability of new fixes and enhancements
- Improved solution architecture for speed and minimal downtime
- Better administrative capabilities and improved service delivery efficiency
- Easy future upgrades and on-boarding
- Better alignment with business objectives

New Features and Enhancements

Upgrading to the latest version helps you avail the new features and enhancements that are provided in CA Service Management. It also provides operational efficiency to conduct your daily IT business. For more information about new features and enhancements, see CA Service Management 17.4 Release Notes.

End of Service (EOS) for Release Versions

EOS Release dates have been announced for older versions of CA Service Management. Ensure that you are up-to-date and using the latest version of CA Service Management to have continued support. Supportability options on an EOS release are minimal and restricts your access to published patches and new code creation. You have limited ability to receive standard support for products that you are using. Staying on an Older release version also increases vulnerability and security concerns. For more information, see Release and Support Life Cycle Matrix.

Pre-Planning for an Upgrade

Planning Considerations

Planning well ensures upgrade readiness before starting the actual upgrade process. Before proceeding with the actual upgrade process, review, consider, and plan for the following tasks:

Task	Additional Information
Download CA Service Management 17.4 Installer from CA Support.	For more information, see Broadcom Support.
Review the Release Note	For more information, see CA Service Management 17.4 Release Notes.
Operating Systems and Database Compatability	For more information, see Supportability Matrix.
Ensure that your environment meets all minimum version requirements. Review Supported Upgrade Paths for CA Service Management 17.4.	For more information, see Upgrade to CA Service Management 17.4
Backing up the Operating Systems and database	For more information, see Database Backup and Database Restore.
Backing up all customizations.	• Are there any customizations you have performed in your environment? • Do you need these customizations after upgrading? For more information, see Pre-Planning for an Upgrade.
Server and Hardware requirements	For more information, see Server and Hardware Requirements.
Environment Scalability	• Whether your Current Environment is meeting your business needs? • Is it scalable?
New Features/Enhancements from Latest Release	• Which new features you need to enable/install? For more information, see CA Service Management 17.4 Release Notes. • Will these new features require more servers?
Which Applications must be upgraded first?	• CA Process Automation and CA Embedded Entitlements Manager must be upgraded first as this allows the CA Service Management installer to automatically integrate these products. • Begin the upgrade with the 17.4 CA Service Catalog, and subsequently proceed to upgrade CA SDM and its sub-components. If you have CA Asset Portfolio Management in your environment, upgrade it in an order of your preference.
Integration	• If the upgrade environment is integrated with CA EEM: Enable active directory only after CA Service Management is successfully upgraded. • If the upgrade environment is configured with a load balancer, SAML, or NTLM: Reconfigure the settings after CA Service Management is successfully upgraded. • Are there any CA Service Management Integrated Products in your environment? Will they need to be upgraded? For more information, see Integrating.

Other Considerations

- When upgrading to Release 17.4 and later, older versions of JRE, MDB, and Tomcat which are not used by Service Desk Manager are backed up in the jre_old, mdb_backup, and tomcat_old folders.
  Example:

- **Windows:** Older version/s of Tomcat is moved from the C:Program Files (x86)/CA/SC/tomcat folder to C:Program Files (x86)/CA/SC/REPLACED/tomcat_old.
- **Linux:** Older version/s of Tomcat is moved from the /opt/CA/SC/tomcat folder to /opt/CA/SC/REPLACED/tomcat_old.

  NOTE
  If other applications are using these older versions of JRE and Tomcat, copy them back to the original location.

- When upgrading to Release 17.4 and later, older versions of jquery and perl are backed up in the jquery and perl_old folders.
  Example:
  - **Windows:** Older version/s of perl is moved from the NX_ROOT/bin/perllib folder to NX_ROOT/REPLACED/perl_old.
  - **Linux:** Older version/s of perl is moved from the NX_ROOT\bin\perllib folder to NX_ROOT\REPLACED\perl_old.

    NOTE
    If your update is successful and other integrations are intact, you can delete the "REPLACED" folders as it may contain older versions of vulnerable jars.

Create a Backup Plan

Plan to take a full backup of your database and ensure it is validated. Plan to take multiple snapshots or a backup of the entire installation folder during the course of the upgrade procedure. This saves time, in case, you need to revert to a certain point while upgrading. Temporarily allocate additional disk space for backups.

For more information, see Database Backup and Database Restore.

Decide the Upgrade Method to Use

- Decide the type of architecture you want to use for CA SDM: **Conventional** or **Advanced Availability**.
- Identify the product components on all systems in your environment.
- Synchronize production data over to the development environment (**Production** > **Development**).
- Prepare a checklist of all tasks that needs to be performed during the upgrade/migration process.
- If time permits, plan a test upgrade to capture actual migration time, validate tasks, and record any possible issues and provide resolutions.
- Ensure that you have the necessary administrative privileges for performing the upgrade procedures.

For more information, see Upgrade Tools.

Plan for Environments

Plan for at least two environments: **Development** and **Production** environments. If a test or development environment is not available, consider Swing Box as the development environment. For more information about Swing Box Migration Method, see Swing-Box Methods to Upgrade to CA Service Management 17.4.

Scaling the Environment

In case of CA SDM Conventional Configuration, limit the number of components installed on a Primary Server for a better upgrade experience, scalability, and better application performance.

Upgrade Tools

This article describes the different ways you can upgrade and migrate from an earlier release version of CA Service Management to the latest.

CA Service Management Common Installer

CA Service Management Common Installer performs the following tasks on launch:

- Detects the version of the CA Service Management products (CA SDM, CA Service Catalog, and CA APM) that are currently installed in your environment and performs the appropriate Upgrade tasks for a given release version.
- Remotely connects to database server (no need to run installer on a remote database).
- Performs automated integration tasks for CA Service Management products (CA SDM, CA Service Catalog, and CA APM), if you had

CA Service Management Swing-Box Upgrade

The Swing-Box Upgrade method is used for the following:

- Applicable for CA SDM
- When a new hardware/Operating System (OS)/database is upgraded
- When MDB (database) is not shared or is shared with other applications that are either already updated or are updated. For more information, see Swing-Box Methods to Upgrade to CA Service Management 17.4.

Pros	Cons
• Allows the use of new/latest hardware with current OS/ database versions. • The remains of the legacy customizations and previous upgrade are cleaned up. • Less risk as current production environment is touched.	More cost of new hardware (need temporary hardware for SWING environment).

CA SDM Customization Upgrade Utility

CA Service Desk Manager allows customers to extend the design forms as required. The Customization Upgrade utility facilitates smooth upgrade and merging of the customized forms into the latest CA SDM version. For more information, see

How does the Customization Upgrade Utility Works?

CA SDM Customization Upgrade Utility does the following tasks:

- Performs comparisons on HTMPL and CSS customizations.
- Attempts to merge the customizations into newer forms.
- Semi-automatic in nature.

For the utility to run successfully, the following are required:

- Out-of-the-Box (OOB) files from an earlier CA SDM Release that you are upgrading from.
- Customized Files from earlier CA SDM Release that you are upgrading from.
- Out of the Box files from latest CA SDM Release (In this case, CA SDM 17.3).
- Target Merged files as a Result. The utility generates a log file containing the status of each file: **Merged**, **Unable to Merge**, and **Copied**.

  NOTE

  Any files that are not merged successfully through the utility must be merged manually.

Upgrade to CA Service Management 17.4

To upgrade CA Service Management, review the following upgrade tasks.

NOTE

If you are planning to upgrade a product that is integrated and configured with Active Directory, ensure to create the **CasmAdmin** user before upgrading to CA Service Management 17.4. Associate the **CasmAdmin** in the Active Directory.

NOTE

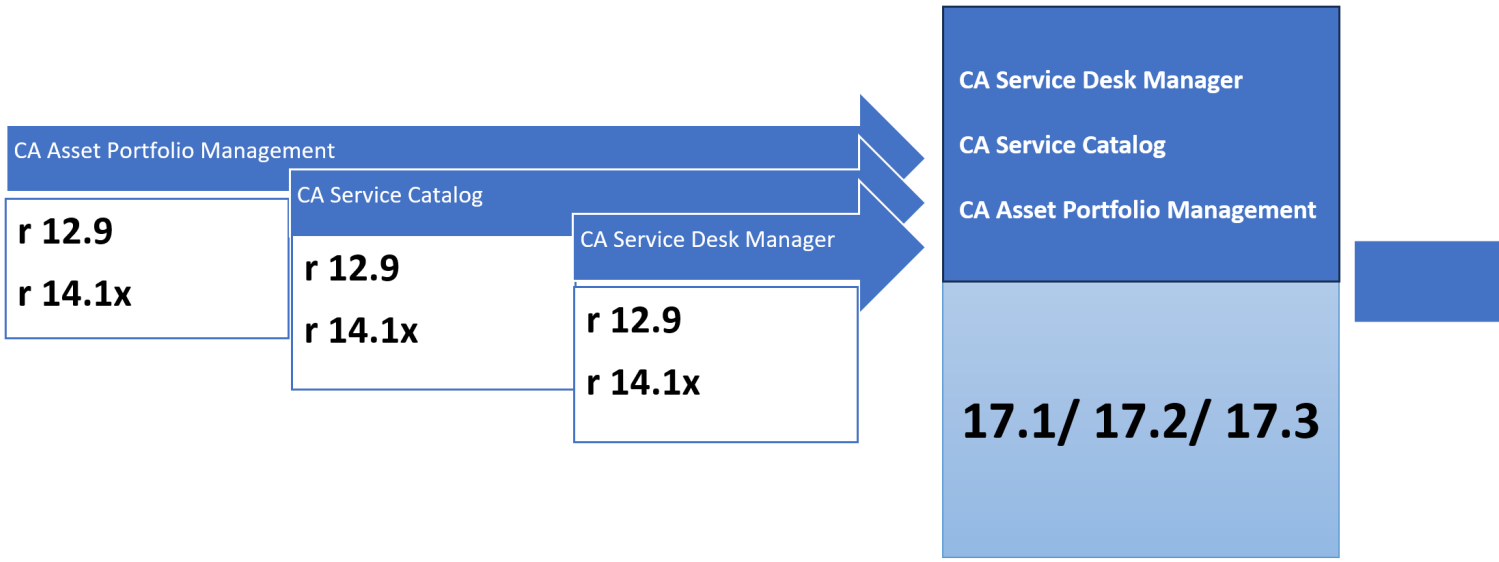
If you are upgrading from CA Service Management 17.3 to CA Service Management 17.4, ensure to rename the *CUM1* folder in *<Nx_ROOT>/patches/* to update the latest MDB changes.

To upgrade CA Service Management products, review the following upgrade tasks:

1. Review and verify the upgrade prerequisites and planning consideration for the following CA Service Management products:
   a. Upgrade CA Service Desk Manager
   b. Upgrade CA Service Catalog
   c. Upgrade CA Asset Portfolio Management
2. Launch the CA Service Management installer on the system/server that you want to upgrade.
   The installer automatically detects the installed CA Service Management release version and upgrades it to 17.4.
3. Complete the upgrade process. Now, you can integrate one or more CA Service Management products in your environment. Perform more steps to finalize the integration.

Supported Upgrade Paths

The following supported products and release versions can be upgraded to CA Service Management 17.4:



CA Service Management Products	Supported Upgrade Paths
CA Service Desk Manager	Upgrade from **17.3** release is supported. CA Service Desk Manager provides the xFlow Interface, App Launcher with Service Point App/Insights App for CABI JasperReports Server, and search server capabilities.
CA Service Catalog	Upgrade from CA Service Catalog **17.3** release is supported.
CA Asset Portfolio Management	Upgrade from **CA Asset Portfolio Management (CA ITAM) 17.3** release is supported. **Note:** If you are upgrading CA Asset Portfolio Management from an earlier release to 17.4, the changes you made to configuration files from an earlier release are not automatically merged with CA Service Management 17.4. Refer to the backup files located in the ***%Temp%\ITAM*** directory and manually merge these changes with the currently installed version.

Upgrading to CA Service Desk Manager 17.4

Ensure to review the upgrade tasks before upgrading on a production or test system.

NOTE
Before you start upgrading to CA Service Desk Manager 17.4, for Oracle Database, ensure that the Oracle PATH environment variable refers to 32-bit oracle client first, and then, to 64-bit Oracle client. To change the sequence, navigate to Environment Variables, System Variables, Path, Edit.

For more information, see the following topics:

- Upgrade Prerequisites - CA SDM
- Pre-Upgrade Tasks
- Upgrade CA Service Desk Manager 17.4
- How to Upgrade Oracle Database Client
- Perform the CA SDM Post-Upgrade Tasks

Upgrade Prerequisites - CA SDM

This article describes the upgrade prerequisites for a successful CA SDM upgrade process. Ensure to complete these prerequisites before you start the upgrade process on a production or test system.

CA SDM 17.4 supports upgrade from 17.1/17.2/17.3 for all supported platforms. For more information, see the Supportability Matrix.

NOTE

If you are on an older release version CA SDM, prior to 17.1 it is recommended that you first upgrade to CA SDM 17.1/17.2/17.3 or above and then, follow the upgrade process for CA SDM 17.4

- Windows users can upgrade directly to the latest version of CA Service Management using the CA Service Management Common Installer.
- Linux users must run the automated upgrade script for CA SDM and must move CA SDM to a supported platform and database before running the automated upgrade script for the release of CA Service Management 17.4
- If you have CA SDM modifications/customization, you must apply these customizations once after running the final automated upgrade script to the release of CA SDM 17.4

Prerequisites

- If you have manually added a variable in the NX.env file or updated a variable value and want to retain the variable value after migration, ensure to add the variables to the NX.env template file before performing the migration process.
- CA SDM supports only ITIL. If you are upgrading from a non-ITIL system, the CA Service Management installation upgrades your environment to an ITIL environment.
- Before migrating from an earlier supported version of CA SDM to CA SDM 17.4, validate that the servlet path URL (in each Repository Server) is in the correct format.
  To validate, complete the following steps:
  a. a. Log into CA SDM.
     b. Navigate to **Administration**, **Attachment Library**, **Repository**.
     c. Edit each repository servlet path URL. Remove the Fully Qualified Domain Name (FQDN) from the servlet path and replace it with the hostname in the servlet URL.
     For example, change (http://myhostname.ca.com:8080/CAisd/UploadServlet) to (https://myhostname:8080/CAisd/UploadServlet)
     Ensure that the repository server functionality is intact and working.
- UTF-8 locale must be installed on Linux platforms.

  NOTE

  On Linux, CA SDM no longer uses the **smtp_mail** script to process outgoing mail notifications.
- If you are using **smtp_mail**, and you upgrade to CA SDM 17.4, your CA SDM administrator must configure the appropriate mail options using the **Default Mailbox Detail** page to enable the CA SDM mail notification feature.

  WARNING

  Migration from an advanced availability environment is not possible using the CA SDM rolling maintenance process. You must shutdown the CA SDM services on all the application and standby servers before starting the migration activity. You need to first migrate the background server and then, verify whether the

background server processes are running. Migrate other servers only after ensuring that the background server processes are up and running.

- If an earlier supported version of CA SDM uses ***domsrvr:01*** , rename the server ID before starting the upgrade. Execute the ***pdm_edit*** command and update the domsrvr ID from **01** to another ID value.

  NOTE

  The ***pdm_edit*** command provides an easier interface to configure the servers. The ***domsrvr:01*** name for object manager is reserved and cannot be used by a custom configuration.

Pre-Upgrade Tasks

Perform the following pre-upgrade tasks as per your environment requirements.

Upgrade your Database

Consider the following before upgrading your CA SDM database:

- If you are using CA SDM 17.3 and want to upgrade to CA SDM 17.4, run the following commands to a supported database: Backup your existing database using the database backup procedures:

```
update mdb_schema_information set FileTimestamp='2012-04-23T09:19:09+0000'
  where FileName like 'doc_rep.xml'
```

- (Applicable for all non-windows machines) If the supported upgrade release versions of CA SDM is configured, install Oracle 19c/ 21c client before you upgrade. For more information, see Supportability Matrix.

  WARNING
  Before upgrading, change the Oracle home path to Oracle 19c/ 21c client path in the *$NXROOT/NX.env* file.

- Archive the installation directory ($NX_ROOT) using your typical archive procedures.
  This action lowers amount of data movement and saves disk space.

  IMPORTANT
  You must take the backup of the installation directory ($NX_ROOT), which helps add any missing files after the upgrade.
- Upgrade CA SDM 17.3 or later to 17.4 on a supported database (Microsoft SQL Server or Oracle).

Run the following script from a command prompt to identify any duplicate records on the Microsoft SQL Server or Oracle database:

NOTE
Run this script on the secondary servers. If you want to run this script using Microsoft SQL Query Analyzer, edit the **SQLCheckr12UniqueIndexes.sql** script and remove the **EXIT** argument before you run the command.

WARNING
These scripts identify the duplicate records. Delete identified duplicate records before you proceed with the upgrade process.

- (Oracle) Run **OracleCheckr12UniqueIndexes.sql**, located in the **..\products\SDM\Migrate** directory on the installation media.
- (Microsoft SQL Server): Perform the following steps:

  NOTE

  The database is named as **use mdb** by default. Before you run the script, update the database name manually to **use <other_database_name>** using the **SQLCheckr12UniqueIndexes.sql** file.

  a. Open a Command Prompt window and run **SQLCheckr12UniqueIndexes.sql** as follows:

```
cd $NX_ROOT\samples\views\SQLServer
```

  b. Run the following command:

```
Sqlcmd  - E  - e < SQLCheckr12UniqueIndexes.sql
```

NOTE
After upgrade, you can find the files at ***$NX_ROOT/samples/views/SQLServer*** or *$NX_ROOT/samples/views/Oracle* on the server.

- If you are using an earlier version of CA SDM on a non-supported operating system and database, move CA SDM to a supported operating environment and database before you upgrade.

  NOTE

  Special Windows characters, such as a long hyphen are not properly stored in the database on a non-Windows system in CA SDM or Knowledge Management.
- **Oracle** -- Oracle does not support case-insensitive indexes for Configuration Item registration. Before you start the migration on Oracle, verify SQLPlus and Oracle DB are able to communicate using the host name. If communication fails, verify that the Oracle database is configured with a loopback adaptor.

  NOTE

  When you migrate a double-byte character environment with an Oracle database, increase the maximum open cursor limit to at least **500**. For more information, see Oracle documents **ORA-01000: maximum open cursor exceeded**.
- **Microsoft SQL Server** -- To upgrade the Microsoft SQL Server database to the current release of CA SDM 17.4, the default configured database must be MDB, if not the upgrade fails and displays the following message:
  The acctyp_v2 table does not exist on the MDB .
- **Table Updates** -- Consider the following table updates that happen during the upgrade process:
  - **Status Tables** -- These tables are also updated with the appropriate status records when the same code values do not exist in your database.
    For example, ***Cr_Status*** is updated with the code ***AEUR*** (Awaiting End User Response).
  - **Functional Areas** -- For each role, the upgrade process automatically adds a row for each ***usp_functional_access*** record. Migration sets the access level to the same level for each CA SDM functional area that the *usp_role* table includes. New functional areas are mapped using a reference field.
- **Foreign Keys** -- Consider the following information:
  - Foreign keys (SRELs) that reference tables, in which the primary key is a **UUID**, change from integer type to **UUID type** (or **BYTE 16**).
  - If you dropped the foreign key constraints in the earlier CA SDM release version that you were using to mass load data, recreate the foreign key constraints before you run the upgrade. The scripts that drop the constraints are found in the following locations:
    - **Oracle**
      $NX_ROOT/samples/views/Oracle/OracleDropConstraints.sql
    - **Microsoft SQL Server**
      $NX_ROOT/samples/views/SQLServer/SQLDropConstraints.sql

      NOTE
      Reapply the dropped constraints by running the appropriate script ***OracleAddConstraints.sql*** or ***SQLServer/SQLAddConstraints.sql*** . These scripts are found in the same directory as the drop constraints and contains instructions.
- **MDB** -- MDB provides a consistent database schema for various IT management data. Data elements from earlier CA SDM environment are incorporated into this schema during upgrade. The size of the data elements can increase and consequently, increases the overall database size.

  NOTE

  When standard data elements extend beyond the column width defined for MDB, the update process can truncate data in these elements. Messages alert you to any truncation that occurs during the upgrade.

- **Distributed Setup** -- We recommend you upgrade your servers in the following order, depending on your CA SDM configuration:
  a. **Conventional**
     - Primary server
     - One or more secondary servers
  b. **Advanced Availability**
     - Background server
     - One or more standby servers
     - One or more application servers
- **Remote Database** -- If you are using Microsoft SQL Server MDB database, **sqlcmd** must be on the client computer before connecting to the remote MDB.

Knowledge Management Considerations

For **EBR** search engine, navigate to CA SDM **Options Manager**, **Search Engine** and edit **ebr_version** to specify KT Search Engine.

LREL Migration Considerations

A *List Relationship* (LREL) represents an association between two objects. An LREL has a left-hand side (lhs) and right-hand side (rhs) relationship. Each side of the relationship is an attribute of the majic object that contains the data relationship.

> **NOTE**
>
> In earlier releases of CA SDM, the **.maj** LREL statements and objects described many-to-many DBMS data relationships. Now, the any-to-many relationships no longer use the LREL majic statement. Instead, individual tables store both sides of the relationship. Objects access the relationship with a standard BREL statement. For example, you can see the relationship between change orders and CIs by reviewing the new **usp_lrel_asset_chgnr** table and in the corresponding **lrel_asset_chgnr** object.

The LREL changes eliminate the need to store attribute names in the database. The two sides of the relationship are foreign key single relationships (SREL) that are easy to join and index. If necessary, the relationship can contain additional relational attributes.

During an upgrade, the following activities happen when the LREL table data migrates to CA SDM 17.4:

- Automatically migrates tables and objects with LREL relationships.
- Names new tables using the ***usp_lrel_lhsName_rhsName*** format.
  For example, the ***usp_lrel_asset_chgnr*** table has a left-hand relationship to assets and a right-hand relationship to change orders.
- Names the corresponding objects using the ***lrel_lhsName_rhsName*** .

For example, the ***lrel_asset_chgnr*** object corresponds to the ***usp_lrel_asset_chgnr*** table.

- Due to database limitation, some names are abbreviated.
- Your data is migrated from the old tables and CA SDM code is modified to use CA SDM 17.4.
- Old LREL database tables are no longer used, such as ***bmlrel*** . However, for reference purposes, the old tables retain the data.
- A backward relation (BREL) attribute to the new object replaces the original LREL attribute in each related majic object definition.
- If you are using a supported API, such as the ***CreateLrelRelationship()*** web service method, the code works as expected.
- If you have included any custom LREL style relationships, CA SDM migrates/upgrades the Custom LREL to the tables of the updated release.
- Any site-defined code or reports that directly access the old LREL tables operate on old data because the system no longer uses those tables. We recommend that you update the code to tables and reports of the updated version of the code.

WARNING
If your code directly accesses legacy LREL objects or tables, the code fails after upgrade. We recommend that you upgrade the code before upgrading. For example, if your code uses **majic** statements to establish LREL relationships, use the ***createLrelRelationships()*** method instead of directly populating a table.

NOTE
We recommend that you verify site-defined code or reports that directly access the database or address the legacy LREL majic objects such as the **lrel1** object to verify that they operate properly. You can update your code to use a supported interface, such as Web Services. You can also update the necessary table names. For reports, you can also update the queries with the new DBMS table references.

How to Upgrade CA EEM

NOTE
The CA SDM17.4 supports CA EEM version 12.6.6.0

To upgrade CA EEM, perform the following tasks:

To upgrade from an earlier supported version of CA EEM, see CA EEM Documentation.

1. Verify that you have upgraded to the current version of CA SDM 17.4.
2. Install/ upgrade CA EEM version 12.6.6.0
3. After you install CA EEM, manually set the appropriate options in CA SDM Options Manager (***eiam_hostname*** , ***use_eiam_artifact*** , and ***use_eiam_authentication***). Review the upgraded options carefully. The default Process Manager URL is no longer **pmService**.

NOTE

The ***cawf_pm_url*** option has changed to default: ***http://<wf_hostname>:<wf_tomcat_port>/pm/service/pmService2*** . You *must* manually change the **pmService** to **pmService**2 for CAWF communication to remain functional.

WARNING
After you upgrade CA EEM, set the ***eiam_hostname*** , ***use_eiam_artifact*** , and ***use_eiam_authentication*** options in CA SDM **Options Manager**, **Security** if you were earlier using **eIAM** CA SDM user authentication.

CA Process Automation Integration

To ensure that CA SDM and CA Process Automation integration works properly, add the **ServiceDesk** user in CA EEM (if not already added) during the upgrade process.

Retain your Customization

Before you upgrade, review the following information to see how you can retain CA SDM customization/modification performed in your environment :

WARNING

Any **modifications** or **adaptions** or c**onfigurations** that are done administratively through the interface (web browser, command-line, Web Screen Painter) are supported, meaning CA Support can assist with basic suggestions and troubleshooting. CA Support will not perform any modifications for the customer. The customer is responsible for the changes and customization that are carried out in an environment.

For example, adding a field to a table and putting the field on a form through Web Screen Painter is a fully supported “modification”. Similarly, installing or uninstalling a feature through the CA SDM Options Manager administration is a fully supported “configuration”. Anything to do with SPEL code, Java scripting (or any language scripting), or a customer-specific change to the underlying base code-line (done by CA Services or a Partner), is not supported by CA Support. The customer can perform these actions, but is responsible for the support, maintenance, and troubleshooting when an issue occurs. If such “customization” affect the expected out-of-the-box behavior, CA Support will ask the customer to remove the customization and see if the behavior persists. For more information, see Customization Upgrade Utility.

- **Modified Forms** -- Upgrade retains the modification of the forms from an earlier release of CA SDM. However, you cannot view the CA SDM Release 17.4 functionality on the modified forms after you upgrade.
- **Modified Form Buttons** -- After upgrade completes, buttons on the modified forms in ***/site/mods/htmpl*** that did not have quotes around the **msgtxt(n)** part of the code show an error message, instead of the button name.
  For example, in the **detail_cr.htmpl** form, modify **msgtxt(441)** with quotes as follows to display the correct button name:

```
ImgBtnCreate("btnchg", "msgtext(441)", "detailSave('NEW_CHANGE')",
true, 0, msgtext(440)); // Save and Create Change Order
```

- **Retaining Modifications**--. When any form is modified, the customer changes are overwritten and has to be recreated. Upgrade process attempts to detect and identify the differences in the forms, and report it to the user. However, it is highly recommended to document your customization before you start the upgrade process. The custom JavaScript file must be customized again according to the CA SDM base release JavaScript file.

  NOTE
  If you modify the ***acctypedtl.rpt*** and ***acctypesum.rpt*** reports, the return data in CA SDM Release 17.4 is obsolete.
- **Notification Rules** -- If you have removed the default activity notifications **Contact**, **Object Contacts**, and **Contact Types** from an earlier installation of CA SDM and want to retain this functionality, then make a note of the default contacts that were removed before migration. After you upgrade to the new version, remove the default Notification contacts again.
- **Role-based Functionality** -- Upgrade may cause issues with the role-based functionality. If you modified any of the following forms, they are considered as read-only by the Web Screen Painter in CA SDM Release 17.4 and they include an **xxx_site.htmpl** version where you can use custom code:
  - **ahdtop.htmpl**
  - **menu_frames.htmpl**
  - **reports.htmpl**
  - **std_body.htmplca**
  - **std_footer.htmpl**
  - **std_head.htmpl**
  - **styles.htmpl**
  - **msg_cat.js**
  - **menu_frames_role.htmpl**

NOTE

The script does not restore files from backup folders to the legacy or **site/mods** directories as in previous releases of CA SDM.

How to Upgrade Oracle Database Client

This article describes how to upgrade the Oracle Database Client:

For Windows

Perform the following steps:

1. Install the Oracle 32-bit client for Oracle 19c/ 21c with Administration Client.
2. Establish the connection with Oracle_Server_SID.
3. Create a Local Net Service Name and test the connection.
4. Edit the PATH variable to have oracle_client home and remove server home from PATH, as shown in the following example:
   C:\app\Administrator\product\<oracle_database_version>\client_32bit\bin
5. Execute pdm_configure with ORACLE_HOME set to client_home, as shown in the following example:
   C:\app\Administrator\product\<oracle_database_version>\client_32bit\
6. Install the Oracle 64-bit client for Oracle 19c/ 21c with Administration Client.
7. Establish the connection with Oracle_Server_SID.
8. Create a Local Net Service Name and test the connection.
9. Edit the PATH variable to have oracle_client home and remove server home from PATH, as shown in the following example:
   C:\app\Administrator\product\<oracle_database_version>\client_64bit\bin
10. Execute pdm_configure with ORACLE_HOME set to client_home, as shown in the following example:
    C:\app\Administrator\product\<oracle_database_version>\client_64bit\

    NOTE
    Before you start installing CA Service Desk Manager 17.4, for Oracle Database, ensure that the Oracle PATH environment variable refers to 32-bit oracle client first, and then, to 64-bit Oracle client. To change the sequence, navigate to Environment Variables, System Variables, Path, Edit.
11. Install CA SDM 17.4

For Linux

Perform the following steps:

1. Install the Oracle 32-bit client with Administration client.
2. Establish the connection with Oracle_Server_SID.
3. Create a Local Net Service Name and test the connection.
4. Export TWO_TASK variable.
5. Edit the ORACLE_HOME and PATH variables to have oracle_client home and remove server home, as shown in the following example:

   ```
   ORACLE_HOME= /opt/app/product/<oracle_database_version>/client_32bit
   PATH= /opt/app/product/<oracle_database_version>/client_32bit/bin
   ```
6. Install the Oracle 64-bit client with Administration client.
7. Establish the connection with Oracle_Server_SID.
8. Create a Local Net Service Name and test the connection.
9. Export TWO_TASK variable.

10. Edit the ORACLE_HOME and PATH variables to have oracle_client home and remove server home, as shown in the following example:

```
ORACLE_HOME= /opt/app/product/<oracle_database_version>/client_64bit
PATH= /opt/app/product/<oracle_database_version>/client_64bit/bin
```

NOTE
Before you start installing CA Service Desk Manager 17.4, for Oracle Database, ensure that the Oracle PATH environment variable refers to 32-bit oracle client first, and then to 64-bit Oracle client in the terminal.

11. Install CA SDM 17.4

Install and Configure Apache Tomcat

CA SDM provides out-of-the-box Apache Tomcat. This document provides steps to upgrade the Apache Tomcat version 8.x.xx or 9.x.xx to Apache Tomcat 9.x.xx.

First perform these steps in your Pre-prod environment; after successful internal validation, perform the same steps in production.

These are all the generic steps for Tomcat upgrade, you may have to perform some more additional steps based on the selected Tomcat version.

Follow these steps:

1. Shut down CA SDM Daemon Service or CA SDM Proctor Service, or both on the relevant CA SDM server (primary or secondary, or both).
2. Download Tomcat 9.x.xx (apache-tomcat-9.x.xx.zip).

NOTE
CA SDM supports service packs and point releases of Operating Systems, Databases, Web Servers, Web Browsers, Java, Servlets, etc., not necessarily noted on the certification matrix as long as the problem reported is reproducible with versions that are listed on the matrix. We reserve the right to refuse support of new point releases should the reported problem require a major SDM rework or redesign in order to function properly. Both Technical Support and Sustaining Engineering will do their best to resolve any issues that occur in a timely manner. If the resolution to the problem is determined to be outside the realm of their support responsibilities, they may ask that you escalate your request for certification to your local account team.

3. Unzip apache-tomcat-9.x.xx.zip and place the files at <drive>:\<install_directory>\CA\SC\tomcat\9.x.xx

NOTE
After unzipping, ensure that <drive>:\<install_directory>\CA\SC\tomcat\9.x.xx contains conf, bin, webapps, and other directories.

4. Make a backup copy of the NX.ENV located at the CA SDM install directory (NX_ROOT).
5. Modify NX.ENV located at the CA SDM install directory (NX_ROOT) as follows:

```
@NX_TOMCAT_INSTALL_DIR=C:\Program Files\CA\SC\tomcat\9.x.xx
```

6. Backup NX_ROOT\bopcfg\www\CATALINA_BASE\conf and copy all the files in the <drive>:\<install_directory>\CA\SC\tomcat\9.x.xx\conf
to
NX_ROOT\bopcfg\www\CATALINA_BASE\conf
7. Verify/update that the server.xml file located in directory NX_ROOT\bopcfg\www\CATALINA_BASE\conf has the same startup (connector) and shutdown ports as defined in the original server.xml file.

NOTE
If any other changes were made to the original server.xml file, then they would need to be made to the new server.xml file.

8. Edit the file NX_ROOT\bopcfg\www\CATALINA_BASE\conf\catalina.properties with a text editor.
Look for the following entry in the file:

shared.loader=
Modify it as follows:

```
shared.loader=${catalina.base}/shared/lib/*.jar
```

Save the file.

9. If CA Visualizer is installed, back up the directory NX_ROOT\bopcfg\www\CATALINA_BASE_VIZ\conf and copy all the files in the <drive>:\<install_directory>\CA\SC\tomcat\9.x.xx\conf
to
NX_ROOT\bopcfg\www\CATALINA_BASE_VIZ\conf
10. Verify that the server.xml file located in the directory NX_ROOT\bopcfg\www\CATALINA_BASE_VIZ\conf has the same startup (connector) and shutdown ports as defined in the original server.xml file.

    NOTE
    If any other changes were made to the original server.xml file, then they would need to be made to the new server.xml file.
11. Edit the file NX_ROOT\bopcfg\www\CATALINA_BASE_VIZ\conf\catalina.properties with a text editor.
Look for the following entry in the file:
shared.loader=
Modify it as follows:

```
shared.loader=${catalina.base}/shared/lib/*.jar
```

Save the file.

    NOTE
    If you encounter any issue related to accessing the latest Visualizer try the followiing steps:

    - Add the following entry in the Visualizer context.xml and Save the file.
      NX_ROOT\bopcfg\www\CATALINA_BASE_VIZ\conf
      <Valve className="org.apache.catalina.valves.rewrite.RewriteValve"/>
12. If CA REST Webservices are enabled, back up the directory NX_ROOT\bopcfg\www\CATALINA_BASE_REST\conf and copy all the files in the <drive>:\<install_directory>\CA\SC\tomcat\9.x.xx\conf
to
NX_ROOT\bopcfg\www\CATALINA_BASE_REST\conf
13. Verify that the server.xml file located in the directory NX_ROOT\bopcfg\www\CATALINA_BASE_REST\conf has the same startup (connector) and shutdown ports as defined in the original server.xml file.

    NOTE

    - If any other changes were made to the original server.xml file, then they would need to be made to the new server.xml file.
    - If you encounter any access related issue try the following steps:
      Update the file catalina.properties under NX_ROOT\bopcfg\www\CATALINA_BASE_REST\conf
      \catalina.properties with the following value:
      common.loader="${catalina.base}/lib","${catalina.base}/lib/*.jar","${catalina.home}/lib","${catalina.home}/lib/*.jar",${catalina.base}/../../../java/lib/CXF/*.jar
      tomcat.util.scan.StandardJarScanFilter.jarsToSkip=*.jar,\
14. Modify config.properties located in directory NX_ROOT\site as follows:
web.tomcat_home=<drive>\:\\<install_directory>\\CA\\SharedComponents\\tomcat\\9.x.xx
web.tomcat.version=9.x.xx \
15. If CA Federated Search components are installed, perform Steps 6 and 7 for CATALINA_BASE_FS folder.
16. Restart CA SDM service.

Tomcat Upgrade for CA Service Catalog using ANT

upgrading tomcat using ant cmd

CA SDM provides out-of-the-box Apache Tomcat. This document provides steps to upgrade the Apache Tomcat version 9.0.71 to Apache Tomcat 9.0.x.

These are all the generic steps for Tomcat upgrade, you may have to perform some more additional steps based on the selected Tomcat version.

1. Download Tomcat 9.0.x version from here.
   a. Choose the version to be upgrade (For Ex if we want to upgrade 9.0.80)
   b. Click on the version link (For Ex : v9.0.80/)
   c. Go to **bin** folder.
   d. Download the .zip file (Ex : apache-tomcat-9.0.80-windows-x64.zip)Note : Catalog product supports 64 bit tomcat prefer to download only 64 bit .zip file.
   e. Once downloaded, follow the steps metioned below.
      a. Launch cmd from %USM_HOME% location.
      b. Type command
         ```
         ant upgrade-tomcat
         ```
      c. Follow the instructions to upgrade Tomcat version.
2. Start the CA Service Catalog services again.

Upgrade Tomcat and JRE (CASM Admin)

The following procedures help you upgrade Tomcat and JRE for CA Service Management Administration.

> **NOTE**
> Perform the same steps when CA Service Catalog is installed on multiple nodes.

Tomcat

Download the Tomcat, which is the later version of 9.0.71 (32-bit version) and place it in the server machine where we are upgrading the Tomcat.

Follow the steps once the downloaded Tomcat.zip is available:

1. Open the *% CASMAdmin_HOME %\scripts\utilities\tomcat* folder.
2. Stop the CA Service Management Admin service.
3. Run the *Tomcat_Upgrade.bat* in Administrator mode.
4. Enter the location of tomcat.zip when prompted.
   Upgrade starts. Wait for the process to upgrade the Tomcat version.

JRE

Download the JRE, which is the later version of 1.8.0_362 (32-bit version) and place it in the server machine where we are upgrading the JRE.

Follow the steps once the downloaded JRE.zip is available:

1. Open the *% CASMAdmin_HOME %\scripts\utilities\jre* folder.
2. Stop the CA Service Management Admin service.
3. Run the *Jre_Upgrade.bat* in Administrator mode.
4. Enter the location of JRE.zip when prompted.
   Upgrade starts. Wait for the process to upgrade the JRE version.

> **NOTE**
> *%CASMAdmin_HOME%* refers the installed location of CA Service Management Administration.
> (**Example:** C:\Program Files\CA\Service Management Administration\).

Upgrade Tomcat and JRE (CAF ITAM)

The following procedures help you upgrade Tomcat and JRE for CAF CA Asset Portfolio Manager.

> **NOTE**
> Perform the same steps when CA Asset Portfolio Manager is installed on multiple nodes.

Tomcat

Download the Tomcat, which is the later version of 9.0.71 (32-bit version) and place it in the server machine where we are upgrading the Tomcat.

Follow the steps once the downloaded Tomcat.zip is available:

1. Open the *%CAF_ITAM_HOME%\scripts\utilities\tomcat* folder.
2. Stop the CA CASM service.
3. Run the *Tomcat_Upgrade.bat* in Administrator mode.
4. Enter the location of tomcat.zip when prompted.
   Upgrade starts. Wait for the process to upgrade the Tomcat version.

JRE

Download the JRE, which is the later version of 1.8.0_362 (32-bit version) and place it in the server machine where we are upgrading the JRE.

Follow the steps once the downloaded JRE.zip is available:

1. Open the *%CAF_ITAM_HOME%\scripts\utilities\jre* folder.
2. Stop the CA CASM service.
3. Run the *Jre_Upgrade.bat* in Administrator mode.
4. Enter the location of JRE.zip when prompted.
   Upgrade starts. Wait for the process to upgrade the JRE version.

> **NOTE**
> *%CAF_ITAM_HOME%*refers the installed location of CA Asset Portfolio Manger.
> (**Example:** *C:\Program Files (x86)\CA\SharedComponents\CASM*).

Perform the CA SDM Post-Upgrade Tasks

After a successful upgrade to CA SDM 17.4, perform the following post-upgrade tasks:

- Customization Upgrade Utility
- Configure CA SDM Servers after Upgrade
- Manually added NX variables need to be merged
- Configure your Tickets
- Enable Services in xFlow Interface
- Modify the New Functional Access Areas Post-Migration
- Review the CA SDM Email Mailbox Options
- Upgrade Knowledge Management
- Add Insights Functional Access to Existing Custom Roles
- Set Active Status for Default Area

After successful completion of the post-upgrade task, perform additional post-installation tasks.

Customization Upgrade Utility

Customization Upgrade for Patch Migration

CA Service Desk Manager allows customers to extend the design forms as required. The Customization Upgrade utility facilitates smooth upgrade and merging of the customized forms into the latest CA SDM version.

WARNING
If you are upgrading from 17.x, ensure to take backup of **bopcfg** (*$NX_ROOT/bopcfg/www/htmpl*) file and provide the same file path into

```
PREVIOUS_BASE_FOLDER
```

Prerequisites

- Create a backup of the *site/mods* folder. This folder is used by the utility to identify the customized files for processing.
- Upgrade to CA SDM 17.3.

TIP

It is recommended that you clean up the unused HTMPL and CSS files from the customization folder before merging the content.

How the Utility Works

For the utility to run successfully, the following folder locations are required:

- Out of the box (OOTB) files from the previous release
- Customized files
- Out of the box files from the latest release
- Target location of the merged files

The utility merges the customization in the OOTB files of the latest release, and then places the merged files in the target location. A log file is also generated, which indicates the status of each file:

- **Merged**: Indicates that the files merged correctly. These files can be placed in the *sites/mods* folder by the administrator.
- **Unable to merge**: The files that fail to merge correctly are created with '**_partial_merge**' in the file name. You can use these files to merge the customization manually.
- **Copied**: When the previous or the current releases do not have a corresponding OOTB file, the utility copies the file in the target location.

WARNING

We recommend that you use the utility to merge only the HTMPL and CSS files. We currently do not provide support to merge the failed files and such files must be merged manually.

Execute the Utility

Follow these steps:

1. Login to CA SDM as an administrator. Navigate to the location that contains the utility.

   WARNING

   When using **** as the file separator to define folder locations on Windows, use another **** as the escape character.
2. *Navigate to **$NX_ROOT/site/cfg/ folder, edit the cu_env.properties** file and define the following properties:*
   - **DO_SDM_CONV**

Set the value to 1, if the CA SDM version that is being upgraded is 12.5 or earlier.
Retain the default value, 0, if the CA SDM version that is being 12.6 and above.

- **PREVIOUS_BASE_FOLDER**
  Define the location of the OOTB files from the previous release.
  For example, *PREVIOUS_BASE_FOLDER=$NX_ROOT/migrate/tor17_2/prer17_2/bopcfg/www/htmpl*
  In case of a patch upgrade, point the variable to backup folder taken for the patch migration.
- **CUSTOMIZED_FOLDER**
  Define the location of the customized files that you saved as the backup.
  For example, *CUSTOMIZED_FOLDER=<Site-mods-backup-path>/www/htmpl*
  If you failed to create a backup of the *site/mods* folder, you can define the CUSTOMIZED_FOLDER path as $NX_ROOT/site/mods/www/htmpl folder. However, the migration process renames some HTMPL files to *_incompatible_for_r<major_release>_<minor_release>* (example, **_incompatible_r17_2**). Rename the files back to the original name before you execute the utility.
- **NEW_BASE_FOLDER**
  Define the location of the OOTB files from the latest release.
  For example, *NEW_BASE_FOLDER=$NX_ROOT/bopcfg/www/htmpl*

  WARNING

  This utility reads the folder recursively to find corresponding files to compare and merge, like any other compare tool. Therefore, the relative path to an htmpl file from PREVIOUS_BASE_FOLDER, CUSTOMIZED_FOLDER, and NEW_BASE_FOLDER folders must match.
  For example, if you want to merge *about.htmpl* file that is located in *$CUSTOMIZED_FOLDER/web/analyst*; ensure that the file exists in *$PREVIOUS_BASE_FOLDER/web/analyst* and *$NEW_BASE_FOLDER/web/analyst* folder locations.

  If the relative folder paths mismatch, the utility might throw errors.
- **MERGED_FOLDER**
  Define the location of the target folder that is used by the utility to create the merged files.

  TIP

  Do not define the MERGED_FOLDER path to any existing CA SDM folder, as the utility might rename the folder.
- **TEMP_LOC**
  Temporary location to contain the processing files.
  For example, TEMP_LOC=$NX_ROOT/temp

  NOTE

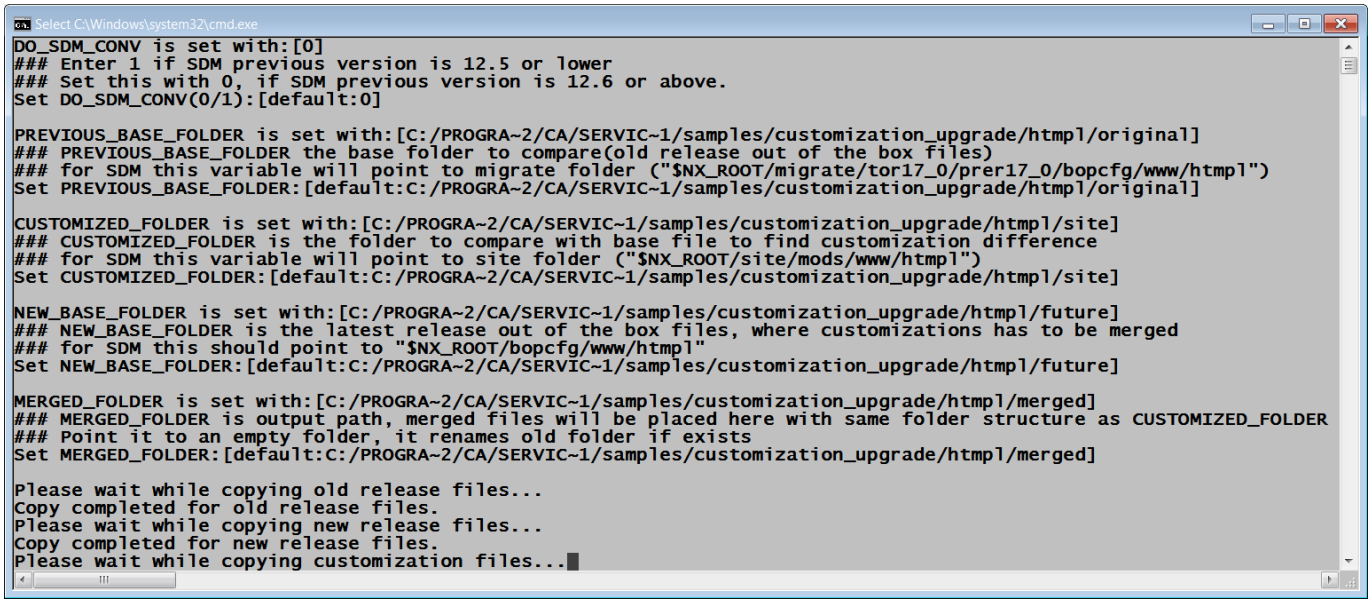
  Ensure enough space to contain the files in the PREVIOUS_BASE_FOLDER, CUSTOMIZED_FOLDER, and NEW_BASE_FOLDER locations.
- **LOG_LOC**
  Location that contains the log and differences files for debugging.
  For example, LOG_LOC=$NX_ROOT/log/UpgradeFactoryLogs

3. *Navigate to $NX_ROOT/bin folder and execute the following file to start the merge process:*
   - *Windows: customization_upgrade.bat*
   - Unix/Linux: *customization_upgrade.sh*

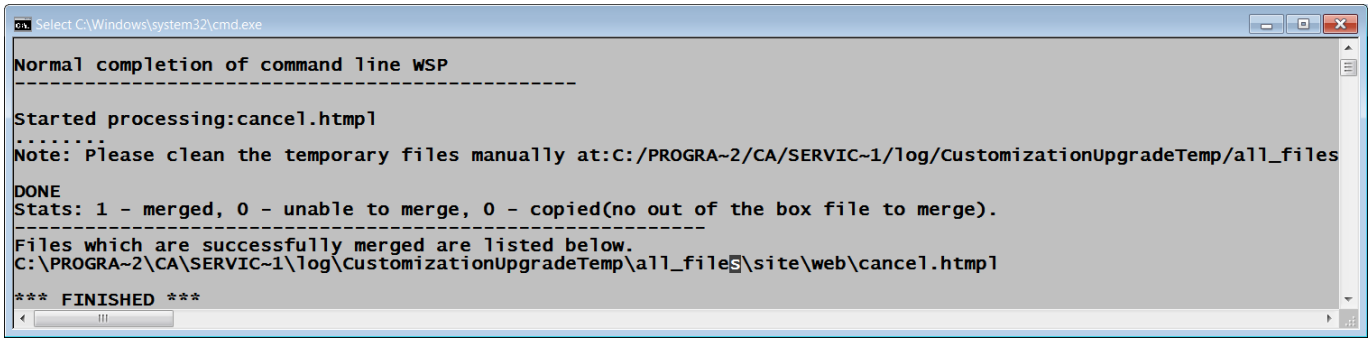
     NOTE

     When you execute the script, it prompts the variables that you defined in *cu_env.properties*, which you can update, if necessary.

   The merge process runs as indicated in this image:



After the merge process completes successfully, you can view the result as indicated in the image:



4. Verify the ***$NX_ROOT/log/customization_merging.log*** log file to ensure successful merging of customization.
   To manage the log level, edit the ***$NX_ROOT/site/cfg/log4j.properties*** *file.*
5. Manually merge the files that the utility failed to merge.
6. Copy the files from the merged folder location to ***$NX_ROOT/site/mods*** folder.
7. Execute the following command on the CA SDM server to clear the cache:
   ```
   pdm_webcache -bH
   ```

Understand the Files Created in the Output Folder

- Successfully merged files are placed in the **MERGED_FOLDER** with the same file extension. For example, <file_name>.htmpl; <file_name>.css
- Partially merged files are created with ***_partial_merge*** in the filename. For example, <file_name>.htmpl_partial_merge
  You can analyze the partially merged files and can perform the manual merge.
- Customizations that do not have a corresponding OOTB file in the previous release are considered as new and copied in the output folder with the same name.
- *Customizations that do not have a corresponding OOTB file in the latest release are considered as unmerged and copied in the output folder with the* ***_unmerged*** *in the file name.*
- The .htmpl file format of the copied files can change based on the value defined in DO_SDM_CONV property in the ***$NX_ROOT/site/cfg/cu_env.properties*** file.
- The log file contains the status of each file processed.

Manually Verify the Merged Files

You can use any diff tools to verify that the merging process was successful.

Verification method 1: Compare the differences

- Compare the files in the **CUSTOMIZED_FOLDER** and the **MERGED_FOLDER**, and
- Compare the files in the **NEW_BASE_FOLDER** and **PREVIOUS_BASE_FOLDER**.

In both the comparisons the differences must match, which indicates that the merge was successful. If not, then, manually merge the files.

Verification method 2: Compare the Customization

- Compare the **PREVIOUS_BASE_FOLDER** and **CUSTOMIZED_FOLDER** to identify the customization
- Compare the NEW_BASE_FOLDER and the MERGED_FOLDER to identify the customization

In both the comparisons, the customization must match. If not, then, manually merge the files.

SITEMODS.JS File

Lines of code added to the ***sitemods.js*** file of the previous version, called from an HTMPL page, must be merged into the current ***sitemods.js*** file before the code works.

Exceptions to Merging Customization

The merge utility fails when your customization falls under the following scenarios:

- When the number of customizations in the file is large.
- When the customized content location has changed only slightly, that is, immediately before or after the customized content, the utility fails to find the reference location and eventually fails.
- When the customized file is split into multiple Out-of-the-Box (OOTB) HTMPL and CSS files.

Configure CA SDM Servers after Upgrade

Inactive Servers Other Than Primary or Secondary

After you upgrade, all the servers that are not entered as primary server in the **usp_servers** table are converted to secondary server. Before upgrading, if you have added any server in the **usp_servers** table, which are not secondary or primary server, inactive them after you upgrade. You can inactive servers from the primary server Web User Interface. The local host name is stored in the **usp_servers** table in **local_host** column.

Clear the Webengine and Browser Cache

> **NOTE**
> After you upgrade CA SDM, run the **pdm_webcache** utility to clear the cache for the web engine and browser.

```
pdm_webcache -b -H
```

- **-b**
  Warns the user to clear their browser cache.
- **-H**
  Clears the webengine cache.

Manually added NX variables need to be merged

Manually updated NX variables are lost when a GA release or RU patch delivers a new `NX.env_nt.tpl` file (located in `NX_ROOT/pdmconf`). This necessitates an additional manual step to merge the custom values from the backup file of `NX.env_nt.tpl` created by `pdm_configure`.

- Manually merge the required changes into the NX.env_nt.tpl file located in NX_ROOT\pdmconf from the backup file at NX_ROOT\REPLACED\GOL-78_EN_US.OLD\pdmconf\NX.env_nt.tpl.
- Restart the SDM services.
- **For Conventional Mode**: Restart the SDM services on all secondary servers.
- **For Advanced Availability Mode**: Restart the SDM services on all standby servers and application servers.

Configure your Tickets

How to Add the Incident Priority Field to Incidents

This article describes how to configure your CA SDM Tickets

The *incident priority* is the sum of the Urgency and Impact values. The incident priority is only for the incident ticket type. The Incident Priority value appears on the incidents after you install the **use_incident_priority** option and add it to the incident Detail page form with Web Screen Painter.

To add the Incident Priority field to incident, do the following:

1. Install the **use_incident_priority** option from the **Options Manager**, **Request Mgr**.
2. Use Web Screen Painter to add the Incident Priority field to the Incident Detail pages.
   The Incident Priority value appears on saved Incident Detail page when the **use_incident_priority** option is installed. When the **use_incident_priority** option is not installed, the Incident Priority value is zero.

   NOTE
   The use_incident_priority option only manages the Incident Priority value. This option is not related to priority calculation.

Add the Urgency Field to Employee Tickets

By default the **Urgency** field does not appear on Employee incidents or requests. However, you can add the **Urgency** field by using the **urgency_on_employee** option.

NOTE
When you uninstall the **urgency_on_employee** option and disable priority calculation, the Priority field appears on the Request and Incident Detail pages for self-service Users.

To add the **Urgency** field to Employee tickets, install the **urgency_on_employee** option from the **Options Manager**, **Request Mgr**. The Urgency field appears on Employee incidents or requests. Self-service users can override the value on the incident.

Activate Status Transitions

After the upgrade, all predefined status transitions are inactive, so status transitions are not in effect. You can activate and modify these status transitions to accommodate the ticket status transition flow you want.

NOTE
All modified status code descriptions that appear on ticket forms are retained during the upgrade process.

To activate a status transition, perform the following steps:

1. On the Administration tab, expand the **Service Desk** node, and select one of the following ticket types:
   – **Change Orders**

    - Change Order Transitions
  - **Issues**
    - Issue Transitions
  - **Requests/Incidents/Problems**
    - Incident Transitions
    - Problem Transitions
    - Request Transitions

  The Transitions List appears.
2. Select **Show Filter** on the Transitions List page.
   The top portion of the page reveals additional search fields.
3. Select **Inactive** in the Record Status field and click **Search**.
   The Transitions List at the bottom of the page displays all inactive transitions.
4. Open the transition for editing.
5. Select **Active in the Record Status** drop-down list.
6. Click **Save** and close the window .
7. Click **Search**.
   The Transition List displays the active transition.

Enable Priority Calculation

Priority calculation is a set of values that automatically set Priority, Urgency, and Impact values on problems and incidents. For new CA SDM installations, the default priority calculation is enabled for problem and incident ticket types by default. However, if you are upgrading from a previous release, the default priority calculation is inactive.

If you create and activate a different priority calculation, the ticket values reflect the settings in the active priority calculation that is associated with an incident or a problem. When no priority calculation is active, users can manually set the Priority and other values on tickets.

> **NOTE**
>
> The modified forms on the Employee and Customer interface operate in the same manner as the previous versions. The Self-Service users can directly change the Priority regardless of the settings in Priority calculation.

To enable priority calculation after the migration, perform the following steps:

1. On the Administration tab, navigate to **Service Desk**, **Request/Incidents/Problems**, **Priority Calculation**.
2. Right-click the default priority calculation or another priority calculation and select **Edit** from the short-cut menu.
   The Update Priority Calculation page appears.
3. Set the status to **Active**.
4. Select one or more of the following ticket types:
   - **Incidents**
     Enables this priority calculation to manage incident tickets. Only one active priority calculation can manage incidents.
   - **Problems**
     Enables this priority calculation to manage problem tickets. Only one active priority calculation can manage problems.
5. Click **Save**.
   The values on the default priority calculation apply to new tickets unless you activated another priority calculation. On new tickets that use a priority calculation, the Priority field is read-only.

Activate Transition Types

By default, all predefined transition types delivered with the product are inactive, so status transition buttons are not in effect. You can activate and modify these transition types to accommodate the status transition flow you want.

To activate a transition type, perform the following steps:

1. Select **Show Filter** on the Transition Type List page.
   The top portion of the page reveals additional search fields.
2. Select **Inactive** in the Record Status field and click **Search**.
   The Transition Type List displays all inactive transition types.
3. Right-click the title of the transition type and select **Edit** from the menu.
4. Select **Active** in the Record Status drop-down list.
5. Click **Save** and close the window.
6. Click **Search**. The Transition Type List displays the active transition type.

Enable Services in xFlow Interface

Enable the xFlow Analyst Interface services after successful installation of the xFlow Interface.

> **NOTE**
>
> Failure to enable services, results in interruption of all the daemons in the xFlow Interface and does not allow the latest information to be displayed.

Perform the following steps to enable services in xFlow Interface:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **Options Manager**, and **General**.
3. From the list of options, select **xFlow_installed**.
4. Click **Edit** and set the **Optional Value** to **Yes.**
5. Click **Save**.
6. Restart the *CA Service Desk Manager* services.

Modify the New Functional Access Areas Post-Migration

This article describes how to modify the functional access areas after you have upgraded to CA SDM 17.3.

A *functional access area* is a group of objects that let you restrict user access. Previous versions of CA SDM included eight fixed functional access groups to restrict access to code components.

During migration, the functional access groups migrate to new functional access areas for each role. Migration automatically handles the Majic changes, the default reference data, and role mapping to the new functional access areas.

After migration, consider the following actions:

- Review how the objects map to existing and new functional access areas and role permissions to each area. Use Web Screen Painter to verify the functional access areas.
- Use CA SDM to remap or change permissions. Verify that users have the proper access to features and objects.

The following table maps Functional access areas to code components:

Functional access area	Code Component	New
Administration	admin	No
Incident/Problem/Request	call_mgr	No

Change Order	change_mgr	No
Inventory	inventory	No
Issue	issue_mgr	No
Knowledge Document	kd	No
Notification	notify	No
Reference	reference	No
Security	security	No
Announcement	announcement	Yes
Incident/Problem/Request Reference	call_mgr_reference	Yes
Incident/Problem/Request Template	call_mgr_template	Yes
Change Order Template	change_mgr_template	Yes
Change Order Reference	change_reference	Yes
Configuration Item	ci	Yes
Configuration Item Common	ci_common_ro	Yes
Configuration Item Reference	ci_reference	Yes
Contact	contact	Yes
Group	group	Yes
Issue Template	issue_mgr_template	Yes
Issue Reference	issue_reference	Yes
Location	location	Yes
Notification Reference	notification_reference	Yes
Organization	organization	Yes
Prioritization	prioritization	Yes
Service Level	service_level	Yes
Site	site	Yes
Stored Query	stored_queries	Yes
Survey	survey	Yes
Tenant Admin	tenant_admin	Yes
Timezone	timezone	Yes
Workflow Reference	workflow_reference	Yes
Workshift	workshifts	Yes

Post-Migration Access Level Changes

After migration, you can verify functional access levels for every role. Because the objects moved to another functional access areas, the user could have access to some screens in some situations that they were denied previously. They can also be denied access to forms to which they had access previously. Both situations can occur when a new functional access area manages permissions for two of the original functional access areas.

Edit Access Types

When you upgrade from CA SDM, the upgrade process automatically creates roles for all access types and correctly assigns access and permissions to the roles. If you want to take advantage of the new roles, you can create roles for access types.

To create roles for access types

1. Log in to the web interface as a user with the ability to access the Administration tab.
2. Click the Administration tab.
3. In the tree on the left, select Security and Role Management, Access Types.
   All available access types display.
4. Click an available access type.
5. Click the Roles tab.
6. Select a new role for the access type and click Update Roles.
   The new role is associated with the access type.

   NOTE
   You can also create a custom role and assign it to the access type.

Adjust Access Types

If you modified access types and data partitions in the previous release of CA SDM, you may have a problem with the Knowledge Management data partitions settings after upgrading. These customizations can cause a problem with the permission groups settings on categories and documents. For example, a user has access to restricted information.

NOTE
Even if you recreated a data partition or an access type after deleting it, verify your access type and data partition settings after the upgrade.

To adjust access types

1. Click the **Administration** tab from the classic CA SDM Interface.
2. Click **Security and Role Management**, **Role Management**, **Role List**.
3. Complete the following steps for each role:
   a. Right-click the role and select **Edit**.
   b. Review the Data Partition Name field under the **Authorization** tab.
      If this field is empty, there is no data partition associated with the selected access type, so the user has no restrictions and can access any document or category in the product, even if you set up permission groups. This action can be appropriate for administrators, but not for all roles. If there is no data partition associated with the role, you can create or modify one.

Review the CA SDM Email Mailbox Options

CA SDM replaces the Options Manager, Email inbound email options with a Mailbox (usp_mailbox table) that supplies corresponding options. The Email outbound email options are still present under the Options Manager. When you upgrade, CA SDM uses your existing email settings to configure a mailbox, instead of the default Mailbox settings that are supplied with the release. Each email option, except **EMAIL_ATTACHMENT_DIR** (which is no longer needed), is mapped to an option in the **usp_mailbox** table. Any option that is not set, is set as null in the table.

The following table lists options that are removed from the Email options, provided in the *usp_mailbox* table, and indicates their labels in the Mailbox Detail page:

Email Option	usp_mailbox Option	De
EMAIL_ALLOW_ANONYMOUS	allow_anonymous	All
EMAIL_ATTACHMENT_DIR	N/A	N/A **No** ma EM
EMAIL_ATTACHMENT_ REPOSITORY	attmnt_repository	Att

EMAIL_FORCE_ATTACHMENT_ SPLITOUT	split_out_attachment	Fo
EMAIL_IS_ATTACHMENT	attach_email	Att
EMAIL_SAVE_UNKNOWN_ EMAILS	save_unknown_emails	Sa
MAIL_EATER_IMAP_HOST_PORT	host_port	Po
MAILEATER_CHECK_MAIL_ INTERVAL	check_interval	Ch
MAILEATER_HOST	host_name	Ho
MAILEATER_LOGIN_PASSWORD	password	Pa
MAILEATER_LOGIN_USERID	userid	Us
MAILEATER_POP3_HOST_PORT	host_port	Po
MAILEATER_SECURITY_LEVEL	security_lvl	Se
MAILEATER_SERVER_TYPE	email_type	Em

WARNING
The Attachment Directory setting is deprecated after you upgrade, so you *must* specify an Attachment Repository before you continue polling the mailboxes.

Maileater.cfg Considerations

Information from your upgraded system that was included in the ***maileater.cfg*** file maps to the ***usp_mailbox_rule*** table after you upgrade. Consider the following information:

- The '**-i**' at the beginning of the line denotes case insensitivity and maps to the **filter_ignore_case** field.
- The search filter "**Subject: *…**" previously denoted a regular expression on which to filter. The "**Subject:**" is removed and is replaced with a "**^**" symbol, and the remaining value maps to the ***filter_string*** field. The **Filter_type** is set to "**Subject Contains**" type.
- The "**TEXT_API xxx**" denotes the object that is processed for the rule. The string "**TEXT_API** " is removed, and the remainder maps to the ***action_object*** field. The ***action_operation*** field is set to **Create/Update** Object.
- The reply to the user typically contains "**PDM_MAIL …**". If you have "**PDM_MAIL**" set, set **reply_method** to 1800 or else leave it set to null.
- If the **- s** parameter is set, remove the subject field from the text and set the ***reply_subject*** with this value.
- The functionality maintains the order of entries. A sequence number starting at 100 and incremented by 100 is set for each valid row.

The other fields in the ***usp_mailbox_rule*** are set as follows:

Field	Value
mailbox	Default
action_write_to_log	0
action_log_prefix	null
delete_flag	0
description	Migrated from pdm_maileater.cfg file
reply_failure_html	<leave blank to inherit default action>
reply_failure_text	<leave blank to inherit default action>
reply_success_html	<leave blank to inherit default action>
reply_success_text	<leave blank to inherit default action>
text_api_defaults	null

text_api_ignore_incoming	null
action_subject_handling	null
last_mod_dt	null
last_mod_by	null
inclusion_list	"*"
email_address_per_hour	-1
exclusion_list	null
log_policy_violation	1

Upgrade Knowledge Management

How to Upgrade Knowledge Management

When you upgrade, CA Service Management Installer automatically upgrades your Knowledge Management environment.

After successful upgrade, perform the following steps to upgrade your knowledge management component:

1. Map links created in a resolution of a document to the database to locate broken links.

   NOTE
   You use the default *Flag broken links* policy to locate broken links.
2. On the **Administration** tab, browse to **Knowledge**, **Automated Policies**, **Policies**, **Scheduling**.
   The Scheduling page appears.
3. Select the **Run Calculation** check box in the **Last Updated** field.
4. Enter a date in the Schedule text box or click the **Calendar** icon to select a date.
5. Select the time interval to perform the calculation and run the policies.
6. Click **Save**.
   The policies are processed at the specified date and time.
7. On the **Administration** tab, browse to **Knowledge**, **Systems**, **General Settings**.
   The General Settings page opens.
8. Complete the following information:
   Path for EBR Index Files
   Defines the location for storing EBR index files. CA SDM creates EBR index files when you save and publish any knowledge document. Depending on your configuration type, consider the following points while defining the EBR index file path:
   – Conventional: If you have not created a UNC path, CA SDM uses the default path to store EBR index files. If you are using a UNC shared drive, manually copy the **ebr/ebr_ADM**folders from the default location (**$NX_ROOT/site**/) to the UNC shared path.
   – Advanced availability: If you are upgrading to the advanced availability configuration, you must create the UNC shared path and use it to store EBR index files. The UNC credentials are not required for the default path. After you create the UNC path, manually copy the **ebr/ebr_ADM** folders from the default location (**$NX_ROOT/site/**) to the UNC shared path.

     WARNING
     EBR Index Files path & **KEIT Files path** must refer to the same UNC credentials and the path must reside on a same server to support this.

   Default: $NX_ROOT/site/ebr
   – **Path For Knowledge Import/Export Files**

Defines the location for storing KEIT import/export packages during an import/export operation. Depending on your configuration type, consider the following points while defining KEIT file path:

- Conventional: If you have not created a UNC path, CA SDM uses the default path to store the KEIT files. If you are using a UNC shared drive, manually copy the Import/Export package folders from the default location ($NX_ROOT/site/keit) to the UNC shared path.
- Advanced availability: If you are upgrading to the advanced availability configuration, you must create the UNC shared path and use it to store the KEIT files. The UNC credentials are not required for the default path. After you create the UNC path, manually copy the Import/Export package folders from the default location (**$NX_ROOT/site/keit**) to the UNC shared path.

  WARNING
  EBR Index Files path & **KEIT Files path** must refer to the same UNC credentials and the path must reside on a same server to support this.

Default: $NX_ROOT/site/keit

- **UNC Credentials**

You can use this option to create UNC credentials to access the network shared drive to access EBR indexing files and import/export packages. Use the **UNC Credentials** link to create the UNC credentials.

NOTE
UNC paths and UNC credentials are required in case of the advanced availability configuration. Restart the CA SDM service when you change any of the UNC details (UNC paths or UNC credentials).

9. (For Keyword Search implementations) Enter the following command at the command prompt:

```
pdm_k_reindex factory:all
```

WARNING
The *all* variable is case sensitive. If you use factory:ALL, errors appear in the log files.

The Knowledge Management environment is upgraded.

NOTE

After the upgrade, printing Knowledge Documents can result in a large space inserted after the Resolution section of the document. This space is inserted due to an issue with upgrading document templates from a previous release.

WARNING
After you upgrade, Knowledge Management notification data from previous releases of CA SDM uses the latest notification engine. For example, there are default activity notifications and notification rules for object types, such as the Knowledge Report Card.

Add Insights Functional Access to Existing Custom Roles

Add Insights functional access to existing custom roles after successful upgrade to 17.3.

Run the following command from **$NX_ROOT\bin** folder to add Insights Functional Access to custom roles:

```
pdm_perl migrate_custom_role_func_access.pl
```

Set Active Status for Default Area

As an administrator, ensure to set an active status of the default areas.

Perform the following steps to set the active status for the following default areas:

1. Log in to Classic CA SDM user interface as an administrator.
2. Navigate to **Administration** tab, select **xFlow Interface**, **ServicePoint**, and **Default Areas**.

3. In the Name column, click the desired tenant configuration name for which the default areas are set to active.
4. If the area status is **Inactive**, click inactive area name.
5. Click **Edit** in the top right corner.
6. In Record Status, set the drop-down value to **Active**.
7. Click **Save**.

Upgrading to CA Service Catalog 17.4

- CA Service Management 17.4 supports direct upgrades from CA Service Catalog 17.1/17.2/17.3, CA Service Management Common Installer detects installed product version in your environment and automatically upgrades it to CA Service Catalog 17.4.
- If you are on versions prior to 17.1, you must first upgrade to 17.1/17.2/17.3 and then, proceed with the 17.4 upgrade process.

  NOTE

  If you want to use custom port numbers, specify them in the fields provided. This requirement applies even if you have specified custom port numbers CA Service Catalog.

To upgrade successfully, review the following upgrade considerations:

- Review Supportability Matrix.
- You can upgrade directly from CA Service Catalog 17.1/17.2/17.3 using the Traditional and Migration Model Upgrades.

  NOTE

  Beginning with CA Service Catalog Release 12.8, **%USM_HOME%** is no longer a Windows environment variable. Instead, **USM_HOME** is the documentation convention that specifies the local CA Service Catalog installation directory. For 32-bit computers, the default path name is *C:\Program Files\CA\Service Catalog*. For 64-bit computers, the default path name is *C:\Program Files (x86)\CA\Service Catalog* for 32-bit installations or *C:\Program Files\CA\Service Catalog* for 64-bit installations.

- Decide if you need to perform a traditional or migration model upgrade.
- Verify that the systems on which you plan to install CA Service Catalog meet the system requirements. For best performance, we recommend that you do *not* install CA Service Catalog on the same system as your Microsoft SQL Server server or Oracle server.

Complete the CA Service Catalog Post Installation Tasks.

Upgrade Prerequisites and Planning Consideration

Preparing and planning for CA Service Catalog upgrade can be done using either a migration model or a traditional model.

Review and perform the following:

1. Find and list out all systems in your implementation that have one or more CA Service Catalog components installed. Use this list to verify and upgrade all required systems efficiently and in the correct sequence/order.
2. Stop all Microsoft Windows services for your existing CA Service Catalog setups.
3. Review whether you have shared any of the folders under CA Service Catalog and Shared Components. If the folders are shared, unshare them before performing the upgrade and restore the shared folders after the upgrade is finished.
4. Verify that your *user ID* is defined as an administrator with *elevated privileges* on each *applicable Windows system*, as follows:
   - ***user ID***
     Specifies your administrative user ID for a Microsoft Windows system (*not* your user ID for CA Service Catalog).
   - ***elevated privileges***

Specifies additional rights on a Microsoft Windows system that are available to administrative users only. To install or upgrade CA Service Catalog, administrators require the elevated privilege named **Log on as Service**.

– ***applicable Windows computer***
Specifies a Windows system on which you plan to install or upgrade CA Service Catalog and which supports elevated privileges for administrators.

5. Verify that your administrative user ID has **Log on as Service** rights on each applicable Windows computer, as follows:
   a. Click **Start**, **All Programs**, **Administrative Tools**, **Local Security Policy**, **Security Settings**, **Local Policies**, **User Rights Assignment**, **Log on as Service**.
   b. Verify that your administrative user ID is listed.
6. (For Migration Model Upgrade Only) If you have an existing filestore that you want to continue using after the upgrade, perform this step. Otherwise, skip this step.
   Record the computer name and the complete pathname of the filestore. Save them for reference after the upgrade. For traditional upgrades, the filestore is backed in the following location:
   C:\Program Files \CA\Service Catalog\SCA_Backup\previous_release\r17.n\Service Catalog
   r17.*n* depending on the version from which you are upgrading.

Upgrade Prerequisites

If you are upgrading to CA Service Catalog 17.4, ensure to perform the following steps:

1. Take a backup of the MDB before proceeding with the upgrade process.
2. The install script for CA Service Catalog relies on the **spadmin** User ID. Run the following command line query to check if the **spadmin** user is present and active. If you do not have the **spadmin** user, create the user:
   ```
   SELECT *FROM ca_contact WHERE userid = 'spadmin' and inactive = 0
   ```
3. Run the following query to get all the duplicate User IDs. . If the list contains **spadmin** and if this user has duplicates IDs, make the inactive User ID unique
   ```
   SELECT userid, COUNT(userid) AS NumOccurrences FROM ca_contact GROUP BY userid HAVING ( COUNT(userid) >
    1 )
   ```

   NOTE

   If the **spadmin** user ID has duplicates and if any one such ID is active, the upgrade fails.

   NOTE

   The **spadmin** duplicate User ID may create problems while upgrading CA Service Catalog. Other duplicate user IDs will not hamper the upgrade process in general, but may show inconsistent application behavior for users with duplicate user IDs.
4. Update the inactive User IDs to some unique value in the database by executing the update statement directly on the MDB:

   NOTE

   Disable the **usm_trigger_update_all_table** trigger in the ca_contact table before updating the user IDs. Enable **usm_trigger_update_all_table** trigger after updating the user IDs.

   NOTE

   This procedure must be followed to update any duplicate inactive user IDs in the **ca_contact** table.

Avoid Re-importing the Service Catalog Content Pack

To avoid importing the CA Service Catalog Content Pack again while upgrading from an earlier release of CA Service Management, perform the following steps before upgrading to CA Service Catalog:

1. Navigate to where you have downloaded the CA Service Management Common Installer files.

2. Locate the <*Common Installer Image File location*>/*Config* folder and open the **common_config.properties** file. Modify the ***slcm.skip.import.contentpack*** value to **1**.
   Changing the above value to **1** helps to skip re-importing the content pack while upgrading.

   NOTE

   The default value of slcm.skip.import.contentpack is '**0**', which reimports the content pack during an upgrade process.

Prepare the Catalog Database and the DBMS

Prepare the Catalog database and the DBMS for the upgrade. Perform the following steps:

1. Review the contents of the Catalog database:
   - The Management Database (MDB) tables that apply to CA Service Catalog; their names typically begin with **CA_ prefix**. The MDB is the common,shared database for CA Technologies products. The MDB provides the database schema for CA Service Catalog and other CA Technologies products.
   - The CA Service Catalog-specific tables; their names typically begin with a **USM_** prefix. These tables are not included in the MDB.
2. Back up your existing Catalog database on the computer where it currently resides.
3. Optimize the System Change Detail tables.
4. If applicable on your DBMS server, upgrade the Oracle or Microsoft SQL Server database to a supported version. For more information, see Supportability Matrix.
5. Apply all patches and other maintenance for your DBMS (Microsoft SQL Server or Oracle). For more information, see your SQL Server or Oracle documentation.
6. Remove replication in your DBMS.

   WARNING
   When replication has been added, the database tables are locked from any schema changes, even if replication is turned off. As a result, the upgrade cannot run successfully. For information, see your database documentation about how to remove replication and how to add it again, after you have completed the upgrade.
7. Verify that the DBMS client software is installed on the computer from which you plan to run the installation program.
8. Record any customizations that you made to XML, XSL, or other CA Service Catalog files, for example, **server.xml**. The upgrade program installs new versions of these files. After the upgrade, you can make the same customizations to the new versions of these files. Follow the same for any customizations that you make to third-party files such as **Tomcat files**.
9. If you have copied the installation media to a network share, map a drive letter to this share. This mapping is required because a batch file runs as part of the upgrade and batch files cannot run from a UNC path.

Optimize the System Change Detail Tables

The System Change Detail tables are important for auditing and database performance. You can optimize the System Change Detail tables by eliminating redundant or obsolete records. This procedure helps optimize the performance of the database and CA Service Catalog. Perform the following steps:

1. Determine the number of each type of record, as follows:
   a. Enter the following command to determine the number of useful records:
      ```
      select count(*) from usm_system_change_detail where old_value!=new_value
      ```
   b. Enter the following command to determine the number of obsolete records:
      ```
      select count(*) from usm_system_change_detail where old_value=new_value
      ```
   Complete the remaining steps if a significant number of obsolete records exist, especially If more obsolete records than useful records exist. Otherwise, skip the remaining steps and finish preparing the Catalog database and the DBMS.

2. Enter the following command to filter the useful records from **usm_system_change_detail** table into a temporary table:

```
Select * into usm_system_change_detail_temp from usm_system_change_detail where old_value!=new_value
```

3. Drop **usm_system_change_detail** table, as follows:
   a. Back up the indexes and database constraints for the following tables:
      - usm_system_change_detail
      - usm_system_change_detail_ext

      NOTE
      For more information about how to perform the backup, see your DBMS documentation. For a sample script that restores indexes and constraints, see the sample script for Microsoft SQL Server.
   b. Drop the foreign key constraints for the **usm_system_change_detail_ext** table.
   c. Drop the **usm_system_change_detail** table.
4. Rename the **usm_system_change_detail_temp** table to **usm_system_change_detail**.
5. Use the script that you created in Step 3a to restore the indexes and database constraints for the following tables.
   – **usm_system_change_detail**
   – **usm_system_change_detail_ext**

Sample Script

The following sample script applies to Microsoft SQL Server. This script backs up indexes and database constraints. You can use this script as a model for backing up the indexes and database constraints in **Step 3a**.

```
ALTER TABLE [dbo].[usm_system_change_detail]
ADD CONSTRAINT [XPKusm_system_change_detail] PRIMARY KEY CLUSTERED
(
[id] ASC,
[name] ASC
)
WITH
(
PAD_INDEX = OFF,
STATISTICS_NORECOMPUTE = OFF,
SORT_IN_TEMPDB = OFF,
IGNORE_DUP_KEY = OFF,
ONLINE = OFF,
ALLOW_ROW_LOCKS = ON,
ALLOW_PAGE_LOCKS = ON
)
ON [PRIMARY]
ALTER TABLE [dbo].[usm_system_change_detail]
WITH CHECK ADD CONSTRAINT [$usm_s_r00002c5700000000] FOREIGN KEY
(
[id]
)
REFERENCES [dbo].[usm_system_change] ([id])
ALTER TABLE [dbo].[usm_system_change_detail]
CHECK CONSTRAINT [$usm_s_r00002c5700000000]
ALTER TABLE [dbo].[usm_system_change_detail_ext]
WITH CHECK ADD CONSTRAINT [$usm_s_r00002c6100000000] FOREIGN KEY
(
[id],
[name]
```

```
)
REFERENCES [dbo].[usm_system_change_detail] ([id], [name])
ALTER TABLE [dbo].[usm_system_change_detail_ext]
CHECK CONSTRAINT [$usm_s_r00002c6100000000]
```

Back Up CA EEM Data

Backing up CA EEM data is a required task whether you upgrade using a migration model or a traditional model. For more information, see CA EEM Documentation.

WARNING
If CA EEM is configured with high availability, perform these steps on the Primary CA EEM server.

Follow these steps:

1. Back up your existing CA EEM on the computer where it currently resides, as follows:
   a. If other CA Service Catalog components exist on the same computer, shut down their Windows services.
   b. Log in to CA EEM; on the login page, select your current CA Service Catalog release as the application instance.
2. Click **Configure**, **EEM Server**, **Export Application**.
3. Perform the following steps:
   a. Select all check boxes under Object List, and verify that **Override the Max Search Size** is *not* selected.
   If CA EEM is configured with External Directory, clear these options: **Global Users**, **Global User Groups**, **Global Folders**, and **Global Settings**.
   b. Click **Export**.
   c. On the File Download prompt, select a location to save the ServiceCatalog.xml file. Record the location where you saved the file, for future reference.
4. Log out of CA EEM.
5. Back up the CA EEM data on the Catalog Component computer in your test system, as follows.

   NOTE

   If you have multiple Catalog Component computers, perform this step on the *first* (formerly *primary*) Catalog Component computer *only*. You run this command once, regardless of how many Catalog Component computers your system has.

   a. Open the command prompt and run the following command:

   ```
   ant backup-eem-app
   ```

   This action generates a file named **eem-backup.xml** in the **USM_HOME** directory.
   USM_HOME is the documentation convention that specifies the local CA Service Catalog installation directory. For 32-bit computers, the default path name is **C:\Program Files\CA\Service Catalog**. For 64-bit computers, the default path name is **C:\Program Files (x86)\CA\Service Catalog** for 32-bit installations or **C:\Program Files\CA\Service Catalog for 64-bit installations**.You have now backed up CA EEM data.

Traditional and Migration Model Upgrades

- You can upgrade directly to the current release of CA Service Catalog using *either* a traditional model or migration model upgrade.
- You *cannot* upgrade from one DBMS to another. For example, you cannot upgrade a CA Service Catalog installation running SQL Server to the current release of CA Service Catalog installation running Oracle.
- The installer upgrades CA Service Catalog in its existing installation directory, except in the following case: If you perform a migration model upgrade to the current release of CA Service Catalog on a 64-bit computer, CA Service Catalog is upgraded to a 64-bit application, and its default installation directory is updated accordingly.

Traditional and Migration Model Upgrades

You can upgrade CA Service Catalog to the current release using *either* a migration model or a traditional model.

- In a traditional model, you upgrade on existing CA Service Catalog computers.
- In a migration model, you install the current release of CA Service Catalog on *new* computers. When you install CA Service Catalog on the new computers, you use the Catalog database and CA EEM computers.

The migration model works as follows:

Consider this sample scenario: Your setup has Catalog Component and the Catalog database on existing Computer 1. Catalog Component and Service Accounting Component are on existing Computer 2, and CA Process Automation on existing Computer 3. Perform the following actions:

- Verify that the current release of CA Service Catalog Release supports the DBMS version on existing Computer 1.
- Verify that the DBMS client software is installed on the new computers on which you plan to run the upgrade.
- Install Catalog Component on new Computer 4, pointing to the existing Catalog database on existing Computer 1. Similarly, install Catalog Component and Service Accounting Component on new Computer 5. When you are prompted for information about the Catalog database or CA EEM, use the *existing* Catalog database and CA EEM specifications, such as the CA EEM host name and application name.
- Utilize CA Process Automation on Computer 3.

  NOTE

  Do *not* upgrade or delete CA Service Catalog on existing Computer 1 until all other computers are upgraded to the current release of CA Service Catalog and are running successfully.

Migrate the CA Service Catalog Data

- T*est system* refers to all computers *from* which you are migrating
- P*roduction system* refers to all computers *to* which you migrating

Thus, these terms describe a typical scenario where you migrate from a test system to a production system. If you are migrating for other reasons, the test system is the *source* system. The production system is the *target* or *destination* system.

This documentation assumes a multi-computer system architecture. For example, one computer for the DBMS, one computer for CA Service Catalog and Service Accounting Component and one computer for CA Process Automation. Unless indicated otherwise, *system* refers to *all* CA Service Catalog computers in your test or production, including the DBMS computer. If you are migrating one stand-alone CA Service Catalog system to another stand-alone system, ignore references to multiple computers.

Verify the Migration Prerequisites

Perform the following prerequisite tasks before you migrate CA Service Catalog. These tasks are required to help ensure that you can complete the migration process successfully.

1. Verify that the setup on the production system matches the setup on the test system. Verify that the production system has CA Service Catalog installed on the same number of computers as the test system. Verify that the same products and components are installed on each computer in the production system as its "matching" computer in the test system. You migrate from the old system to the new system incrementally in pairs.
   For example, suppose that the first test computer has installed CA Service Catalog, the Catalog Content, and Service Accounting Component. In that case, the first production computer must also have each of these components installed. Moreover, the production computer must not have any *additional* CA Service Catalog products and components installed.
2. Verify that the business unit ID of the service provider is *the same* in both systems.

WARNING
The service provider business unit ID for the new installation *must match* the previous installation.

3. Verify that all computers in both systems are at the same patch level for all important software.
4. Verify that the CA EEM Application Name for CA Service Catalog is the same on both the test and production systems. By default, the name is *Service Catalog*.
   If necessary, update the Application Name, on either or both systems.
5. Stop the CA Service Catalog services on all CA Service Catalog computers using the Windows Control Panel.
6. Back up the MDB of your *production* system and also your *test* system, on the computer where the MDB is installed. This requirement applies, regardless of whether the system is installed on one computer or multiple computers.
   You have now completed the prerequisite tasks for migrating CA Service Catalog.

How to Migrate

You can migrate CA Service Catalog products and components from one system to another. Perform the following steps:

1. Restore the MDB database backup of the test system into your production system. During this process, select the option for overwriting the existing MDB database.
2. Unregister the CA EEM application that the production system uses, as follows:
3. 1. Log in to the Global Application of CA EEM as the EiamAdmin user.
      If your systems use a different name than *Service Catalog* for the CA Service Catalog application name, use that name.
   2. Select Configure, Applications, Service Catalog application and click the UnRegister button.
4. Back up the CA EEM data on the CA Service Catalog computer in your test system, as follows.
   If you have multiple CA Service Catalog computers, perform this step on the *first* CA Service Catalog computer. You run this command once, regardless of how many CA Service Catalog computers your system has.
   a. Open the CA Service Catalog command prompt by clicking **Start**, **Programs**, **CA**, **Service Catalog**, Service Catalog Command Prompt.
   b. Run the following command:
      ```
      ant backup-eem-app
      ```
      This action generates a file that is named *eem-backup.xml* in the *USM_HOME* directory.
5. Copy the following files from the test CA Service Catalog computer to the production CA Service Catalog computer.
   If you have multiple CA Service Catalog computers, perform this step on the *first* CA Service Catalog computer in each system. You copy these files once, regardless of how many CA Service Catalog computers your system has.
   – *USM_HOME\seeddata.properties*
   – *USM_HOME\filestore folder*
     This folder can exist on a different computer than the current computer. To verify its location, select **Administration**, **Configuration**, **Filestore** Information. As a best practice, soon after the migration, set up a single location for shared files.
   – *USM_HOME\eem-backup.xml*
6. Run the following commands on all CA Service Catalog computers in the production system, one computer at a time.
   a. Update the Database Host, Password, Instance, Service Name, or Port
   b. Update the database host, password, instance, service name, or port for the database, as needed.

      WARNING
      The database host name that you specify must be different from the one used in the test system. Updating the other settings is optional.
   c. Run the *ant restore-eem-app* command.
      This command restores the CA EEM database from test to production, using the *eem-backup.xml* that you copied.
   d. Run the *ant update-usm-host* command.
      This command enables you to change the host name and port number for a computer running CA Service Catalog.

WARNING
All host names for production CA Service Catalog must be different from the ones in the test system. Updating the other settings is optional.

For more information about this command, see Update the Host Name and Port Number Using the ant Command section.

7. Start CA Service Catalog services on all computers in the production system.
8. Log in to CA Service Catalog in the production system. Select **Administration**, **Configuration**. Update the configuration sections for Filestore, CA Service Desk Manager Integration, and CA CMDB Integration.

   WARNING
   If your post-migration environment does *not* include any option in the list, update the configuration settings to *remove* the integration! Similarly, if your post-migration environment *does* include any of these options, perform the following step: Verify that the host names, port numbers, and other configuration data are correct for your post-migration environment. Remember that setting up a filestore location is a best practice.
9. Test by verifying that the same users, services, and requests, that existed in test also exist in production.

Post-Upgrade Tasks - CA Service Catalog

NOTE

In case, if you are upgrading from CA Service Management 17.3 to CA Service Management 17.4, the below steps are optional and are not required.

1. If you have upgraded to CA EEM in a clustered setup and have updated the **MaxKeepAliveRequests** property in the Apache **proxy.conf** file to meet the CA EEM installation requirements. After upgrading to CA Service Catalog 17.4, reset the **MaxKeepAliveRequests** property to its original value.
2. Reset the JMS port number only if you specified **7777** as the CA Service Catalog startup or shutdown port when you ran the installation program. We recommend that you do *not* use port **7777** as the startup or shutdown port. Port **7777** is reserved for Java Messaging Service (JMS). Perform the following steps:

   WARNING
   If you must use port 7777 for the startup or shutdown port, reset the JMS port number after you have finished running the setup utility. Otherwise, port conflicts occur, and the product does not function correctly.

   a. Open the file that is named **USM_HOME/config.properties** in a text editor.
   b. Update the value of the *jms.port* property to a new value.
   c. Restart the Windows service named CA Service Catalog.
      You have reset the JMS port number.
3. Log in to the root business unit of CA Service Catalog as a **Service Delivery Administrator**.
4. If you are performing a migration model upgrade, perform the following step. Otherwise, skip this step.
   a. Click **Catalog**, **Configuration**, **System Configuration**.
      The System Configuration page appear.
   b. Set the value of the **Use Service Provider Catalog Only** option to **Yes** or **No**. You decided the value when you System Configuration.

      NOTE
      The value that you set applies to the entire Catalog system.
5. Verify that you and other users can log in to CA Service Catalog on the new computers. Verify that the CA Service Catalog components are working properly.
6. If you have integrated CA Service Catalog with CA Service Desk Manager in the previous release, update the host computer names. Also reconfigure other connection details between these two products.

7. If you have enabled the following features in the previous release, to continue using them enable them for the current release:
   – Secure Socket Layer (SSL)
   – Windows NTLM authentication

   NOTE
   These options are disabled by default, for both new installations and upgrades. Verify that your configuration specifications were retained and reset them, if necessary.
8. Set up shared and customized files. This step can include re-applying customizations from the previous release and setting up the filestore, if applicable.
9. (For Migration Model Upgrades Only) Uninstall the previous versions of CA Service Catalog products and components from the "old" CA Service Catalog computers. If you installed a new version of CA EEM, uninstall the old version of CA EEM from the old CA Service Catalog computers.
   You have finalized the upgrade.

Set Up Shared and Customized Files

Setting up shared and customized files is a required task when you finalize the upgrade. For example, re-apply any customizations that you recorded for XML, XSL, or other CA Service Catalog files when you prepared for the upgrade. Perform the following steps:

1. (For Multiple Catalog Component Computers) Perform the following steps:
   a. If you have not already done so, set up the filestore (the single location for shared files). Otherwise, skip this step.
   b. Click **Administration**, **Configuration**, **Filestore** on any Catalog Component computer. Verify that the filestore location is correct. If necessary, correct the location.
   c. Access the filestore computer and verify that the filestore folder includes the themes folder. If necessary, copy the themes folder to the filestore folder.
2. To use the old filestore location, if applicable, proceed as follows. Otherwise, skip this step.
   a. Copy the themes folder from the local filestore to the old filestore.
   b. Click **Administration**, **Configuration**, **Filestore**.
   c. Specify the original filestore location. You recorded this location when you prepared for the upgrade.
3. Copy all filestore contents (files shared by all users in the environment) from the previous filestore location to the new location, as follows:
   – Documents: Copy from *USM_HOME\view\documents to USM_HOME\filestore\documents*
   – Images:
     • Copy from *USM_HOME\view\webapps\usm\images\offerings to USM_HOME\filestore\images\offerings*
     • Copy from *USM_HOME\view\webapps\usm\images\rateplans to USM_HOME\filestore\images\rateplans*
   – Forms: Copy from *USM_HOME\view\forms to USM_HOME\filestore\forms*
   – Custom directory: Copy any files that you want to update or replace from *USM_HOME\view\webapps\usm\custom to USM_HOME\filestore\custom*

   NOTE
   Your installation can have some or all of these folders, depending on the previous version of CA Service Catalog that was installed.
4. Re-apply any customizations that you recorded for XML, XSL, or other CA Service Catalog files, such as **category.xml** or **requestshared.xml**. Restore or verify your customizations, as follows:
   (For **Migration model** upgrade only)

   WARNING
   You can replace certain new files with your backup files, in certain cases. However, *before* doing so, contact Technical Support and verify each file that you want to replace.

- Compare each customized file that you backed up earlier with the files supplied in this release. Update the new file with your customizations from the backup file.
  Follow the same process for any customizations that you made to related third-party files such as Tomcat files.

(For Traditional upgrade only)

- Review any CA Service Catalog files that you customized, such as **custom.xml** or **requestshared.xml**. Verify that your customizations are intact and are applicable for this release.

The traditional upgrade automatically backs up customized files before the upgrade and restores them after the upgrade.

5. Perform this step if you customized the CA Service Repository Agent in the previous release and you want to continue using the same customizations for the current release:

   NOTE
   The CA Service Repository Agent is also named the Data Mediation Data Repository Agent. This repository agent automates the process of importing usage data in Delimiter Separated File format or Fixed Length File format.

   NOTE
   After upgrade, images for the newly created content pack on the previous CA Service Catalog version may get lost and the content pack offering images on the latest CA Service Catalog version are seen as broken on the application. To resolve this issue, copy the missing images from the backup location USM_HOME\SCA_Backup \filestore\images folder to USM_HOME\filestore\images.

After successful completion of the above tasks, perform additional post-installation tasks.

Upgrading to CA Asset Portfolio Management 17.4

CA Service Management 17.4 supports CA Asset Portfolio Management (CA APM, formerly CA ITAM) upgrades from CA APM release 17.1/17.2/17.3. To upgrade release versions prior to 17.1, it is recommended that you first upgrade to APM 17.1/17.2/17.3, and then proceed to upgrade to 17.4 version.

Prerequisites

Verify and consider the following prerequisites before upgrading to CA APM 17.4:

1. To upgrade from CA APM 17.4, ensure to set the database compatibility level to Microsoft SQL Server and Oracle Database Server. For more information, see Supportability Matrix.
2. Stop all the CA APM services.
3. Stop the scheduled tasks for the integrated CA Service Management products: CA Service Catalog, CA Service Desk Manager, CA Client Automation.
4. Back up the system database (MDB) This ensures safe data recovery, in case the upgrade is not complete.
5. Back up the configuration files.
6. Upgrade CA EEM from the CA APM 17.4 installer.

Upgrade to CA Asset Portfolio Management 17.4

Verify and complete the prerequisites before proceeding with the upgrade.

NOTE

In CA APM distributed environment, Service Management must be installed on all web and application servers. The database screen is shown only on the component server and you must install the MDB patch from the component server.

1. Download the CA Asset Portfolio Management installer from Broadcom Support.

2. The DVD contains the installer for CA Asset Portfolio Management 17.4. If you have integrated CA APM with CA Service Catalog and if you are upgrading or want to integrate CA APM with Catalog while doing a fresh or new installation, download the appropriate installer DVD.
   a. CA ASSET PORTFOLIO MANAGEMENT 17.4 FOR WINDOWS DVD (WITHOUT CATALOG).ISO
   b. CA SERVICE MANAGEMENT APM PACKAGE 17.4 FOR WINDOWS (WITH CATALOG).ISO
3. Copy and extract the installation ZIP files on all servers in your environment where you plan to install CA APM.
4. Right-click **Setup.exe** and launch the CA Service Management Installer.

   NOTE

   You must be logged in as a local admin.
5. Select a language from the **Language Selection** screen.
6. Click the CA Service Management link.
7. Accept the license agreement and click **Next.**
8. The installer automatically detects the CA APM release a version that is installed in your environment and proceeds with upgrading it to CA APM 17.4.
   Click **Next** to proceed.
9. Provide the database configuration details as per the selected database (Oracle or Microsoft SQL Server):
   a. **Microsoft SQL Server**: Complete the following if you have installed the Microsoft SQL Server database:
      - **Database Server**: The host name of the database server. If the target instance is part of a clustered instance, the virtual host name of the cluster must be used.
      - **Database Name**: Specifies the Database name (mdb), the name of the target DBMS. The default value is mdb.
      - **Database Port**: Specifies the port identifier for the target DBMS.
      - **Database Server Instance**: The database instance name. Leave this field blank if you are using the default instance.
      - **Database Admin User**: For SQL Server, **sa** is the default value. Provides permission to create users and schema.
      - **Database Admin Password**: Specifies the database password of users who are specified by the database admin user.
      - **mdbadmin Password**: Specify the password for the mdbadmin user.
      - **Confirm mdbadmin Password**: Confirm the mdbadmin user password.
   b. **Oracle**: Complete the following if you have installed Oracle database:
      - **Database Server**: Specifies the host name of Oracle database server.
        If the target instance is part of a clustered instance, the virtual host name of the cluster must be used.
      - **Oracle Service Name**: Specifies the Oracle Service name.
      - **Listener Port**: Specifies the listener port for database.
      - **Net Service Name**: Identifies the Net Service Name of Oracle database where the database resides.
        If database is remote, use the Net Service Name that is defined in Oracle client on the local computer. CA SDM accesses the database through a local installation of the Oracle client.
      - **DBA User Name**: Authenticates the name of the user with DBA access. The default value for DBA user is **SYS.**
      - **DBA User Password**: Authenticates the password for DBA user.
      - **mdbadmin Password**: Specify password for mdbadmin user.
      - **Confirm mdbadmin Password**: Confirm mdbadmin user password.
      - **Tablespace Path (on DB Server)**: Specifies the tablespace directory on the database server.
      - **Oracle Home Path**: Specifies the Oracle client 32-bit path.
      - **Data Tablespace Name**: Specifies tablespace name. The default value is **MDB_DATA**.
      - **Index Tablespace Name**: Specifies index tablespace name: Default value is **MDB_INDEX**.
10. Click **Next.**
11. The installer lists the CA Service Management products and CA Common Components that is installed on the selected MDB. Click **Next** to proceed.

12. Review the **Select the Products and Integrations** screen. The installer automatically selects the CA APM components that are already installed in your environment to upgrade it to the latest version.
13. 1. **Common Components**: Select this option to integrate CA Asset Portfolio Management with common components such as CA EEM, CA Process Automation.
14. Click **Next**.
15. Review the Pre-installation configuration summary and click **Next**.
16. Review the pre-populated values and provide the CA Asset Portfolio Management Server details. Click **Next**.
17. If CA Embedded Entitlements Manager (CA EEM) is installed in your environment, provide the CA Embedded Entitlements Manager (CA EEM) details:
    a. **CA EEM Server Name**: Specifies the CA EEM server name which is configured with CA Service Catalog.
    b. **CA EEM Admin User Name**: Authenticates the name of the user with Admin access. The default value for the Admin user is **EiamAdmin.**
    c. **CA EEM Admin Password**: Specify password for CA EEM admin user.
18. If CA Process Automation (CA PAM) is installed in your environment, provide the CA Process Automation details.
19. Review the installation progress. Click **Install** to upgrade the select product/products.
20. After the upgrade or installation is complete, click **Finish**.

NOTE

After installing CA APM 17.4, the release version is shown as **17.0.0.1034** on the application user interface

The env.info file for CA APM 17.4 in the CA APM installed folder includes the following information:

- product=ITAM
- major=17
- minor=4
- cum=0
- roll-up=0

21. Complete the CA APM Post Install Steps.

NOTE
The only supported ITAM WCF service is the WSDL, which can be downloaded from the ITAM Web UI by navigating to the Administration tab >> Web Services tab >> WSDL Download.

Post-Upgrade Tasks for CA APM 17.4

NOTE
After successfully upgrading to CA APM 17.4, perform the tasks mentioned in CA Asset Portfolio Management Post Installation Tasks.

Start all the Services

1. Open the **Control Panel** (click Start> Settings> Control Panel).
2. Double-click Administrative Tools.
3. Double-click Services.
4. Locate and start each of the following services:
    a. Apache Tomcat 9.0 AMS Service
    b. CA Asset Portfolio Management - Data Importer Engine
    c. CA Asset Portfolio Management - Event Service
    d. CA Asset Portfolio Management - Export Service
    e. CA Asset Portfolio Management - Registration Service
    f. CA Asset Portfolio Management - HW Reconciliation Engine
    g. CA Asset Portfolio Management - LDAP Import Service

h. CA CASM

NOTE

For performance reasons, we recommend that you do not start the CA CASM service when you do not use multi-tenancy.

Start the Web Interface

After the installation is complete, you can start the web interface to verify that CA APM is ready to use. After you verify that the web interface starts, provide all administrators with the URL and login credentials to log in and prepare the product for users. Administrators can then set up security, configure the user interface, set up hardware reconciliation, and, if necessary, configure the product components. After the administrators prepare the product, they can provide users with the URL and login credentials.

Follow these steps:

1. Start the web interface using one of the following methods:

- – Open a supported web browser and enter the appropriate URL in the following format:
  `http://servername:port/itam`
  – Replace servername and port with the name of the server and the port that are hosting the CA APM web servers.
- – To log in to CA APM, enter the following default credentials:
  - **User Name**
    uapmadmin
  - **Password**
    uapmadmin

    NOTE

    If you changed the password during the installation, use the password that you created.

  In some situations, a browser error or a user name error appears. You can resolve these errors by following the troubleshooting instructions in the message.

IIS Reset

Execute the following command to reset IIS on the web server and the application server:

```
iisreset
```

Replace *servername* with the name of the server that is hosting the CA APM web servers.

Upgrade Troubleshooting

System Resource Issues

Example:

- DEBUG [AWT-EventQueue-0] [DiskSpacePrereqValidator] Dir: /sd/Servicedesk1 Drive: / Usable Disk Space: 4976779264
- DEBUG [AWT-EventQueue-0] [DiskSpacePrereqValidator] Available Disk Space: 4746, Required Disk Space: 5120
- ERROR [AWT-EventQueue-0] [DiskSpacePrereqValidator] Required disk space is insufficient. Minimum diskspace error limit: 5120

Solution: Ensure systems are correctly allocated:

1. Move attachments from *NX_ROOT\site\attachments* to another drive.

2. Move archived backups.
3. Remove old logs, backup version folders.

Integration Issues

CA EEM

Example: CA Service Management Common Installer attempts to create Administrator accounts that which are failing. Applications are unable to integrate with CA EEM.

Solution: Verify that CA EEM is integrated with external LDAP. Create admin accounts manually in LDAP first. For more information,.

CA Process Automation

Example: CA Process Automation with SSL. For more information, see Install CA Process Automation for CA Service Management.

DEBUG [AWT-EventQueue-0] [PAMWebserviceManager] Get ITPAM version

Error Message:[AWT-EventQueue-0] [PAMValidator] CA PAM validation
failed com.ca.smsi.installcore.webservices.WebserviceException: ; nested exception is:

```
javax.net.ssl.SSLHandshakeException: sun.security.validator.ValidatorException: PKIX path building failed:
sun.security.provider.certpath.SunCertPathBuilderException: unable to find valid certification path to
 requested target
at com.ca.smsi.installcore.webservices.PAMWebserviceManager.getITPAMVersion(PAMWebserviceManager.java:265)
Solution:
```

CDB Tables

Invalid information in the CDB tables. For more information, see Run the Database Cleanup Utility.
Example: References to old or invalid installation information may cause failures during installation.

Solution: Run the Database Cleanup Utility to clean up references to old application installs.

> **NOTE**
>
> CDB tables only exist in CA Service Management 14.1 and later versions.

xFlow Interface

Confirm the web server type (Apache Tomcat vs IIS) prior to upgrading CA Service Management. If you are upgrading using a different web server, a full uninstall and reinstall may be required to resolve issues.

Example: Newer xFlow functionality is missing after upgrade

Solution:

- Clear the browser cache.
- Delete the contents from where you have installed xFlow Interface, for example, *c:\windows\temp\casmplayapi*
  In case of CA Service Management 17.3.0.4 Widows OS, navigate to \Program Files\CA\xFlow\APPS\temp instances.
  For CA Service Management 17.3.0.4 Linux OS, navigate to /opt/CA/xFlow/APPS/temp
- Restart the CA xFlow Analyst Interface Services.

Log List

Verify the following logs, in case of any installation issues:

Common Installer Logs

- %temp%\casm
- *<Install Drive>\Program Files (x86)\CA\SC\logs<timeStamp>*
- <Install Drive>*stdout.txt* and <Install Drive>*stderr.txt*
- Database logs (*stderr.log* for example)

CA Service Desk Manager

- <NX_ROOT>/log
- <Install Drive>\stdout.txt and <Install Drive>\stderr.txt
- Database logs (stderr.log for example)

CA Service Catalog logs

- <USM_HOME>\logs

CA Asset Portfolio Manager

- %TEMP%\CA_Asset_Portfolio_Management_xxxxx.log
- <Install Drive>\Program Files (x86)\CA\ITAM\Application Server*.log
- <Install Drive>\Program Files (x86)\CA\ITAM\Web Server*.log

Swing-Box Methods to Upgrade to CA Service Management 17.4

CA Service Management - Swing Box Migration Overview
This document describes the Swing Box Migration process to upgrade CA Service Management 17.4 for the following:

- CA Service Desk Manager
- CA Service Catalog

> **IMPORTANT**
> Unified Self-Service (USS) is not supported in CA Service Management 17.4. If you have USS in your production environment, it is recommended that you test and adapt Service Point (Self-Service) 17.4.

> **IMPORTANT**
> If your upgrade environment is having CA EEM integration, ensure that you do not enable active directory. Enable Active directory only after upgrading to CA Service Management to 17.4 on your swing-box environment.

> **IMPORTANT**
> If your environment is configured with a load balancer or SAML or NTLM, ensure that you do not enable these configurations during migration. Reconfigure these settings after upgrading to CA Service Management 17.4 on your swing-box environment.

Review the following topics:

- CA Service Desk Manager (SDM) - Swing Box Migration
- CA Service Catalog - Swing Box Migration
- Use Case 1 - Swing-Box Migration to Upgrade CA Service Management 17.4 and Above
- Use Case 2 – CA Service Management 17.3.0.3 Swing Box Move from the Production to the Target Server

CA Service Desk Manager (SDM) - Swing Box Migration

This article describes the Swing Box Migration process to upgrade to CA Service Desk Manager (CA SDM) 17.4.
Use any of the below two Swing-box migration methods to upgrade to CA SDM 17.4:

- Swing-Box Migration using Production Replica

> **IMPORTANT**
> In case of Production Replica, moving the production delta data can be tedious (delta here means the additional data or any data added over a period of time post the Swing Box migration). To move the delta

data in your production server, you must repeat the entire Swing box migration process on your complete production data and not just on the delta or supplementary data.

- Swing-Box Migration using Intermittent Server

  NOTE
  This method facilitates the move of the production delta data in an easier way as compared to the "**Swing-Box Migration Using Production replica**".

The above two methods leave your current production system fully intact in case of a disaster recovery issue or in case of a failed migration. With VMware environment as the swing system/intermittent servers, you have the advantage of using the snapshot functionality to test the migration process multiple times, and gather data with timestamp and required steps.

Approach 1 - Production Server		**Approach 2 - Replica of Production Server (Swing Box)**
Moving the delta is tedious and time consuming (if production and target server release levels are different). For example: CA Service Management 17.1/17.2/17.3 with CA Service Management 17.4 It's recommended to have similar release versions on the production and target servers (that is, CA Service Management 17.4 and above patches.)		Moving the delta data is an easier approach (Adding intermittent server to move the delta data). For example: CA Service Management 17.1/17.2/17.3 with CA Service Management 17.4 It is recommended to have different release versions for production and target server (For example: CA Service Management 17.1/17.2/17.3)
Number Of servers required to setup production replica is same as number of servers used in the production deployment. For more information, see OS and Database Requirements for Swing Box Migration Using Production Replica.		Number of Servers required for intermittent server swing-box migration is either one or two along with the same number of servers used in production deployment. In case of Conventional Deployment, number of servers can be **1** (one for Intermittent Server) along with the number of servers used in production deployment. In case of Advance Availability Deployment, number of servers can be **2** (**1** for background server and **1** for Application server) along with the number of servers used in production deployment. It's recommended that you have the Intermittent servers in a Virtual machine, as this facilitates taking snapshot and helps in reverting back to the stable state of intermittent server, while migrating the delta data. For more information, see OS and Database Requirements for Swing Box Migration using Intermittent Servers

CA SDM Recommended OS and Database Requirements

Review the following:

- OS and Database Requirements for Production Replica
- OS and Database Requirements for Intermittent Servers

  NOTE
  For more information, review the following Supportability or compatability Matrix:

  - CA Service Management 17.4
  - CA Service Management 17.3

CA SDM Recommended OS and Database Requirements using Production Replica

The below table showcases the operating system and database requirements for Swing-Box Migration methods discussed in this article:

IMPORTANT
Your target server must be a mirror of the products or applications installed in your production server.

Production Server	**Replica of Production Server (Swing Box - Target Server)**
Operating System: CA SDM 17.1/17.2/17.3 or above • Windows 2012/2016/ 2019 • RHEL 7.x	**Operating System**: CA SDM 17.1/17.2/17.3 or above (Migrate to CA SDM 17.4) • Windows 2016/ 2019/ 2022 • RHEL 7.x/ 8x
Database: • MS SQL server 2012/2016/2019 • Oracle 12c/19c	**Database**: • MS SQL server 2016/ 2019/ 2022 Oracle 19c/ 21c

OS and Database Requirements for Swing Box Migration using Intermittent Servers

Production Server	**Replica of Production Server (Swing Box)**	**Target Server 17.4 (Swing box)**
CA SDM 17.1/17.2/17.3 or above **Operating System**: • Windows 2012/ 2016/ 2019 • RHEL 7.x	**CA SDM 17.1/17.2/17.3 or above (Migrate to CA SDM 17.4)** **Operating System**: • Windows 2016/2019 • RHEL 7.x	**CA SDM: 17.4** **Operating System:** • Windows 2016/2019/ 2022 • RHEL 7.x or 8.x
Database: • MS SQL server 2012/ 2016/ 2019 • Oracle 12c/19c	**Database**: • MS SQL server 2016/ 2019 • Oracle 19c	**Database**: • MS SQL server 2016/ 2019/ 2022 • Oracle 19c/ 21c

Prerequisites and considerations for using CA SDM Swing Box Migration

Ensure that you consider the following prerequisites before using the swing-box migration procedures. This activity saves lot of time while upgrading:

- No form, or schema (tables and columns) customization, or changes must be made to any system once upgrade testing is started (CA SDM production, development, test, Swing box, and so on).
- If you are planning to add or modify additional tables or columns, it must be done in your production environment prior to upgrading. This can also be done after your production upgrade is complete and when you are planning for another outage or downtime using CA Service Desk 17.4 on a new production system.
- It is assumed that you have already done a test upgrade on a replica of your production system. Complete re-customizing any of your custom forms from earlier CA SDM versions that are incompatible with CA SDM 17.4.
- Now, you have a final customized and complete site\mods directory on CA SDM 17.4.

CA SDM Swing-Box Migration Using Production Replica High Level Steps

The below table showcases a high-level overview of your production environment along with supported CA SDM versions and deployment modes (Conventional/Advance Availability) and upgrade to the target server 17.4 using the swing-box migration. For more information, see Install CA Service Desk Manager.

IMPORTANT
Your target server must be a mirror of the products or applications installed in your production server.

S.No	Mode of Deployment	Production Environment	Target 17.4 (Swing Box)
1	**Conventional**	• **Release Version: CA SDM 17.4 and above** • **Mode of deployment: Conventional**	• Setup CA SDM 17.4 and above, similar your production deployment model. Example: Windows Server 2016/ 2019/ 2 or RHEL 7.x/ 8.x • Take a **snapshot-1.** • Move MDB from the production environm • Copy customizations from the productio environment. • Take a **snapshot-2.** • Upgrade to CA SDM 17.4 • Merge the customizations with CA SDM forms. • Take **snapshot 3** (CA SDM 17.4 with production data, customizations).
	• **Release Version: CA SDM 17.4** • **Mode of deployment: Conventional**	• Setup CA SDM 17.4 with supported OS with the same production mode of deployment. Example Windows Server 2016/2019/2022 or RHEL 7.x/8.x • Take a snapshot-1 • Move MDB from the production environment. • Copy customizations from the production environment. • Take snapshot 2 (CA SDM 17.4 with production data, customizations).	

2	**Advance Availability**	• Release Version: CA SDM 17.4 and above • Mode of deployment: Advance Availability	• Setup CA SDM 17.4 and above, same a your production deployment model. Example: Windows Server 2016/ 2019/ 2 or RHEL 7.x/ 8.x • Take a **snapshot-1.** • Move MDB from the production environm • Copy customizations from the productio environment to target environment with 1 mapping (Production to target Backgrou (BG) server, standby server, and all application servers). • Take a **snapshot-2.** • Upgrade to CA SDM 17.4 • Merge the customizations with **1-1** mapp (Production to target BG server, standby server, and all app servers) with CA SDM 17.4 forms • Take snapshot 3 (CA SDM 17.4 with production data, customizations).
	• **Release Version: CA SDM 17.4** • **Mode of deployment: Advance Availability**	• Setup CA SDM 17.4 with supported OS with the same production mode of deployment. Example: Windows Server 2016/2019/2022 or RHEL 7.x/8.x • Take a **snapshot-1.** • Move MDB from the production environment. • Merge file customization from the production environment to target environment with **1-1** mapping (production to target BG server, standby server, and all app servers). • Take a snapshot-2 (CA SDM 17.4 with production data, customizations)	

CA SDM Swing-Box Migration using Production Replica to Upgrade to CA SDM 17.4

This method of swing-box migration uses a separate server to replicate your current production environment to upgrade to CA SDM 17.4. Move the upgraded CA SDM data and customizations over to a fresh system (a system that was never before upgraded) and install on a new hardware. This method leaves your current production system fully intact in case of a disaster recovery issue or in event of a failed migration.
In this method of migration, you have to prepare a replica of your Production environment via Swing box with CA SDM 17.4.

NOTE
This process requires a Production System and a replica of your current Production System.

Review and perform the following:

1. Prepare a Production replica Server (Swing Box) with supported hardware and software for CA SDM.
   For more information, see Supported OS and Database.
   For more information Server Nomenclature.
2. Backup and restore database and customizations from your production environment.
   a. For more information, see Backup Files/Data from your Production Server.
   b. For more information, see Prepare a Swing Box from you production Servers.

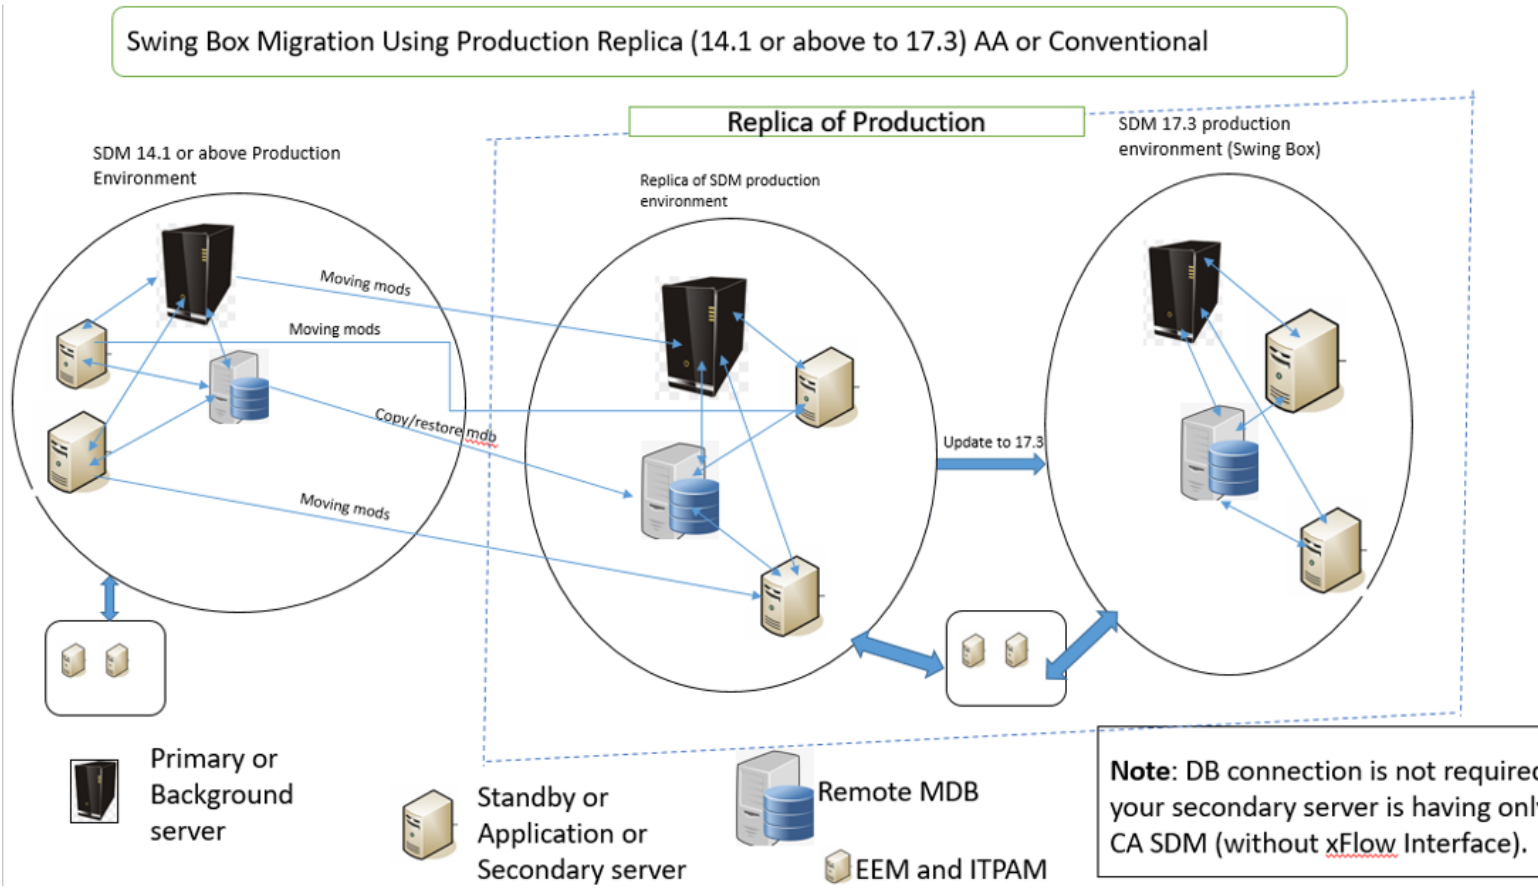
3. Prepare to Upgrade to CA SDM 17.4 using the Swing-Box Migration process on the Production Replica server.
   a. For more information, see Upgrade to CA SDM 17.4.

Server Nomenclature for Swing-Box Production Replica and Process Flow Diagram

The below example server names are used to describe the Swing-Box Production Replica procedure to update CA Service Desk Manager CA SDM 17.1/17.2/17.3 and above to CA SDM 17.4 or above.
Here, the following abbreviated terms have been used for Server names:

- **bg**: Background Server
- **mdb**: MDB Database for Conventional and Advance Availability
- **prim**: Primary Server
- **sec**: Secondary Server
- **app**: Application Server
- **sb**: Standby Server
- **new**: If server names are appended with new, they denote the target servers.

Production Servers		Swing Box/Production Repl		
		Replica of Your Production Servers > M		
CA SDM 17.1/17.2/17.3 or above (Advance Availability Configuration)	**CA SDM 17.1/17.2/17.3 or above (Conventional Configuration)**	**CA SDM 17.1/17.2/17.3 or above (Advance Availability Configuration)**	**CA SDM 17.1/17.2/17.3 or above (Conventional Configuration)**	**CA SDM Availabi**
testqa-mdb	testqa-mdb	testqa-mdb-new	testqa-mdb-new	testqa-m
testqa-bg	testqa-prim	testqa-bg-new	testqa-prim-new	testqa-bg
testqa-sb	testqa-sec	testqa-sb-new	testqa-sec-new	testqa-sb
testq-app	testqa-sec	testqa-app-new	testqa-sec-new	testqa-ap



Step 1: Backup Files/Data from your Production Servers

Perform the following steps:

1. Take a SQL Backup of MDB from the current production database server (**testqa-mdb**) and save it as **.bak** file (usually a normal SQL backup).
2. From the NX_ROOT\site\ directory, make a copy of the “mods\" directory and these two **tblobj.cfg** and **ddict.sch** files from the (**testqa-bg**, **testqa-sb**, **testqa-app**, or **testqa-prim**, **testqa-sec**) based on the current production deployment model (**Advance Availability** or **Conventional Configuration**).
   It is recommended that you compile this into a Zip format.

   IMPORTANT
   Copy the files from your application, standby, background, or primary and secondary servers based on your deployment model.
3. Make a copy of "NX_ROOT\site\attachments" from **testqa-bg** or **testqa-prim** based on your deployment model.

   NOTE
   In case, your attachment repositories are configured on different servers/locations, ensure to copy from this location.

   It is recommended that you compile this into a Zip format.
4. Copy the above files from **Step 1**, **Step 2**, and **Step 3** to any of your swing-box environments to a standby directory and do not place the files in their respective locations for now.

Step 2: Prepare a Swing Box (Production Replica) Environment

For reference purposes, we will refer to the database server here as "**testqa-mdb-new**" and the application server as "**testqa-bg-new**" (Advance Availability) or "**testq-prim-new**" (Conventional Configuration) on a swing box environment.

1. On **testqa-mdb-new**, verify that Microsoft SQL Server is already installed on this server.
2. On **testqa-bg-new** or **testq-prim-new** - install the SQL client and native client (workstation tools).
3. Install the same version of CA SDM as your current production environment on **testqa-bg-new** or **testq-prim-new**. Now, you have a basic CA SDM installation up and running without customizations.
4. Install Standby and number of Application servers (Advance Availability similar to your current production environment.)
   For conventional configuration, this will be replaced by Secondary servers, if any, similar to your current production environment.
5. **NOTE**
   Ensure to set the option to **OVERWRITE** the entire database when restoring.
   Also, follow the instructions in Move the CA MDB Data from the Production to the Target Systems based on your database type (MS SQL or Oracle).
   IMPORTANT
   Additionally, ensure that the below step **6** - step **13** are performed appropriately in your environment.
6. As a database administrator, execute the Microsoft SQL Restore command and restore the MDB from your current production (**testqa-mdb**) that you have backed up on the **testq-mdb-new** server as shown in Step 1: Backup Files/ Data from your Current Production System. For more information, see Server Nomenclature for Swing-Box Production Replica Method.
   a. Here, Production MDB server will be referred as **testqa-mdb** and target MDB server is **testqa-mdb-new**.
   b. For more information, see Server Nomenclature for Swing-Box Production Replica Method.
7. After you have completed the Microsoft SQL Server restore process on the target mdb (**testqa-mdb-new**) server, execute the stored procedure in SQL to fix the orphaned users which are created when restoring a database from one Microsoft SQL Server instance to another.
   For Example:
   ```
   sp_change_users_login 'AUTO_FIX','mdbadmin'
   ```
8. Copy the NX_ROOT/site/mods directory and the **tblobj.cfg ddict.sch** files from the production server to the Swing Box server:
   NOTE
   The below steps are applicable only if your production environment is customized. This is not applicable for the out-of-the-box (OOTB) content.
   a. **Advance Availability**:
      - Production background server (BG) (**testqa-bg**) to the target background server (BG) (**testqa-bg-new**).
      - Production Standby (**testqa-sb**) to the target Standby (**testqa-sb-new**).
      - Production Application Server (**testqa-app**) to the target Application Server (**testqa-app-new**).
   b. **Conventional Configuration**:
      - Production Primary (**testqa-prim**) to the target Primary server (**testqa-prim-new**).
      - Production Secondary (**testqa-sec**) to the target Secondary server (**testqa-sec-new**).

      NOTE
      Perform on all secondary servers in your environment.
      NOTE
      The above steps are applicable only if you have customizations in your environment. This is not applicable for the out-of-the-box (OOTB) content.
      NOTE
      Ensure that you are taking a backup of NX_ROOT\site\mods directory, NX_ROOT/**site/tblobj.cfg**, and NX_ROOT/**site/ddict.sch** files on the swing box/Production Replica. You will need to rebuild your form customizations using the CA SDM 17.4 form delivered with the installer as the earlier customized

CA SDM forms will not work. Once you have completed the rebuilding of your customizations, take a backup of your NX_ROOT\site\mods directory, NX_ROOT/**site/tblobj.cfg**, and NX_ROOT/**site/ddict.sch** files on the swing box/production Replica.

c. Copy the site\attachments directory (or where you have placed the attachments directory) that you backed up from the production server (**testqa-bg** or **testqa-prim**) and place it in the swing-box environment (**testqa-bg-new**or **testqa-prim-new**) based on the deployment model.

9. Execute the pdm-configure command:
   a. Run **pdm_configure -S** on the target BG Server (**testqa-bg-new**) for Advance Availability.
   It configures silently. Monitor the progress of **pdm_configure** using **NX_ROOT/logs/configure.log** file.
   b. Run **pdm_configure** on the target primary server (**testqa-prim-new**) for Conventional Configuration.
   c. Ensure that you do not select the **LOAD DEFAULT DATA** checkbox option.
10. In the configuration wizard, click **Next** on the database section.
   A message is displayed to show that the database was previously configured. This message indicates that you have restored the MDB from a different environment.
   Click **Yes**.
11. After **pdm_configure** is complete, start the CA SDM services (if the services are not started already).
12. Run **pdm_configure** on the Swing Box standby and all application servers (Advance Availability) and on all secondary servers (conventional configuration).
13. Verify and test the functionality to ensure that CA SDM is up and running with customizations seamlessly as a full replica of your production environment.

Step 3: Upgrade to CA SDM 17.4

Now you can upgrade to CA SDM 17.4 based on your deployment configuration. For more information, see Install CA Service Desk Manager 17.4.
Perform the following steps:

1. Mount the CA SDM 17.4 install media and then, run the **setup.exe**, run as **Administrator** from the local folder where you have copied the CA SDM installer.
   a. If you are extracting an ISO of the install media, it should be stored in a path and the folder should have no spaces in the name.

      NOTE
      Download the CA Service Desk Manager 17.4 installer DVD from Broadcom Support.

      - CA SERVICE MANAGEMENT SDM PACKAGE 17.4 FOR WINDOWS (WITH CATALOG).iso
      - CA SERVICE DESK MANAGER 17.4 FOR WINDOWS (WITHOUT CATALOG).iso
      - CA SERVICE DESK MANAGER 17.4 FOR LINUX.iso
2. Launch the CA Service Management 17.4 installer.
3. Select a language of your choice and click **Next**.
   For example, select **English**.
4. Select CA Service Management.
5. Follow the installation wizard to complete the installation process.
   This may take some time to complete depending upon the size of the CA SDM database that you are upgrading/migrating.
6. At this point, if you are doing a test run on the intermittent server, you must re-build your form customizations using the CA SDM 17.4 form delivered with the installer as the earlier (17.1/17.2/17.3 or above) customized CA SDM forms will not work. Once you have completed the rebuilding of your customizations, take a backup of your NX_ROOT**site\mods** directory, NX_ROOT/**site/tblobj.cfg** and NX_ROOT/**site/ddict.sch** files on the Intermittent Server and store it somewhere outside of this environment for later use.
7. Execute the **pdm-configure**command:
   a. Run **pdm_configure -S** on the target BG Server (t**estqa-bg-new**) for Advance Availability.
   It configures silently. Monitor the progress of **pdm_congure** using *NX_ROOT/logs/configure.log* file.

b. Run **pdm_configure** on the target primary server (**testqa-prim-new**) for Conventional Configuration.
c. Ensure that you do not select the **LOAD DEFAULT DATA** checkbox option.

8. Test the migrated and customized CA SDM 17.4 production replica server for integrity and functionality.
9. If all tests are successful, you can now start the process of moving your migrated data and customizations to the target or swing box 17.4 environment.
10. Upgrade Standby and number of Application servers (Advanced Availability similar to your current production environment.)
    For conventional configuration, this will be replaced by Secondary servers, if any, similar to your current production environment.

CA SDM Swing-Box Migration using Intermittent Server - High Level Steps

CA SDM Swing-Box Migration using Production Replica - High Level Steps

The below table showcases a high-level overview of your production environment along with supported CA SDM versions and deployment modes (Conventional/Advance Availability) and upgrade to the target server 17.4 using the swing-box migration. For more information, see Install CA Service Desk Manager.

S.No	Mode of Deployment	Production Environment	Intermittent Server Migra
1	**Conventional Configuration**	• Release Version: CA SDM 17.3 and above • Mode of deployment: Conventional	• Setup Intermittent 17.3 supported OS . Example: Windows 201 RHEL 7.x/ 8.x • Take a **snapshot-1.** • Move MDB from the pro • Take a **snapshot-2.** • Upgrade to CA SDM 17 • Take **snapshot-3**
		• Release Version: CA SDM 17.4 and above • Mode of deployment: Conventional	• Setup CA SDM 17.4 wi the same production m Example Windows Serv or RHEL 7.x/8.x • Take a **snapshot-1** • Move MDB from the pro • Copy customizations fr environment. • Take **snapshot 2** (CA S production data, custom
2	**Advance Availability Configuration**	• Release Version: CA SDM 17.3 • Mode of deployment: Advance Availability	• Setup Intermittent 17.3 Example: Windows Ser or RHEL 7.x • Take a **snapshot-1** • Move MDB from the pro • Take a **snapshot-2** • Upgrade to CA SDM 17 • Take **snapshot 3.**

		• Release Version: CA SDM 17.3 • Mode of deployment: Advance Availability	• Setup CA SDM 17.4 wi the same production m Example: Windows Ser RHEL 7.x/8.x • Take a **snapshot-1.** • Move MDB from the pr • Merge file customizatio environment to target e mapping (production to standby server, and all • Take a s**napshot-2** (CA production data, custom

Swing-Box Migration using Intermittent Server to Upgrade to CA SDM 17.4

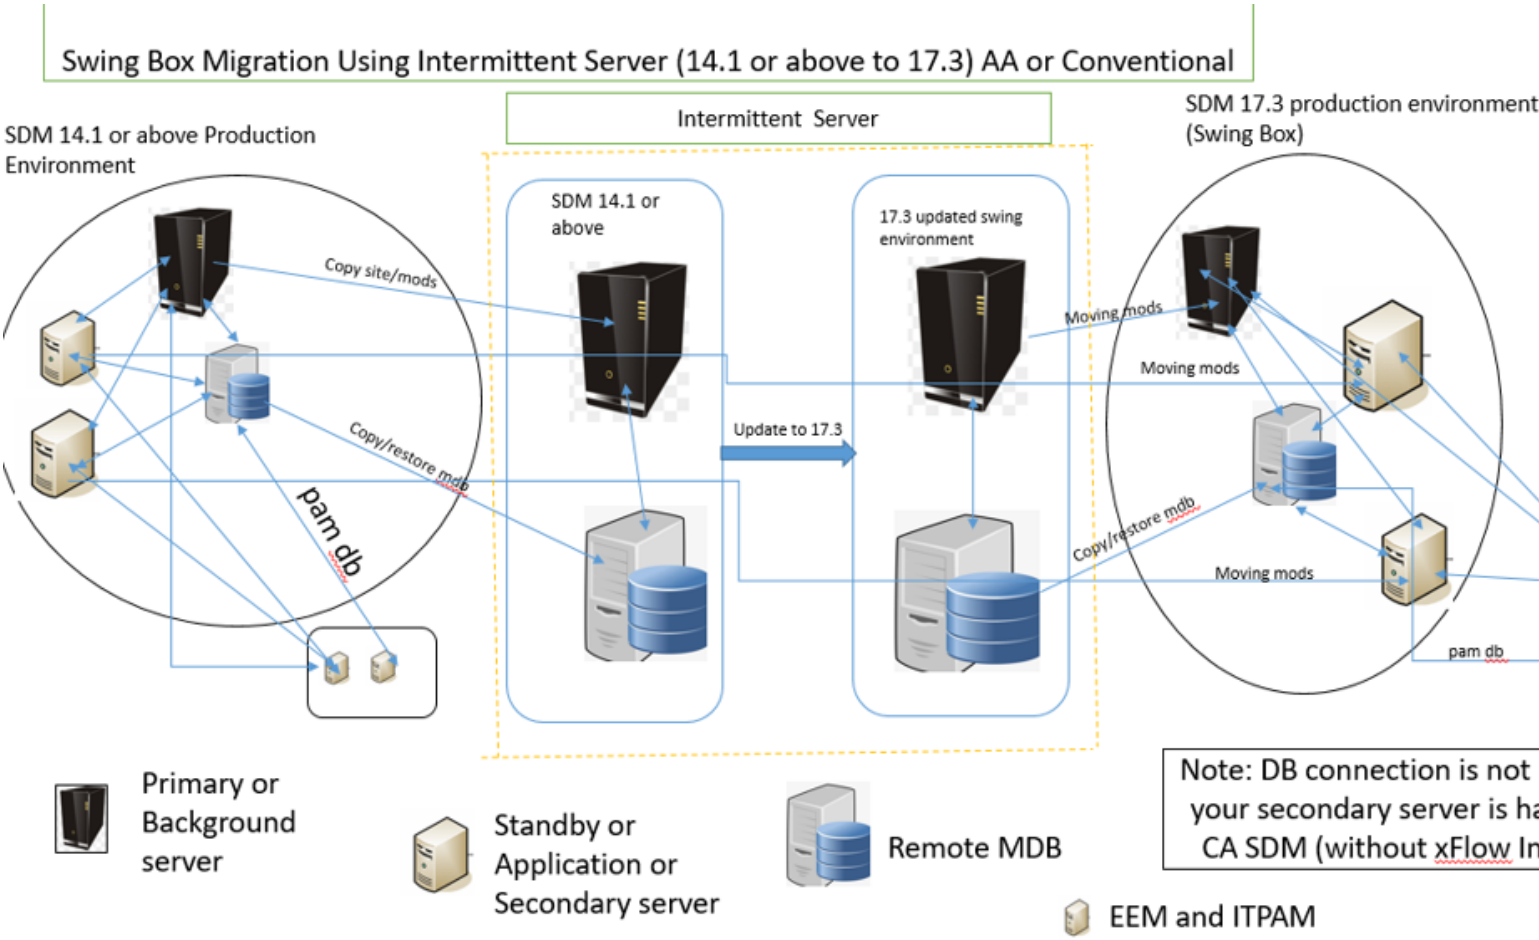
This method of swing-box migration is performed by using an intermittent server to migrate your current CA SDM production system data along with customizations, and then upgrade it to CA SDM 17.4. It involves an intermittent server (**Stand alone** in case of conventional configuration or two boxes, one for the background and one for the Application server in case of **Advance Availability**).
Review and Perform the following:

1. Prepare an Intermittent Server. Ensure that you have reviewed the OS and Database requirements
   For more information, see Supported OS and Database and follow the Server Nomenclature for Swing-Box Intermittent Server.
2. Take a database and file customization backup of your production environment.
   – For more information, see Step 1: Collect Files/Data from your current Production System.
   – For more information, see Step 2: Prepare the intermittent Server.
3. Install a fresh or new instance of CA SDM 17.4 server (a server that was never upgraded before) on the target server (swing box). This server should have the same deployment as your production server.
   For more information, see Install CA Service Desk Manager
4. Take a database backup of your intermittent server and customizations from application/secondary servers of the production environment and restore it to the target servers.
   – For more information, see Step 3: Upgrade to CA SDM 17.4 on the Intermittent Server.
   – For more information, see Step 4: Move the upgraded Intermittent Server install to a Swing-Box (Target) 17.4.

Server Nomenclature for Swing-Box Intermittent Server and process flow diagram
The below example server names are used to describe the Swing-Box Intermittent Server Migration to update CA Service Desk Manager (CA SDM) 17.1/17.2/17.3 or above to CA SDM 17.4 or above.
The following abbreviated terms have been used for Server names:

- **bg**: Background Server
- **mdb**: MDB Database for Conventional and Advance Availability
- **prim**: Primary Server
- **sec**: Secondary Server
- **app**: Application Server
- **sb**: Standby Server
- **new**: If server names are appended with new, they denote the target servers.

Production Server		Intermittent Server	Target S
CA SDM Release 17.1/17.2/17.3 or above with Advance Availability Configuration	**CA SDM Release 17.1/17.2/17.3 or above with Conventional Configuration**	**CA SDM 17.1/17.2/17.3 Intermittent Server**	**CA SDM 17.4 Advance Availability**
testqa-mdb	testqa-mdb	testqa-mdb-inter (bg server or primary server)	testqa-mdb-new
testqa-bg	testqa-prim	testqa-app-inter (bg server or primary server	testqa-bg-new
testqa-sb	testqa-sec		testqa-app-new
testqa-app	testqa-sec		testqa-app-new



Step 1: Collect Files/Data from your Current Production System

Perform the following steps to collect files or data from your production system :

1. Take a SQL Backup of MDB from the current production database server (**testqa-mdb**) and save it as **.bak** file (usually a normal SQL backup).
2. Make a copy of the “\Program Files\CA\Service Desk\site\mods\" directory, **tblobj.cfg**, and **ddict.sch** files from the (**testqa-bg**, **testqa-sb**, **testqa-app**, or **testqa-prim**,**testqa-sec**) based on the current production deployment model (Advance Availability or Conventional Configuration).
   It’s recommended that you compile this into a Zip format.

   NOTE
   Copy the files from all your application, standby, background, or primary and secondary servers based on your deployment model.
3. Make a copy of "Program Files\CA\Service Desk\site\attachments" from **testqa-bg** or **testqa-prim** based on your deployment model.

   NOTE
   In case, if your attachment repositories are configured on different servers/location, ensure to copy from this location.

   It’s recommended that you compile this into a Zip format.

Step 2: Prepare the Intermittent Server

NOTE
For reference purposes, in this section we will refer to the database server as “**testqa-mdb-inter**" and the application server as "**testqa-app-inter**". Here, **testqa-app-inter** is SDM Primary or SDM BG server based on your production environment deployment mode.

Perform the following steps:

1. It is assumed that you have already installed Microsoft SQL Server (**testqa-mdb-inter**).
2. On **testqa-app-inter** server, ensure to install the SQL client and native client (workstation tools).

   NOTE
   If your intermittent server has both Database and Application running on a single server you may skip the **Step 2** and also ensure to install the Microsoft SQL Server Client and native client (workstation tools) on **testqa-mdb-inter**.
3. Install the same release version of production server CA SDM on **testqa-app-inter**, so that you can have a basic installation of CA SDM up and running in your environment (without customizations).
4. As a database administrator, execute the Microsoft SQL Restore command and restore the MDB from your current production (**testqa-mdb**) that you have backed up on the **testqa-mdb-inter** server.

   NOTE
   Ensure to set the option to **OVERWRITE**the entire database when restoring.

   – Here, production mdb server will be referred as **testqa-mdb** and target mdb server is **testqa-mdb-inter**. For more information, see Server Nomenclature.
   – Also, follow the instructions in Move the CA MDB Data from the production to the Target Systems based on your database type (MS SQL or Oracle).

   IMPORTANT
   Additionally, ensure that the below step 6 - step 13 are performed appropriately in your environment.
5. After you have completed the Microsoft SQL Server restore process on the target mdb (**testqa-mdb-inter**) server, execute the stored procedure in SQL to fix the orphaned users which are created when restoring a database from one Microsoft SQL Server instance to another.
   For example:

```
sp_change_users_login 'AUTO_FIX','mdbadmin'
```

6. Copy the site/mods directory **tblobj.cfg** and **ddict.sch** files from the production server to the Swing Box server:
   a. **Advance Availability**: production BG (**testqa-bg**) to the target BG (**testqa-app-inter**).
   b. **Conventional Configuration**: production Primary (**testqa-prim**) to the target Primary server (**testqa-app-inter**)

      NOTE
      The above steps are applicable only if you have customizations in your environment. This is not applicable for the out-of-the-box (OOTB) content.
7. Copy the *site**attachments* directory (or where you have placed the attachments directory) that you backed up from the production server (**testqa-bg** or**testqa-prim**) and place it in the swing-box environment (**testqa-app-inter**) based on the deployment model.
8. Execute the pdm-configure command:
   a. Run **pdm_configure -S** on the target BG Server (**testqa-app-inter**) for Advance Availability.
      It configures silently. Monitor the progress of **pdm_congure** using NX_ROOT/logs/configure.log file.
   b. Run pdm_configure on the target primary server (**testqa-app-inter**) for Conventional Configuration.
   c. Ensure that you do not select the **LOAD DEFAULT DATA** checkbox option.
9. In the configuration wizard, click **Next** on the database section.
   A message is displayed to show that the database was previously configured. This message indicates that you have restored the MDB from a different environment.
   Click **Yes**.
10. After **pdm_configure** is complete, start the CA SDM services (if the services are not started already).
11. Verify and test the functionality to ensure that CA SDM is up and running with customizations seamlessly as a full replica of your production environment.

Step 3: Upgrade to CA SDM 17.4 on the Intermittent Server

Test the migration to become familiar with the processes and issues that you may encounter while migrating your production system. Ensure that you have considered the following:

- If your Intermittent Server is on a VMware environment, it's recommended that you take a snapshot. You can roll back to that snapshot when you take down your production system for maintenance or other purposes.
- Perform a Microsoft SQL Server backup on the production system. Restore it to the Intermittent Server and complete the below steps mentioned in this section.
  In case, if the migration to SDM 17.4 fails, you can revert to the CA SDM production system and start the services.
- Retest migration on the intermittent server again and schedule the migration for another time.

Perform the following steps:

1. Mount the CA SDM 17.4 install media and then, run the **setup.exe**, run as **Administrator** from the local folder where you have copied the CA SDM installer.
   a. If you are extracting an ISO of the install media, it must be stored in a path and the folder must have no spaces in the name.
   b. Run locally from the same drive volume where you plan to install CA SDM 17.4. **Do not run the installer from a network drive or mounted share as this may cause install issues and failures**.

      NOTE
      Download the CA Service Desk Manager 17.4 installer DVD from Broadcom Support.

      - CA SERVICE MANAGEMENT SDM PACKAGE 17.4 FOR WINDOWS (WITH CATALOG).iso
      - CA SERVICE DESK MANAGER 17.4 FOR WINDOWS (WITHOUT CATALOG).iso
      - CA SERVICE DESK MANAGER 17.4 FOR LINUX.iso
2. Launch the CA Service Management 17.4 installer.
3. Select a language of your choice and click **Next**.
4. Select **CA Service Management**.
5. Follow the installation wizard to complete the installation process.

This may take some time to complete depending upon the size of the CA SDM database that you are upgrading/ migrating.

6. At this point, if you are doing a test run on the intermittent server, you must re-build your form customizations using the CA SDM 17.4 form delivered with the installer as the earlier (17.4 or above) customized CA SDM forms will not work. Once you have completed the rebuilding of your customizations, take a backup of your site\mods directory, site/ tblobj.cfg and site/ddict.sch files on the Intermittent Server and store it somewhere outside of this environment for later use.
7. Execute the **pdm-configure** command:
   a. Run **pdm_configure -S** on the target BG Server (**testqa-app-inter**) for Advance Availability.
      It configures silently. Monitor the progress of pdm_congure using NX_ROOT/logs/configure.log file.
   b. Run **pdm_configure** on the target primary server (**testqa-app-inter**) for Conventional Configuration.
   c. Ensure that you do not select the **LOAD DEFAULT DATA** checkbox option.
8. Test the migrated and customized CA SDM 17.4 Intermittent Server for integrity and functionality.
9. If all tests are successfully completed, you can now start the process of moving your migrated data and customizations to the target or swing box 17.4 environment.

Step 4: Move Upgraded Intermittent Server Install to a Swing-Box (Target) 17.4

Your Swing-box (Target) environment must already be up and running with a clean or fresh installation of CA Service Desk Manager 17.4 same as your production deployment model.
Perform a Microsoft SQL Server backup on the intermittent server (**testqa-mdb-inter**) and have your database administrator perform a Microsoft SQL Server Restore onto the SQL database instance on your Swing-box or target server (**testqa-mdb-new**).
Perform the following steps:

1. Create a Microsoft SQL Server backup on the intermittent server (**testqa-mdb-inter**), and have your database administrator perform a SQL Restore on the SQL instance used by your Swing-box or target server (**testqa-mdb-new**).

   NOTE
   Ensure to set the option to **OVERWRITE** the entire database when restoring.

   – Here, production mdb server will be referred as **testqa-mdb-inter** and target mdb server is **testqa-mdb-new**.
   – Also, follow the instructions in Move the CA MDB Data from the production to the Target Systems based on your database type (MS SQL or Oracle).

   NOTE
   Additionally, ensure that the below step 2 - step 6 are performed appropriately in your environment.
2. After you have completed the Microsoft SQL Server restore process on the target mdb (**testqa-mdb-inter**) server, execute the stored procedure in SQL to fix the orphaned users which are created when restoring a database from one Microsoft SQL Server instance to another. For example:

   ```
   sp_change_users_login 'AUTO_FIX','mdbadmin'
   ```
3. **Advance Availability**:
   Perform the following steps:
   a. Ensure that you have installed the following components:
      a. (Oracle) database client is installed and the net service name is configured to connect with the new database server.
      b. (MS SQL) MS SQL database client is installed.
      c. Copy the site/mods directory, site/tblobj.cfg, and site/ddict.sch files from the production CA SDM server to the target CA SDM server:
         a. production BG (**testqa-bg**) to the target BG (**testqa-bg-new**).
         b. production Standby (**testqa-sb**) to the target Standby (**testqa-sb-new**).
         c. production Application Server (**testqa-app**) to the target Application Server (**testqa-app-new**) (Perform on all application servers in an environment).

NOTE
The above steps are applicable only if your production environment is customized. This is not applicable for the out-of-the-box (OOTB) content.

NOTE
Ensure that you are taking a backup of site\mods directory, **site/tblobj.cfg**, and**site/ddict.sch** files on the swing-box or target servers. You will need to rebuild your form customizations using the CA SDM 17.4 form delivered with the installer as the earlier customized CA SDM forms will not work. Once you have completed the rebuilding of your customizations, take a backup of your **site\mods** directory, **site/tblobj.cfg**, and **site/ddict.sch** files on the swing-box or target servers.

d. Run **pdm_configure -S** on BG Server (**testqa-bg-new**). It configures silently. Monitor the progress of **pdm_congure** using NX_ROOT/logs/configure.log file.
e. Run pdm_configure on Standby Server (**testqa-sb-new**).
f. Run the pdm_configure on all application servers (**testqa-app1-new**) and **testqa-app2-new**).
g. Execute the pdm_k_reindex command on the CA SDM target system of BG Server machine **testqa-bg-new**to index knowledge documents that are created and copied from the production system of BG Server machine **testqa-bg**.

4. **Conventional Configuration**: Perform the following steps:
   a. Copy the site/mods directory, **site/tblobj.cfg** and**site/ddict.sch** files from the production CA SDM server to the target CA SDM server.
   b. production Primary (**testqa-prim**) to the target Primary (**testqa-prim-new**).
   c. production Secondary (**testqa-sec**) to the target secondary (**testqa-sec-new**) (Perform on all secondary servers in this environment).

      NOTE
      The above steps are applicable only if your production environment is customized. This is not applicable for the out-of-the-box (OOTB) content.

      NOTE
      Ensure that you are taking a backup of *site**mods* directory, **site/tblobj.cfg**, and **site/ddict.sch** files on the swing-box or target servers. You will need to rebuild your form customizations using the CA SDM 17.4 form delivered with the installer as the earlier customized CA SDM forms will not work. Once you have completed the rebuilding of your customizations, take a backup of your **site\mods** directory, **site/tblobj.cfg**, and **site/ddict.sch** files on the swing-box or target servers.

   d. If conventional configuration, add **NX_SWING_BOX_MIGRATE=Yes** variable to NX.env file and run the **pdm_configure** command.
   e. Do not select **TO LOAD DEFAULT DATA**.
   f. In the configuration wizard, click **Next** in the database section.
      A message displays, stating that the database was previously configured. This message indicates that you have restored the MDB from a different environment.
   g. Click **Yes**.
   h. After the configuration is complete, perform the following tasks:
      a. Start the CA SDM services (if not started).
      b. Run the **pdm_configure** on all application servers (**testqa-sec1-new**) and **testqa-sec2-new**).
      c. Execute the **pdm_k_reindex** command on the CA SDM target system of Primary Server machine **testqa-prim-new** to index knowledge documents that are created and copied from the production system of Primary Server machine **testqa-prim**.

5. Test the system functionality to ensure the swing-box or target environment with CA Service Desk Manager 17.4 and above is up and running with data and customizations intact.

CA Service Catalog - Swing Box Migration

This document describes how to upgrade to CA Service Catalog 17.4 using swing box migration. Use any of the below two swing-box methods to upgrade to CA Service Catalog 17.4:

- Swing-Box Migration using Production Replica

  NOTE
  In case of Production Replica, moving the production delta or supplementary data can be tedious (supplementary here means the additional data or any data added over a period of time post the Swing Box migration). To move the supplementary data in your production server, you must repeat the entire Swing box migration process on your complete production data and not just on the delta or supplementary data.
- Swing-Box Migration using Intermittent Server

  NOTE
  This method facilitates the move of the production delta or supplementary data in an easier way as compared to “Swing-Box Migration Using Production replica”.

CA Service Catalog Recommended OS and Database Requirements

- Production Replica - OS and Database Requirements
- Intermittent Servers -OS and Database Requirements

The below table showcases the Operating system and database requirements for Swing-Box Migration methods discussed in this article:

OS and Database Requirements for Swing Box Migration using Production Replica

Production Server	**Replica of Production Server (Swing Box)**
CA Service Catalog: 17.1/17.2/17.3 or above	*CA Service Catalog: 17.1/17.2/17.3 or above (migrate to CA Service Catalog 17.4)*
Operating System: • Windows 2012/2016/2019	**Operating System**: • Windows 2016/ 2019
Database: • MS SQL server 2012/2016/2019 • Oracle 19c	**Database**: • MS SQL server 2016/ 2019 • Oracle 19c

OS and Database Requirements for Swing Box Migration using Intermittent Server

Production Server	**Replica of Production Server (Swing Box)**	**Target Server with 17.4 (Swing Box)**
CA Service Catalog: 17.1/17.2/17.3 or above	*CA Service Catalog: 17.1/17.2/17.3 or above (migrate to CA Service Catalog 17.4)*	CA Service Catalog: 17.4

Operating System: • Windows 2012/2016/ 2019	**Operating System**: • Windows 2016/ 2019	**Operating System**: • Windows 2016/ 2019/ 2022
Database: • MS SQL server 2012/2016/ 2019 • Oracle 12c/19c	**Database**: • MS SQL server 2016/2019 • Oracle 19c	**Database**: • MS SQL server 2016/2019/ 2022 • Oracle 19c/ 21c

Prerequisites and Considerations for using CA Service Catalog Swing Box Migration

Ensure that you consider the following prerequisites before using the swing-box method. This activity saves you a lot of time while upgrading:

- **Do not enable Active Directory on EEM Application** . Enable Active Directory only after installing CA Service Catalog 17.4.
- No form, or schema (tables and columns) customization, or changes must be made to any system once upgrade testing is started (CA Service Catalog production, development, test, swing box, and so on).
- If you are planning to add or modify additional tables or columns, it must be done in your production environment prior to upgrade. This can also be done after your production upgrade is complete and when you are planning for another outage or downtime using CA Service Catalog 17.4 on a new production system.
- You have already done a test upgrade on a replica of your production system. Complete re-customizing any of your custom forms from earlier CA Service Catalog versions that are incompatible with CA Service Catalog 17.4.
  Now, you have a final customized and complete filestore\custom directory on CA Service Catalog 17.4.

  NOTE
  If you have a shared filestore, copy from the shared filestore location. This is recommended to avoid multiple overlap of common files.
- Ensure to take a backup of CA EEM policies on the production CA Service Catalog server.

CA Service Catalog Swing-Box Production Replica - High Level Steps

The table below shows a high-level overview of your production environment with supported CA Service Catalog release versions and upgrade to target CA Service Catalog Server 17.4 using the swing-box migration.

NOTE
The tabular information is applicable for both standalone and multiple server instances of CA Service Catalog. For more information about how to upgrade to CA Service Catalog 17.4, see Install CA Service Catalog.

S.No	Intermittent Server	Target 17.4 (Swing Box)
1	*CA Service Catalog: 17.3 or above (migrate to CA Service Catalog 17.4)*	• Setup CA Service Catalog 17.3 similar to your production deployment model. Example: Windows 2016/ 2019 • Take a **snapshot-1** • Move MDB from the production environment. • Copy customizations from the production environment to target environment with **1-1** mapping (production to target of Catalog application Servers). If you have a shared filestore, you need to copy from the shared filestore location (example: filestore/custom). This is required to avoid multiple overlap of common files. • Take a **snapshot-2** • Upgrade to 17.4. • Merge the customizations with **1-1** mapping (production to target of Catalog application Servers) with CA Service Catalog 17.4 • Take snapshot 3 (CA Service Catalog 17.4 with production data, customizations).
2	Version: CA Service Catalog 17.4	• Setup CA Service Catalog 17.4 with supported OS with the same production mode of deployment. Example: Windows 2016/ 2019/ 2022 • Take a **snapshot-1** • Move MDB from the production environment. • Merge file customization from the production environment to target environment with **1-1** mapping (production to target of Service Catalog Application servers). If you have a shared filestore, you need to copy from the shared filestore location (example: filestore/custom). This is required to avoid multiple overlap of common files. • Take **snapshot 2** (CA Service Catalog 17.4 with production data, customizations).

Swing-Box Migration Using Production Replica to Upgrade to CA Service Catalog 17.4

This method uses the replica method on a separate server to replicate your current production environment to upgrade to CA Service Catalog 17.4. Move the upgraded CA Service Catalog data and customizations over to a fresh system (a system that was never upgraded before) and install on a new hardware. This method leaves your current production system fully intact in a disaster recovery issue or in event of a failed migration.

In this method of migration, you have to prepare a replica of your production environment using swing box with CA Service Catalog 17.4.

NOTE
This process requires a production system and a replica of your current production system.

Review and perform the following:

1. Prepare a Production replica Server (Swing Box) with supported hardware and software for CA Service Catalog.
   For more information, see Production Replica - OS and Database Requirements and Server Nomenclature for Swing-Box Production Replica.
2. Backup and restore database and customizations from your production environment.
   For more information, see Step:1 Collect Files/Data from your Current Production System.
3. Prepare to upgrade from CA Service Catalog 17.1/17.2/17.3 using the Swing-Box Migration process on the Production Replica server.
   For more information, see Prepare to Upgrade to CA Service Catalog 17.4.

   NOTE
   Moving the production delta or supplementary data can be tedious (supplementary here means the additional data or any data added over a period of time post the Swing Box migration). To move the supplementary data in your production server, you must repeat the entire Swing box migration process on your complete production data and not just on the delta or supplementary data.

Server Nomenclature for Swing-Box Production Replica Method and Process Flow Diagram

The following example server names are used to describe the swing-box production replica method to upgrade CA Service Catalog 17.1/17.2/17.3 or above to CA Service Catalog 17.4 or above release versions.

- **mdb**: MDB database
- **catalog1**: Catalog Production Server
- **catalog1-new**: Replica of Catalog Production Server
- **catalog2**: Catalog Production Server 2
- **catalog2-new**: Replica of Production Server 2
- **new**: If Server names are appended with new, they denote the target servers.

Production Servers	**Swing Box/Production Replica Server**	
	Replica of Your Production Servers > Migrated to 17.4	
CA Service Catalog 17.1/17.2/17.3 or above	*CA Service Catalog: 17.1/17.2/17.3 or above (migrate to CA Service Catalog 17.4)*	CA Service Catalog 17.4
testqa-mdb testqa-catalog1 testqa-catalog2	CA Service Catalog 17.1/17.2/17.3 or above testqa-mdb-new testqa-catalog1-new testqa-catalog2-new	CA Service Catalog 17.4 testqa-mdb-new testqa-catalog1-new testqa-catalog2-new

Step 1: Backup Files/Data from your Production Servers

Perform the following steps:

1. Take a SQL Backup of MDB from the current production database server (**testqa-mdb**) and save it as **.bak** file (usually a normal SQL backup).
2. Make a copy of the shared filestore directory of the (**testqa-catalog1**and **testqa-catalog2**) based on the current production deployment model.

   It is recommended that you compile this into a Zip format.

   NOTE

   If you have a shared filestore, you must copy from the shared filestore location. This is required to avoid multiple overlaps of common files.

   NOTE

   Make a copy of the "*Program Files**CA**Service Catalog**filestore**custom*" directory files from the **testqa-catalog1**if you have single catalog server.
3. Copy the above files from Step 1 and Step 2 to any of your swing-box environments to a standby directory and do not place the files in their respective locations for now.

Step 2: Prepare a Swing Box (Production Replica) Environment

For reference purposes, we refer to the database server here as "**testqa-mdb-new**" and the application server as **"testqa-catalog1-new**" on a swing box environment.

1. On **testqa-mdb-new**, verify that Microsoft SQL Server is already installed on this server.
2. On **testqa-catalog1-new**- install the SQL client and native client (workstation tools).
3. Install the same version of CA Service Catalog as your current production environment on **testqa-catalog1-new**. Now, you have a basic CA Service Catalog installation up and running without customizations.
4. Install number of Catalog Application servers (similar to your current production environment).

CA EEM Policies Backup and Restore on CA Service Catalog server

Perform the following steps to backup CA EEM data on production Catalog server (**testqa-catalog1**):

1. Open the CA Service Catalog command prompt. Click **Start**, **Programs**, **CA**, **Service Catalog**, usm command prompt (*%usm_home%**usm.cmd*) from Catalog Server 17.1/17.2/17.3 or above installed as example **testqa-catalog1** in this document.
2. Run the following command:

   ```
   ant backup-eem-app
   ```

   NOTE

   During execution, provide input parameters like EEM password . After successful completion, **"eem-backup.xml"** file is generated in the %USM_HOME% directory.

   NOTE

   If you have multiple CA Service Catalog computers, perform this step on the first CA Service Catalog computer. Run this command once, regardless of the number of Service Catalog servers in your environment.

Perform the following steps to restore CA EEM on the target Catalog server **(testqa-catalog1-new)**:

1. Copy file (**eem-backup.xml**) from **testqa-catalog1** to the **testqa-catalog1-new** in the *%USM_HOME%* folder.
2. Run the following command:

   ```
   ant restore-eem-app
   ```

   After successful completion-related entries are updated in the EEM.
3. Restart CA Service Catalog services.
4. As database administrator, execute the Microsoft SQL Restore command and restore MDB from your current production (**testqa-mdb**) that is backed up on the **testq-mdb-new** server.

NOTE
Ensure to set the option to OVERWRITE the entire database when restoring.

For more information, see Step 1: Backup Files/Data from your Production Servers.

5. Here, production mdb server is referred as testqa-mdb and target mdb server is testqa-mdb-new. For more information, see Server Nomenclature for Swing-Box Production Replica Method.
6. Also, follow the instructions in Move the CA MDB Data from the Production to the Target Systems based on your database type.

   NOTE
   Also, ensure that the below **step 6 - step 9** are performed appropriately in your environment.
7. After you have completed the Microsoft SQL Server restore process on the target mdb (testqa-mdb-new) server, execute the stored procedure in SQL to fix the orphaned users which are created when restoring a database from one Microsoft SQL Server instance to another.

   Example:
   sp_change_users_login 'AUTO_FIX','mdbadmin'
8. Copy shared filestore directory files from the production server (testqa-catalog1/testqa-catalog2) to the Swing Box server.

   NOTE
   The below steps are applicable only if your production environment is customized. This is not applicable for the out-of-the-box (OOTB) content.
9. If you have a shared filestore, copy from the shared filestore location. This is required to avoid multiple overlaps of common files.
10. Make a copy of the “<usm_home>\filestore\custom" directory files from the **testqa-catalog1**if you have single catalog server.
11. Ensure that you are taking a backup of ***filestore**custom*** directory files on the swing box Production Replica.
    You are required to rebuild your form customizations using CA Service Catalog 17.4 form that is delivered with the CA Service Management installer as earlier customizations for CA Service Catalog will not work.
12. Once you have completed the rebuilding of your customizations, take a backup of your filestore/custom directory files on the swing box/production Replica.
13. Start the CA Service Catalog services.
14. Verify and test the functionality to ensure that CA Service Catalog is up and running with customizations seamlessly as a full replica of your production environment.

Step 3. Upgrade to CA Service Catalog 17.4

Now, you are ready to upgrade to CA Service Catalog 17.4 based on your deployment configuration.

IMPORTANT
Test the migration to become familiar with the processes and issues that you may encounter while migrating your production system. Perform a Microsoft SQL Server backup on the production system. Restore it to the Swingbox/Replica Server and complete the below steps that are mentioned in this section. Ensure that you have considered the following:

Perform the following steps:

1. Mount the CA Service Catalog 17.4 install media and then, run the **setup.exe**, run as **Administrator** from the local folder where you have copied the CA Service Catalog installer.
   a. If you are extracting an ISO of the install media, it must be stored in a path and the folder must have no spaces in the folder name.

      NOTE

      - Download the CA Service Management installer 17.4 from Broadcom Support.

- **CA SERVICE MANAGEMENT SDM PACKAGE 17.4 FOR WINDOWS (WITH CATALOG).iso**
- **CA SERVICE CATALOG 17.4.iso**
- **CA SERVICE MANAGEMENT APM PACKAGE 17.4 FOR WINDOWS (WITH CATALOG).iso**

b. Run locally from the same drive volume where you plan to install CA Service Catalog 17.4.

IMPORTANT
Do not run the installer from a network drive or mounted share as this has been known to cause install issues and failures.

2. Launch the CA Service Management 17.4 installer.
3. Select a language of your choice and click Next.
   For example, select **English**
4. Select CA Service Management.
5. Follow the installation wizard to complete the installation process.
   This may take some time to complete depending upon the size of the CA Service Catalog database that you are upgrading/migrating.

CA Service Catalog Swing Box Migration Intermittent Server - High Level Steps

The below table shows a high-level overview of your production environment, intermittent Servers, along with supported CA Service Catalog versions and upgrade it to target servers 17.4 using the swing-box migration.

NOTE
The below information is applicable for both standalone and multiple server instances of CA Service Catalog.

S.No	Production Environment	Intermittent Server - Migration	Target 17.4 (Swing Box)
1	Version: CA Service Catalog 17.3	• Setup Intermittent server 17.3 with supported OS Example: Windows 2016/ 2019 • **Take snapshot -1** • Move MDB from Production • **Take snapshot -2** • Upgrade to 17.4 • **Take snapshot -3**	• Fresh Install 17.4 same as of deployment. Example: Windows 2016/ • **Take a snapshot - 1** • Move MDB from the Interm • Copy/Merge file customiza the production environmen environment with **1-1** mapp target of Catalog Applicatio have a shared filestore, yo from the shared filestore lo filestore/custom). This is re multiple overlap of commo • Take **snapshot 2** (CA Serv with production data, custo
2	Version: CA Service Catalog 17.4	• Setup Intermittent server 17.4 with supported Operating System. Example: Windows Server 2016/ 2019 • Take a**snapshot-1** • Move MDB and Customizations from the production environment. • Take **snapshot 2** (CA Service Catalog 17.4 with production data, customizations). • Update to latest rollup of 17.4 if required	• Fresh Install 17.4 same as of deployment. Example: Windows Server • Take a **snapshot-1** • Move MDB from the Interm • Copy/Merge file customiza the production environmen environment with **1-1** mapp target Catalog Application • Take **snapshot 2** (CA Serv with production data, custo

Use the Swing Box Intermittent Server to Upgrade to CA Service Catalog 17.4

This method of swing-box migration is performed using an intermittent server to migrate the current production system data along with customizations, and then upgrade it to CA Service Catalog 17.4.

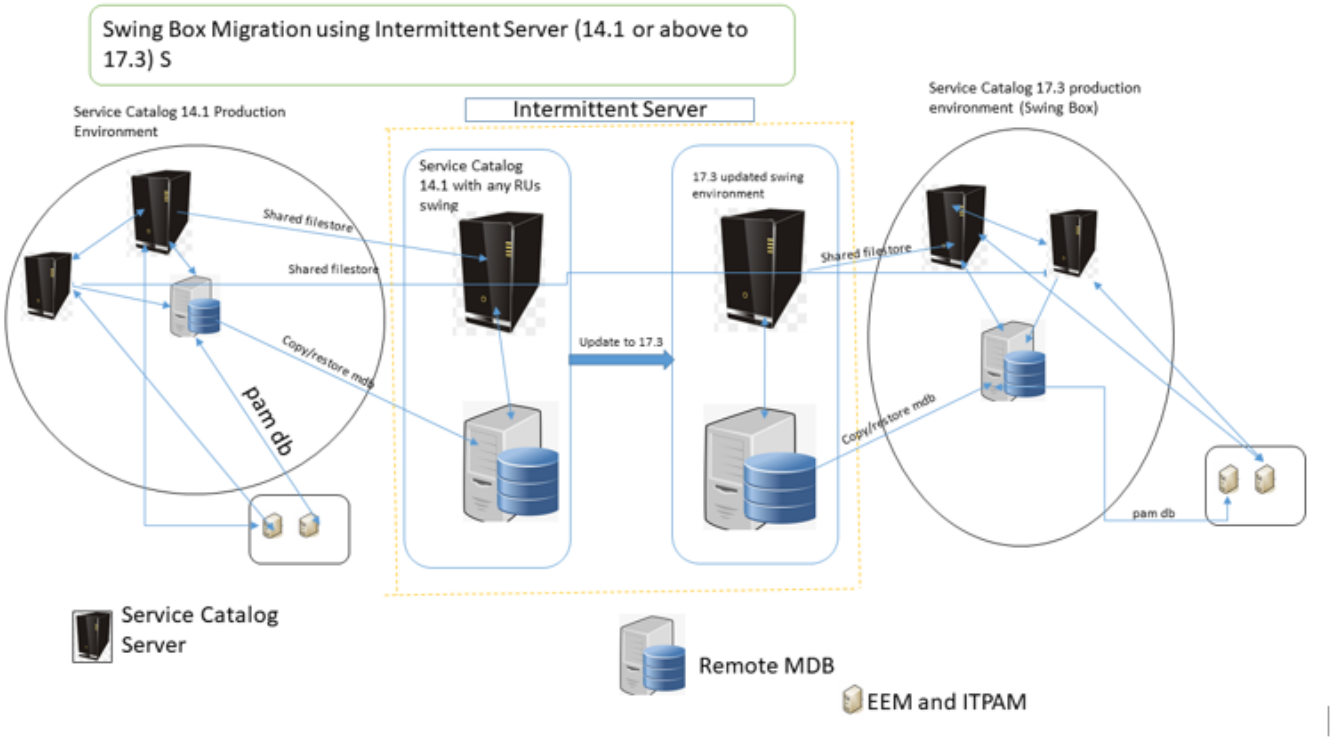
Review and Perform the following:

1. Prepare an Intermittent Server.
   For more information, see Recommended OS and Database Requirements and Server Nomenclature for Swing-Box Intermittent Server Migration.
2. Take a database and file customization backup of your production environment.
   For more information, see Step 1: Collect Files/Data from your Current Production System and Step 2: Prepare the Intermittent Server .
3. Upgrade to CA SLCM 17.4 on the Intermittent Server. For more information, see Step 3: Upgrade to CA SLCM 17.4 on the Intermittent Server.
4. Install a fresh or new instance of CA Service Catalog 17.4 server (a server that you have not upgraded before) on the target server (swing box) with the same configuration and deployment as your production server.
   For more information, see Install CA Service Catalog 17.4.
5. Take a database backup of your intermittent server and customizations from application or secondary servers of the production environment and restore it to the target servers.
   – For more information, see Step 4: Move Upgraded Intermittent Server Install to a Swing-Box (Target) 17.4 .
   – For CA EEM, see CA EEM Policies Backup and Restore on CA Service Catalog server.

Server Nomenclature for Swing-Box Production Replica Method and Process Flow Diagram

The below example server names are used to describe the swing-box production replica method to upgrade CA Service Catalog 17.1/17.2/17.3 or above to CA Service Catalog 17.4 or above release versions.

Production Server	Intermittent Server	Target Server
CA Service Catalog 17.1/17.2/17.3 or above	CA Service Catalog: 17.1/17.2/17.3 Intermittent server	CA Service Catalog 17.4
testqa-mdb	CA Service Catalog 17.1/17.2/17.3 or above testqa-mdb-inter	CA Service Catalog 17.4 testqa-mdb-new
testqa-catalog 1	testqa-app-int er	testqa-catalog1-new
testqa-catalog 2		testqa-catalog2-new



Step 1: Collect Files/Data from your Current Production System

Perform the following steps to collect files or data from your production system:

1. Take a SQL Backup of MDB from the current production database server (**testqa-mdb**) and save it as **.bak** file (usually a normal SQL backup).
2. Make a copy of the shared filestore directory of the (**testqa-catalog1**) and (**testqa-catalog2**) based on the current production deployment model.
   It's recommended that you compile this into a Zip format.

   NOTE
   If you have a shared filestore, you are required to copy from the shared filestore location. This is required to avoid multiple overlap of common files.

   NOTE
   Make a copy of the "<usm_home>\filestore\custom" directory files from **testqa-catalog1** if you have single catalog server.
3. Copy the above files from Step 1, Step 2 (only files copied from **testqa-catalog1**) to your intermittent app server (**testqa-app-inter**) to a standby directory and do not place the files in their respective locations for now.

Step 2: Prepare the Intermittent Server

Perform the following steps:

NOTE
For reference purposes, in this section we will refer to the database server as "**testqa-mdb-inter**" and the Service Catalog application server as "**testqa-app-inter**".

1. It is assumed that you have already installed Microsoft SQL server on **testqa-mdb-inter**.
2. On **testqa-app-inter** server, ensure to install the SQL client and native client (workstation tools).

3. Install the same release version of production server CA Service Catalog on **testqa-app-inter**and run configuration so that you have a basic installation of CA Service Catalog running in your environment (without customizations).
4. As database administrator, execute the Microsoft SQL Restore and restore the MDB from your current production that you have backed up, to the**testqa-mdb-inter** server.
5. As database administrator, execute the Microsoft SQL Restore command and restore the MDB from your current production (**testqa-mdb**) that you have backed up on the **testqa-mdb-inter** server.

   NOTE
   Ensure to set the option to **OVERWRITE** the entire database when restoring.

   – Here, source mdb server will be referred as **testqa-mdb** and target mdb server is **testqa-mdb-inter**. For more information, see Server Nomenclature for Swing-Box Production Replica Method.
   – Also, follow the instructions in Moving the CA MDB Database on Microsoft SQL Server based on your database type (MS SQL or Oracle).

   NOTE
   Additionally, ensure that the below **step 6 - step 9** are performed appropriately in your environment.
6. After you have completed the Microsoft SQL Server restore process on the target mdb (**testqa-mdb-inter**) server, execute the stored procedure in SQL to fix the orphaned users which are created when restoring a database from one Microsoft SQL Server instance to another.
   For Example:
   ```
   sp_change_users_login 'AUTO_FIX','mdbadmin'
   ```
7. Copy shared filestore directory files from the production server (**testqa-catalog1**/**testqa-catalog2**) to the swing box server.

   NOTE
   The below steps are applicable only if your production environment is customized. This is not applicable for the out-of-the-box (OOTB) content.
8. If you have a shared filestore, copy from a shared filestore location. This is recommended to avoid multiple overlap of common files.
9. Make a copy of the “Program Files\CA\Service Catalog\filestore\custom" directory files from the **testqa-catalog1** if you have a single catalog server.
10. Ensure that you are taking a backup of filestore\custom directory files on the swing box (production replica).
    You are required to rebuild your form customizations using CA Service Catalog 17.1/17.2/17.3 or above form packaged with the CA Service Management installer as the earlier customized CA Service Catalog forms will not work. Once you have completed the rebuilding of your customizations, take a backup of your filestore/custom directory files on the swing box/production Replica.
11. Start the CA Service Catalog services.
12. Verify and test the functionality to ensure that CA Service Catalog is up and running with customizations seamlessly as a full replica of your production environment.

Step 3: Upgrade to CA Service Catalog 17.4 on the Intermittent Server

Test the migration to become familiar with the processes and issues that you may encounter while migrating your production system.

Ensure that you have considered the following:

- If your Intermittent Server is on a VMware environment, it is recommended that you take a snapshot. You can roll back to that snapshot when you have a down time of your production system for maintenance or other purposes.
- Perform a Microsoft SQL Server backup on the production system. Restore it to the Intermittent Server and complete the below steps mentioned in this section.
  In case, if the migration to CA Service Catalog 17.4 fails, you can revert to the CA Service Catalog production system and start the services.
- Retest migration on the intermittent server again and schedule the migration for another time.

Perform the following steps to upgrade to CA Service Catalog 17.4 on the Intermittent Server:

1. Mount the CA Service Catalog 17.4 install media and then, run the **setup.exe**, run as **Administrator** from the local folder where you have copied the CA Service Catalog installer.
   a. If you are extracting an ISO of the install media, it must be stored in a path and the folder must have no spaces in the folder name, for example: catalog174Setup.

      NOTE

      Download the CA Service Management installer 17.4 from Broadcom Support.

      - **CA SERVICE MANAGEMENT SDM PACKAGE 17.4 FOR WINDOWS (WITH CATALOG).iso**
      - **CA SERVICE CATALOG 17.4.iso**
      - **CA SERVICE MANAGEMENT APM PACKAGE 17.4 FOR WINDOWS (WITH CATALOG).iso**

   b. Run locally from the same drive volume where you plan to install CA Service Catalog 17.4.

      NOTE
      Do not run the installer from a network drive or mounted share as this has been known to cause install issues and failures.
2. Launch the CA Service Management 17.4 installer.
3. Select a language of your choice and click **Next**.
   For example, select **English**
   .
4. Select **CA Service Management**.
5. Follow the installation wizard to complete the installation process.
   This may take some time to complete depending upon the size of the CA Service Catalog database that you are upgrading/migrating.

CA EEM Policies Backup and Restore on CA Service Catalog server

Perform the following steps to backup CA EEM data on CA Service Catalog server (**testqa-catalog1**):

1. Open the CA Service Catalog command prompt. Click **Start**, **Programs**, **CA**, and **Service Catalog**, **usm Command Prompt** (% usm_home% \usm.cmd) from where you have installed Catalog 17.1/17.2/17.3 and above.
   Example: **testqa-catalog1**
   a. Run the following command:
      ```
      ant backup-eem-app
      ```
   b. During execution, provide input parameters like EEM password and so on.
   c. After successful completion, "**eem-backup.xml**" file is generated in the *%USM_HOME%* directory.

      NOTE
      If you have multiple CA Service Catalog computers, perform this step on the first CA Service Catalog computer. Run this command once, regardless of the number of CA Service Catalog servers in your environment.
2. Perform the following steps to restore CA EEM on the target Catalog server (**testqa-app-inter**):
   a. Copy the file (**eem-backup.xml**) from **testqa-catalog1**to the **testqa-app-inter** in the *%USM_HOME%* folder.
   b. Run the following command:
      ```
      ant restore-eem-app
      ```
   c. After successful completion related entries are updated in the EEM.
   d. Restart CA Service Catalog services.
3. At this point, if you are doing a test run on the intermittent server, you must rebuild your customizations using CA Service Catalog 17.4 packaged with the installer as the earlier CA Service Catalog 17.1/17.2/17.3 or above customizations will not work.
4. Once you have completed the rebuilding of your customizations, take a backup of your shared filestore directory on the Intermittent Server and store it somewhere outside of this environment for later use.

5. Test the migrated and customized CA Service Catalog 17.4 Intermittent Server for integration and functionality.
6. After successful completion, start the process of moving your migrated data and customizations to a target or swing box 17.4 environment.

Step 4: Move Upgraded Intermittent Server Install to a Swing-Box (Target) 17.4

Your swing-box (target) environment must already be up and running with a clean or fresh installation of CA Service Catalog 17.4 same as your production deployment model.

CA EEM Policies Backup and Restore on CA Service Catalog server

Perform the following steps to backup CA EEM data on the source Catalog server (**testqa-app-inter**):

1. Open the CA Service Catalog command prompt. Click**Start**, **Programs**, **CA**, **Service Catalog**, usm Command Prompt (*%usm_home%\usm.cmd*) from the Catalog 17.1/17.2/17.3 or above installed source server:
   Example: **testqa-catalog1**
2. Run the following command:
   ```
   ant backup-eem-app
   ```
   NOTE
   During execution, provide input parameters like EEM password and so on. After successful completion, "**eem-backup.xml**" file is generated in the %USM_HOME% directory.
   NOTE
   If you have multiple CA Service Catalog computers, perform this step on the first CA Service Catalog computer. Run this command once, regardless of the number of CA Service Catalog servers in your environment.
3. Perform the following steps to restore CA EEM on the target Catalog server (t**estqa-catalog1-new**):
   a. Copy the file (eem-backup.xml) from **testqa-app-inter**to the **testqa-catalog1-new**in the %USM_HOME% folder.
   b. Run the following command:
      ```
      ant restore-eem-app
      ```
   c. After successful completion related entries are updated in CA EEM.
   d. Restart CA Service Catalog services.
4. Perform a Microsoft SQL Server backup on the intermittent server (**testqa-mdb-inter**) and have your database administrator perform a Microsoft SQL Server Restore onto the SQL database instance on your Swing-box or target server (**testqa-mdb-new**).
   NOTE
   Ensure to set the option to **OVERWRITE** the entire database when restoring.
5. Here, source mdb server will be referred as **testqa-mdb-inter** and target mdb server is **testqa-mdb-new**. For more information, see Server Nomenclature.
6. Also, follow the instructions in Move the CA MDB Data from the Source to the Target Systems based on your database type (MS SQL or Oracle).
   NOTE
   Additionally, ensure that the below step 6 - step 9 are performed appropriately in your environment.
7. After you have completed the Microsoft SQL Server restore process on the target mdb (**testqa-mdb-inter**) server, execute the stored procedure in SQL to fix the orphaned users which are created when restoring a database from one Microsoft SQL Server instance to another.
   For example:
   ```
   sp_change_users_login 'AUTO_FIX','mdbadmin'
   ```
8. Copy the shared filestore directory files from the production server (**testqa-catalog1**/**testqa-catalog2**) to the swing box server.

If you have a shared filestore, copy from a shared filestore location. This is recommended to avoid multiple overlap of common files.

NOTE
The below steps are applicable only if your production environment is customized. This is not applicable for the out-of-the-box (OOTB) content.

9. Make a copy of the "*Program Files**CA**Service Catalog**filestore**custom*" directory files from the **testqa-catalog1** if you have a single catalog server.
10. Ensure that you are taking a backup of filestore\custom directory files on the swing box (production replica).
    You are required to rebuild your form customizations using CA Service Catalog 17.4 form packaged with the CA Service Management installer as the earlier customized CA Service Catalog forms will not work. Once you have completed the rebuilding of your customizations, take a backup of your filestore/custom directory files on the swing box/production Replica.
11. Start the CA Service Catalog services.
12. Test the system functionality to ensure the swing-box or target environment with CA Service Catalog 17.4 is up and running with data and customizations intact.

Troubleshooting- Swing-Box Migration Issues

This article describes the following Swing-Box Migration issues and how to troubleshoot:

Unable to Submit Catalog Request from Service Point
Problem: Unable to submit CA Service Catalog request from service point as a result getting a below error message on Chrome browser Version V80 + only.
For more information, see Chrome Browser issues in Service Point.
Solution: Enable the following flags to disable this constraint:

- SameSite by default cookies
- Cookies without SameSite must be secure

Perform the following to disable Chrome flags:

1. Open Chrome browser.
2. Enter Chrome://flags.
3. Search with above flags and disable.

Reconfigure CA EEM
If you are using CA EEM for authentication on your CA SDM environment, and if the configured CA EEM is not accessible from CA SDM or if you want to configure a new CA EEM server, perform the following steps:

1. Edit the NX.env file and set **USE_EIAM_FOR_AUTH=No**.
2. Restart the CA Service Desk Manager services.
3. Login to CA Service Desk Manager as an administrator.
4. Navigate to Options Manager, and reconfigure all CA EEM options to point to the appropriate CA EEM server, along with proper credentials and configurations for that server.
5. Edit the NX.env file again to **USE_EIAM_FOR_AUTH=Yes**.
6. Restart CA Service Desk Manager Services again.

Use Case 1 - Swing-Box Migration to Upgrade CA Service Management 17.4

This article describes the Swing Box Migration use case scenario to upgrade to CA Service Management 17.4 and above. CA Service Management installation comprises CA Service Desk Manager and CA Service Catalog along with CA common components (CA EEM and CA Process Automation).

Perform the following:

- Upgrade from CA Service Management 17.1 (production) to CA Service Management 17.1 (Target)
- Upgrade to CA Service Management 17.3 update
- Update to CA Service Management 17.3.0.2
- Update to CA Service Management 17.4

> **NOTE**
> These steps are mentioned for a particular use case, and are not mandatory. You can upgrade from 17.1 to 17.4

Product Installation Sequence

Install the CA Service Management Solution products in the sequence shown below:

1. CA EEM Server

   > **NOTE**
   > Do not enable Active Directory on EEM Application. Enable Active Directory after installing CA Service Management 17.4.
2. CA Process Automation
3. CA Service Desk Manager
4. CA Service Catalog

Server Nomenclature

The following server/host names were used in-house for testing the procedures outlined in this article for installing, upgrading CA Service Management 17.1 to CA Service Management 17.3 to updating it to CA Service Management 17.3.0.2, and upgrade to CA Service Management 17.4.

Following server names are used for CA Service Catalog installation and upgrade scenarios wherever applicable for Production and Target servers.

- **mdb**: MDB database.
- **catalog1**: Catalog Production Server 1
- **catalog1-new**: Replica of Catalog Production Server 1
- **catalog 2**: Catalog Production Server 2
- **catalog2-new**: Replica of Catalog Production Server 2
- **new**: If server names are appended with new, they denote the target servers.

After installing CA Service Management 17.3, update it to CA Service Management 17.3.0.2, and upgrade to CA Service Management 17.4.

production System (CA Service Management 17.1)	**Target System (Swing Box move from production CA Service Management 17.1)**	**Upgrade Management 17.3.0.2, a**
Remote MDB: **testqa-mdb**	Remote MDB: **testqa-mdb-new**	Remote MDB: **testq**
CA EEM Server: **testqa-eem**	CA EEM Server: **testqa-eem-new**	CA EEM Server: **tes**
CA Process Automation: **testqa-pam**	CA Process Automation: **testqa-pam-new**	CA Process Automa
CA Service Desk Manager: **Advance Availability**		
Background Server (BG Server): **testqa-bg**	Background Server: **testqa-bg-new**	Background Server:
Standby Server: **testqa-sb**	Standby Server: **testqa-sb-new**	Standby Server: **tes**

Application Server 1: **testqa-app1** Application Server 2: **testqa-app1**	Application Server 1: **testqa-app1-new** Application Server 2: **testqa-app1-new**	Application Server 1 Application Server 2
CA Service Catalog Server: **testqa-sc**	CA Service Catalog Server: **testqa-sc-new**	Application Server 3 CA Search Server: **t** Virtual Analyst (RAS CA Service Catalog

NOTE
Assumption is that the production system is already installed with CA Service Management 17.1 in your environment. The below procedures are for replicating the production system to the target system using the Swing Box mechanism to CA Service Management 17.3, then update it to CA Service Management 17.3.0.2, and upgrade to CA Service Management 17.4.

Perform the following:

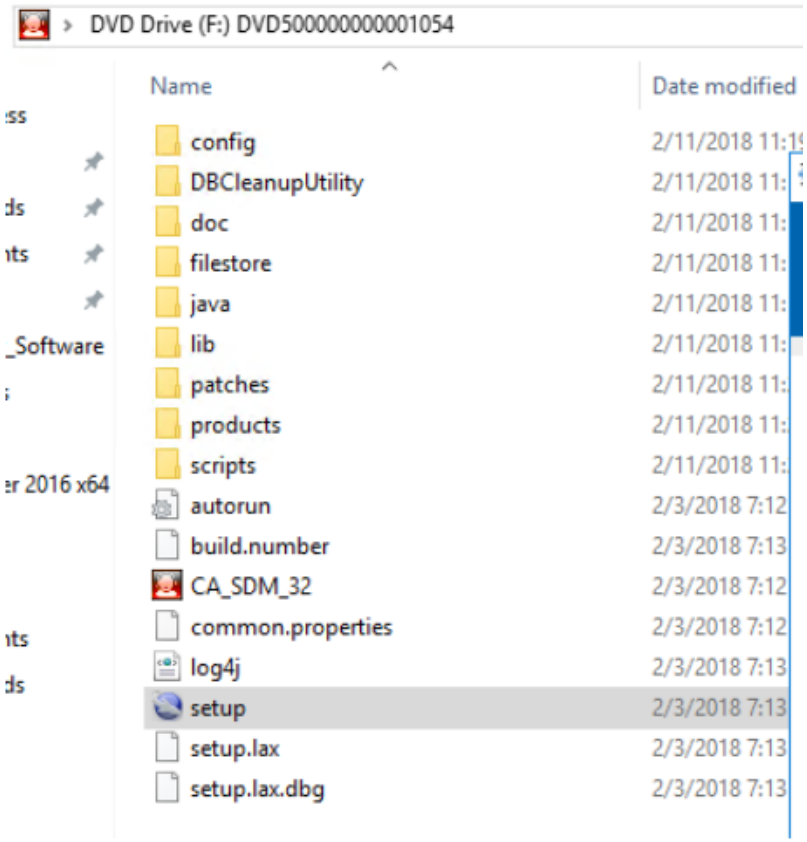
- Install CA EEM (testqa-eem-new)
- Install CA Process Automation 4.3.0.5 (testqa-pam-new)
- Install CA Service Management 17.1
- CA Service Management Solution Integration
- Upgrade CA Service Management 17.1 to CA Service Management 17.4
- Troubleshooting

Install CA EEM (testqa-eem-new)

WARNING
Do not enable Active Directory on CA EEM server (testqa-eem-new) for a successful install experience. After installing CA Service Management 17.3.0.2, enable Active Directory in your environment.

Perform the following steps:

1. Download CA Service Management Installer 17.1 from Broadcom Support.
2. Mount CA Service Management 17.1. DVD on **testqa-eem-new**.
3. Select **Setup.exe**, right-click Run as **Administrator**.
4. Select a language of your choice. For example: English
   Click **Next**.
5. Click CA Embedded Entitlements Manager (CA EEM) to run the CA EEM installation wizard.
6. CA EEM installation process begins.
7. Click **OK**.
8. Click **Next**.
9. Review and accept the License Agreement.
10. Enter the path of Shared Components and CA Directory.
11. Click **Next**.
12. Click **Next**.
    Provide the CA Directory Information (Port/DB size).
13. Enter Password and Confirm Password in the "EiamAdmin Password" Screen.
14. Click **Next**. Enter the EiamAdmin Password
15. Click **Next**. Enable FIPS information, if required.



16. Click **Install**.
    CA EEM Installation Process begins.
17. Click **Done** after successful installation.
18. Open and launch the CA EEM URL *https://<hostname>:<portnumber>/spin/eiam> For example: https://testqa-eem-new:5250/spin/eiam.*
19. Enter User Name and Password in the EEM login page.
20. Click Log In to login to CA EEM.
    CA EEM Home page is displayed.

This completes the CA EEM Installation process.

Install CA Process Automation 4.3.0.5 (testqa-pam-new)

This articles describes the CA Process Automation Installation process.

Prerequisites
Review the following supported JDK versions for CA Process Automation:

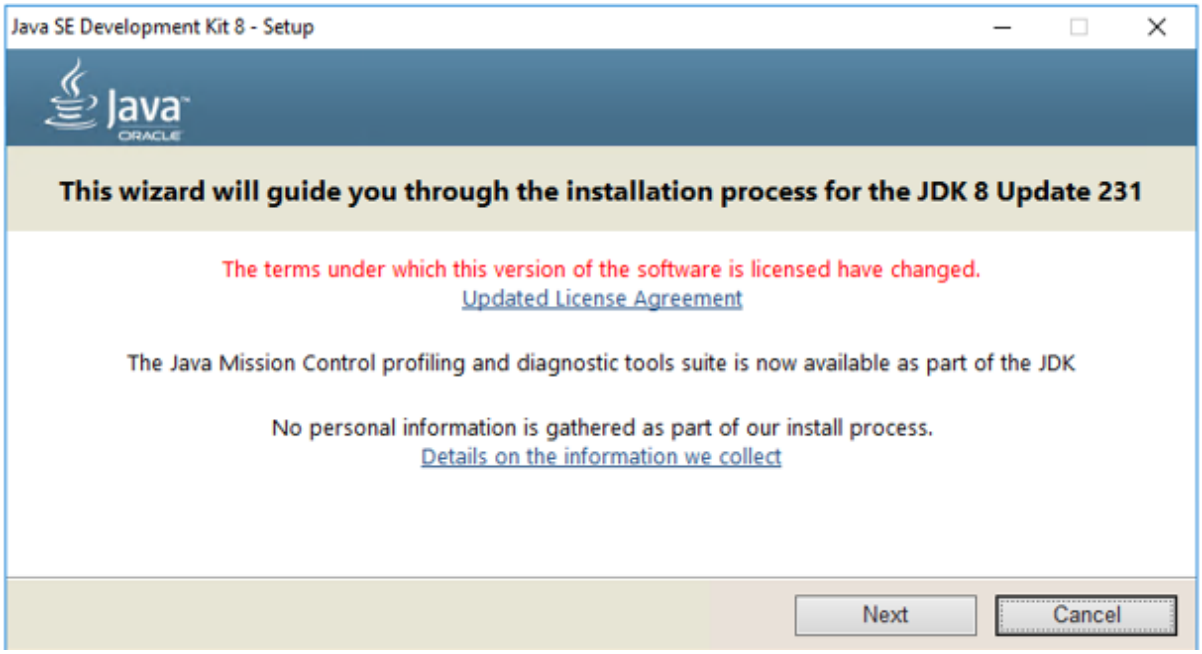
- Oracle Java Development Kit (JDK) 1.8.162 and above OR
- One of the following JDK requirements:
  - AdoptOpenJDK HotSpot jdk8u222-b10
  - AdoptOpenJDK OpenJ9 jdk8u222-b10_openj9-0.15.1 along with AdoptOpenJDK icedtea-web-1.8.3

For more information, see JDK Prerequisites.

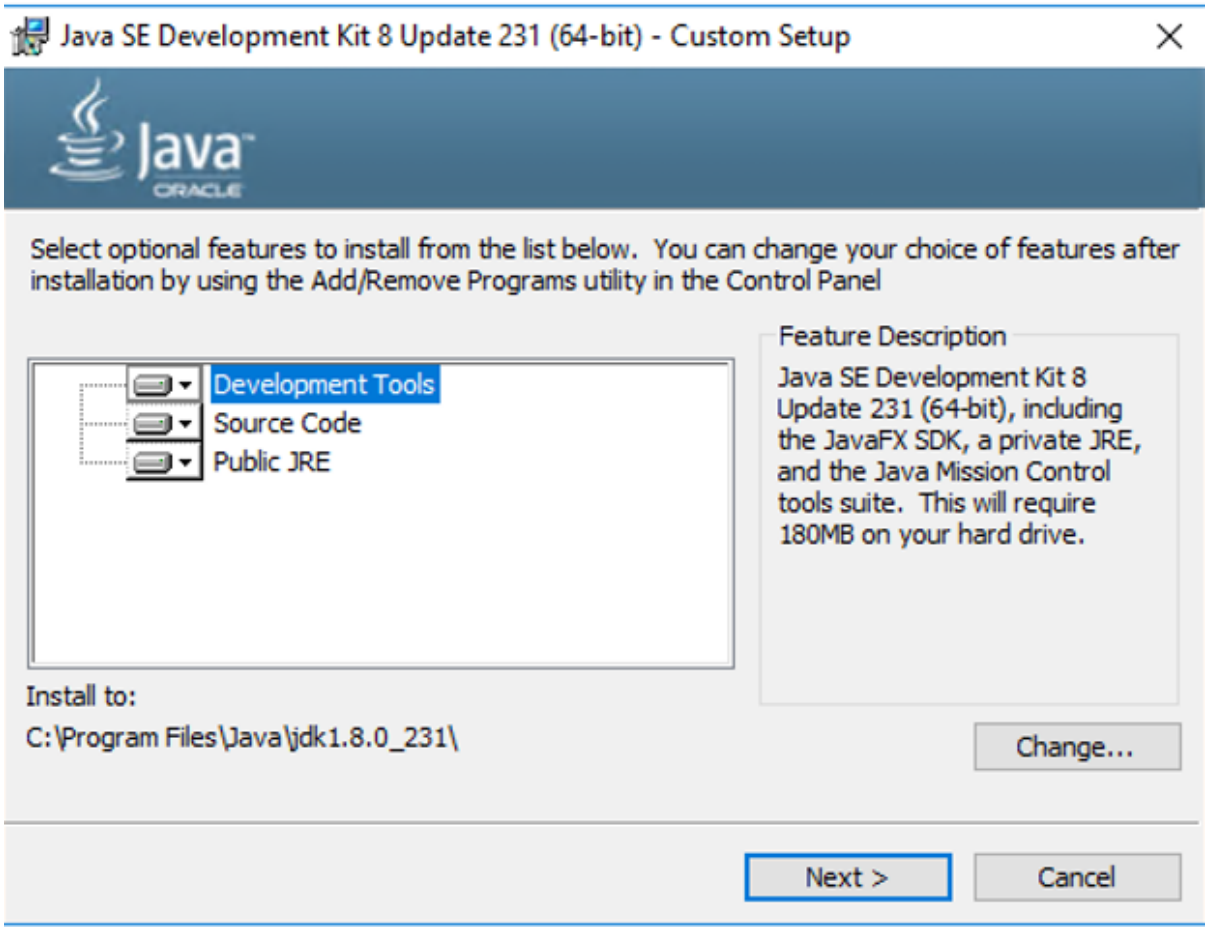
To install CA Process Automation Workflow, perform the following steps. For example: **testqa-pam-new**.

Install JDK

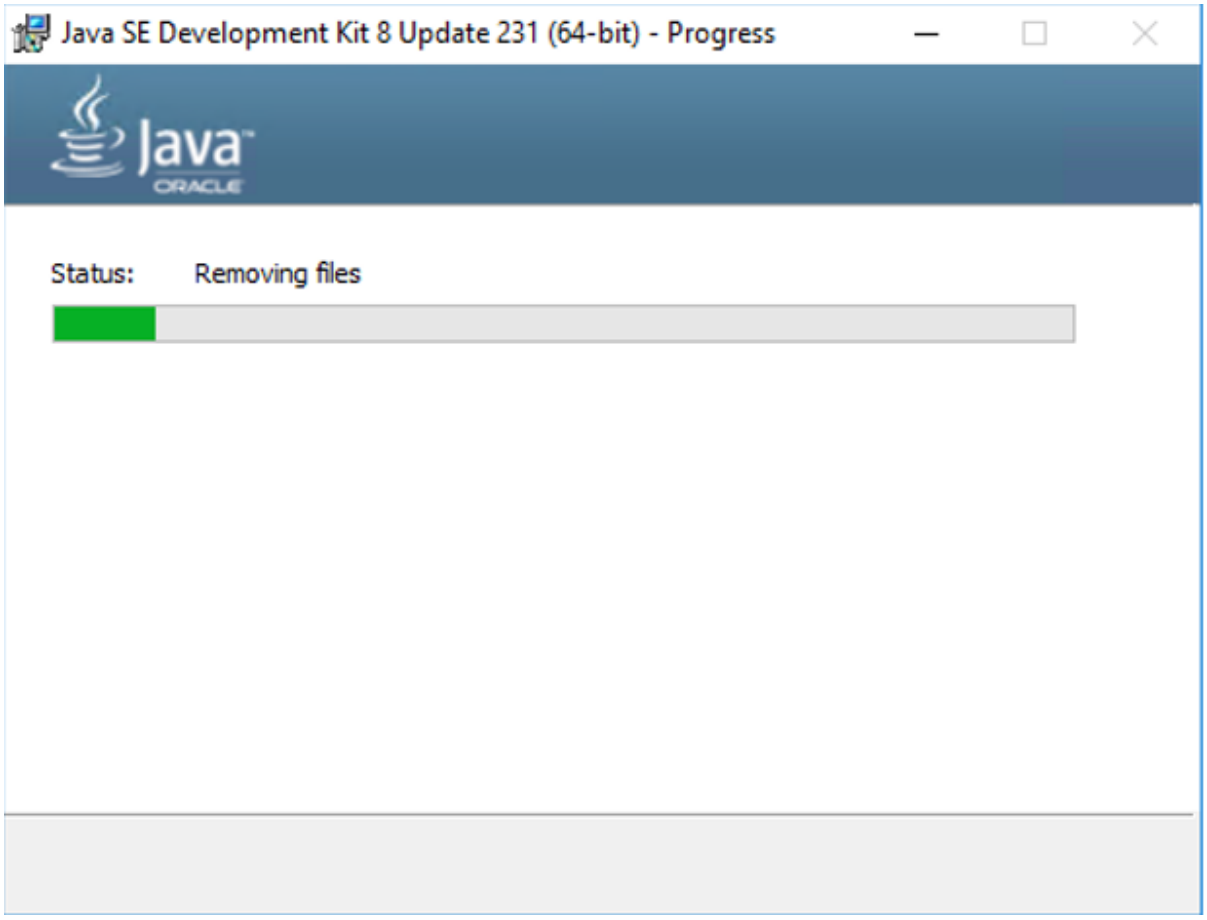
1. Download JDK. Click **setup.exe** and right click to select "**Run as Administrator**" option.
   Click **Next**.



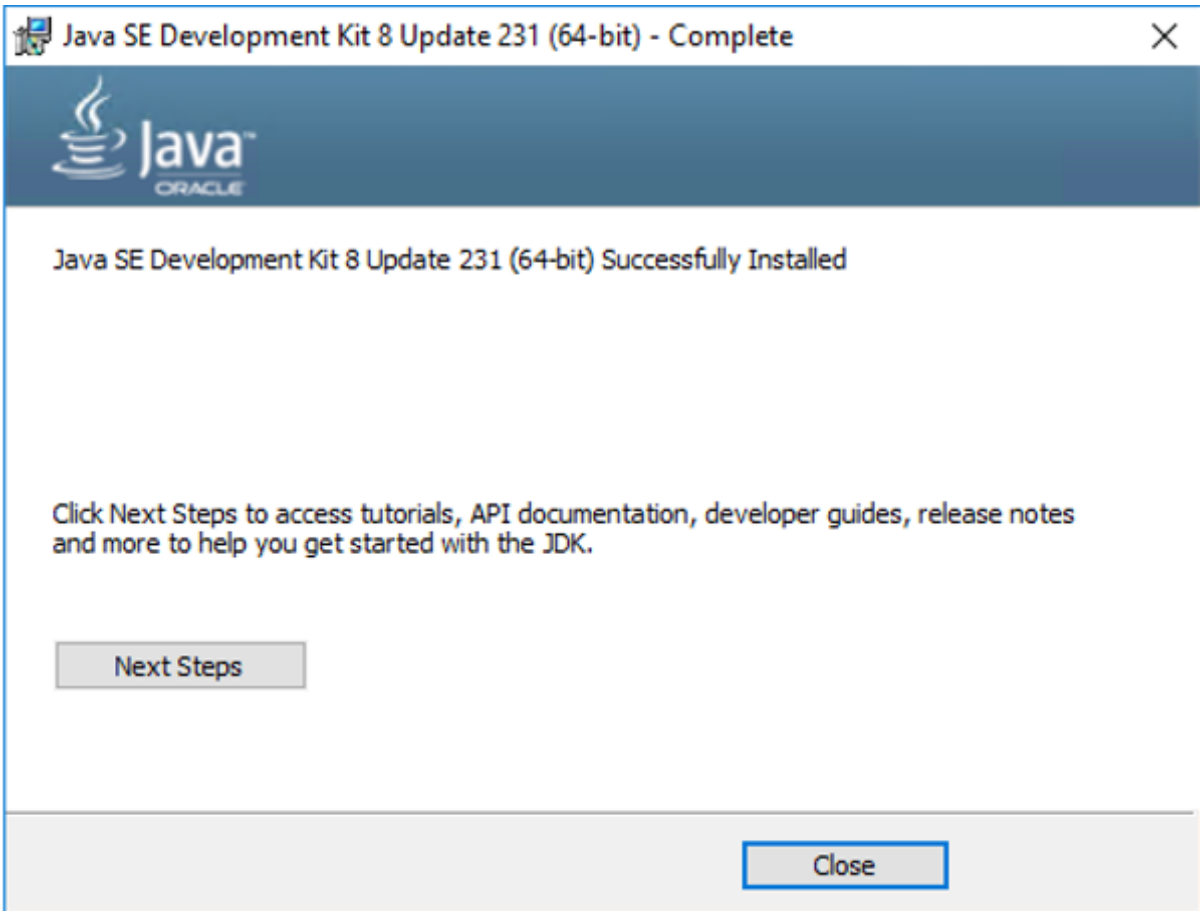
2. Click **Next**.



Java SE Development Kit 8 Update 231 (64-bit) - Custom Setup
Java
ORACLE
Select optional features to install from the list below. You can change your choice of features after installation by using the Add/Remove Programs utility in the Control Panel
Development Tools
Source Code
Public JRE
Feature Description
Java SE Development Kit 8 Update 231 (64-bit), including the JavaFX SDK, a private JRE, and the Java Mission Control tools suite. This will require 180MB on your hard drive.
Install to:
C:\Program Files\Java\jdk1.8.0_231\
Change...
Next >
Cancel



3. Follow the installation Wizard.

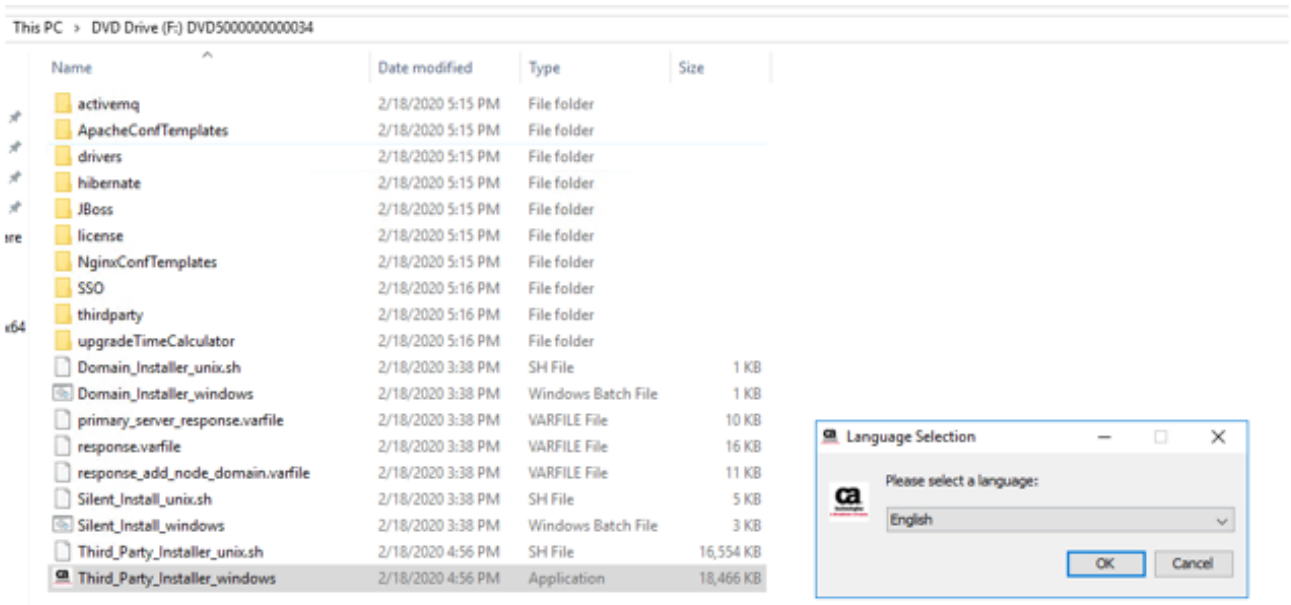


4. Click Close once the installation is successful.

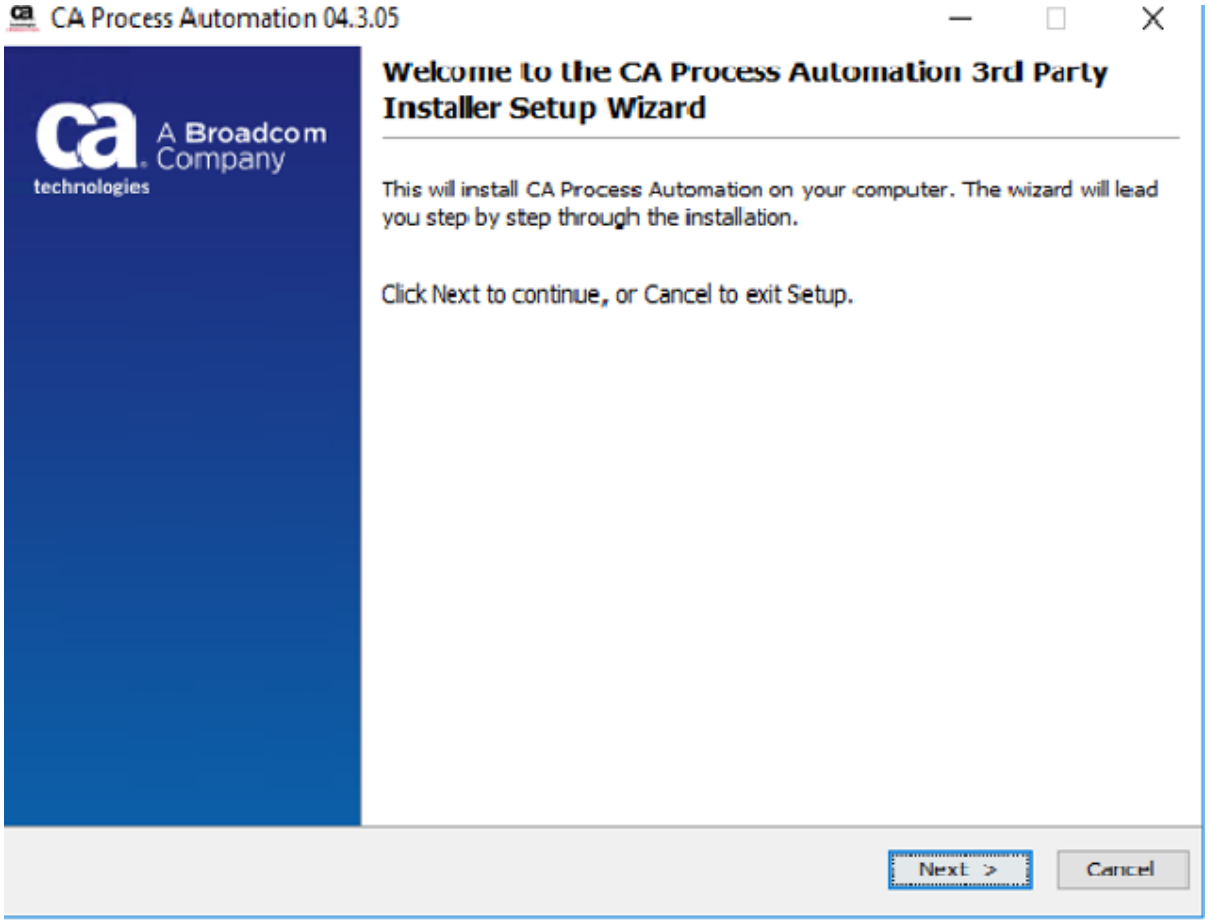
Install CA Process Automation

Perform the following steps:

1. Mount the CA Process Automation **DVD (DVD500000000003410)**on **testqa-pam-new** and Select "**Third_Party_Installer_Installer_windows**" and right-click to select "**Run as Administrator**".

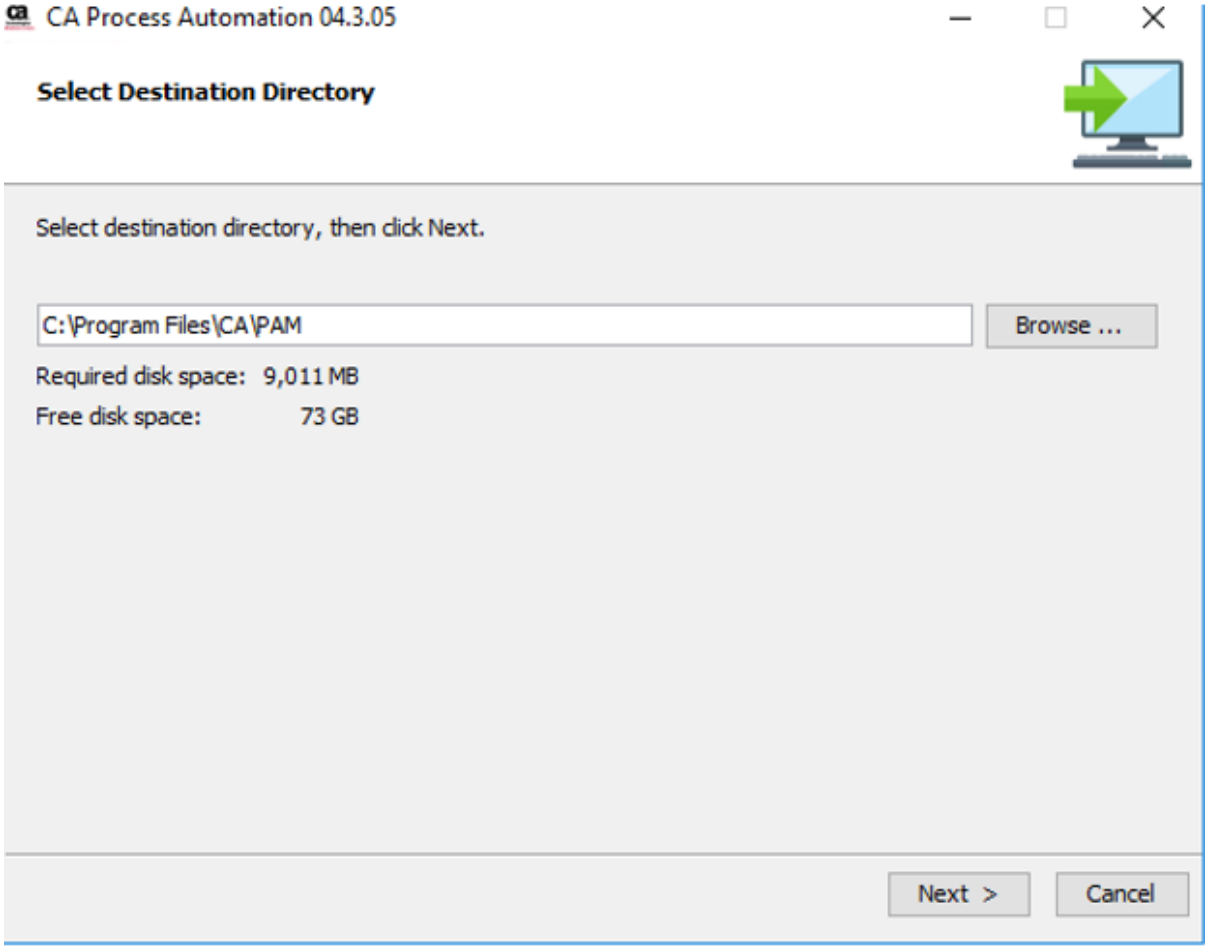


2. Click OK.
3. Click Next.

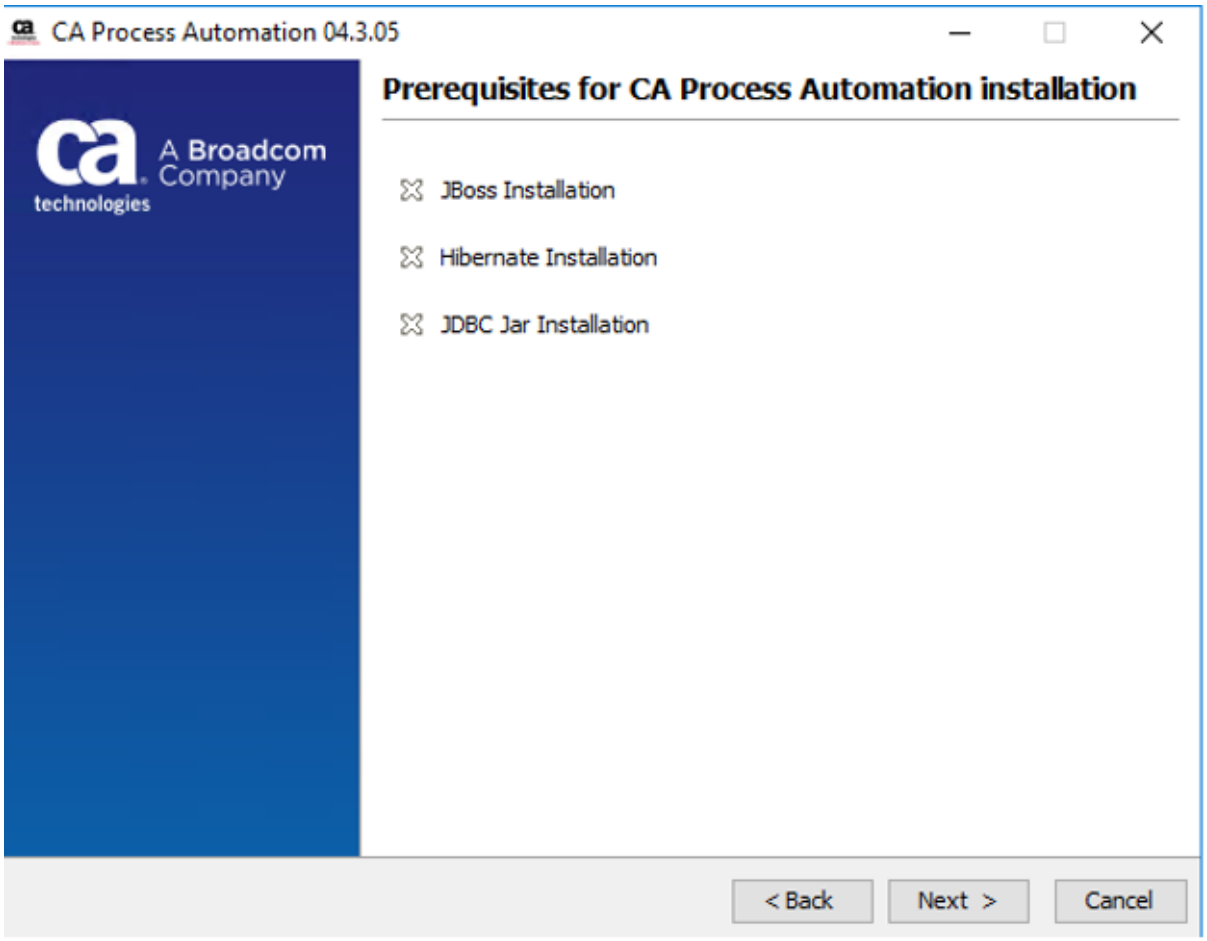


4. Review and accept the license agreement.

5. Click **Next** and enter the installation path by selecting the destination directory.



6. Click **Next**. Provide the **JDBC**jar location path.
7. Click **Next**.
   The Installation process begins.
8. Verify that you completed the prerequisites shown below.



CA Process Automation 04.3.05
A Broadcom Company

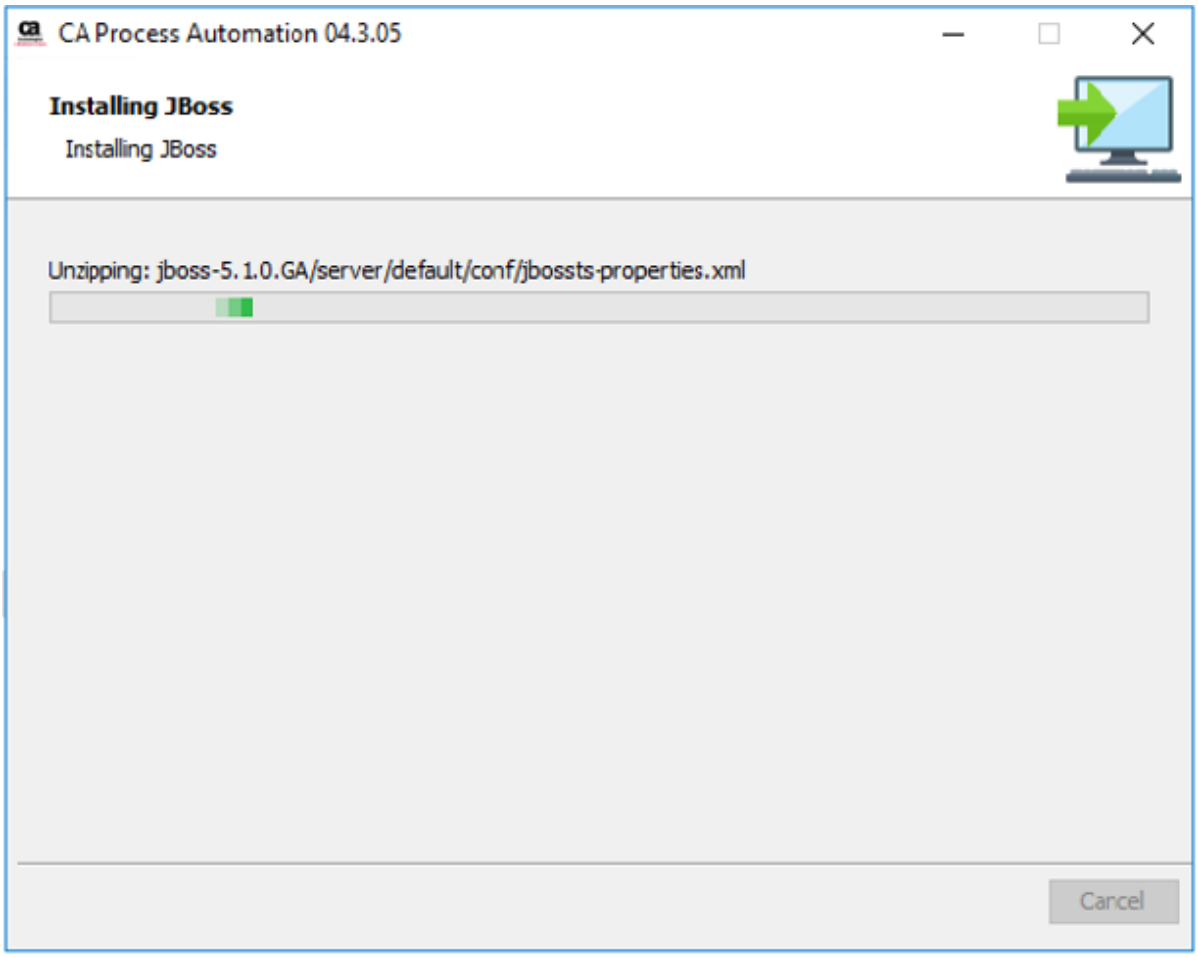
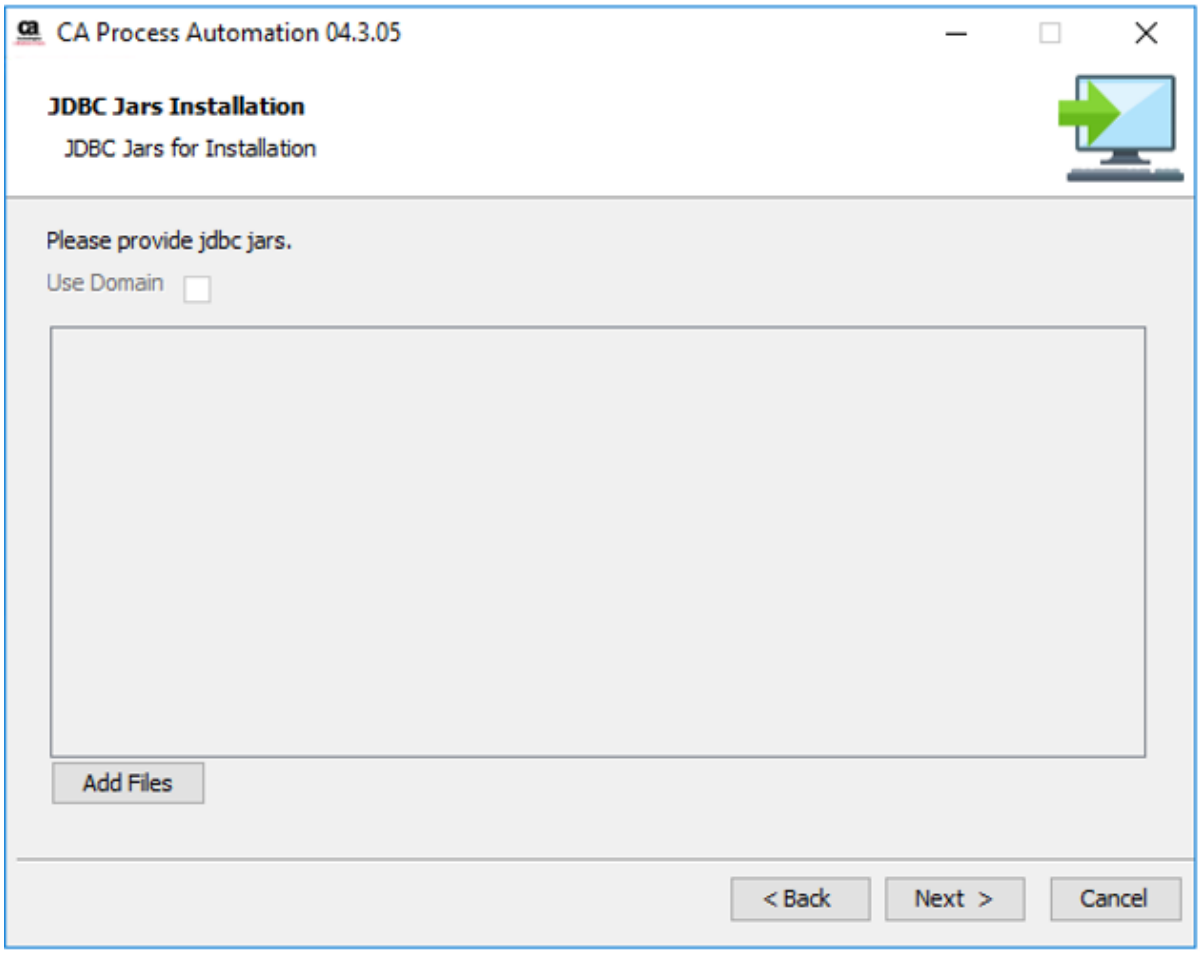
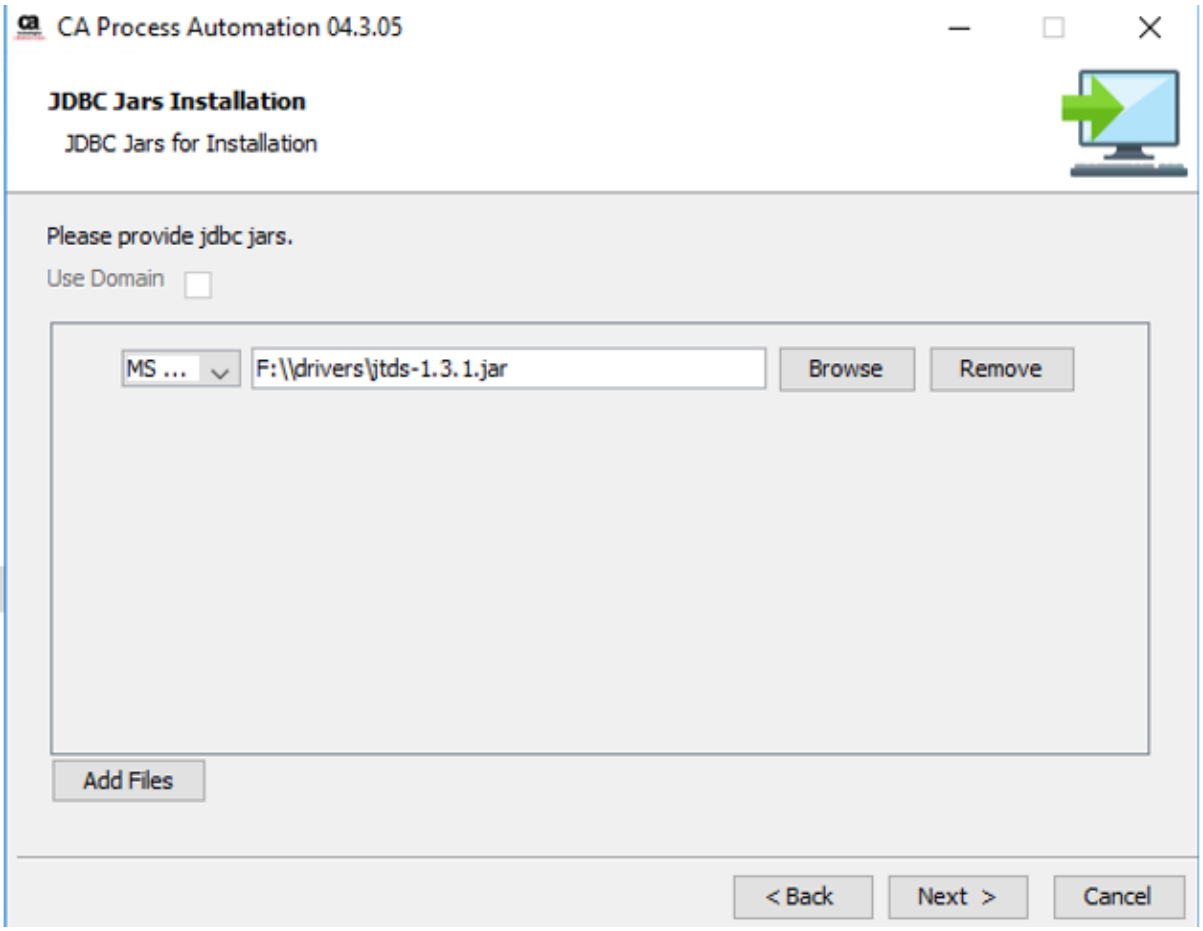
Prerequisites for CA Process Automation installation
JBoss Installation
Hibernate Installation
JDBC Jar Installation
< Back
Next >
Cancel



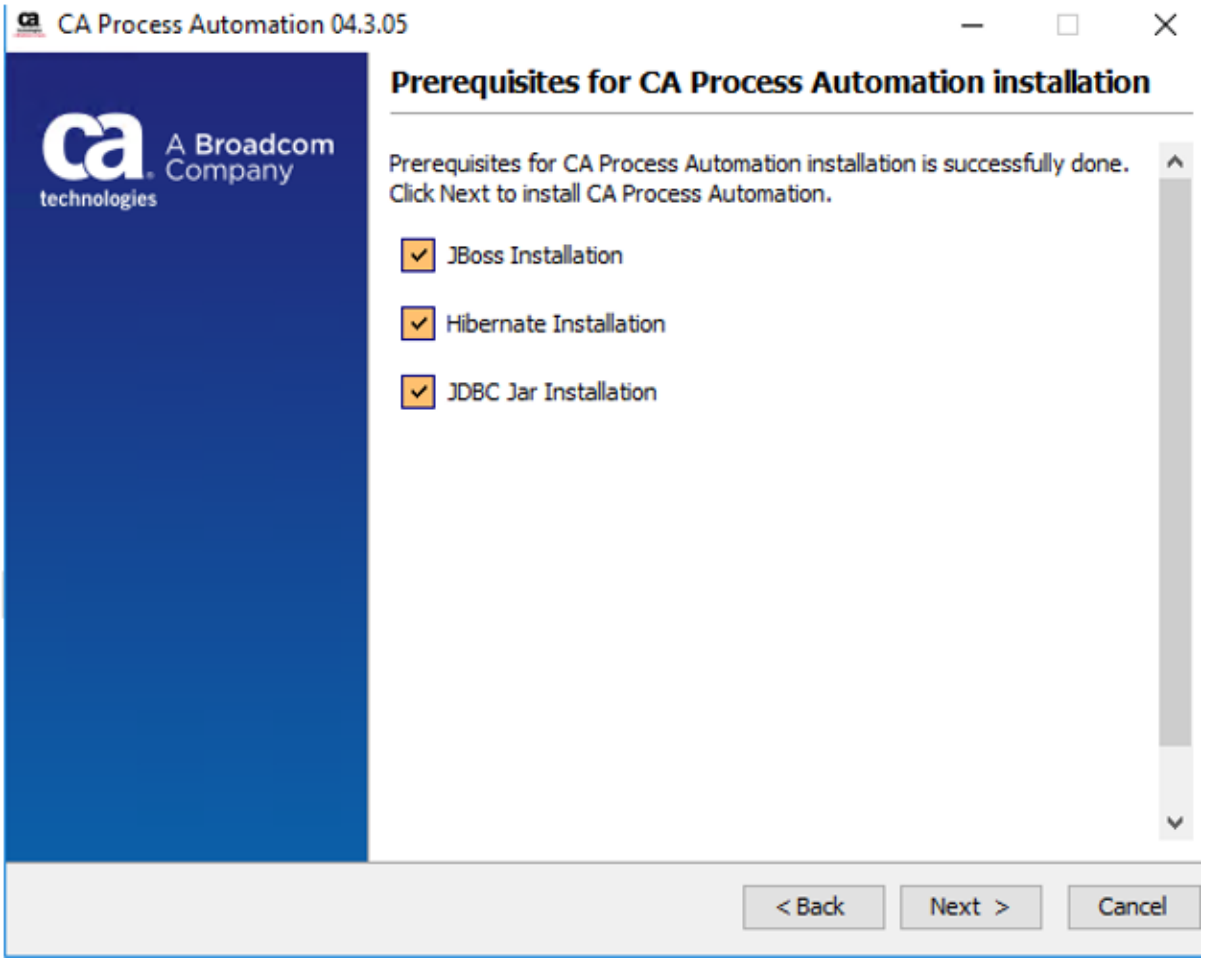
9. Click "**Add Files**" and Select the Microsoft SQL Server.



10. Click **Next**. Provide the JDBC jar location path.



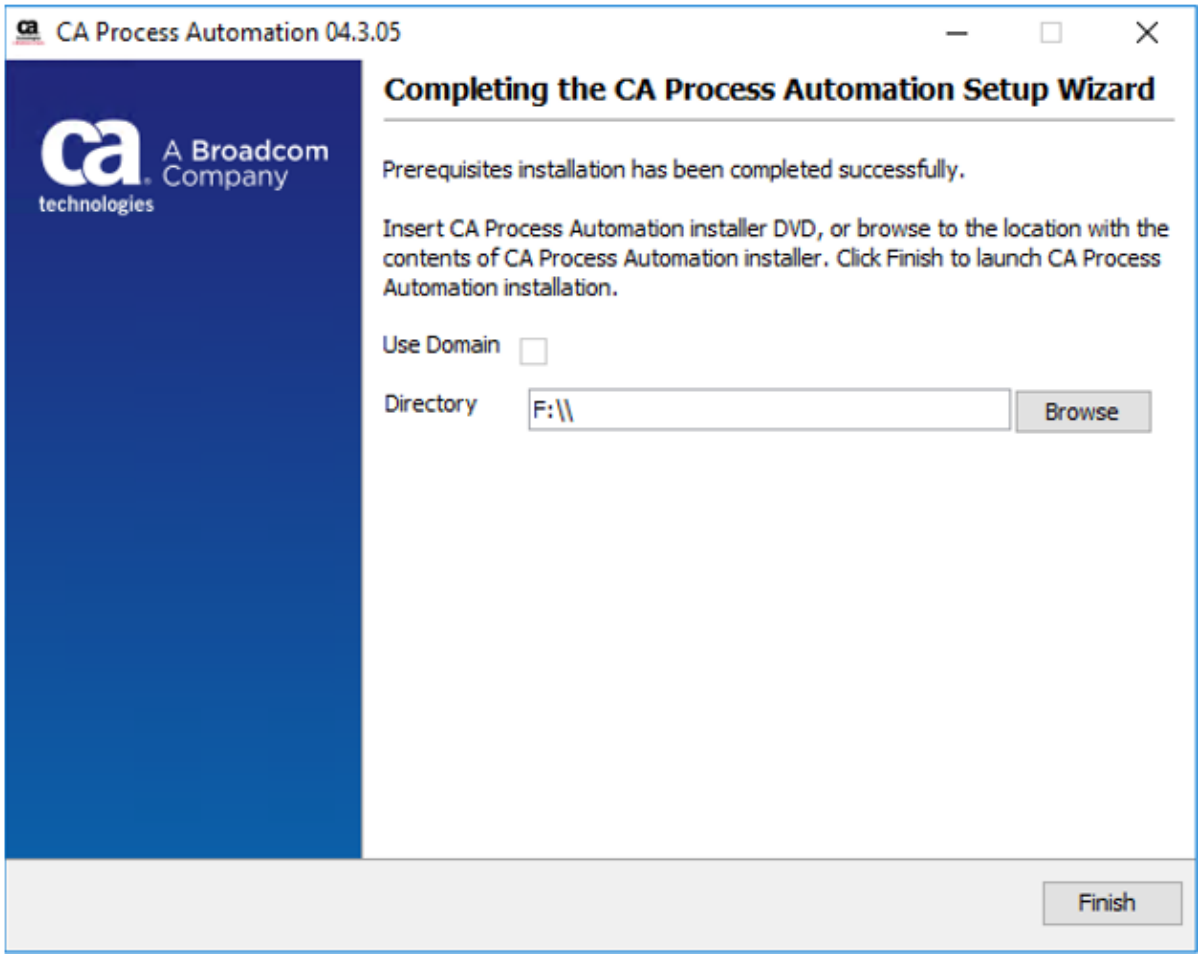
11. Click **Next**.
12. Review the installation prerequisites and proceed if these components are installed in your environment.



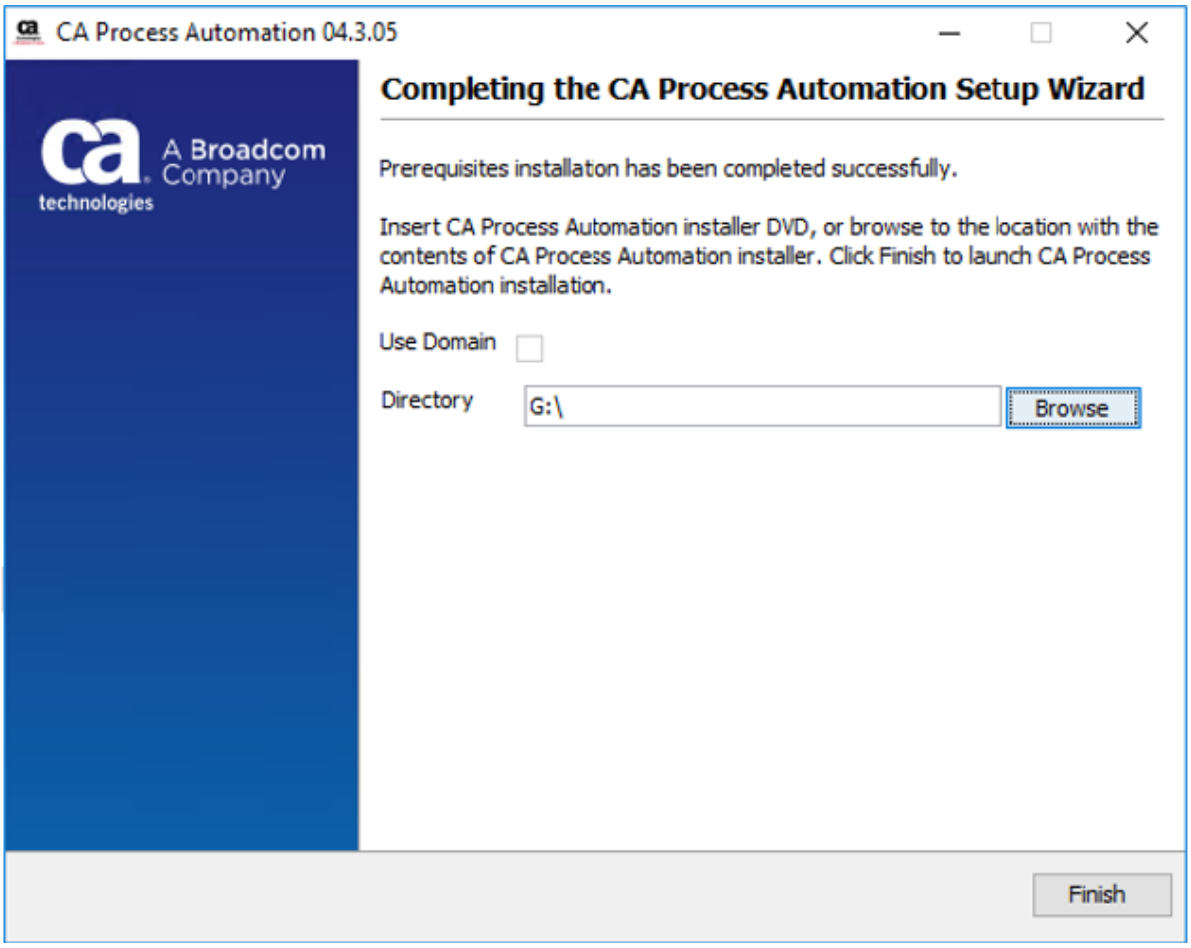
13. Mount the CA Process Automation second **DVD (DVD500000000003420)** on **testqa-pam-new**.

    NOTE

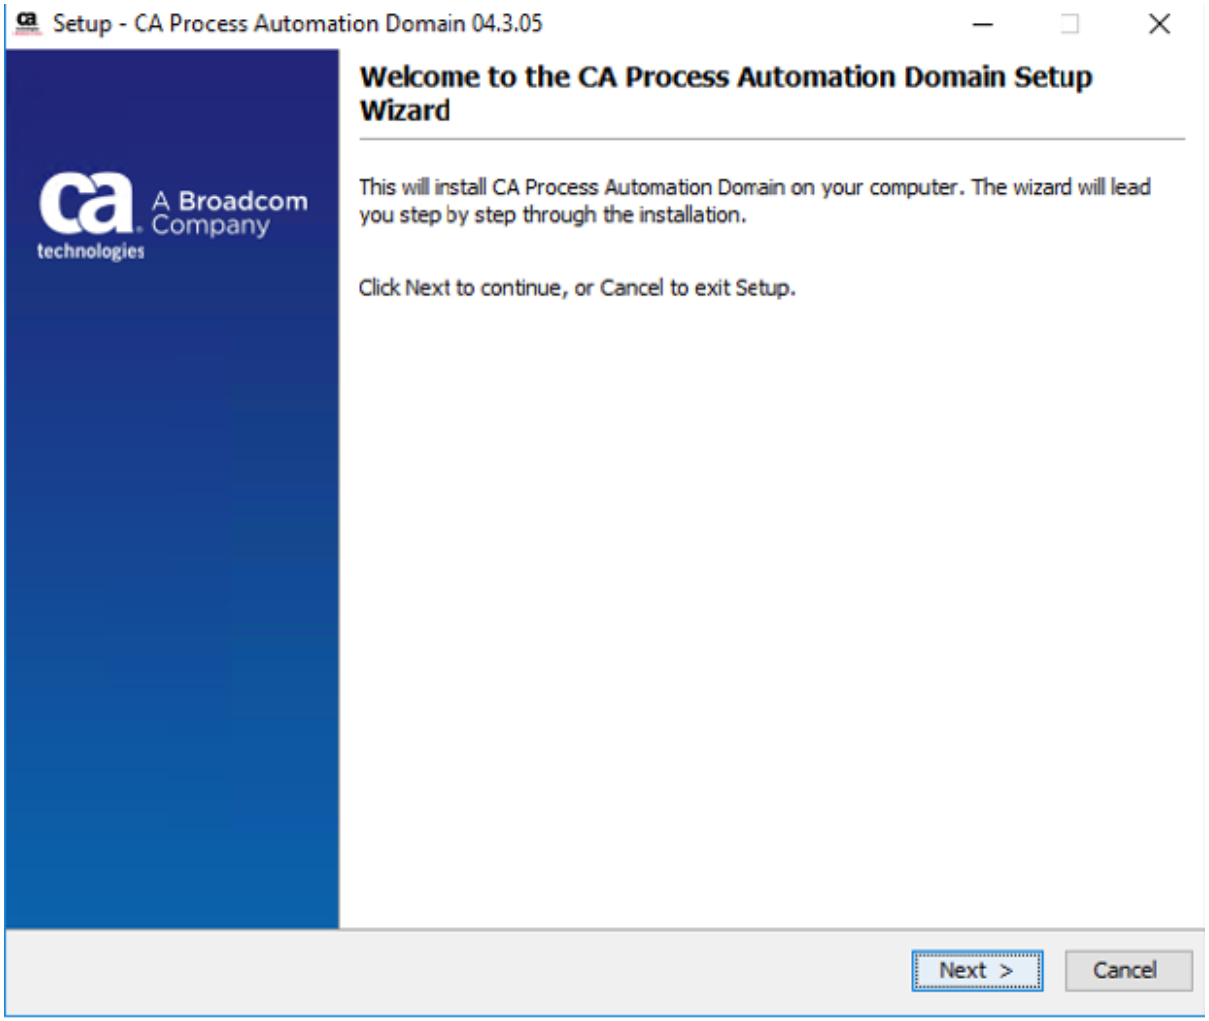
    For example: Mount**DVD500000000003420** on G: drive and change the directory path to G: drive. The first PAM DVD is mounted on F: drive as shown in the image.



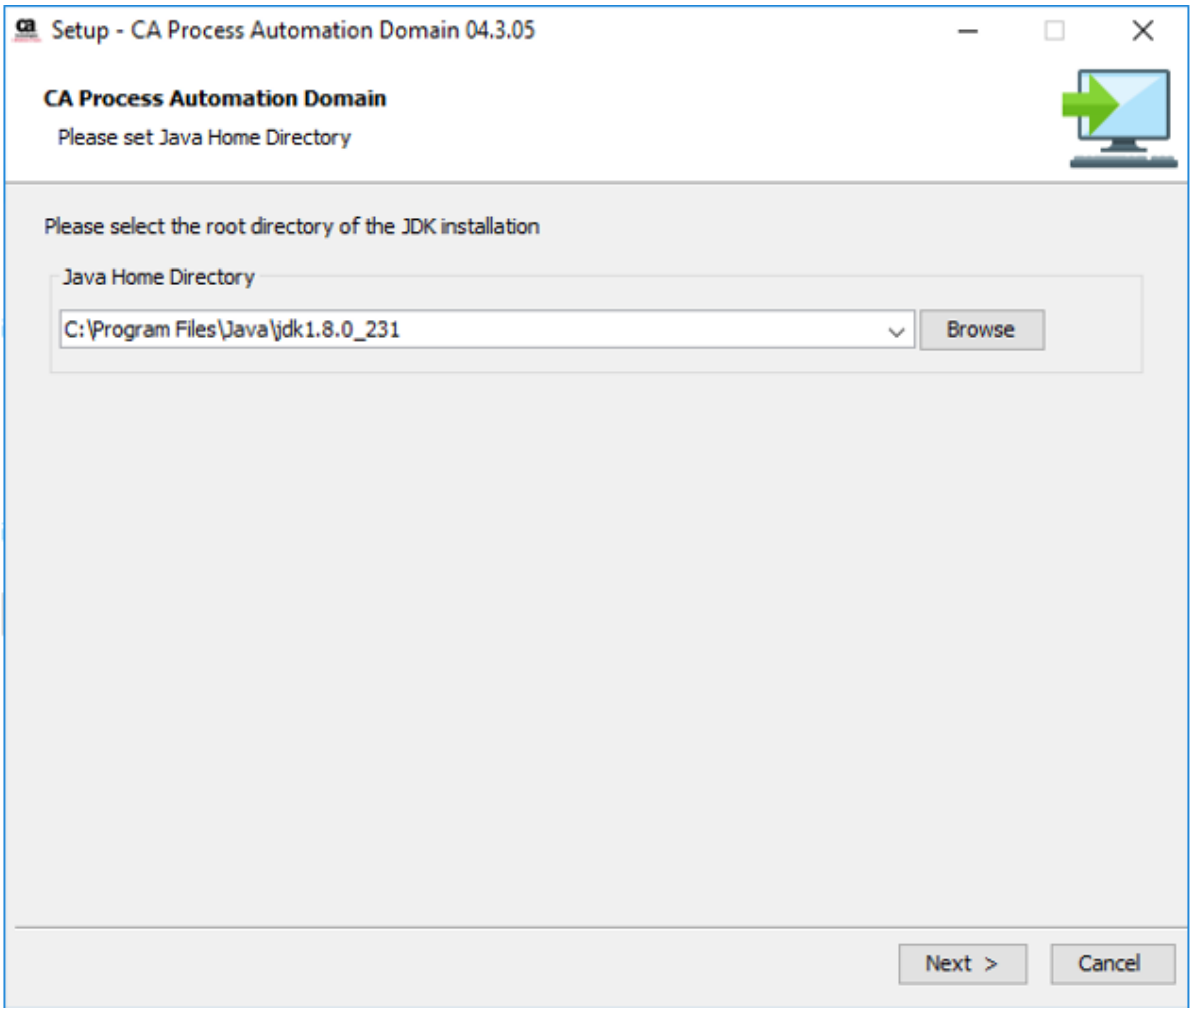
14. Click **Finish**.
    Installer takes some time to fetch details for the second DVD installation screen.



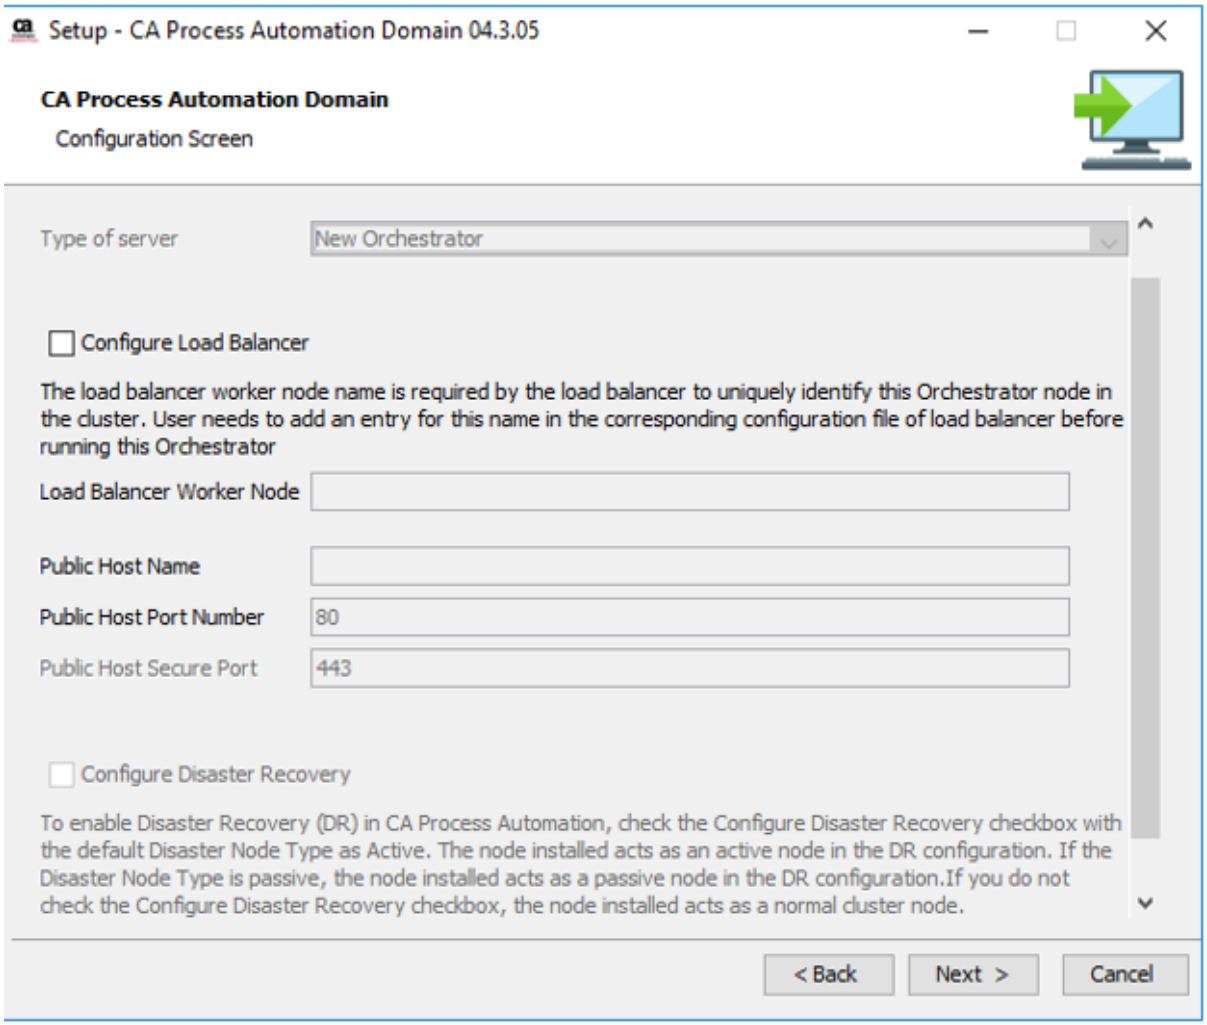
15. Click**Next**.



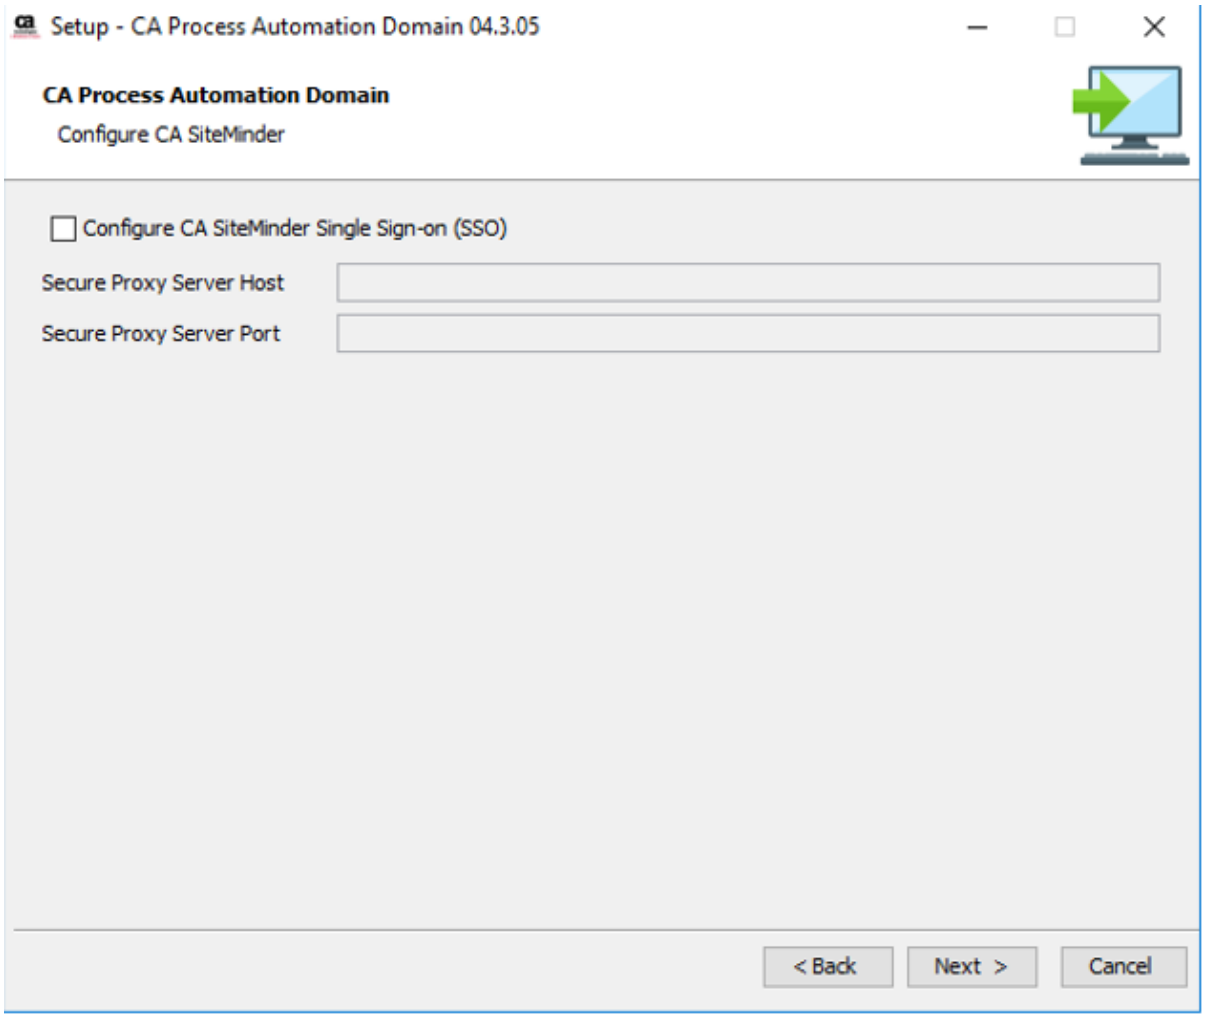
16. Review and accept the License Agreement.
17. Click **Next** and select the java home path (JDK installation location).



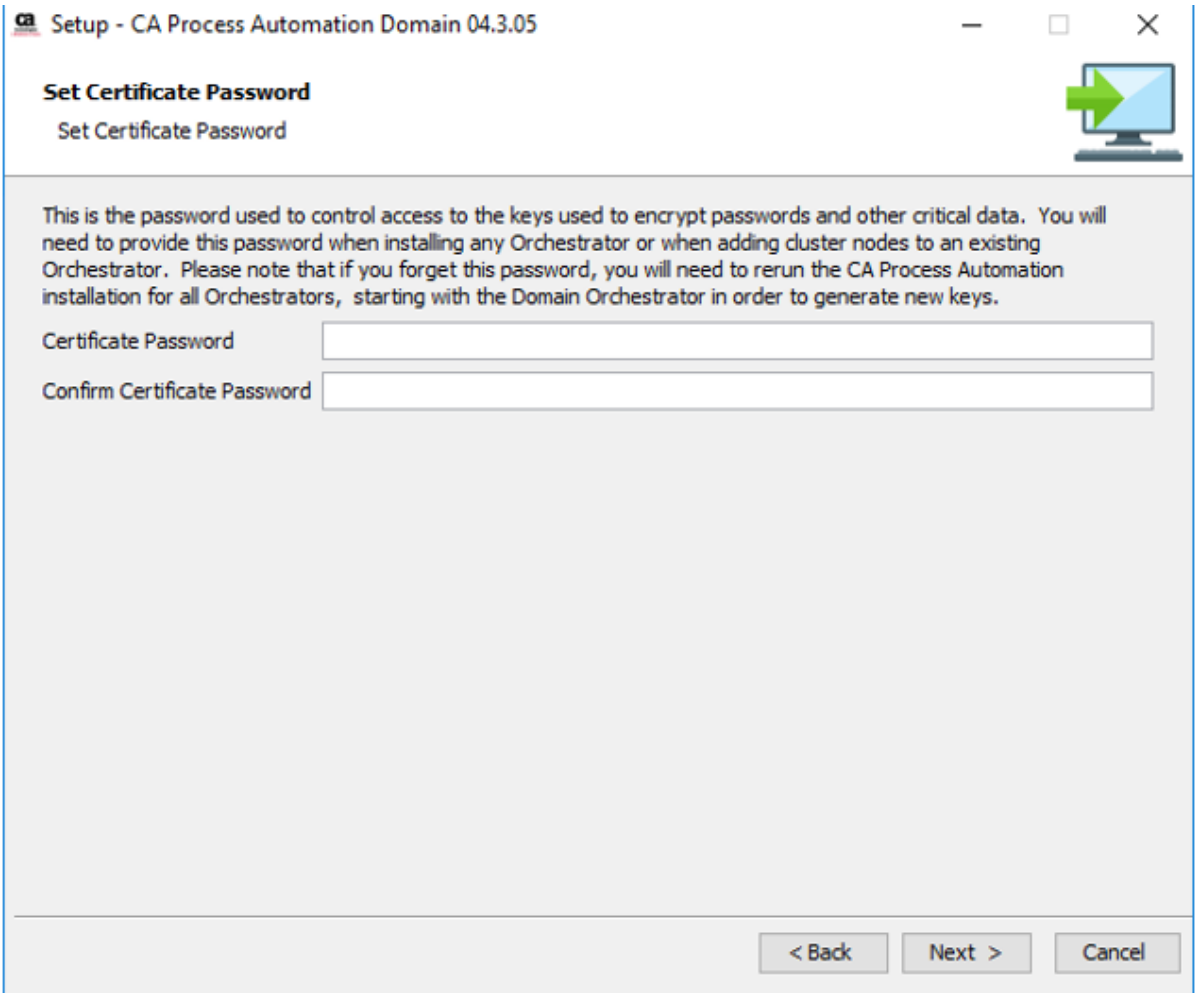
18. Click **Next** with default details as this configuration does not have a Load balancer.



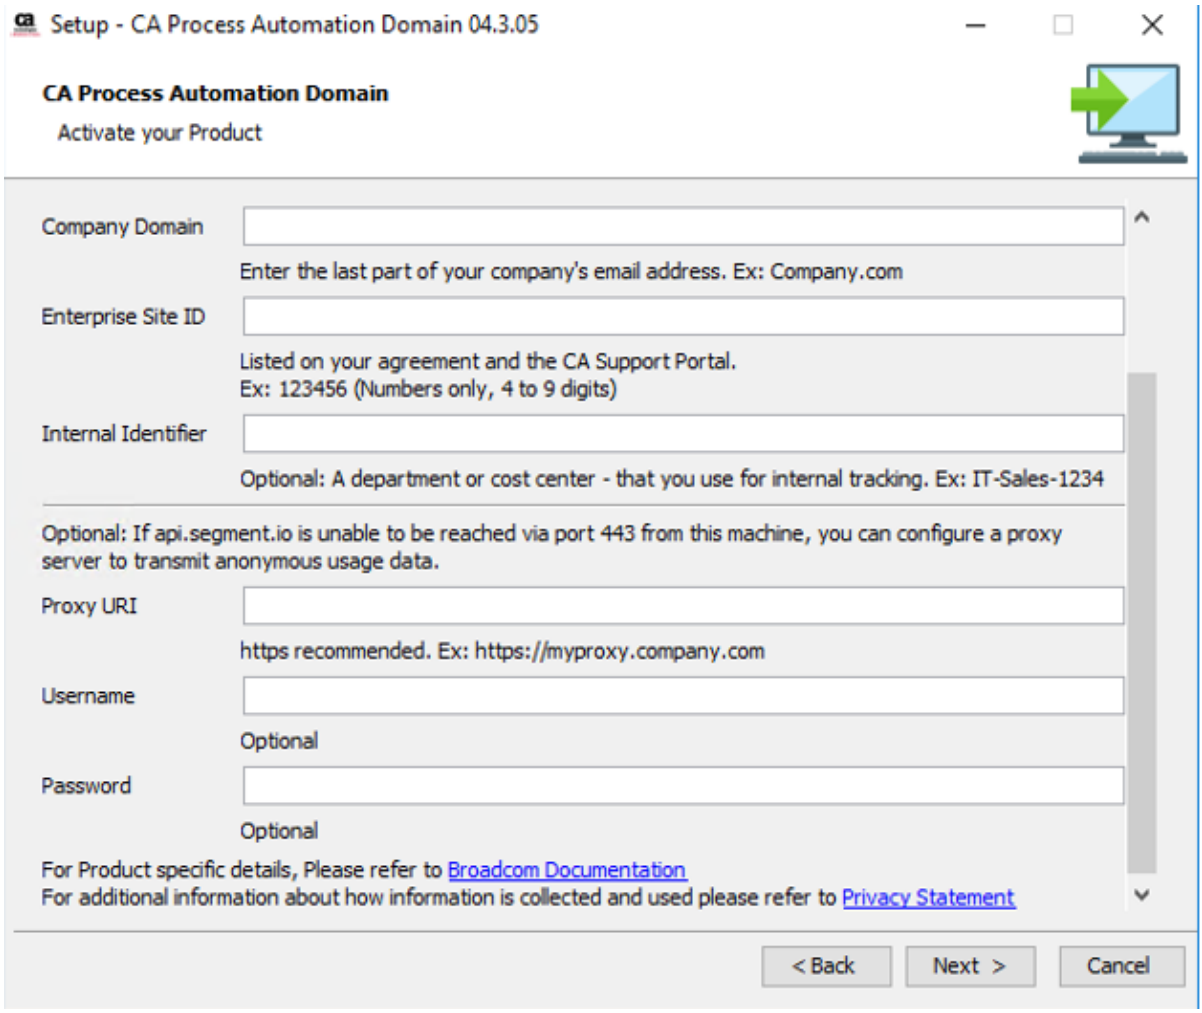
19. Click **Next**.



20. Enter certificate password and confirm Certificate Password.



21. Enter **Enterprise Site ID**, **Company Domain** and **Internal Identifier**.



Setup - CA Process Automation Domain 04.3.05

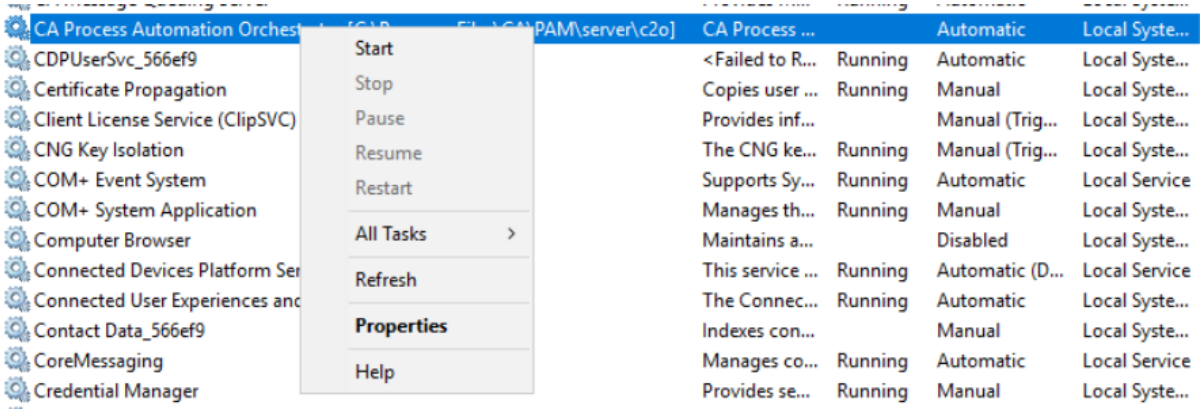
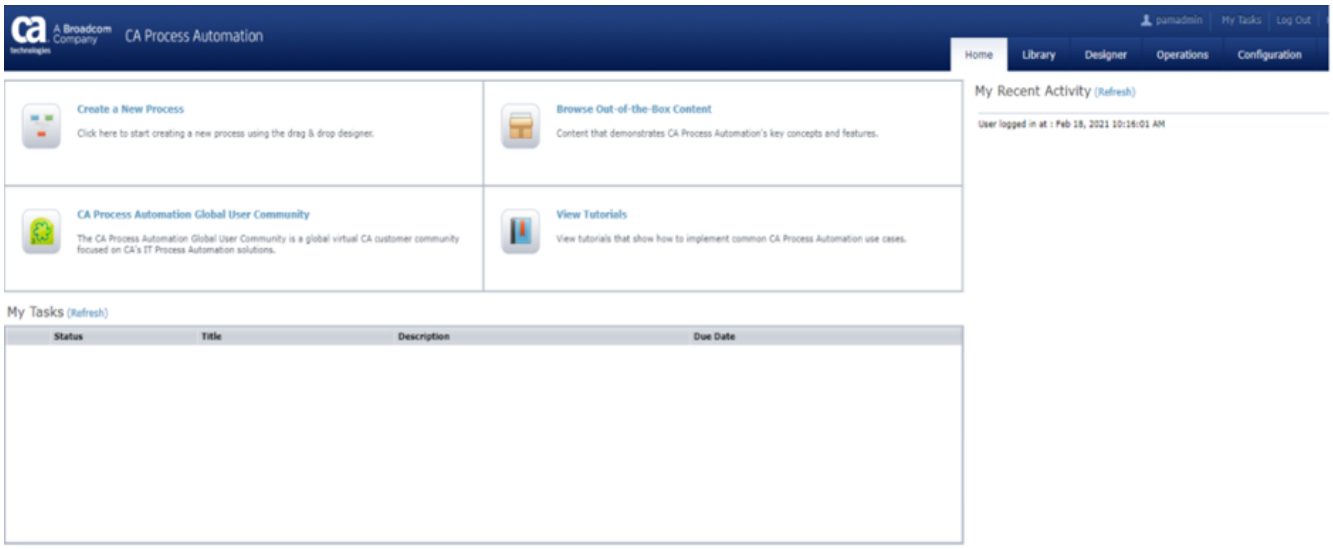
43. Click **Finish**.
44. Navigate to Windows Services and start the CA Process Automation Services.



45. Open the CA Process Automation Web URL: ***http://<hostname>:<portnumber>/itpam***
46. Enter the username and password.
47. CA Process Automation home page is displayed.



Install CA Service Management 17.4

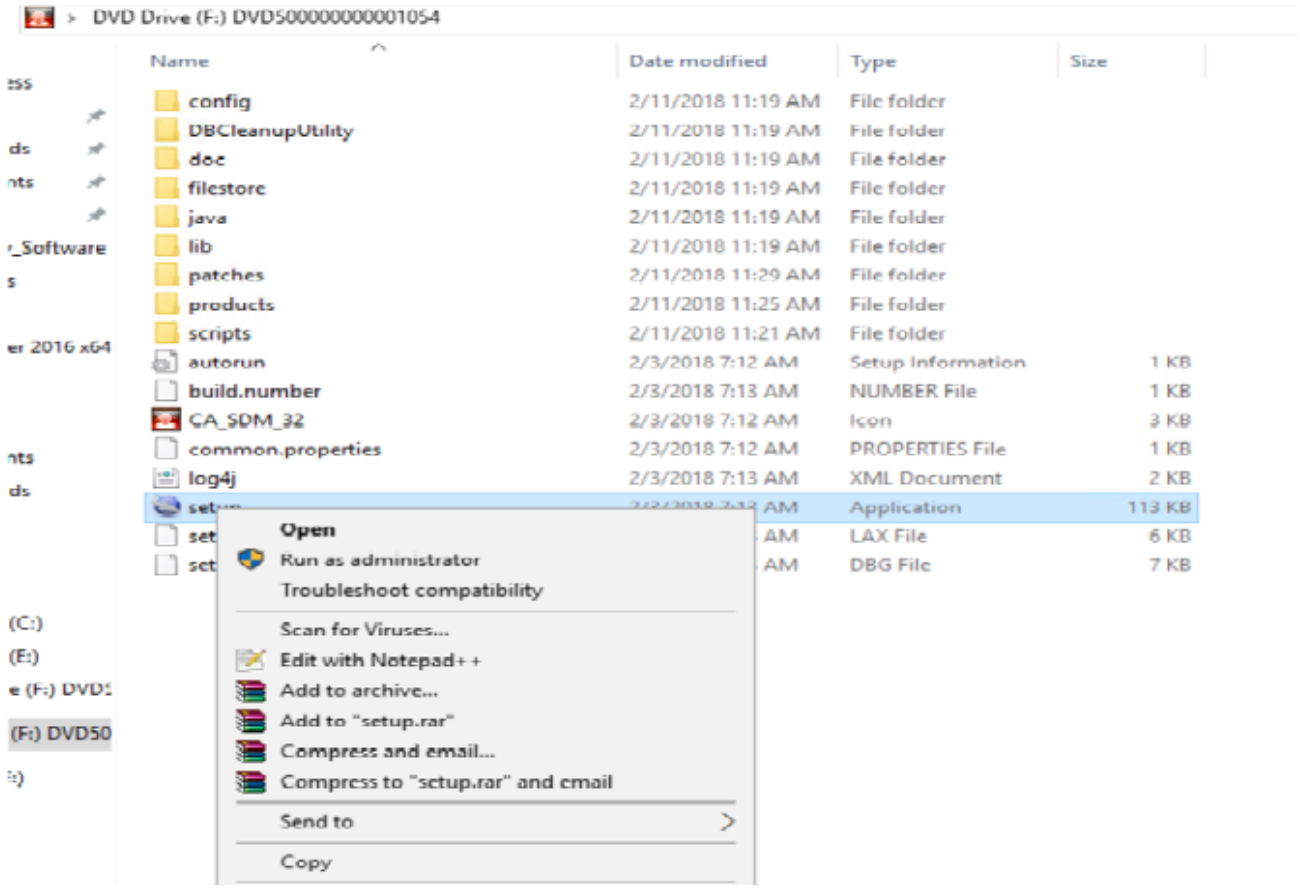
This section describes CA Service Management 17.4 installation procedures for CA Service Desk Manager (CMDB Visualizer), and CA Service Catalog with CA Common Components – CA EEM and CA Process Automation Workflow.

Install CA Service Desk Manager (SDM) 17.4
Perform the following steps to install CA Service Desk Manager 17.4 (Advanced Availability Configuration):

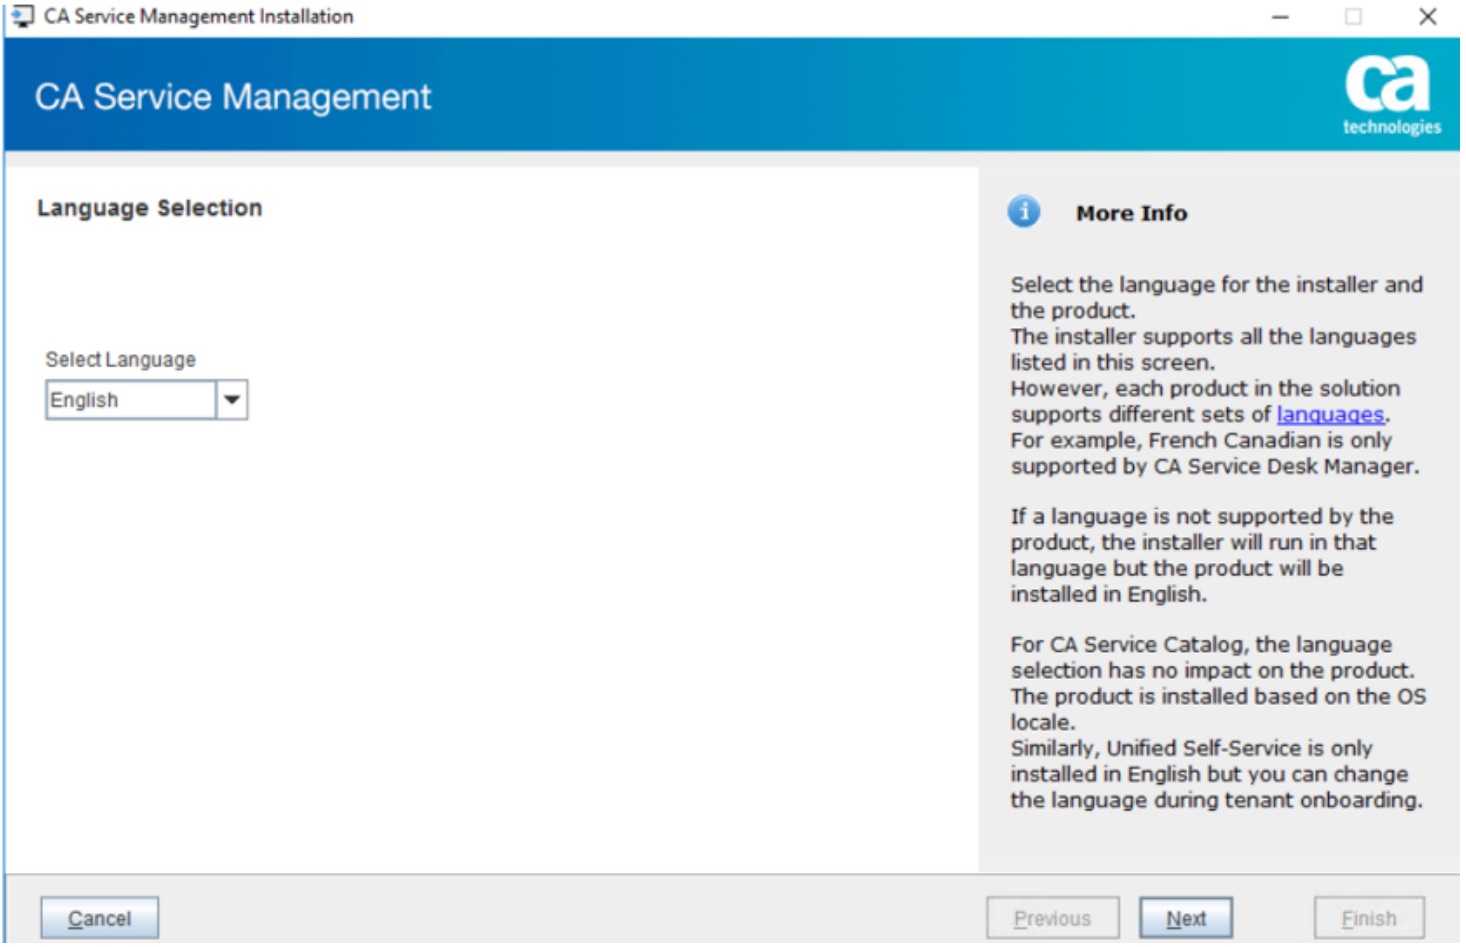
- CA SDM Installation 17.4 on Background server (**testqa-bg-new**)
- Install the Standby Server (**testqa-sb-new**)
- Install the First Application Server installation (**testqa-app1-new**)
- Install the Second SDM Application Server on (t**estqa-app2-new**)

Install CA SDM Background Server (testqa-bg-new)
Perform the following steps:

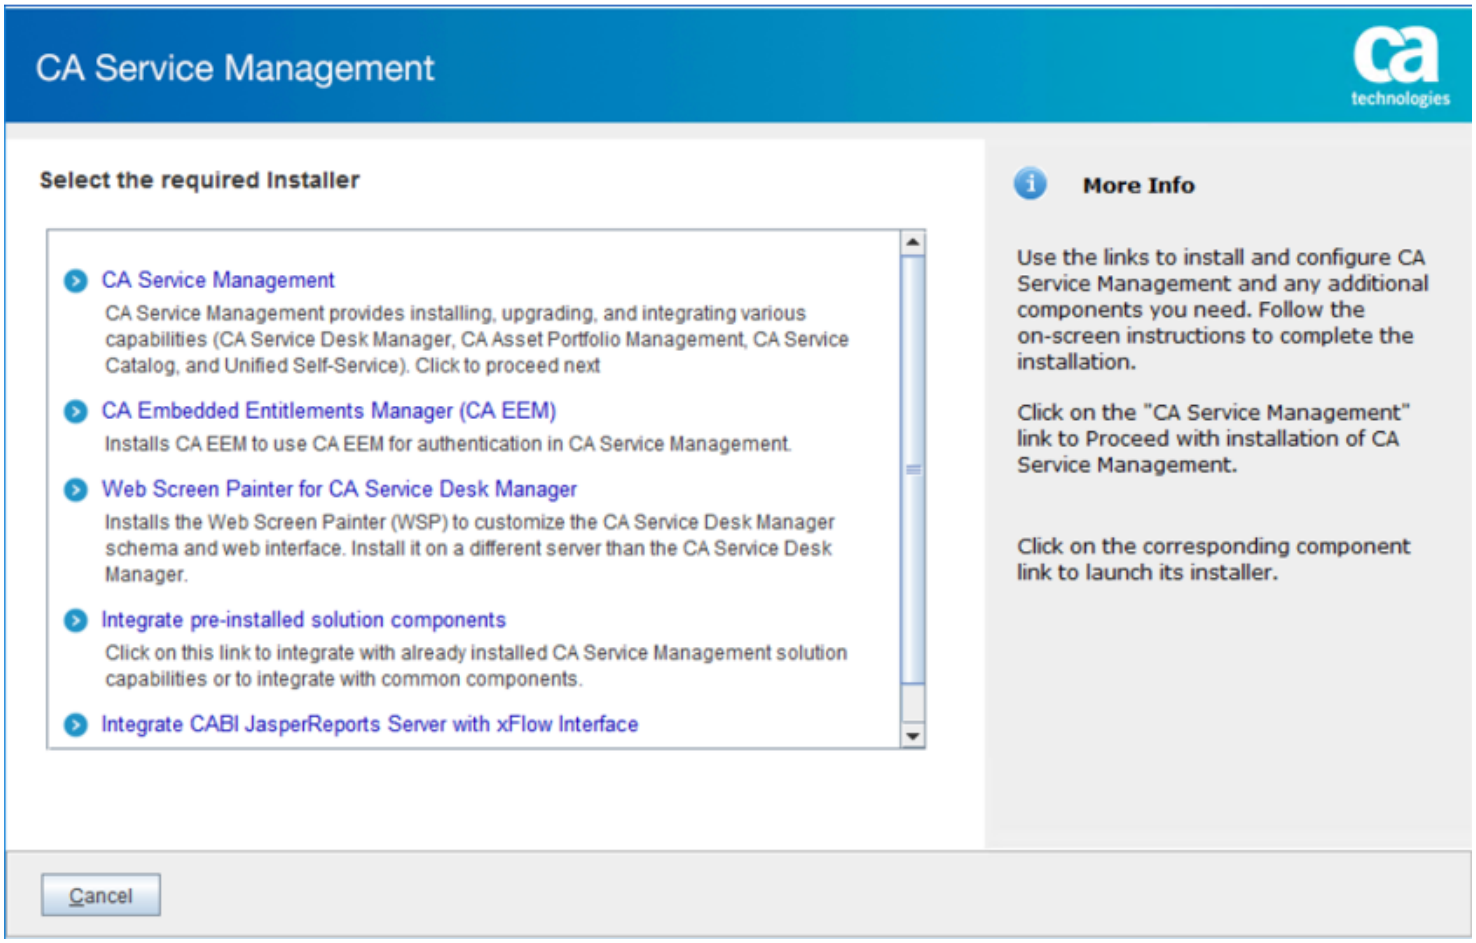
1. Mount the CA SDM DVD and click the **setup.exe**. Right-click and select **Run as administrator**.



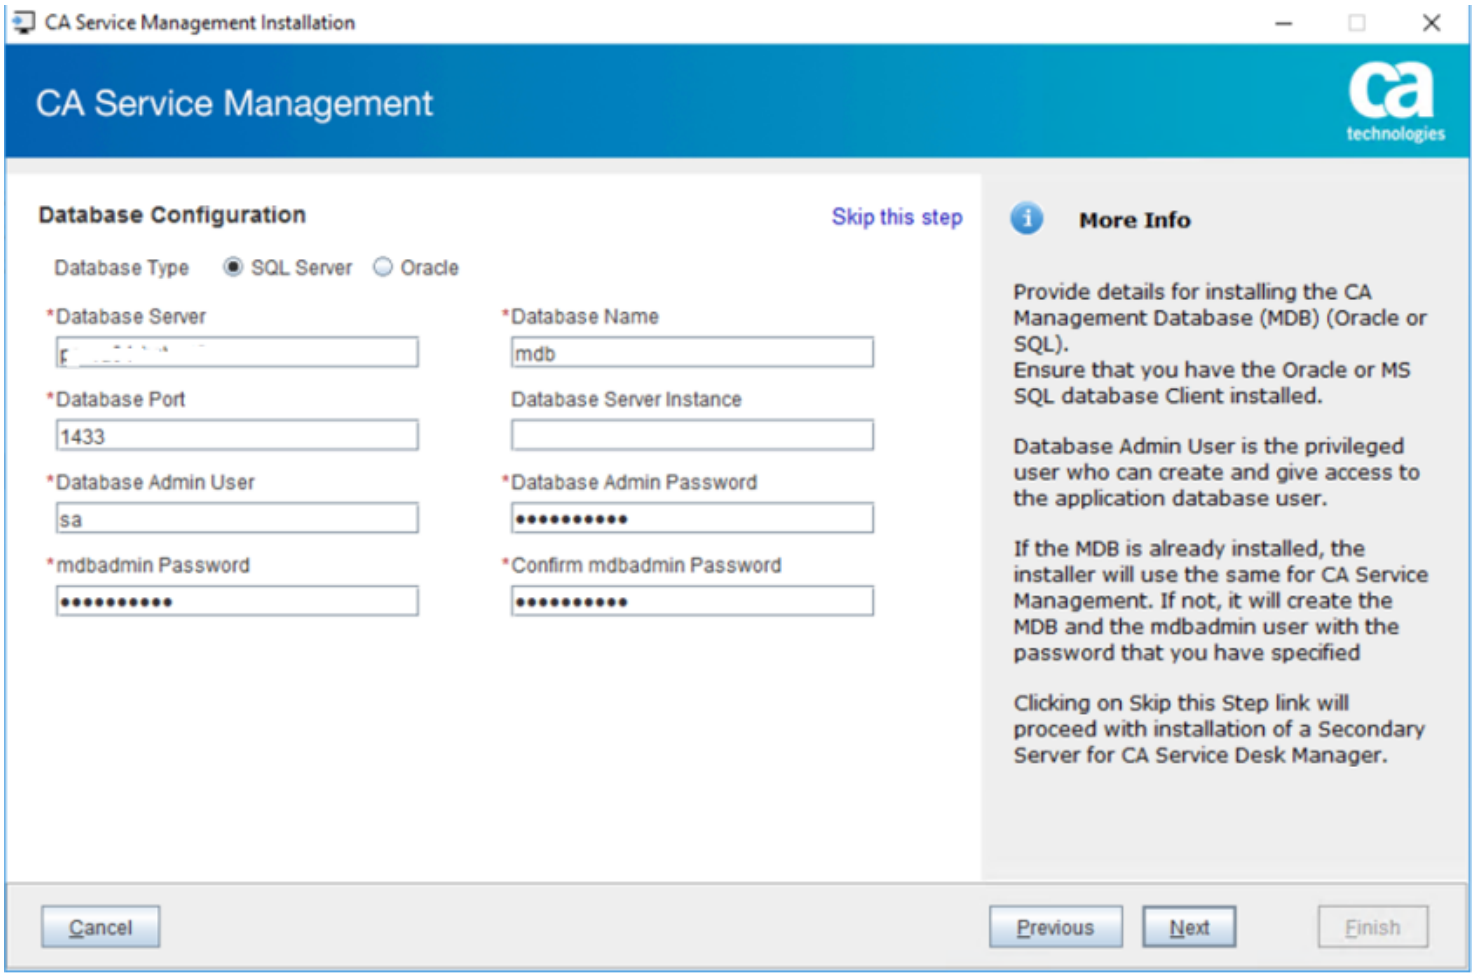
2. Click **Next** and select a language of your choice.



3. Select the "**CA Service Management**" link.



4. Review and accept the License Agreement.
5. Click **Next**.
   Select Database Type as **SQL Server**. Enter the database details.



6. Click **Next** and configure the Common Components (CA EEM, CA Process Automation Workflow).

More Info
Select a single product or combination of products under CA Service Management. The selected options are installed locally.
Select "Configure Common Components" option to configure and integrate the Common components with selected product or products.
Note that Unified Self-Service can be installed as standalone only if you have either CA Service Desk Manager or CA Service Catalog or both installed in the environment.
The products or components that are in gray are already installed on this server. The products or components that are automatically selected are mandatory.
Click on the checkbox to see more details.

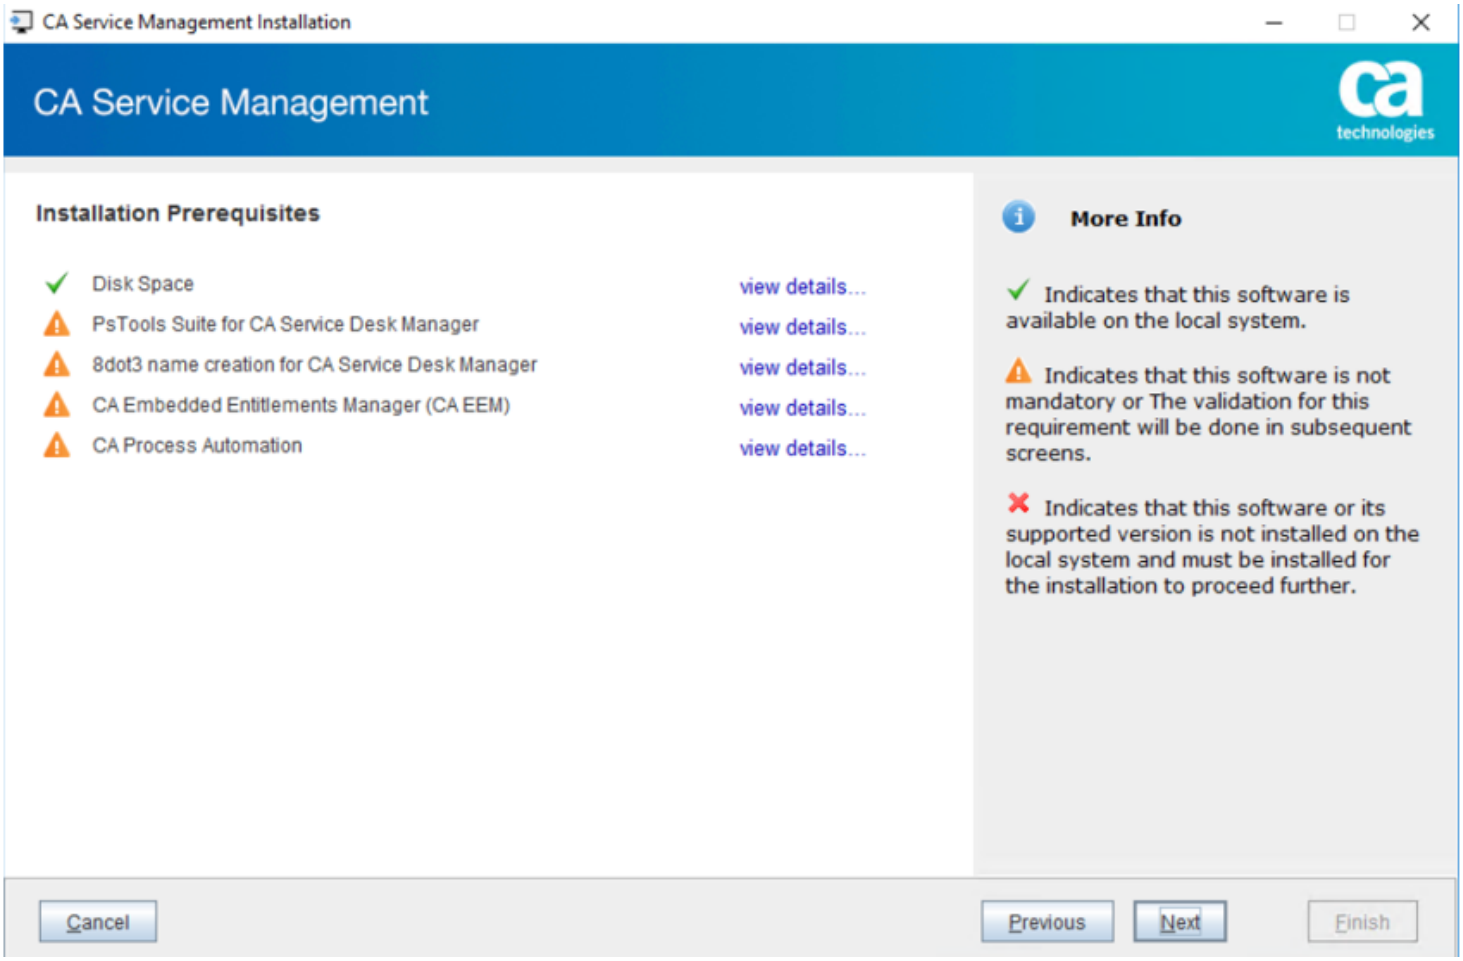
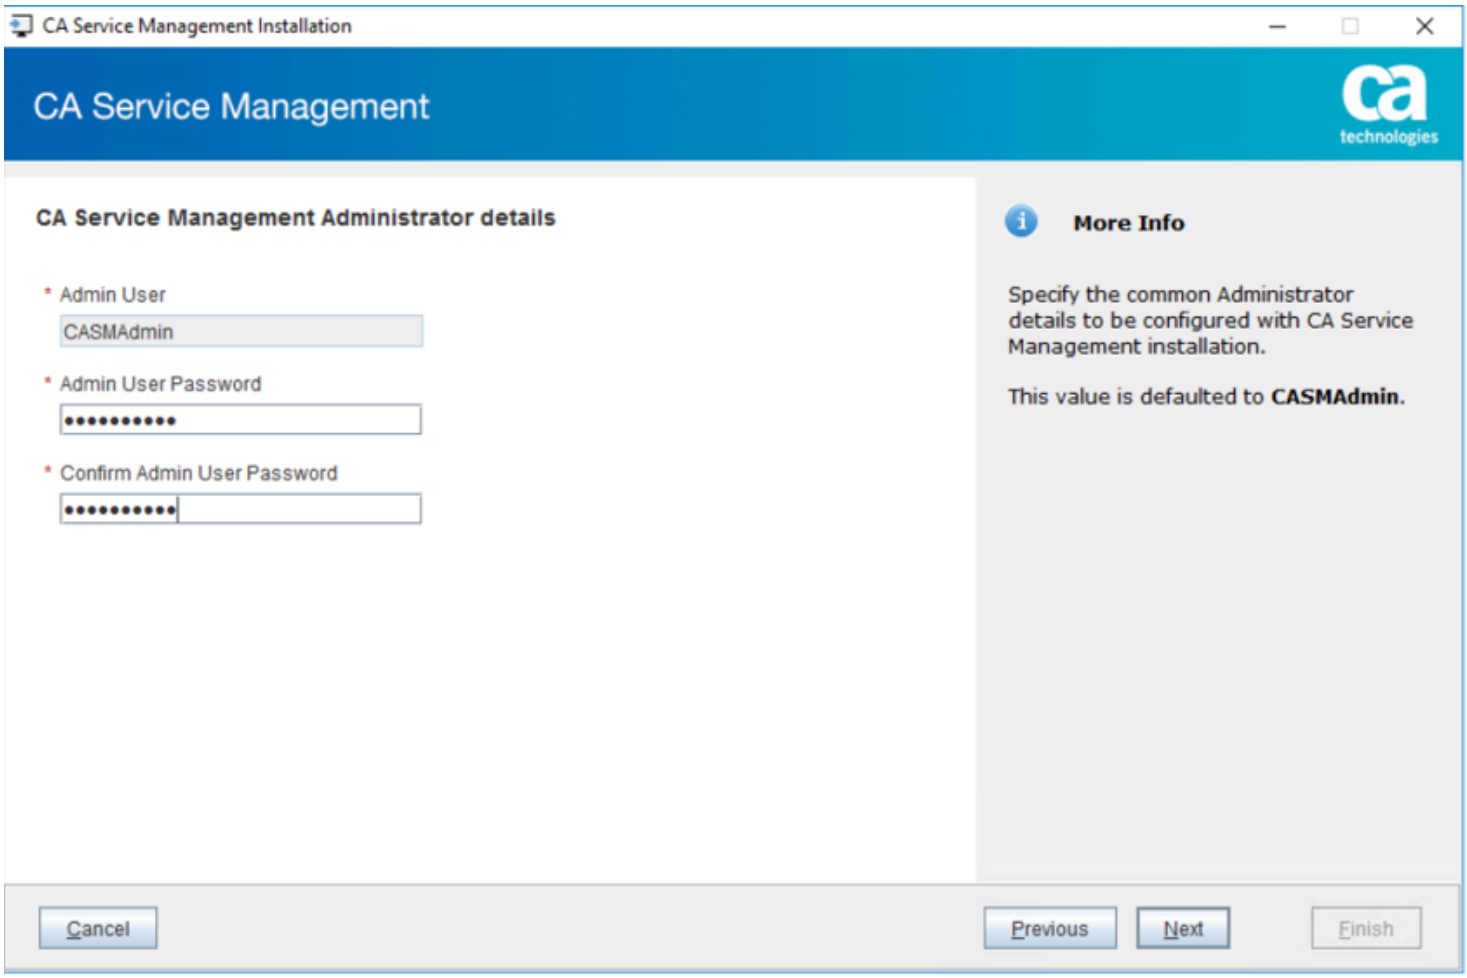
Next
Finish

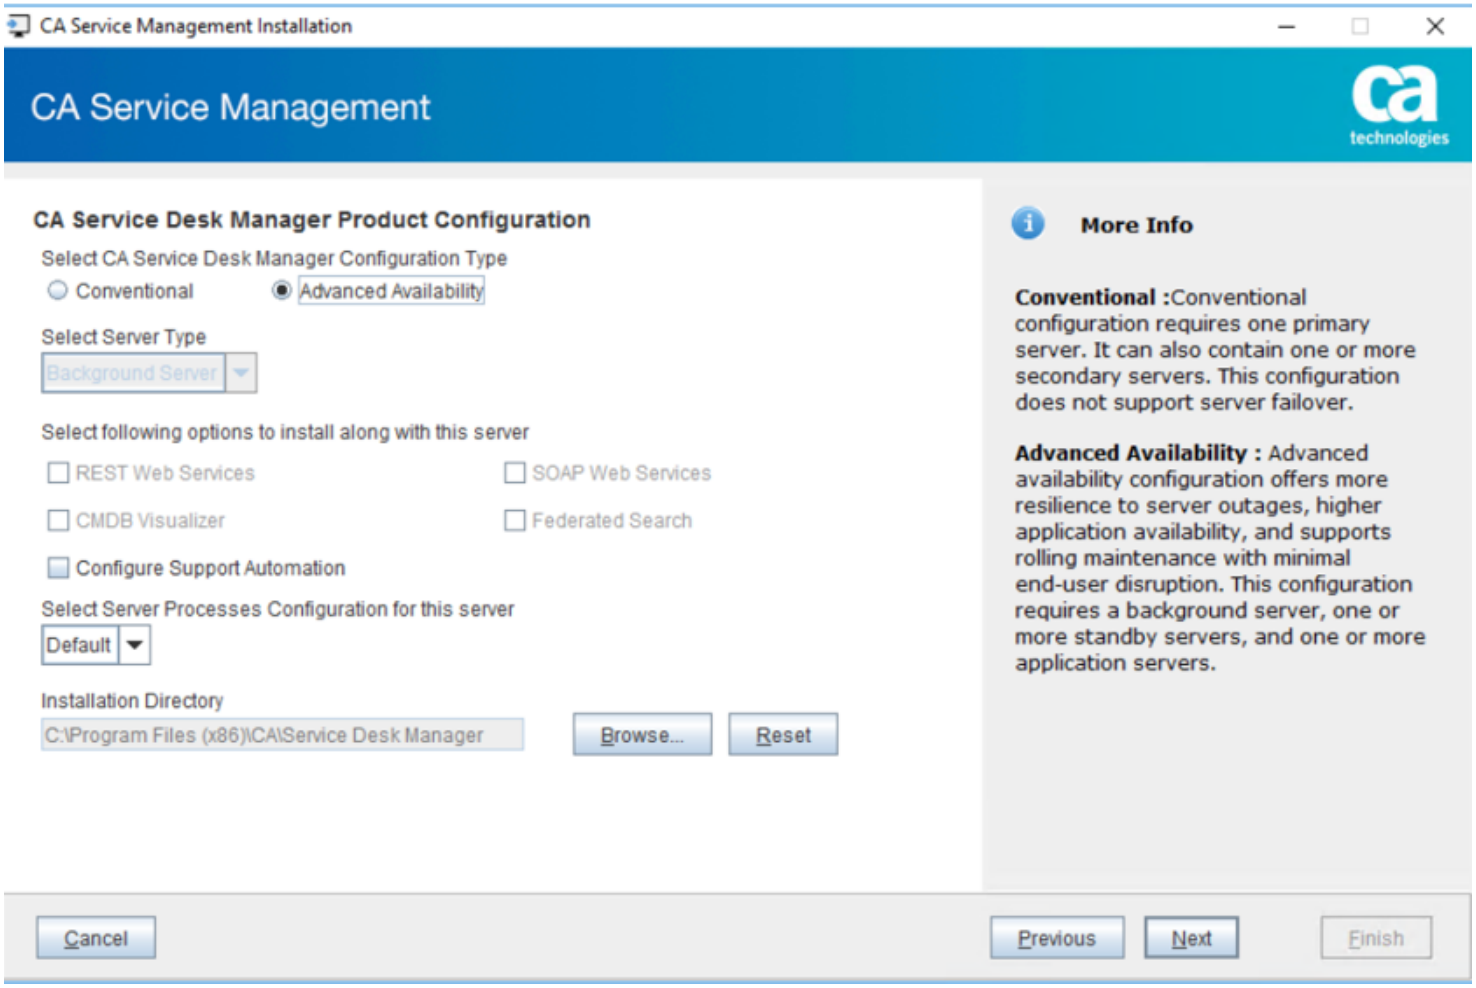
7. Click **Next**.



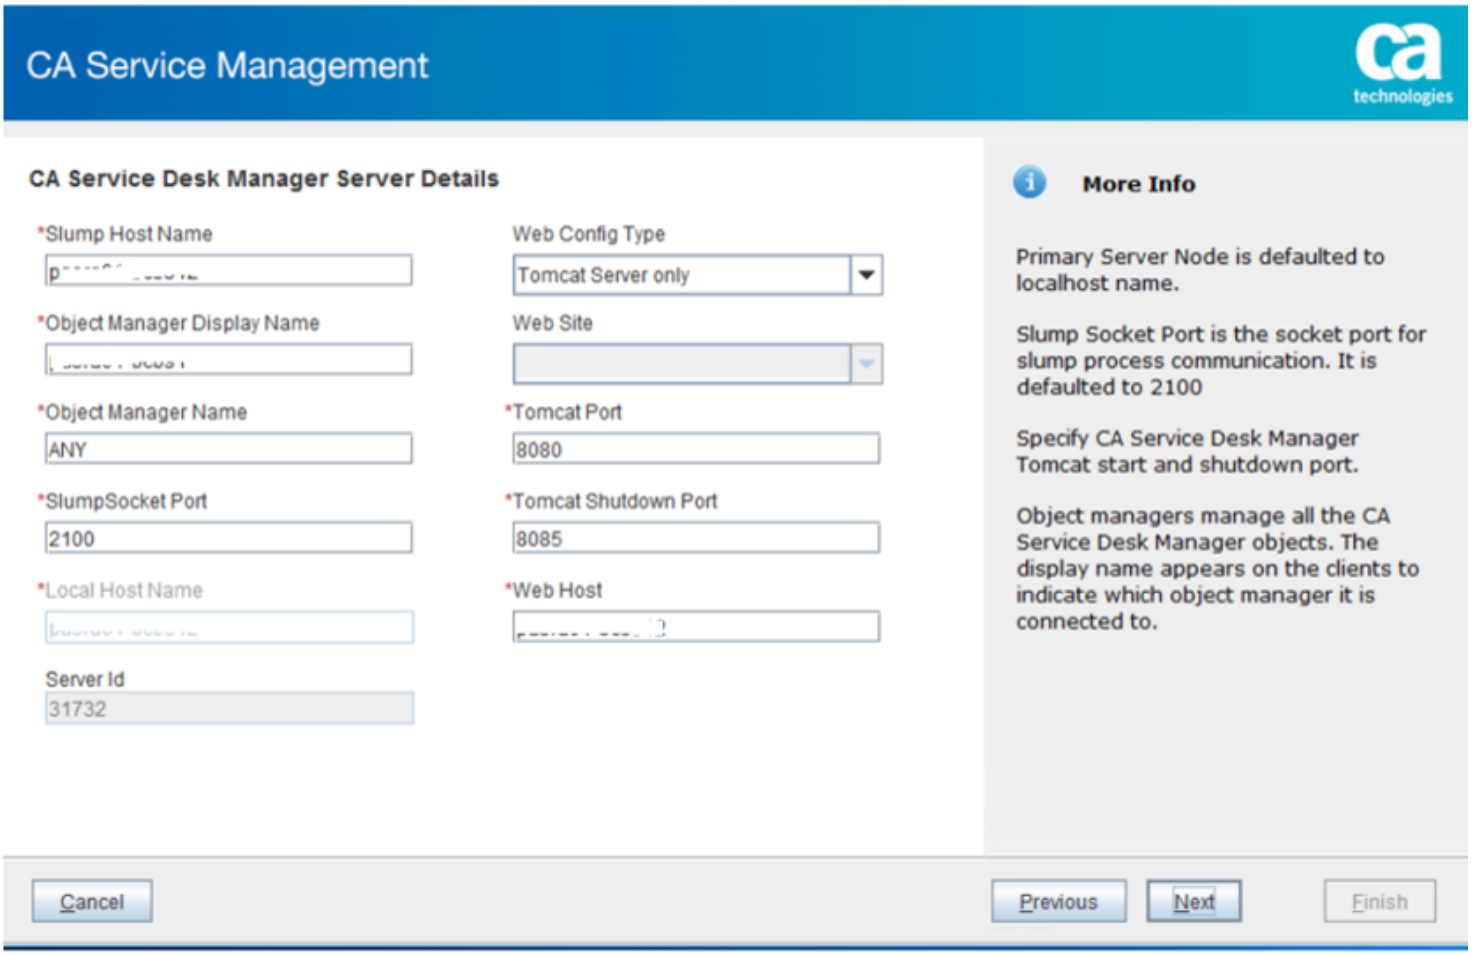
8. Enter CASM Admin User password.



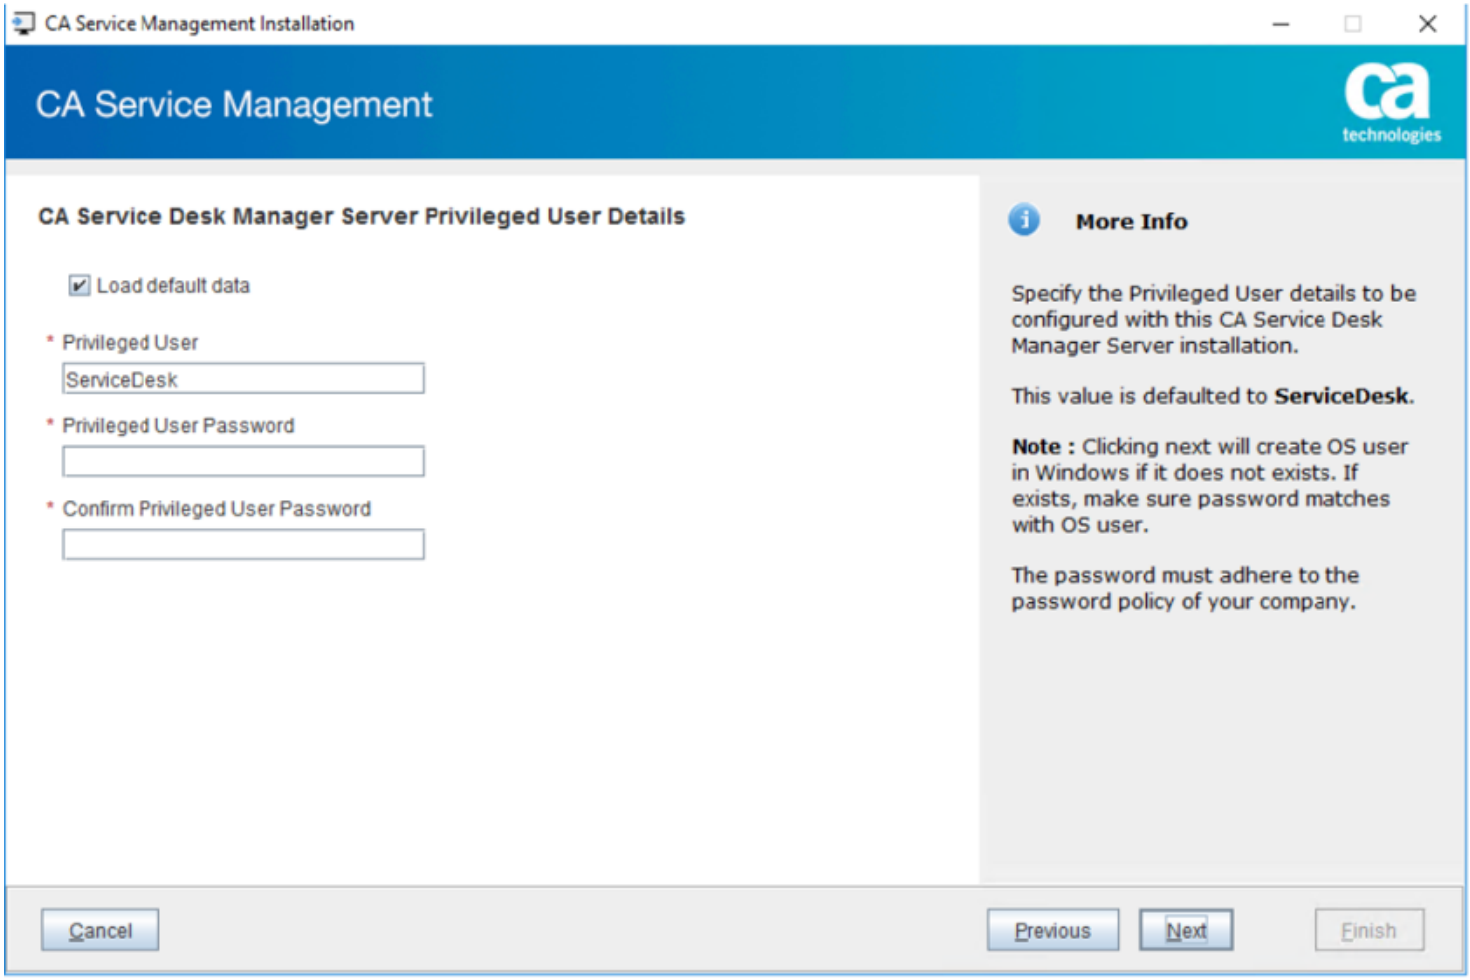
9. Click **Next**.
   Select **Advanced Availability** as the mode of SDM configuration and provide the required details.



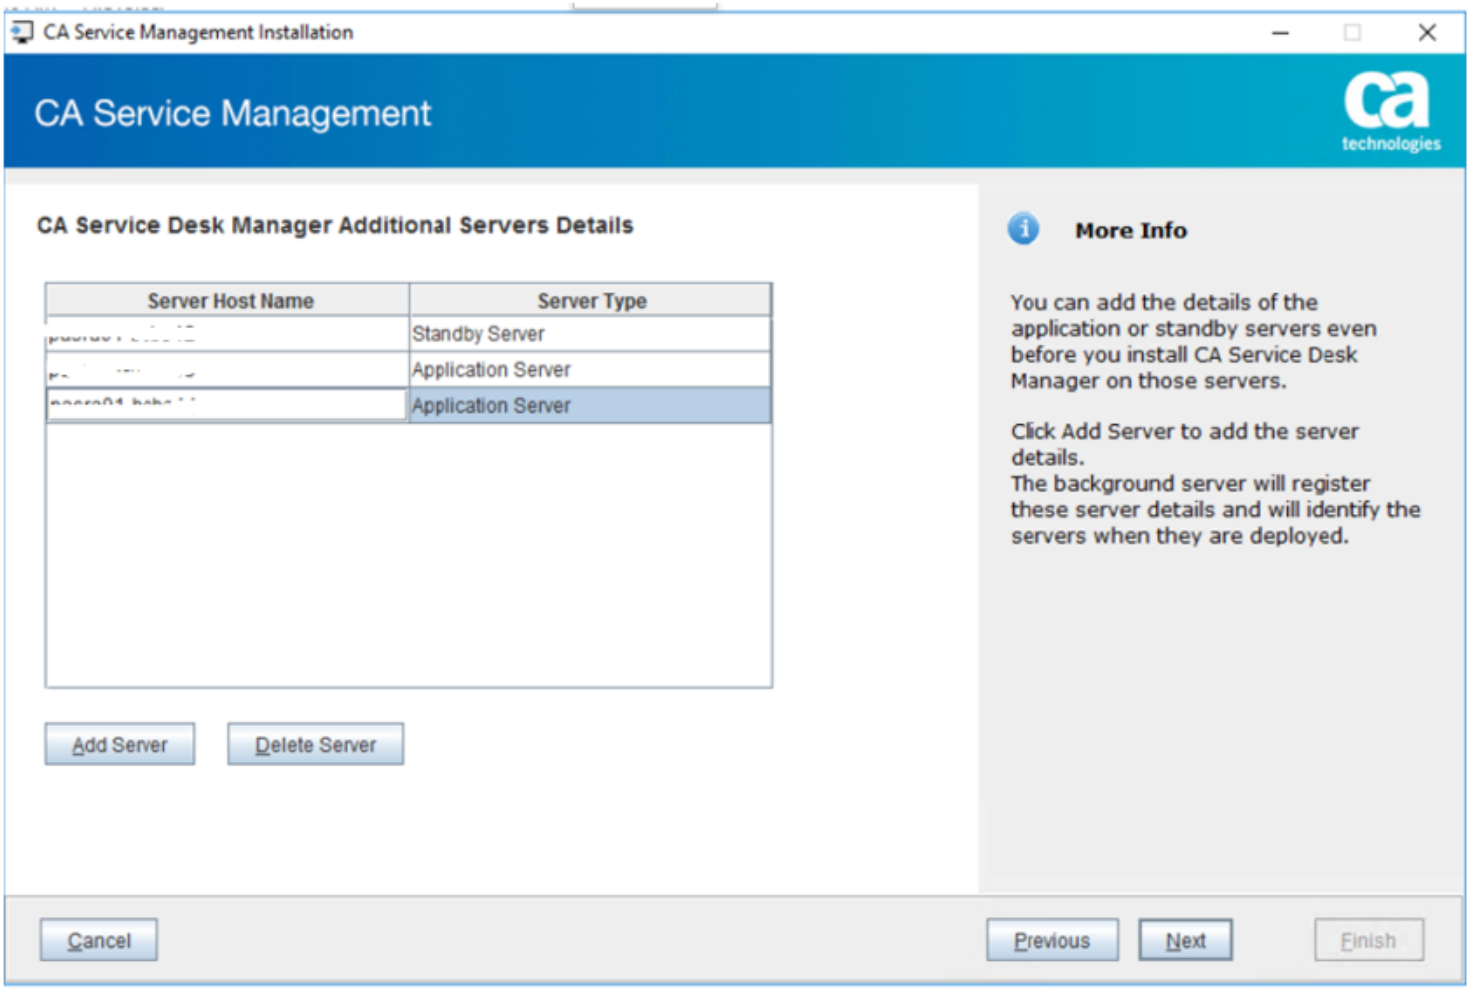
10. Click **Next**.
    Enter slump host name, slump port details, object manager name, and tomcat port and other details.



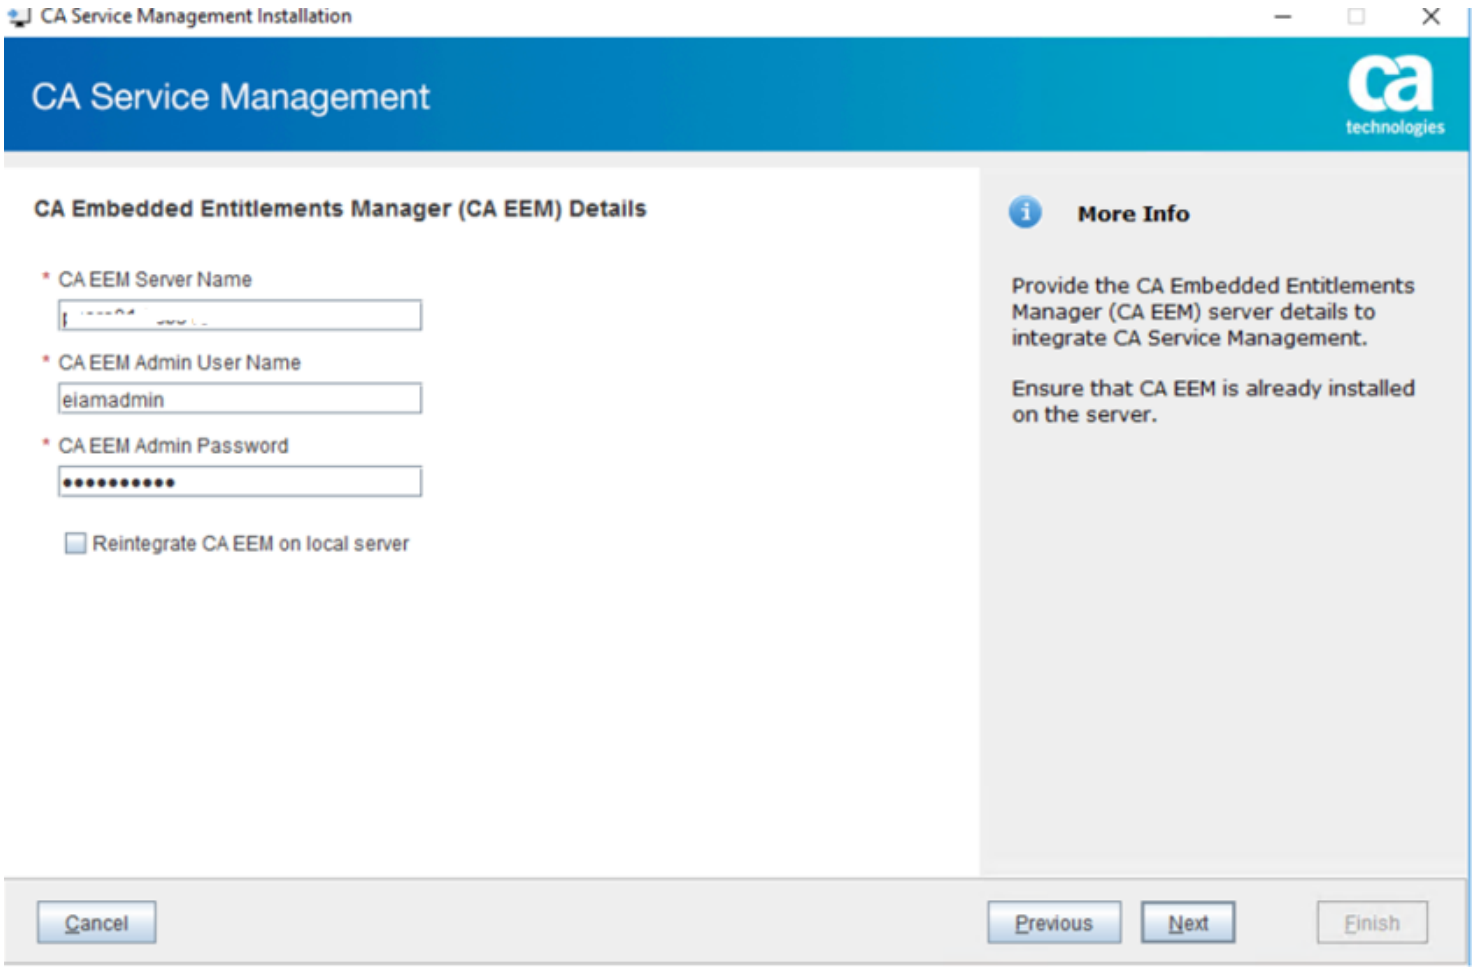
11. Click **Next**.
    Enter the Privileged User password and confirm password.



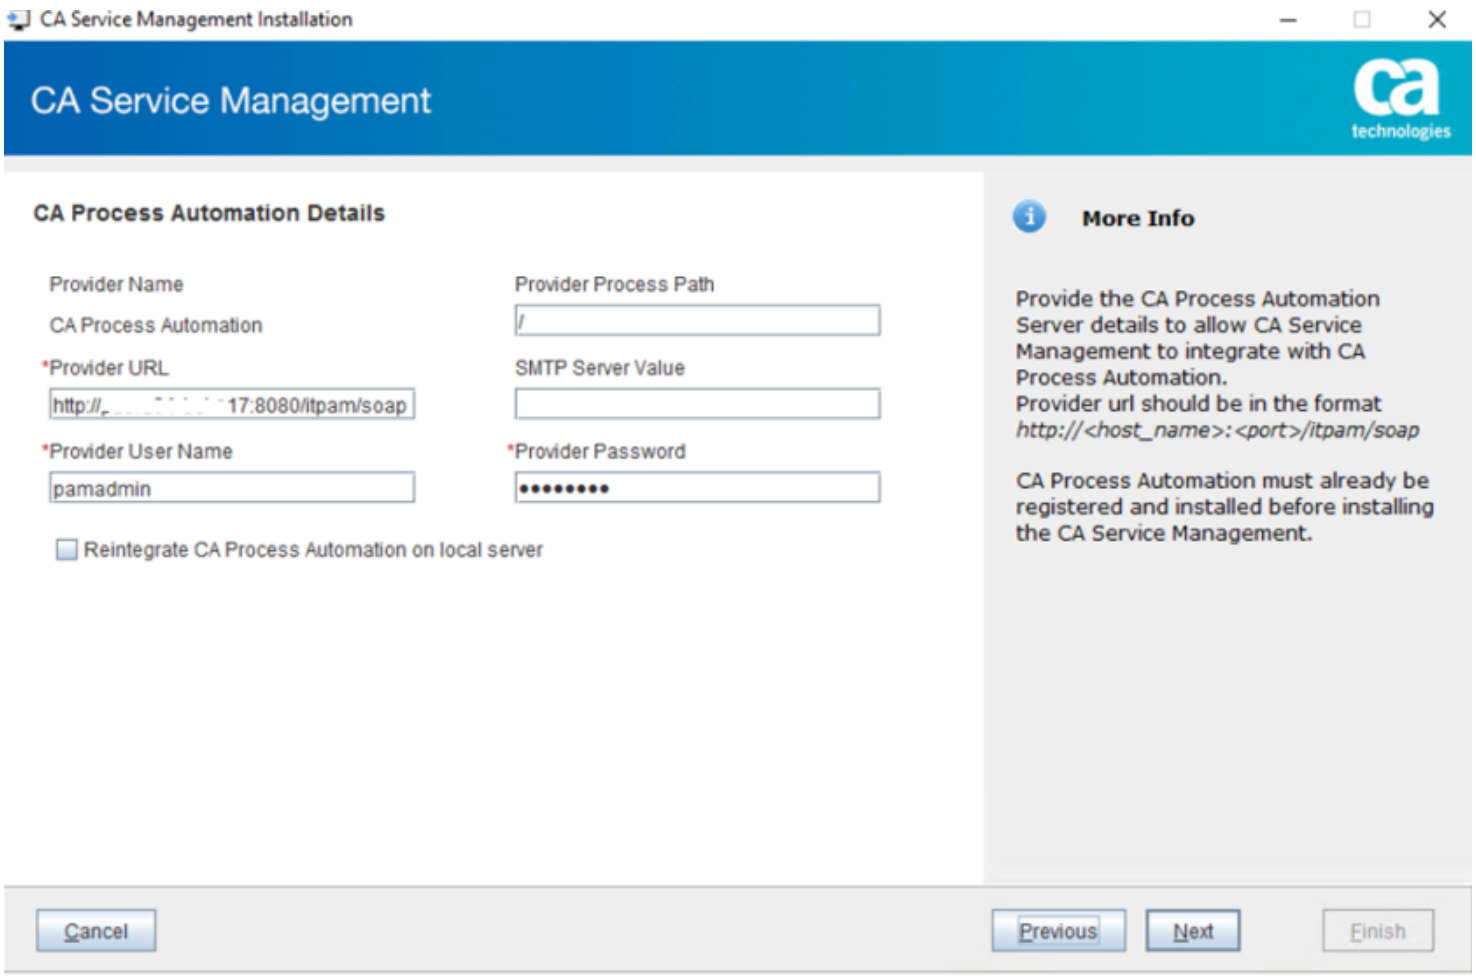
12. Click **Next**.
    Add the Standby Server **testqa-sb-new**, two Application Server - **testqa-app1-new** and **testqa-app2-new**.



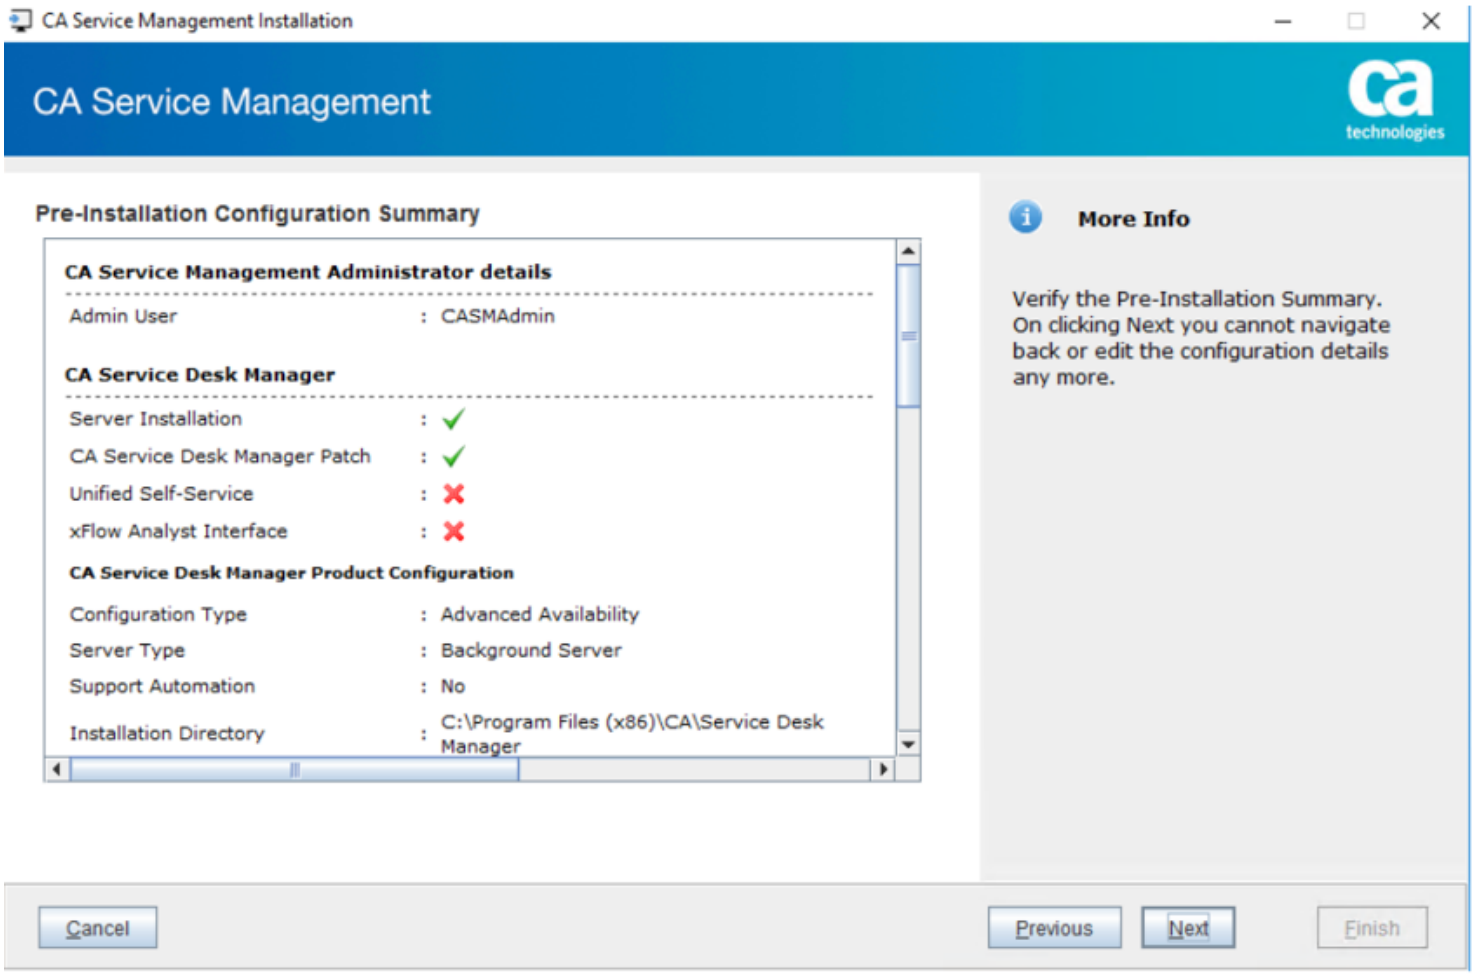
13. Enter EEM Host name (**testqa-eem-new**) and Password.



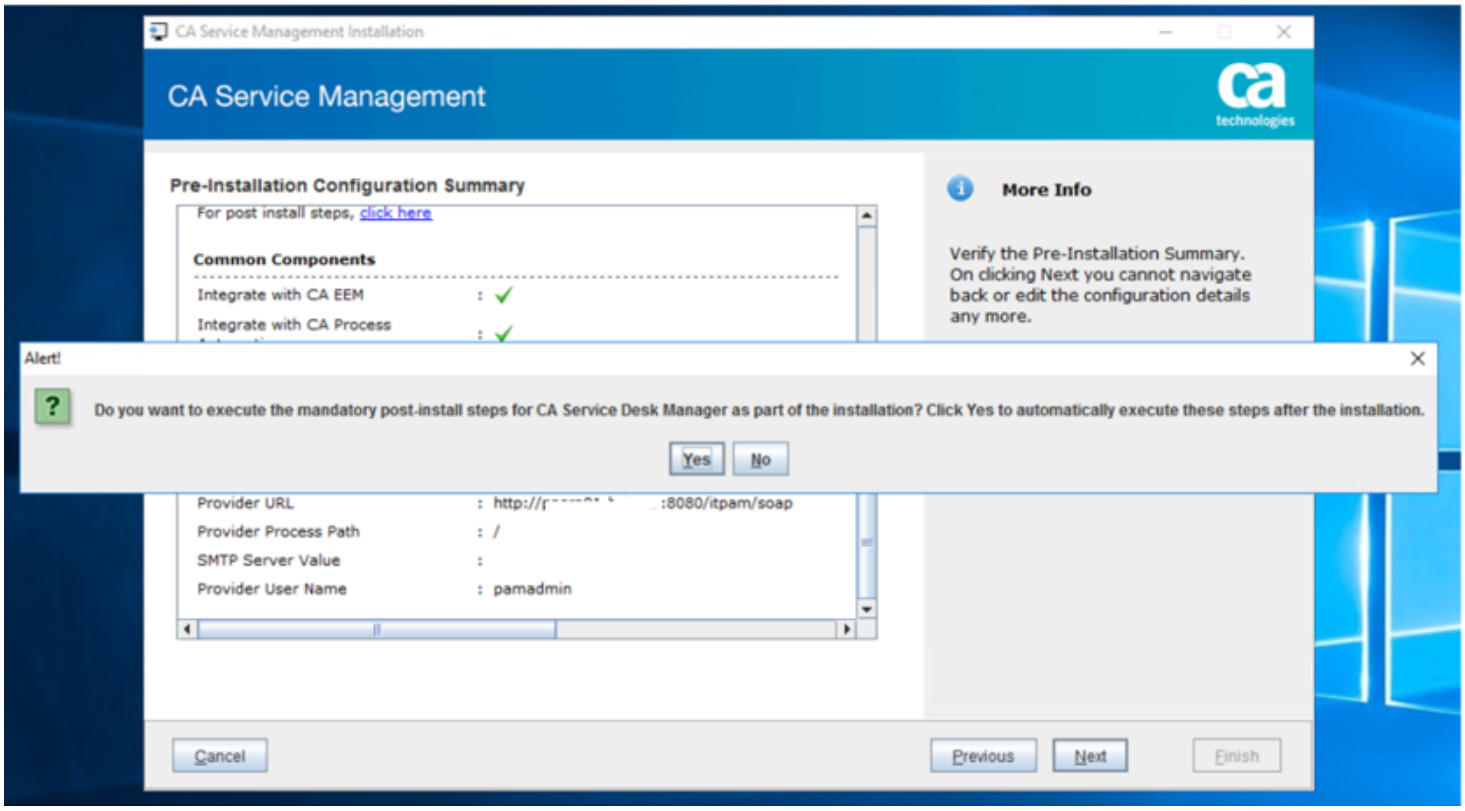
14. Click **Next**.
    Enter CA Process Automation URL: *http://testqa-pam-new:8080/itpam/soap*
15. Enter the user name and Password.



16. Click **Next**. Review the Pre-installation configuration summary.



17. Click **Next**. Follow the installation wizard.
18. Click **Yes** to automatically execute the post-installation steps for CA SDM. Click **No** if you want to perform the manual post-install steps once installation completes successfully.



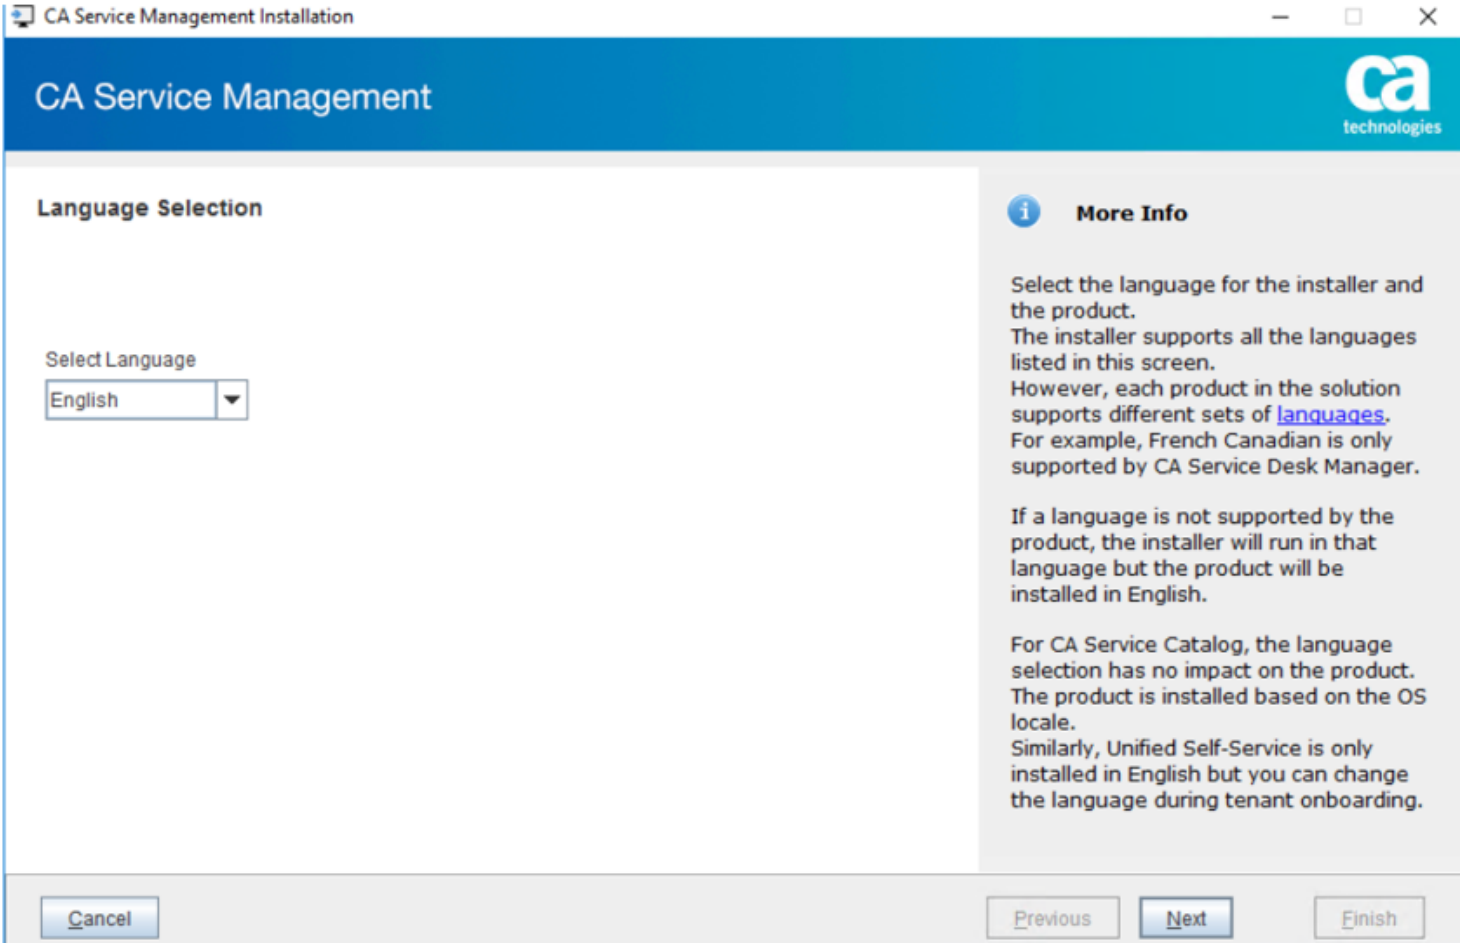
19. Click **Install**.
    The installation process begins.
20. Click **Finish** once installation is successful.
21. Now open the CA SDM Background server web interface: *http://testqa-bg-new:8080/CAisd/pdmweb.exe*
22. Click **Login**.

CA SDM background server is launched.

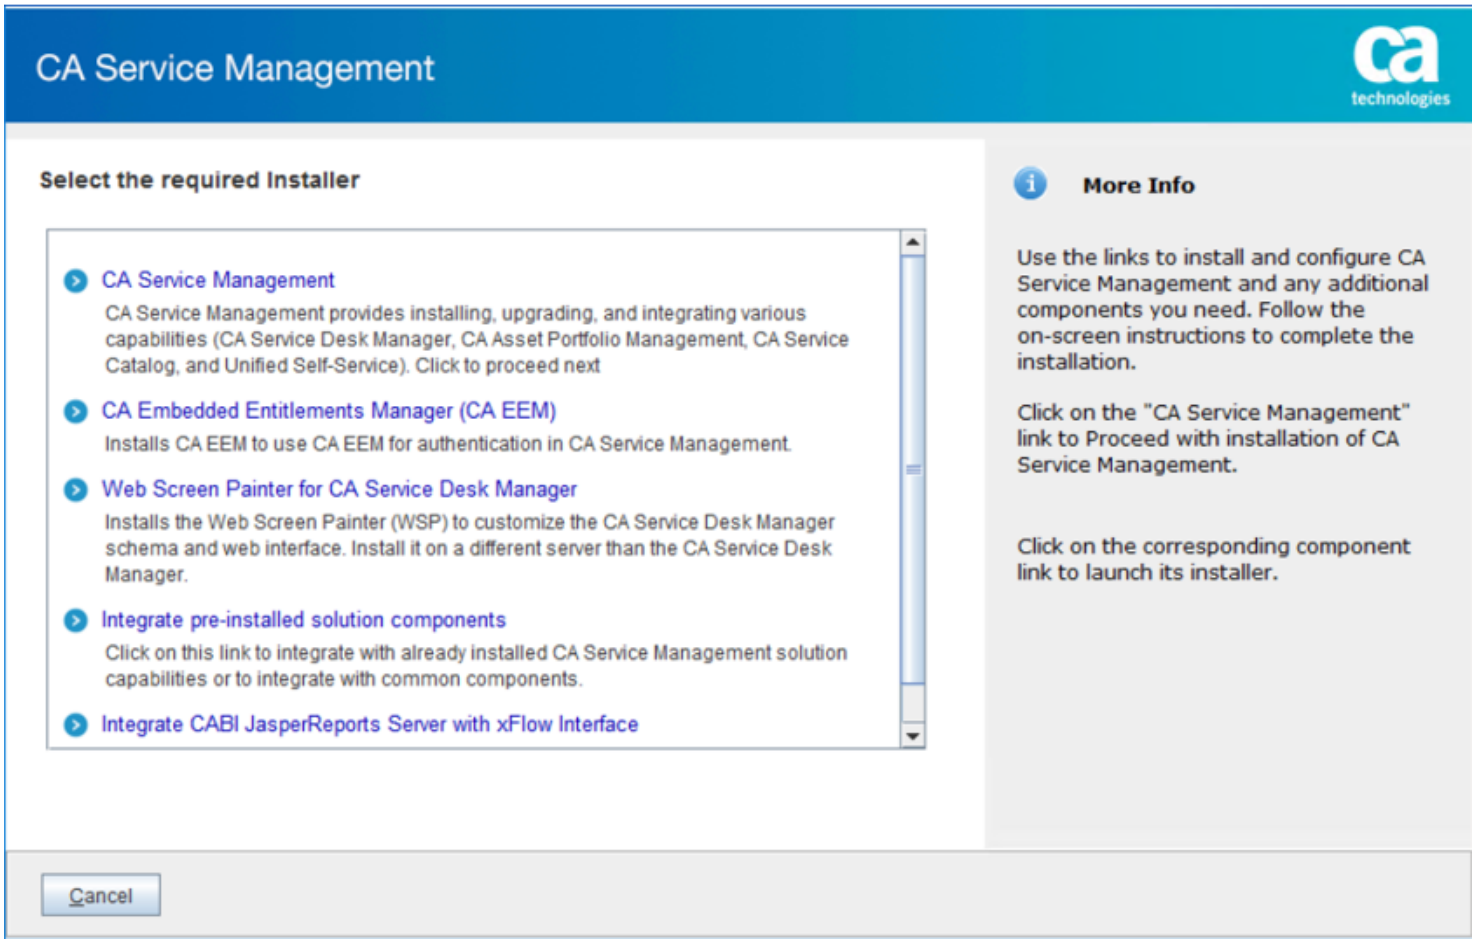
Install CA SDM Standby Server (testqa-sb-new)

Perform the following steps to install the standby server:

1. Login to Broadcom Support.
2. Mount CA Service Management 17.4 DVD and Launch the installer.
3. Select Language as **English**.



4. Click CA Service Management Link to run the CA Service Management installation wizard.



5. Review and accept the license agreement.
6. Select Database type as SQL Server. Enter the Database Server details (**testqa-mdb-new**) and provide the database password.

Provide details for installing the CA Management Database (MDB) (Oracle or SQL).
Ensure that you have the Oracle or MS SQL database Client installed.
Database Admin User is the privileged user who can create and give access to the application database user.
If the MDB is already installed, the installer will use the same for CA Service Management. If not, it will create the MDB and the mdbadmin user with the password that you have specified
Clicking on Skip this Step link will proceed with installation of a Secondary Server for CA Service Desk Manager.

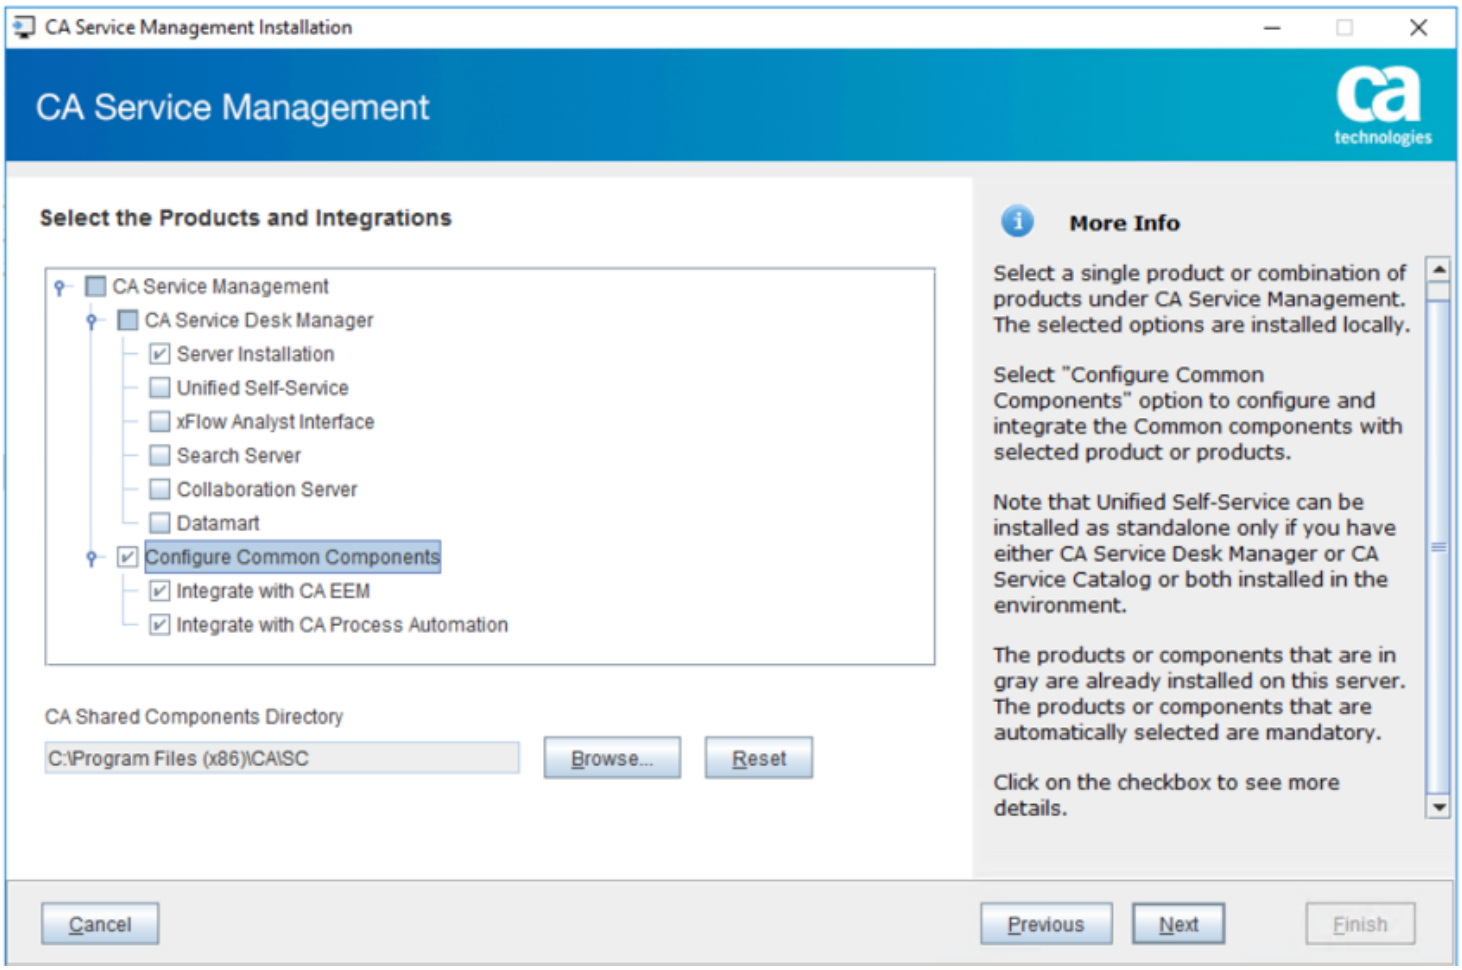
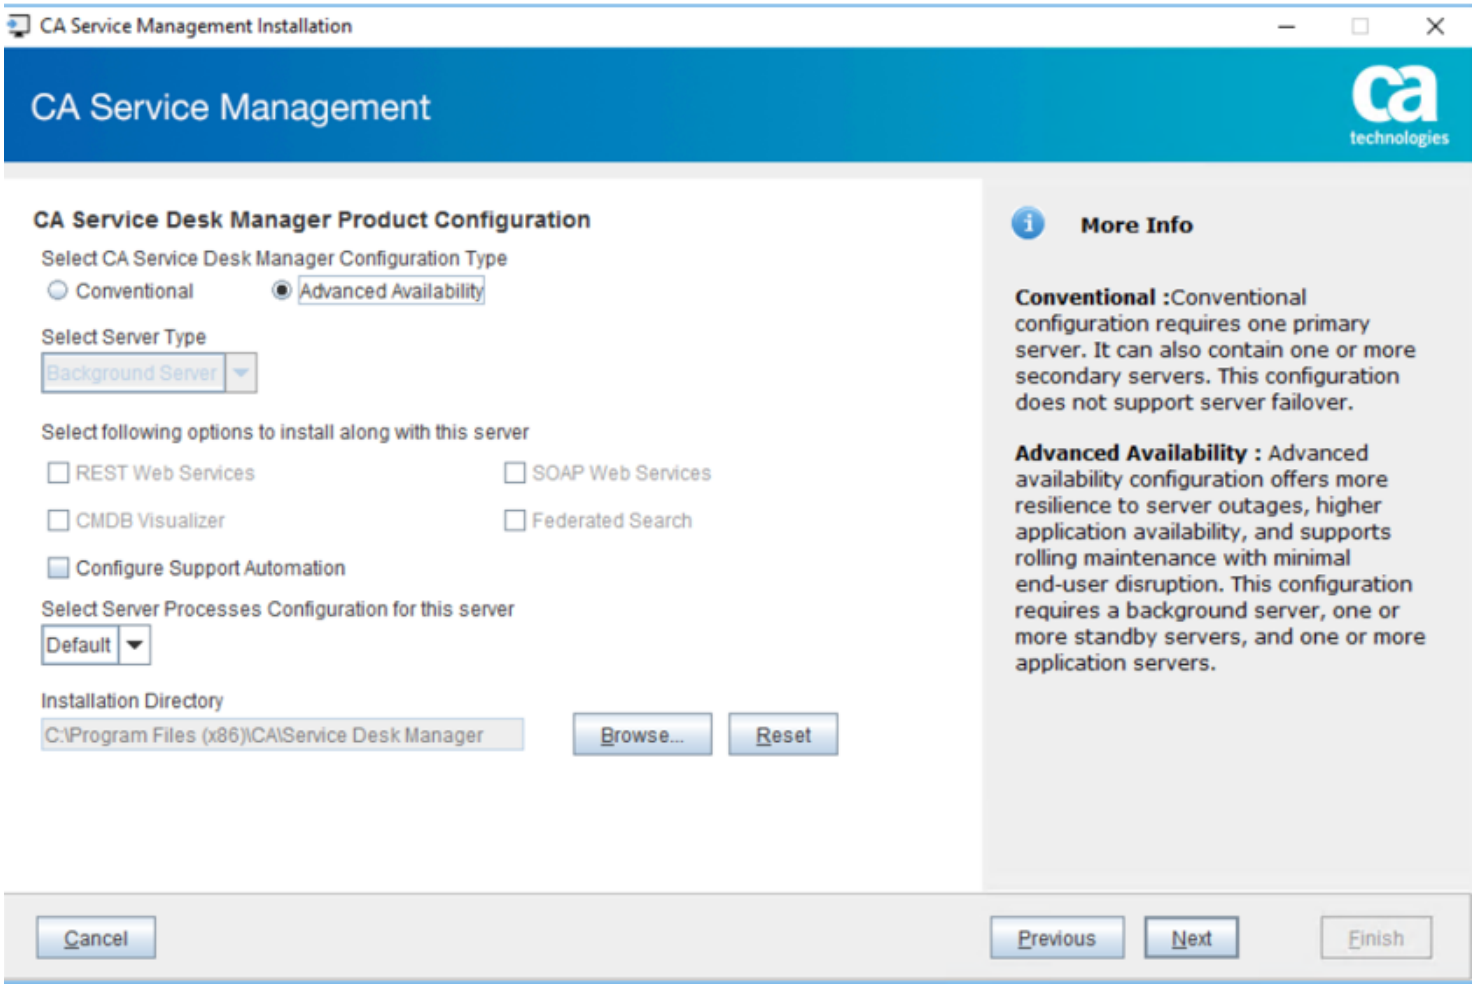
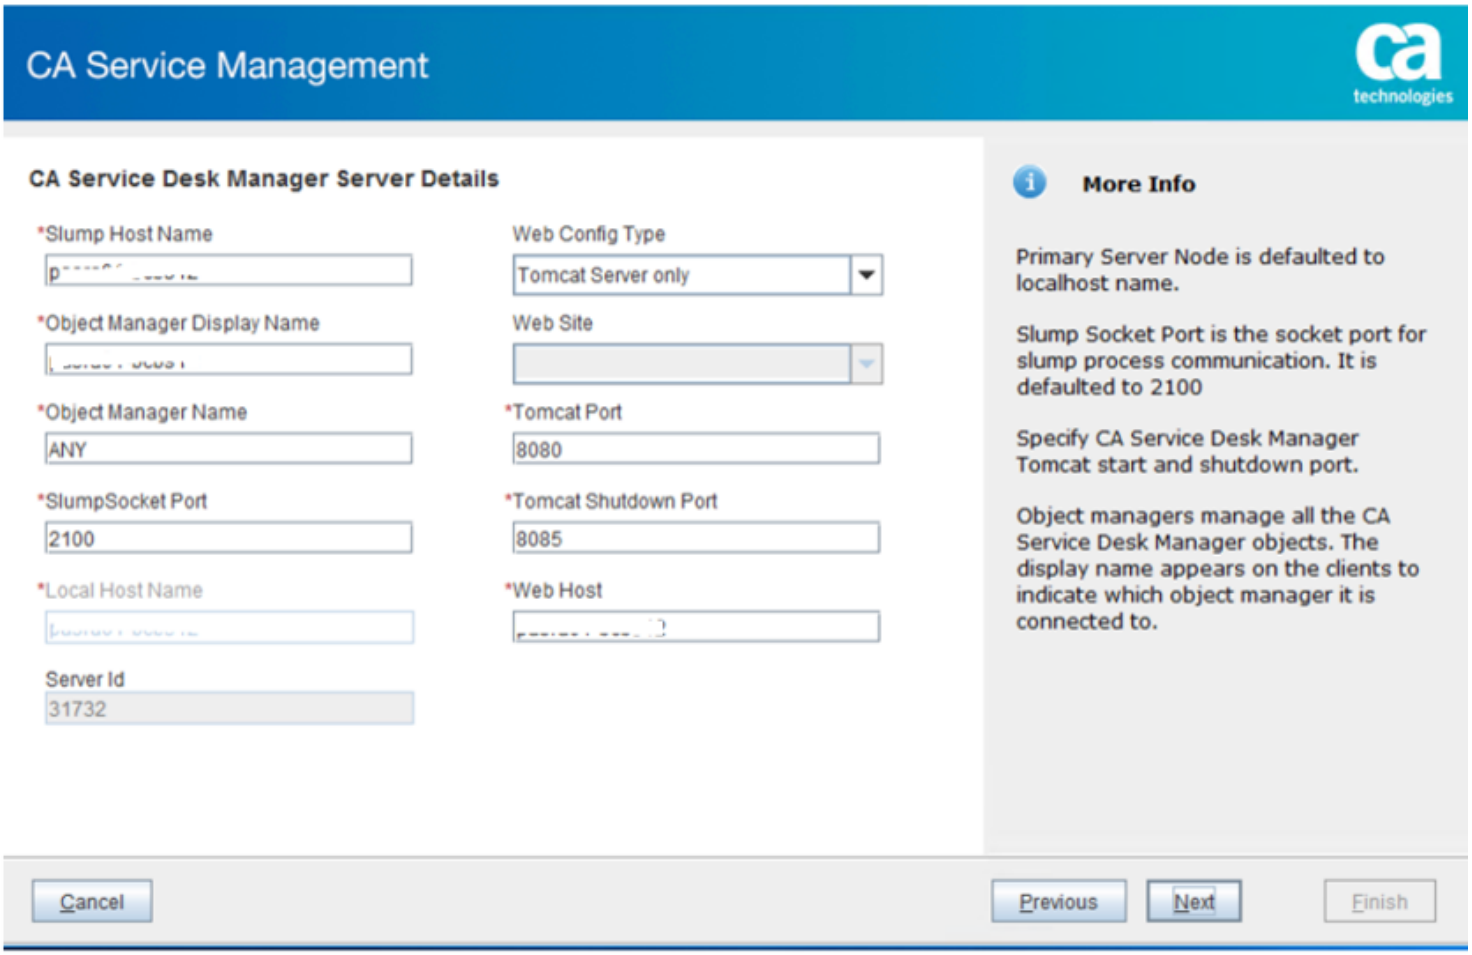
9. Select Configure Common Components (CA EEM and CA Process Automation).



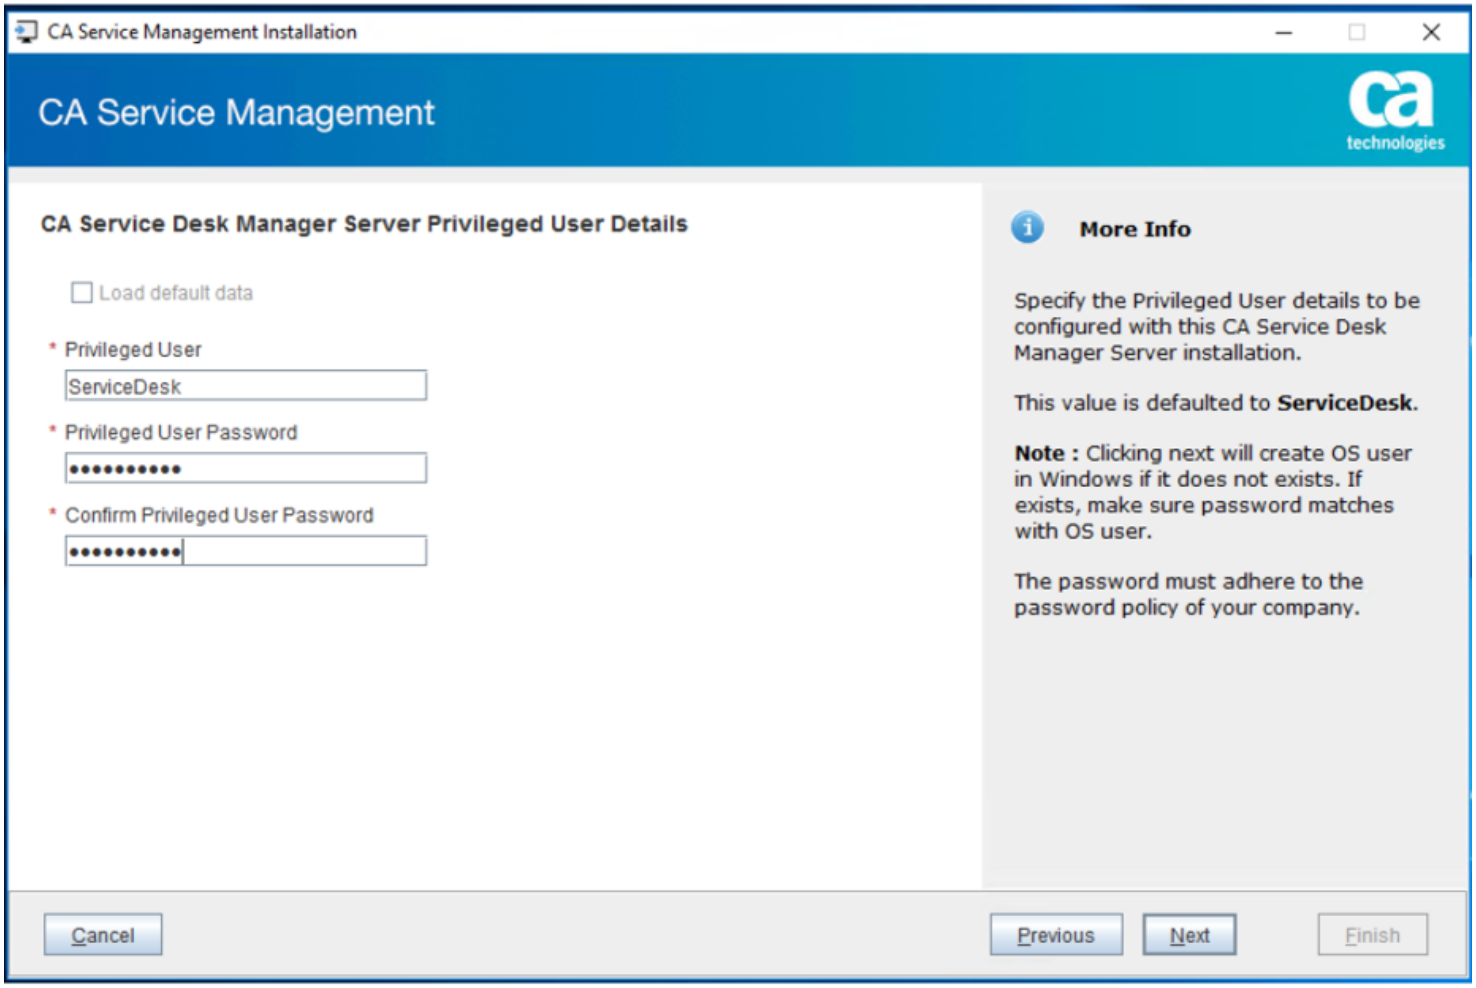
10. Review the installation prerequisites.
11. Click **Next**.
12. Click **Next**.
    Select Advanced Availability configuration. Enter the required details.



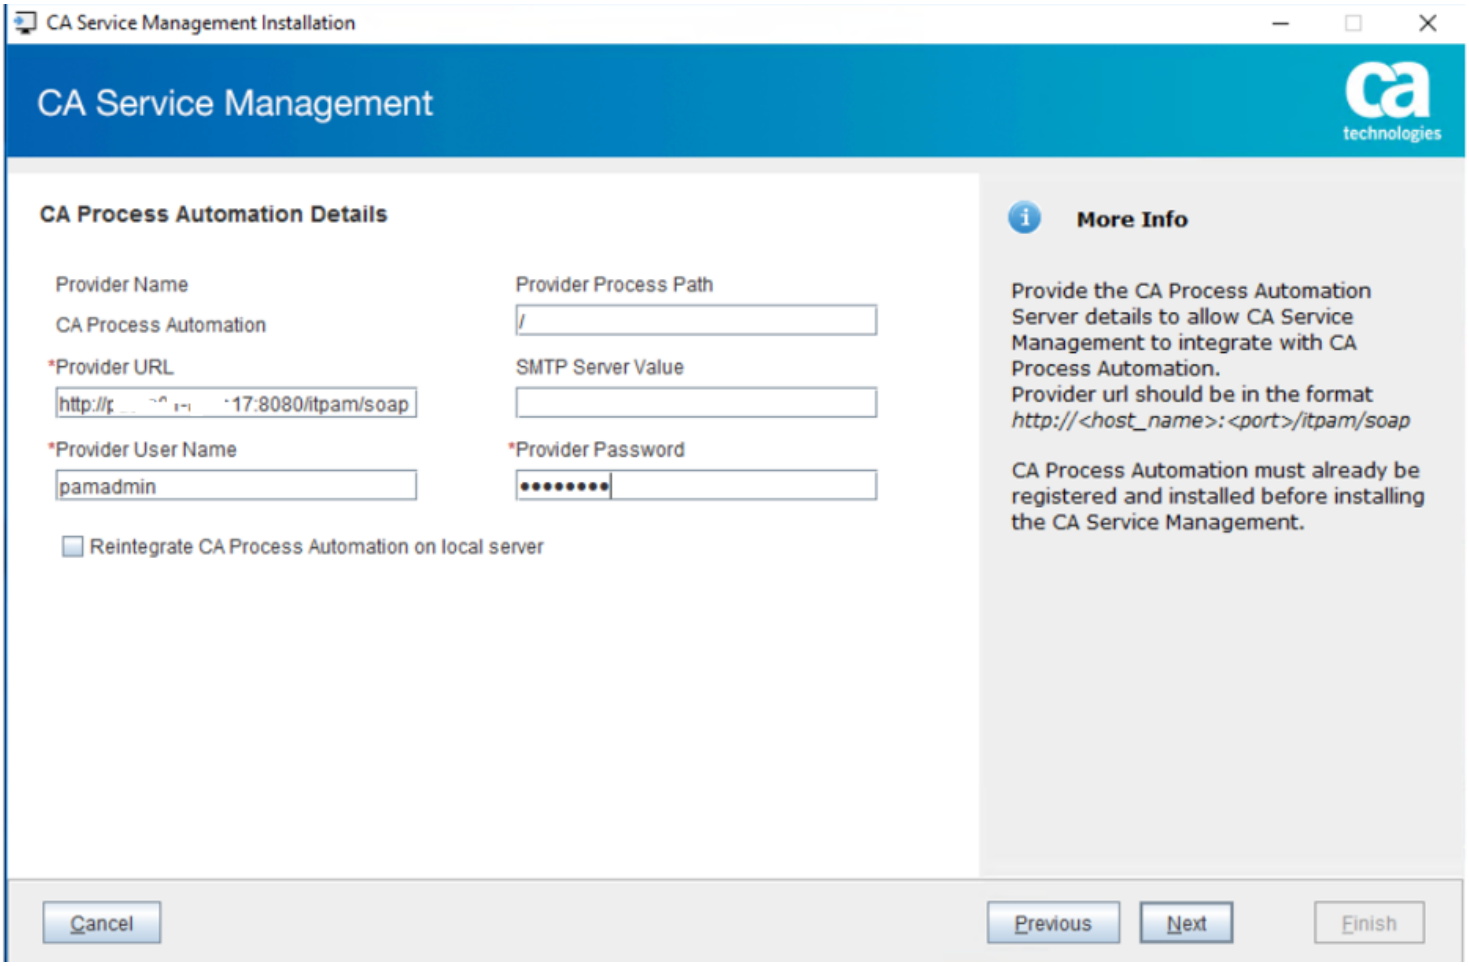
13. Click **Next**.
14. Provide Slump host name and other details (Tomcat port, slump host name, slump port, Object Manager name and web host details) as seen below.



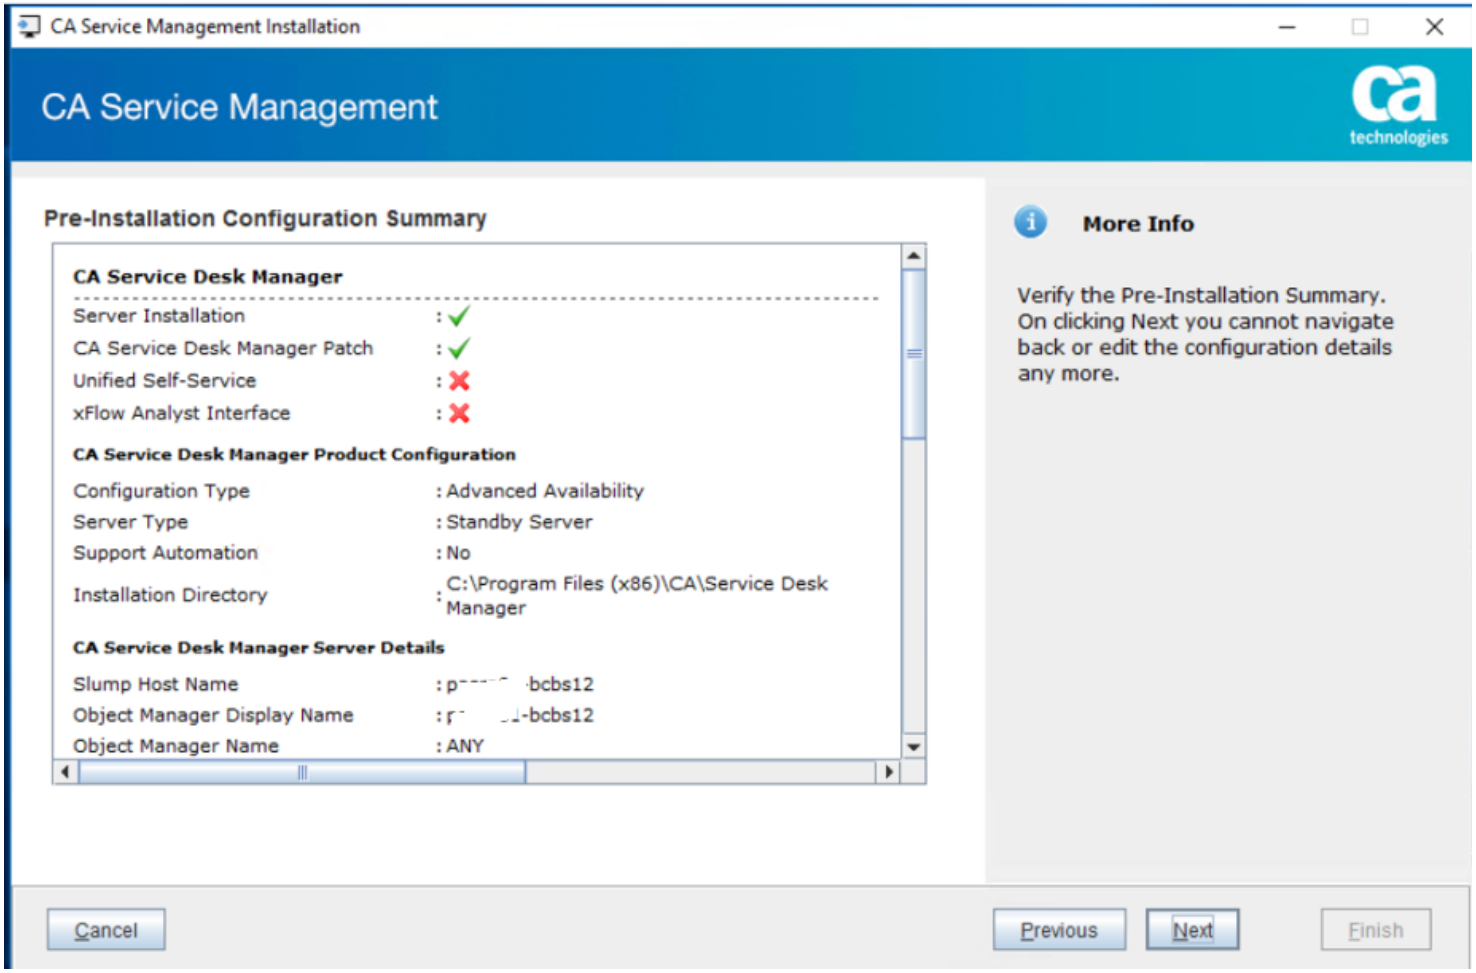
15. Click**Next**.
    Enter Privileged User Password and Confirm Privileged User Password



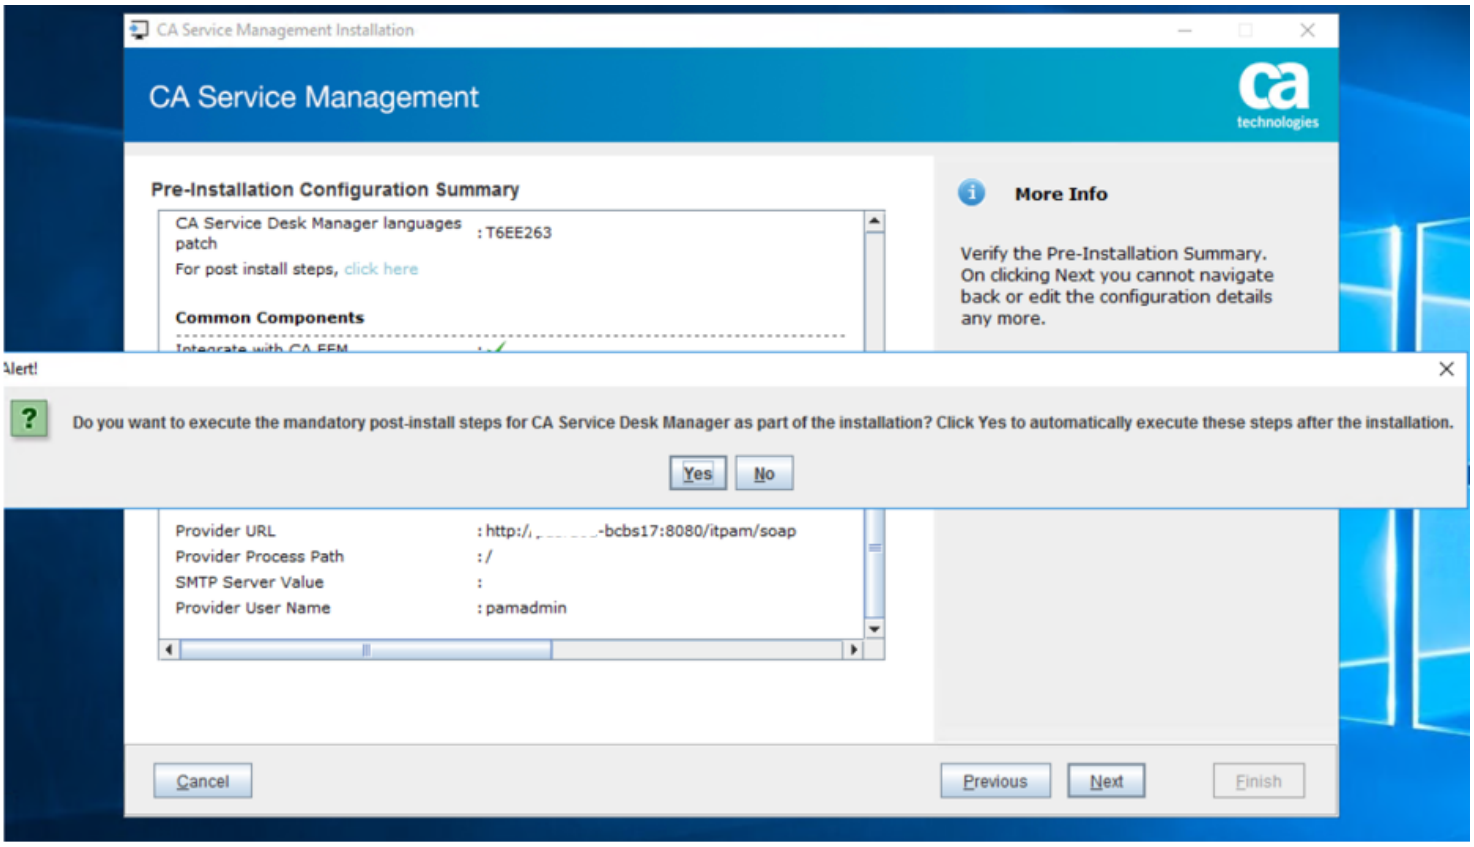
16. Click **Next**.
    Enter EEM Admin Password
17. Click **Next**.
    Enter CA Process Automation Provider Password



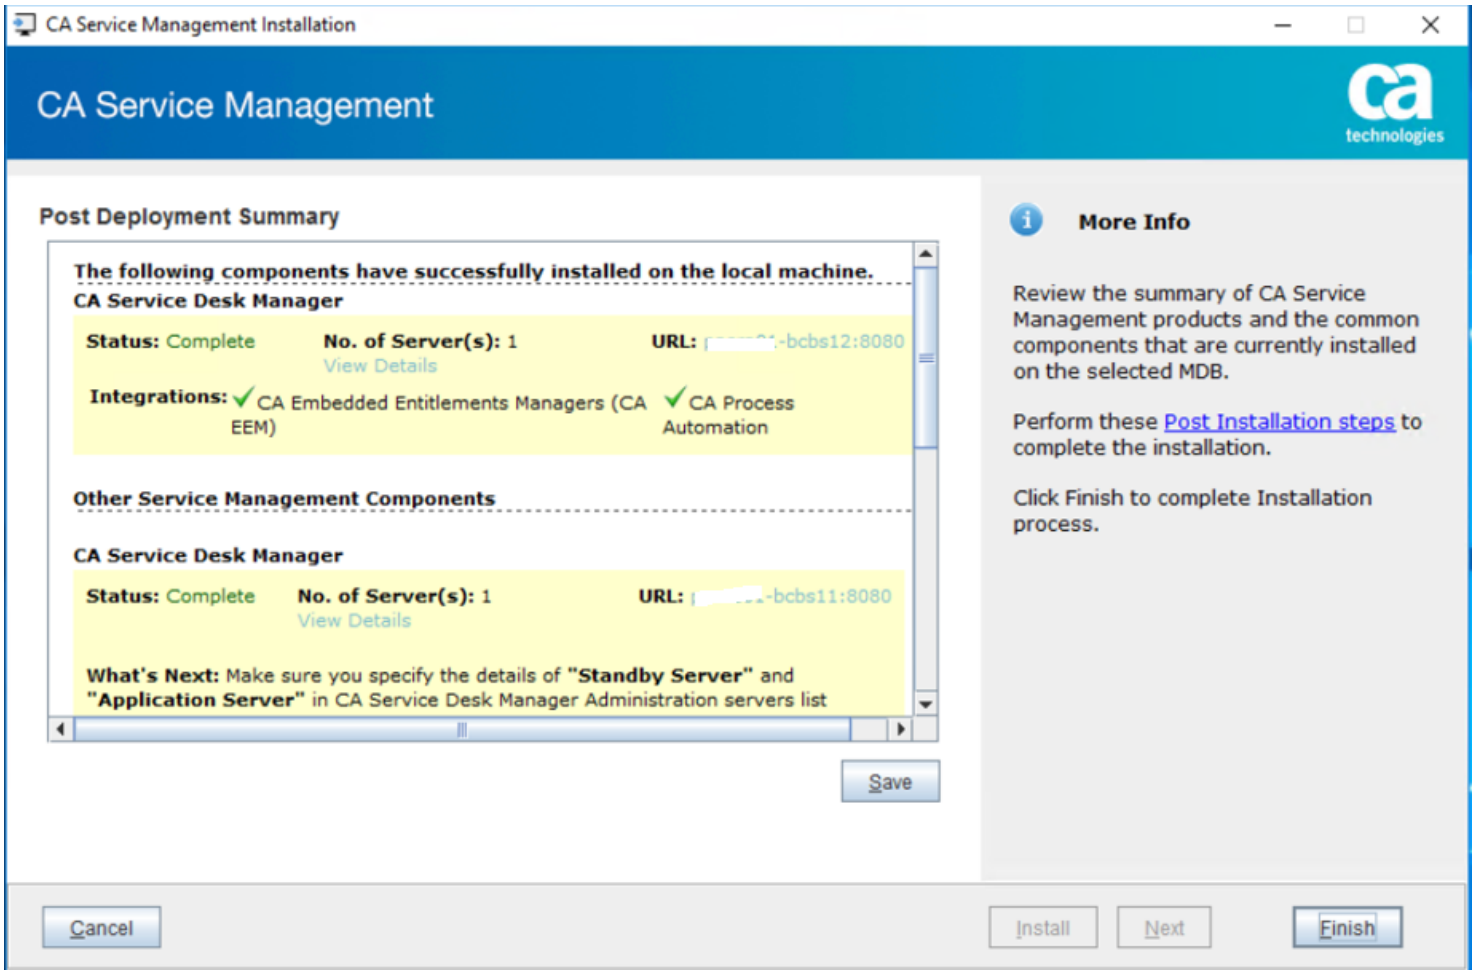
18. Click **Next**.
19. Review the Post-Installation Configuration Summary.
    It shows installation progress for selected components.



20. Click **Yes** to automatically execute the post-installation steps. Click **No** to perform manual post-installation steps.



21. Click **Install**.

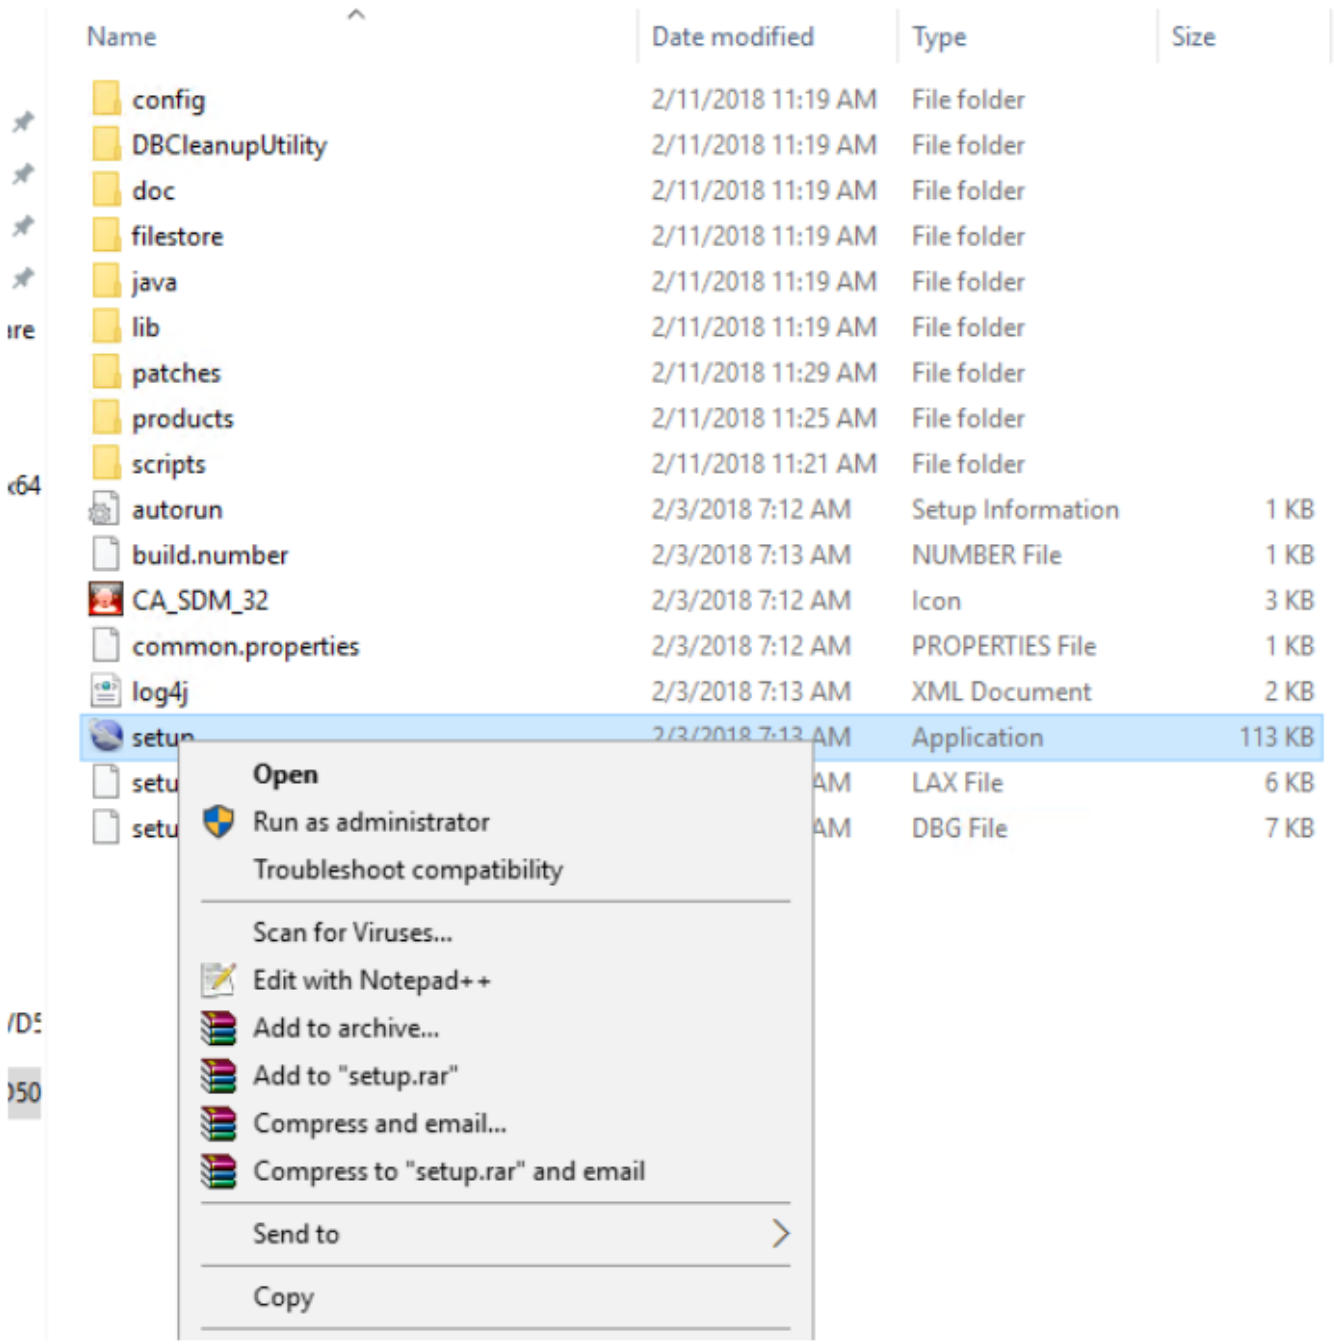


22. Click **Finish**.

Install the First Application Server (testqa-app1-new)

Perform the following steps:

1. Mount the SDM DVD and select **setup.exe**, right click '**Run as Administrator**'.



2. Click **Next**. Select Language “**English**”.
3. Click **CA Service Management** link to run the CA Service Management Installation wizard.
4. Review and accept the license agreement.
5. Click **Next**.
6. Enter Database Server as **testqa-mdb-new**and enter all passwords.

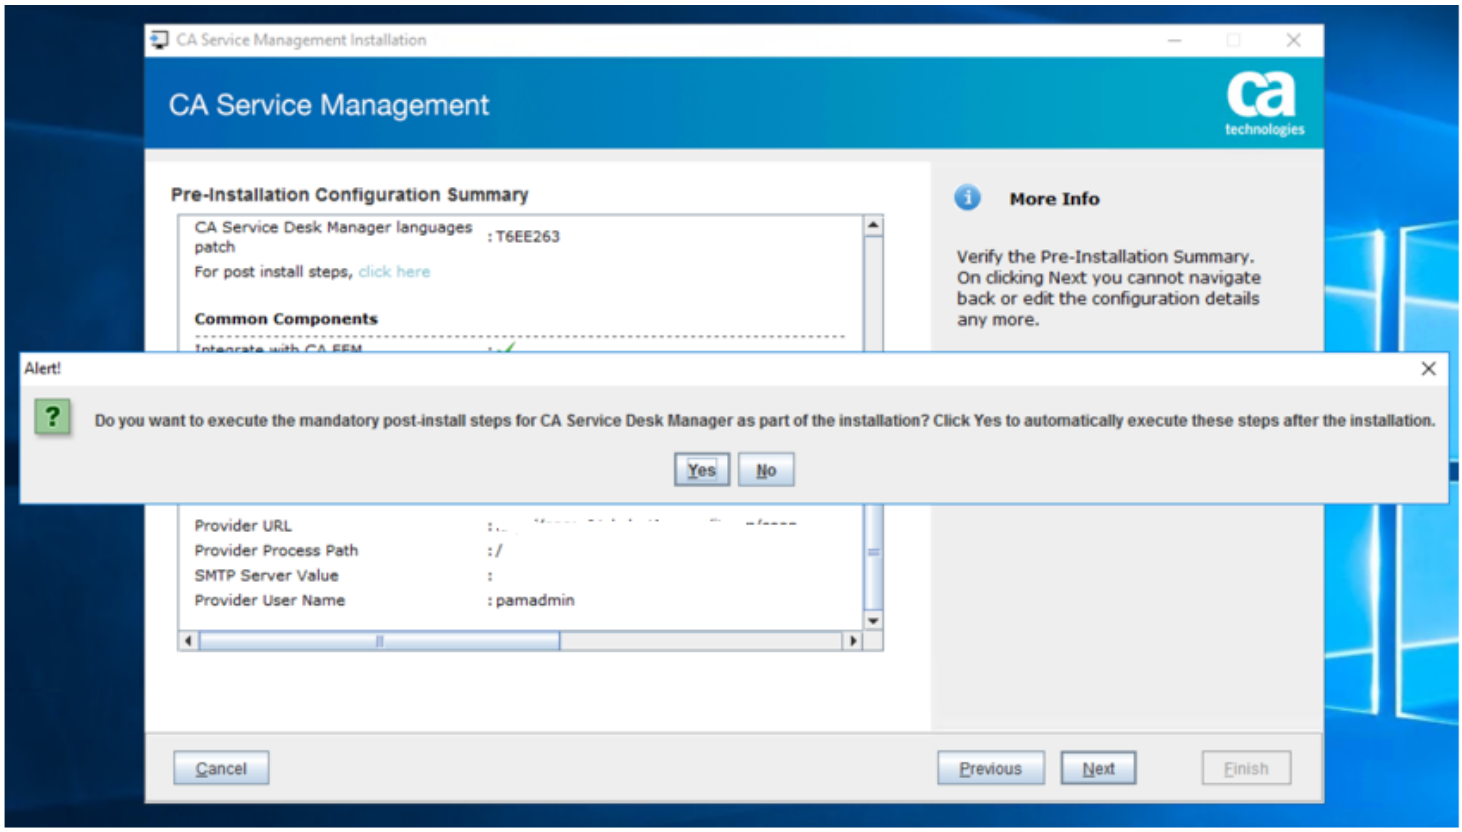
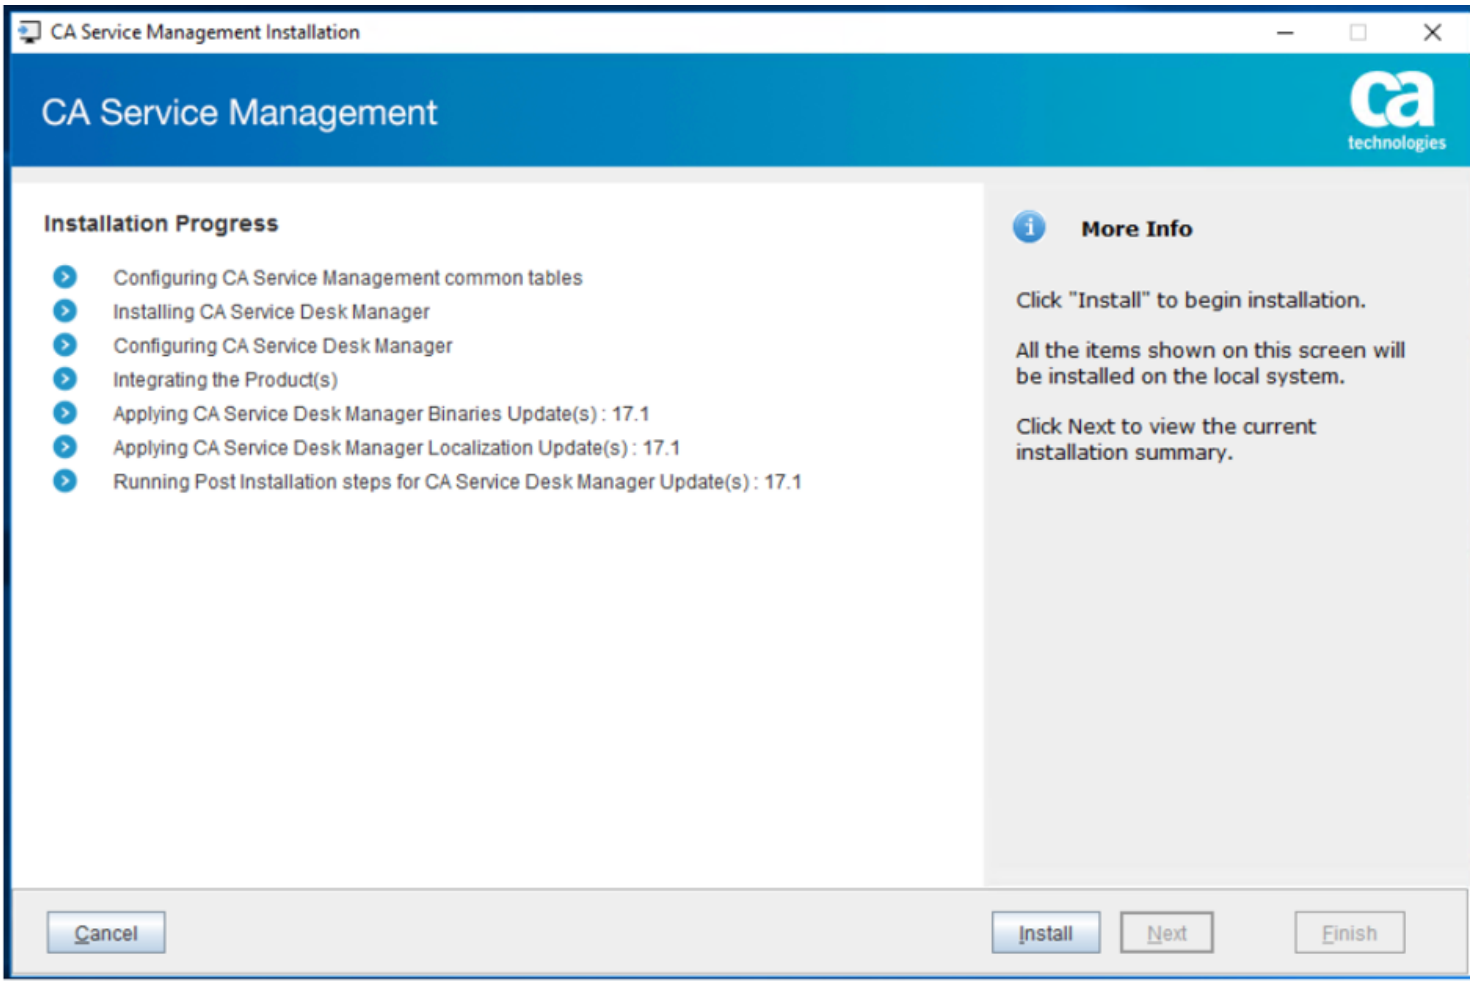
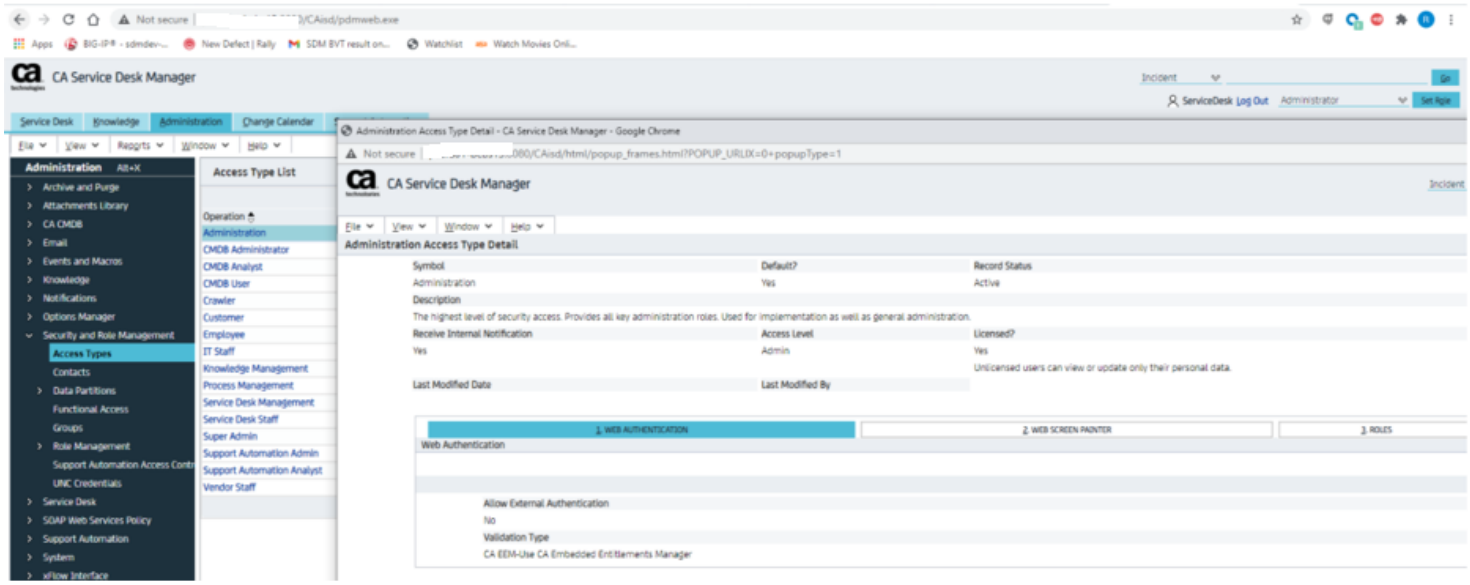
20. Click **Next**.
    Follow the Installation wizard.
21. Click **Next**.
22. Click **Yes** to automate the post-install steps. Click **No** to perform manual post-install steps.



23. Click **Install**.



24. Click **Finish** once installation completes.
25. Review the Post-Installation Summary.
26. Open the SDM Application Server URL: *http://testqa-app1-new:8080/CAisd/pdmweb.exe*
27. Enter Login or access credentials (Username and password).
28. Check the EEM option in the Administration Access type detail page using the Navigation path Administration tab, Security and Role Management, Access Type.

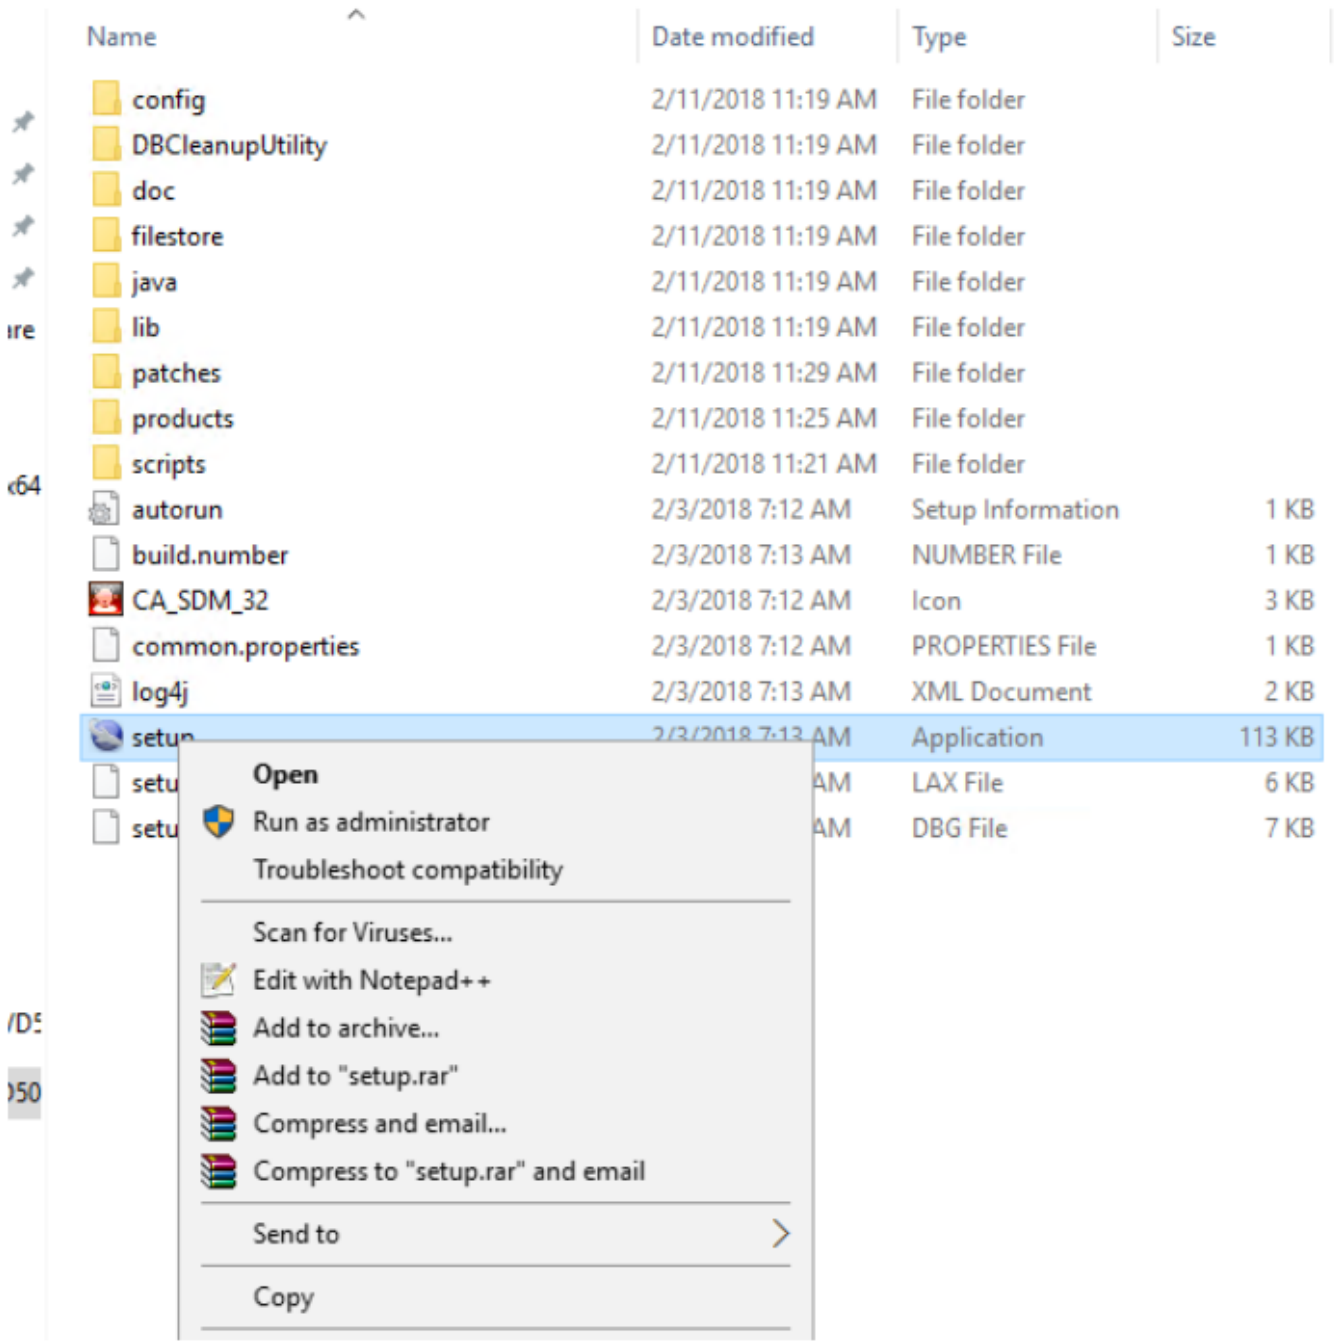


This completes the Application Server 1 (**testqa-app1-new**) installation.

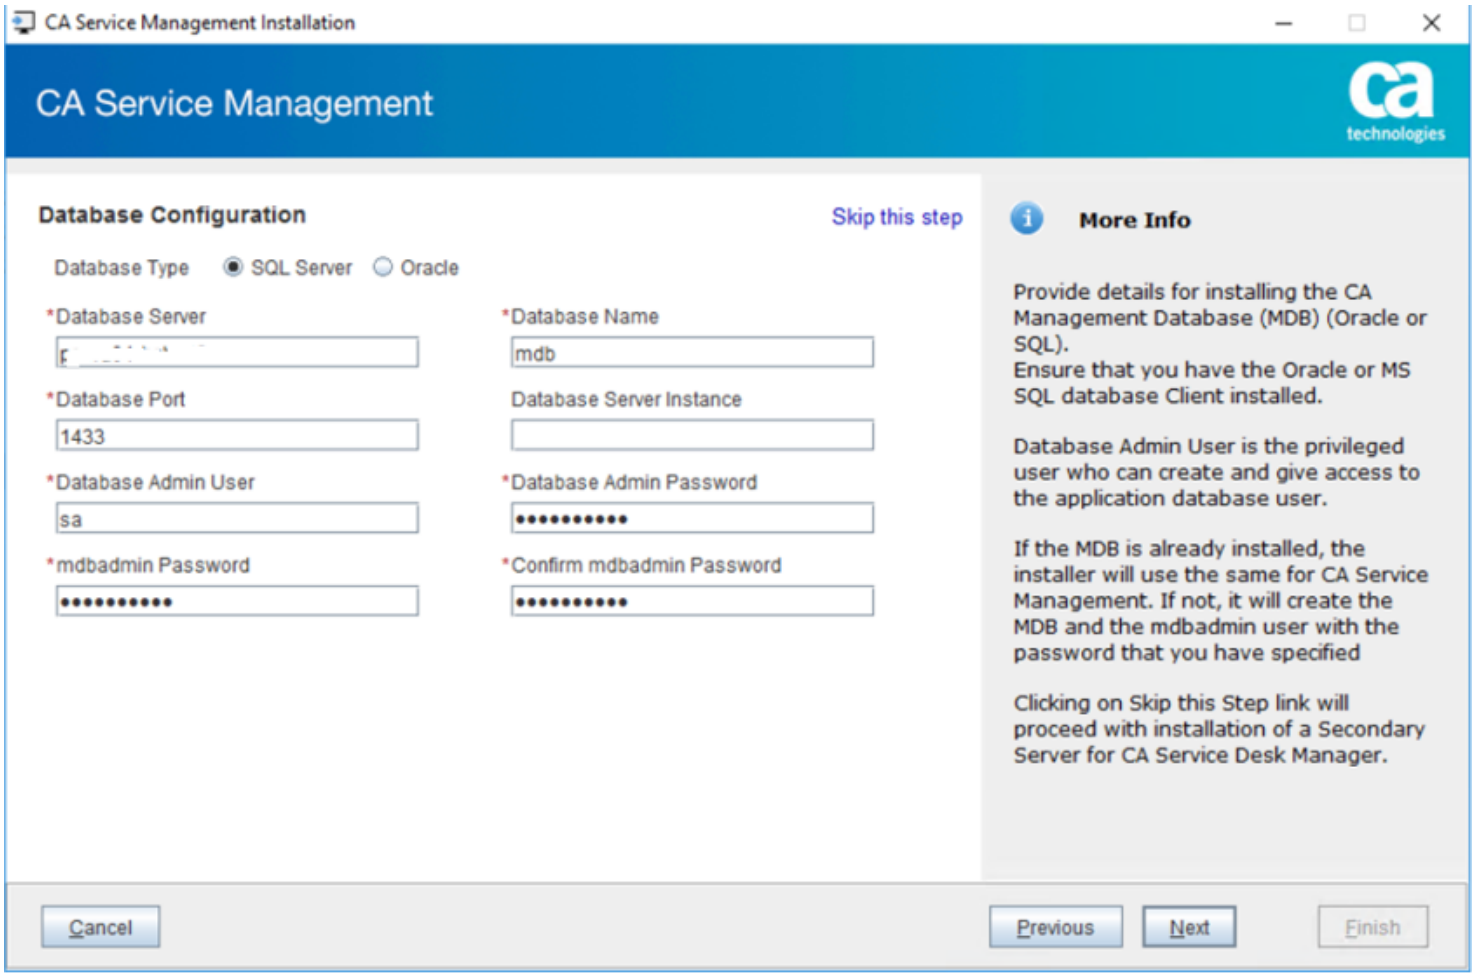
Install the Second Application Server (testqa-app2-new)

Perform the following steps:

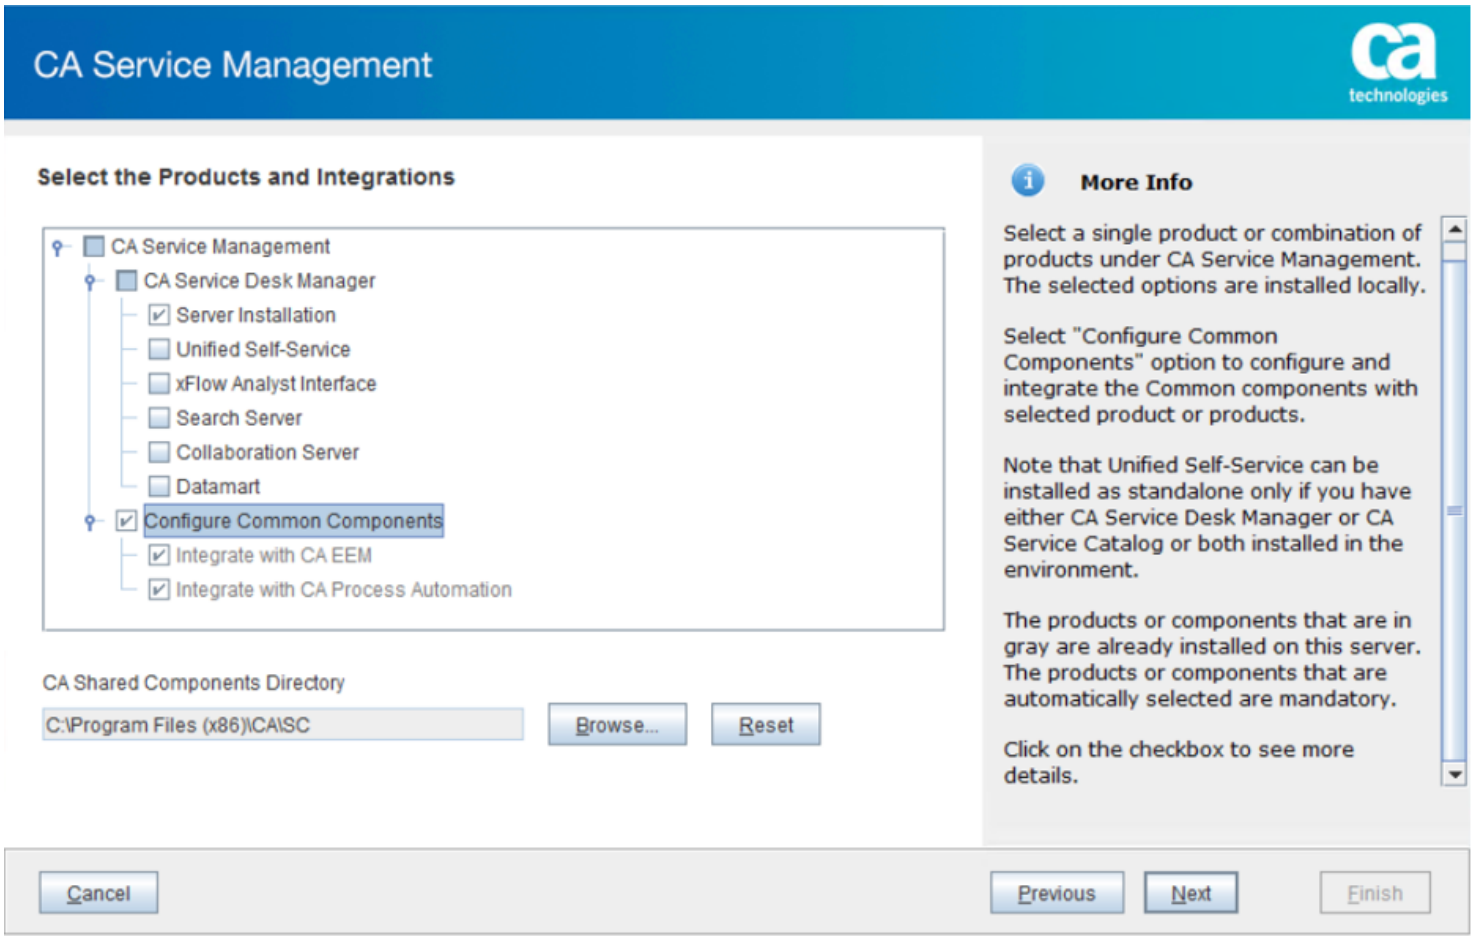
1. Mount the SDM DVD and Select the setup.exe, right click "**Run as Administrator**".



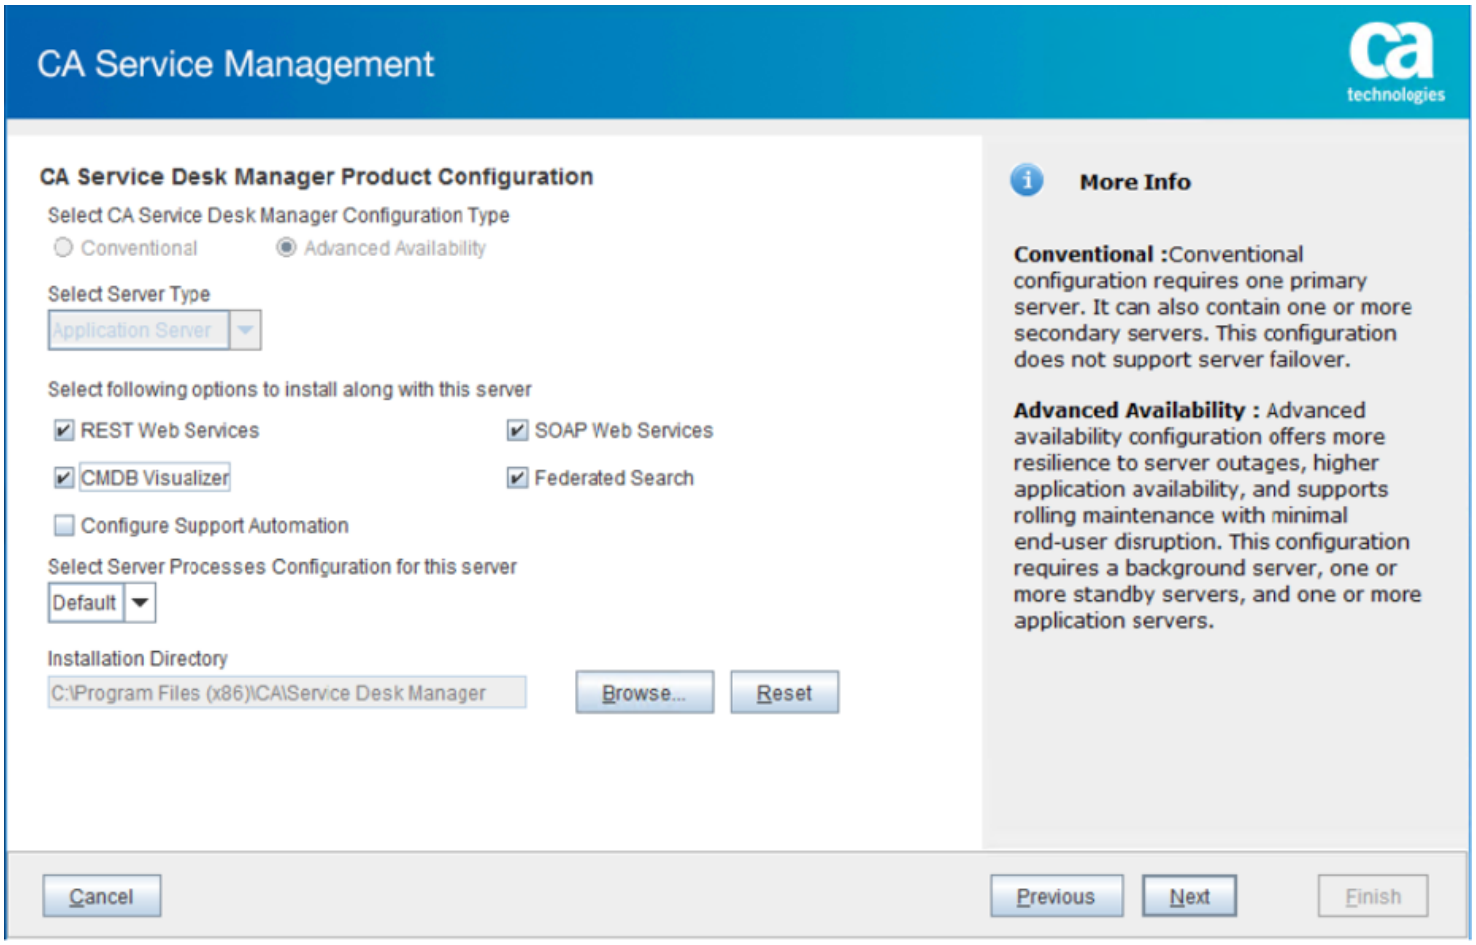
2. Click **Next**. Select **English** as Language.
3. Click "**CA Service Management**" link to run the CA Service Management Installation Wizard.
4. Review and accept the license agreement.
5. Enter the database details based on your environment requirements.



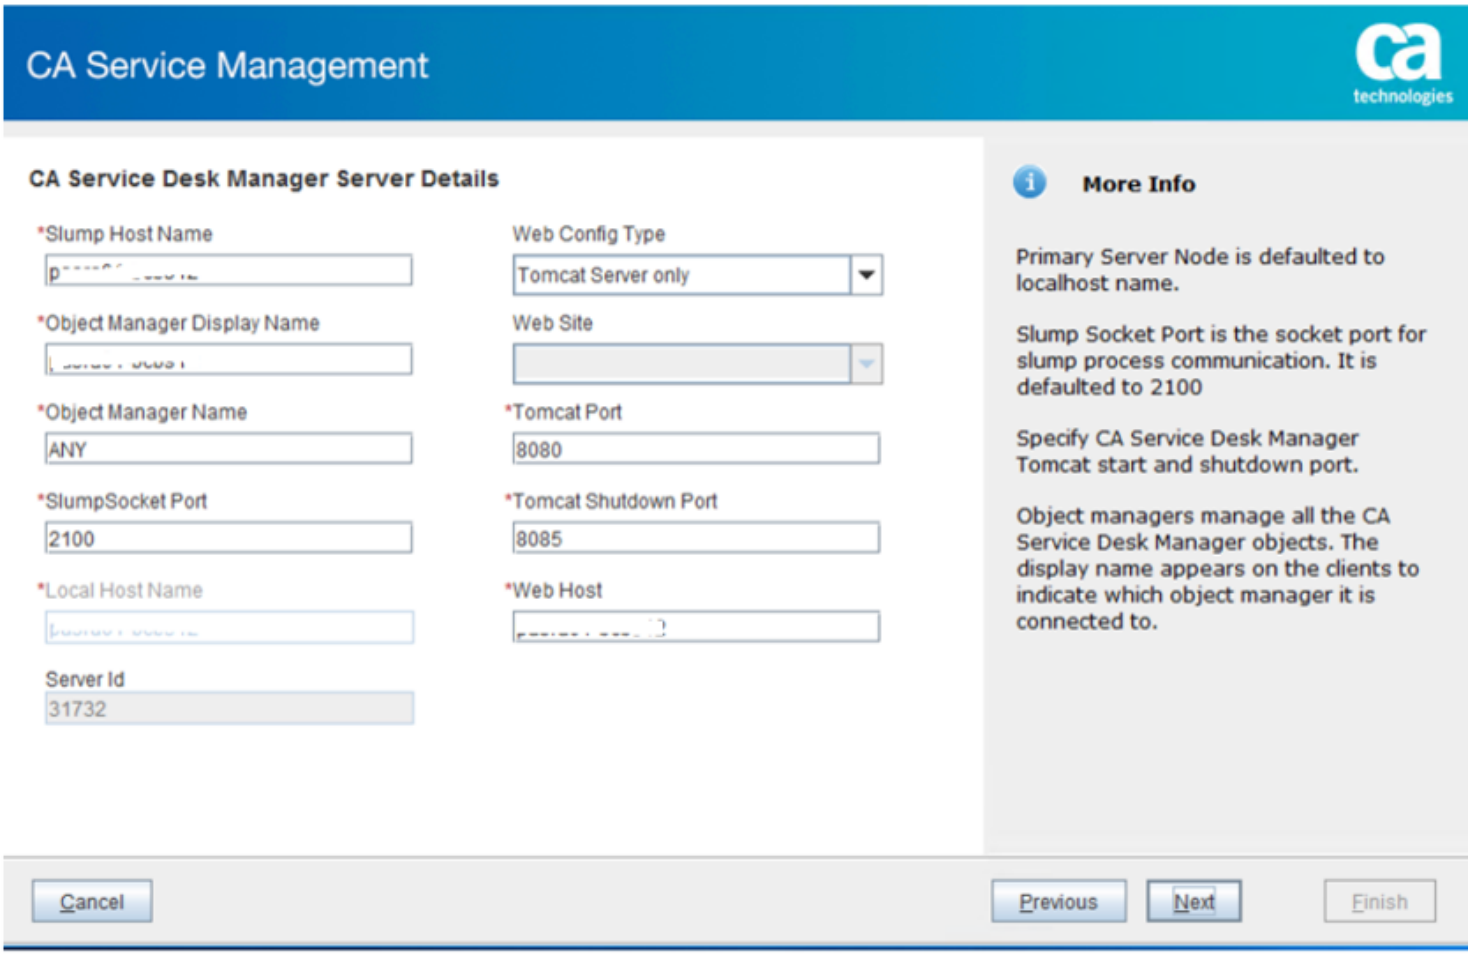
6. Click **Next**. Review the Current Deployment details in your environment.
7. Click **Next**. Check the "**Server Installation**" checkbox under CA Service Desk Manager and Select "**Configure Common Components**" check box (CA EEM and CA Process Automation).



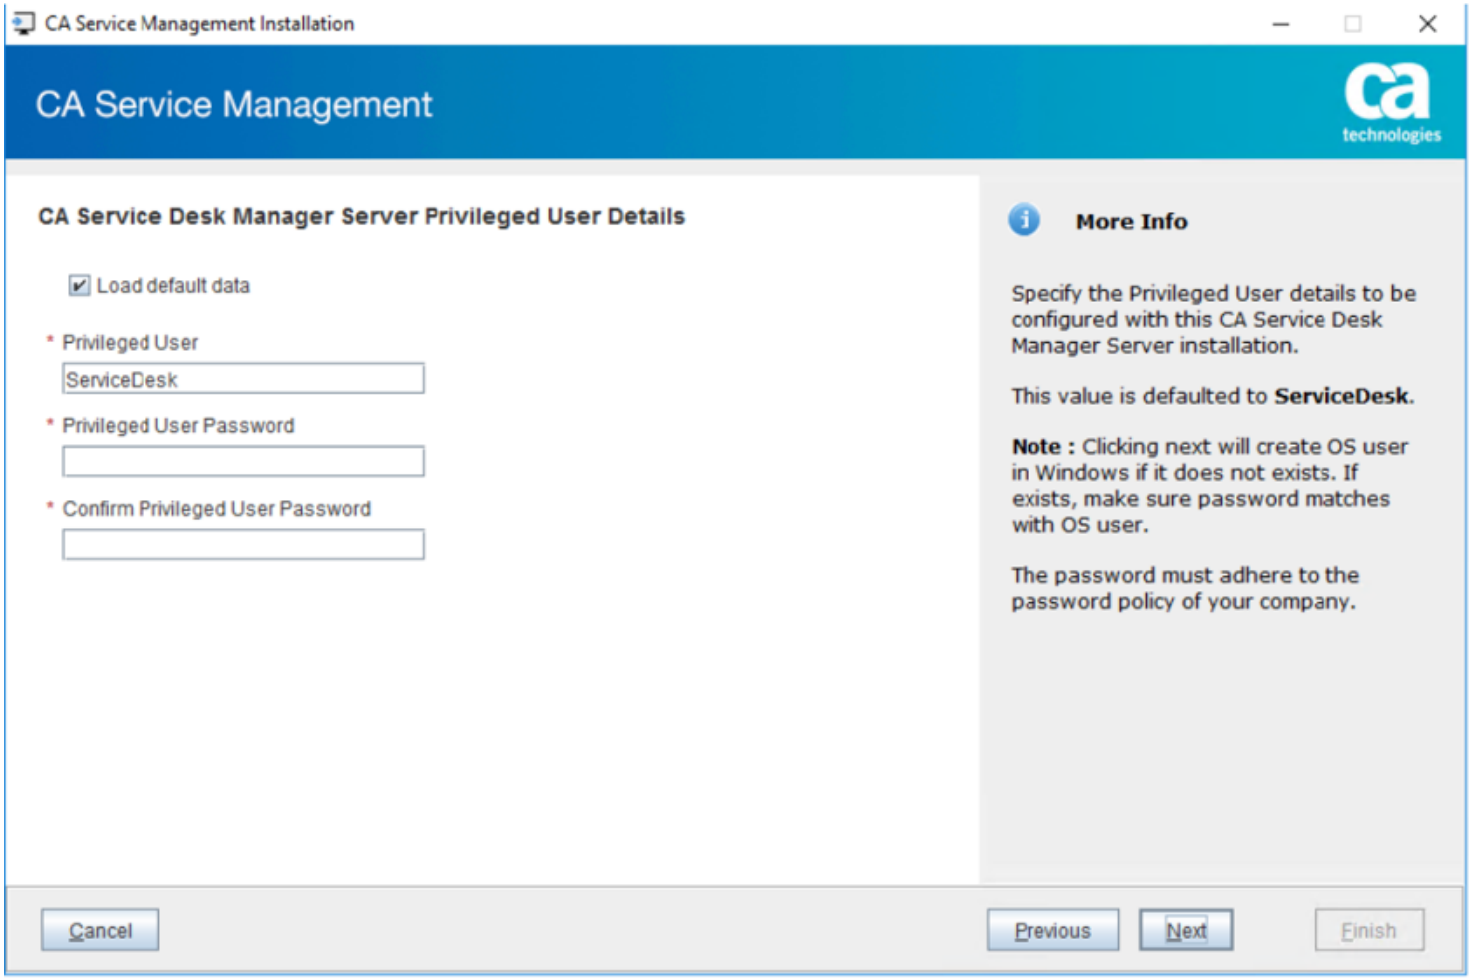
8. Click **Next**. Review the installation prerequisites.
9. Click **Next**. Select the Advanced Availability configuration.



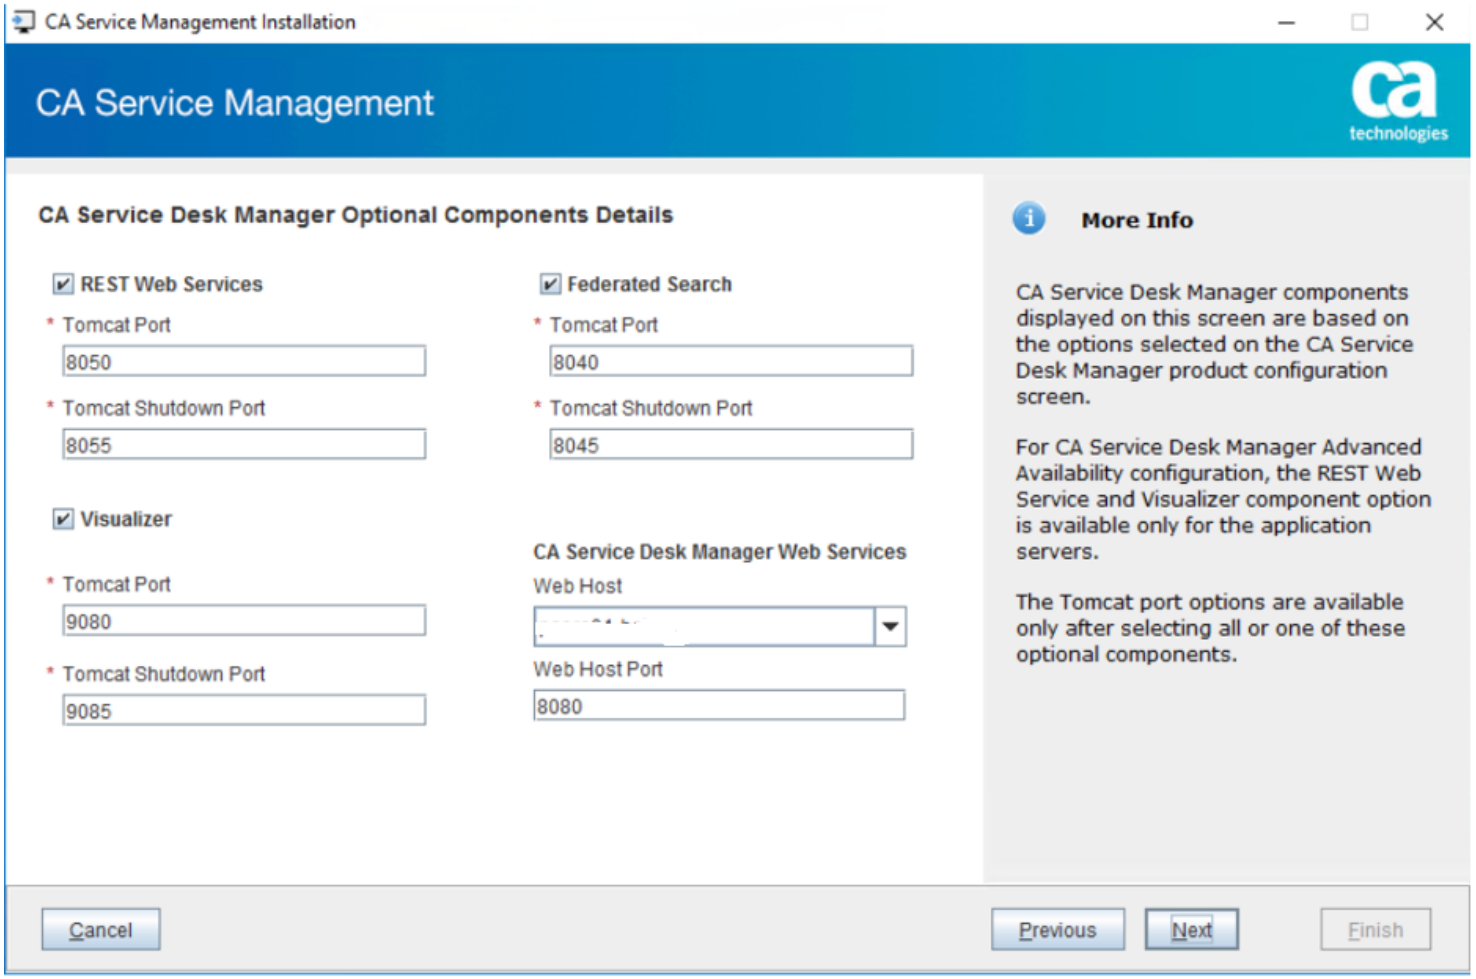
10. Provide the Slump host name, slum port details, Tomcat Port, and object manager name.



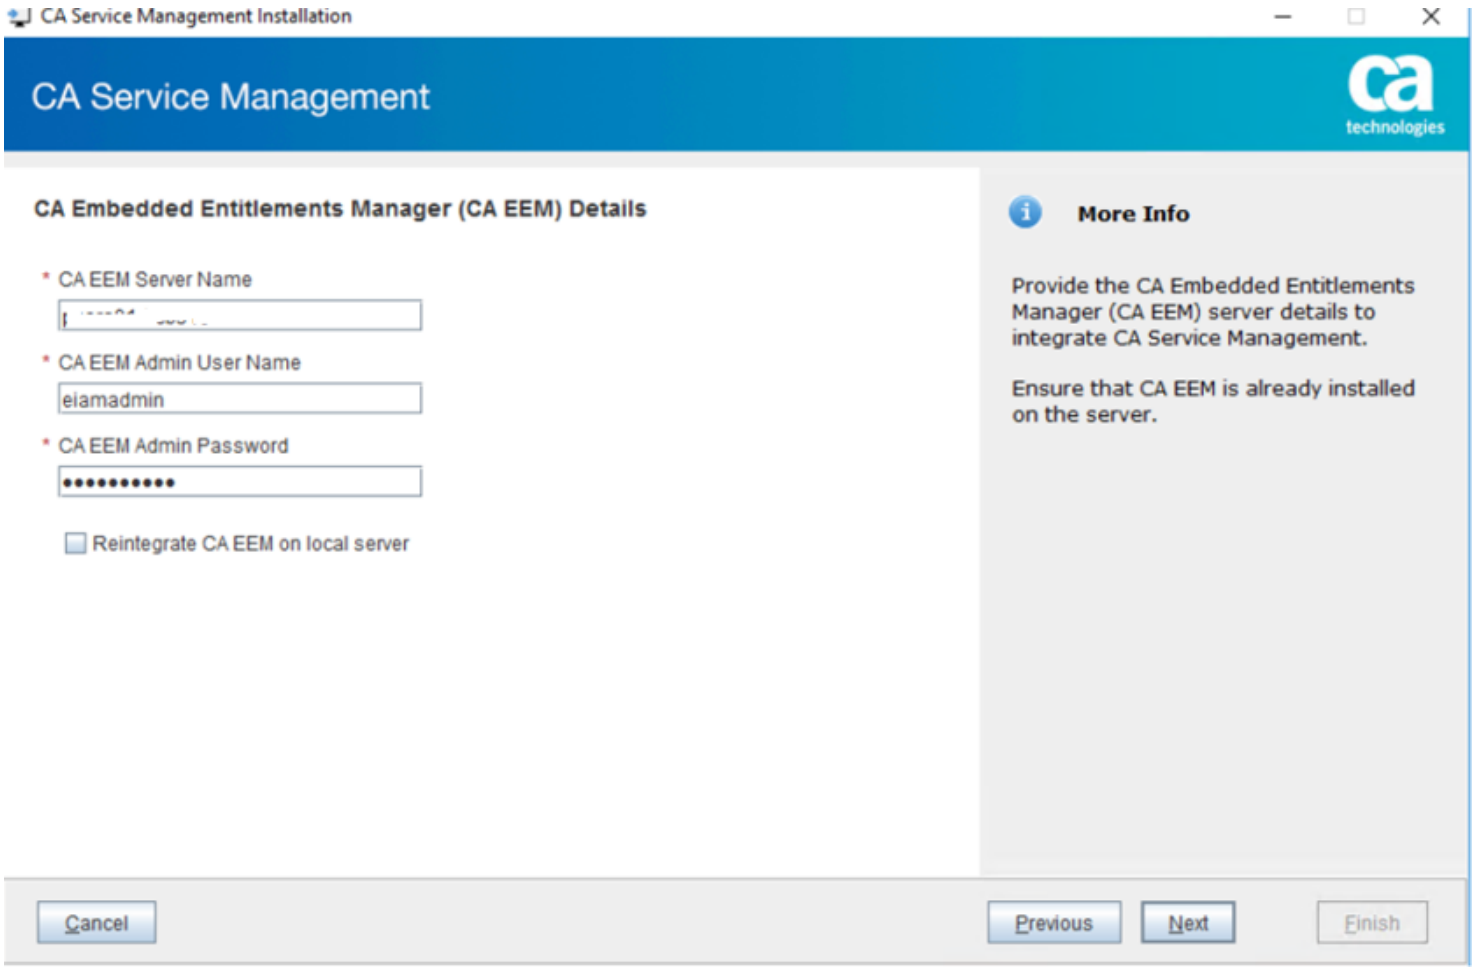
11. Enter the privileged User password and Confirm Privileged User Password.



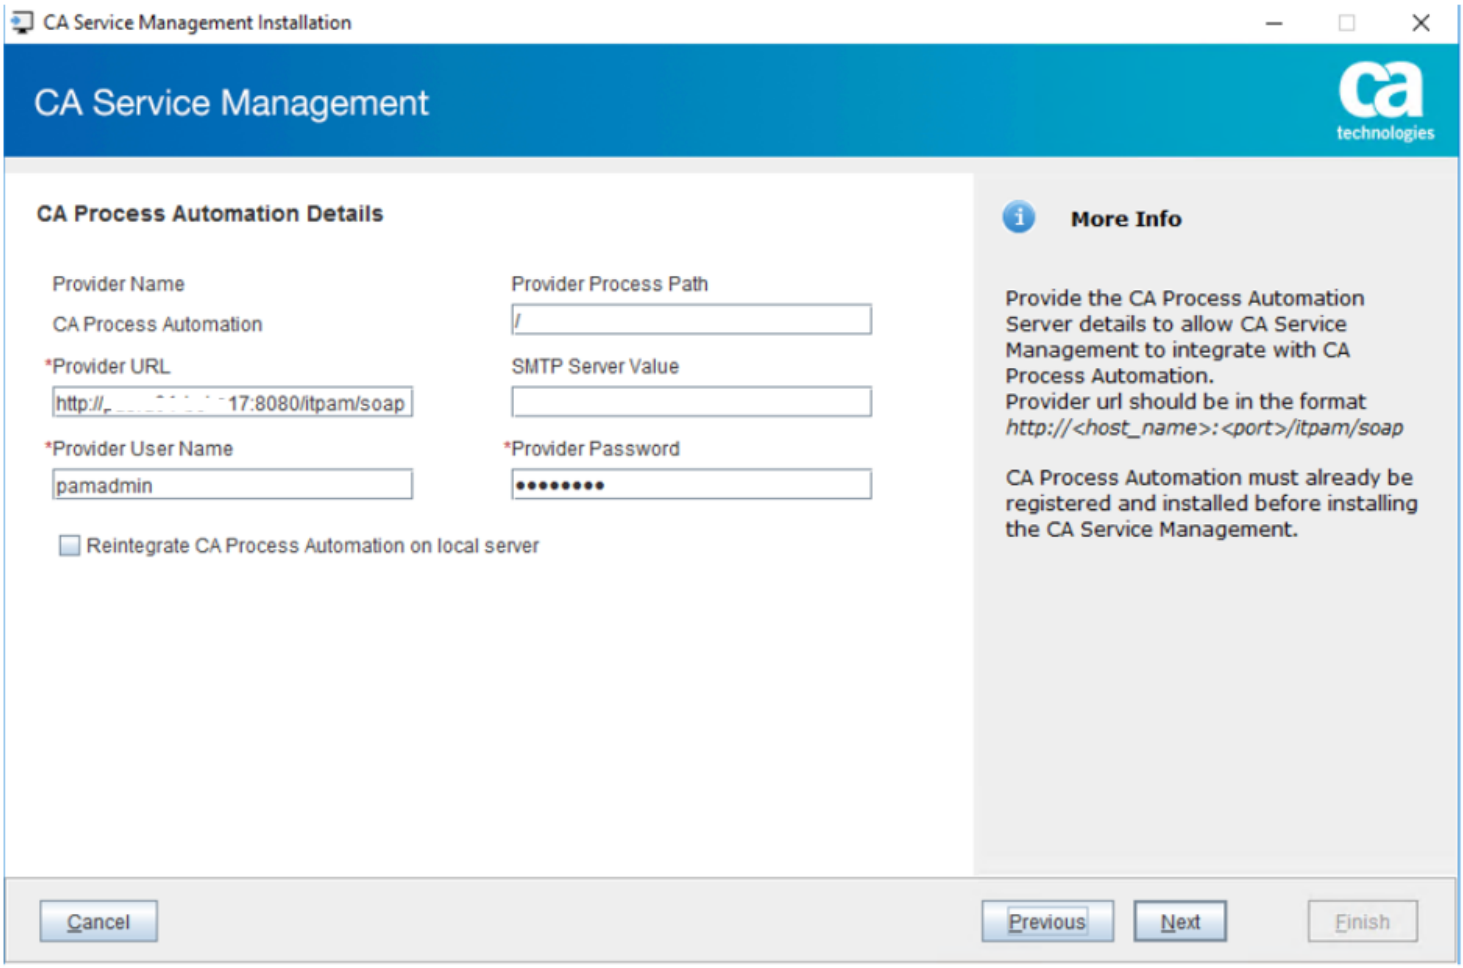
12. Enter the CA SDM Optional Component Details like Rest Web Services, Tomcat Shutdown port, Federated Search, and Visualizer details.



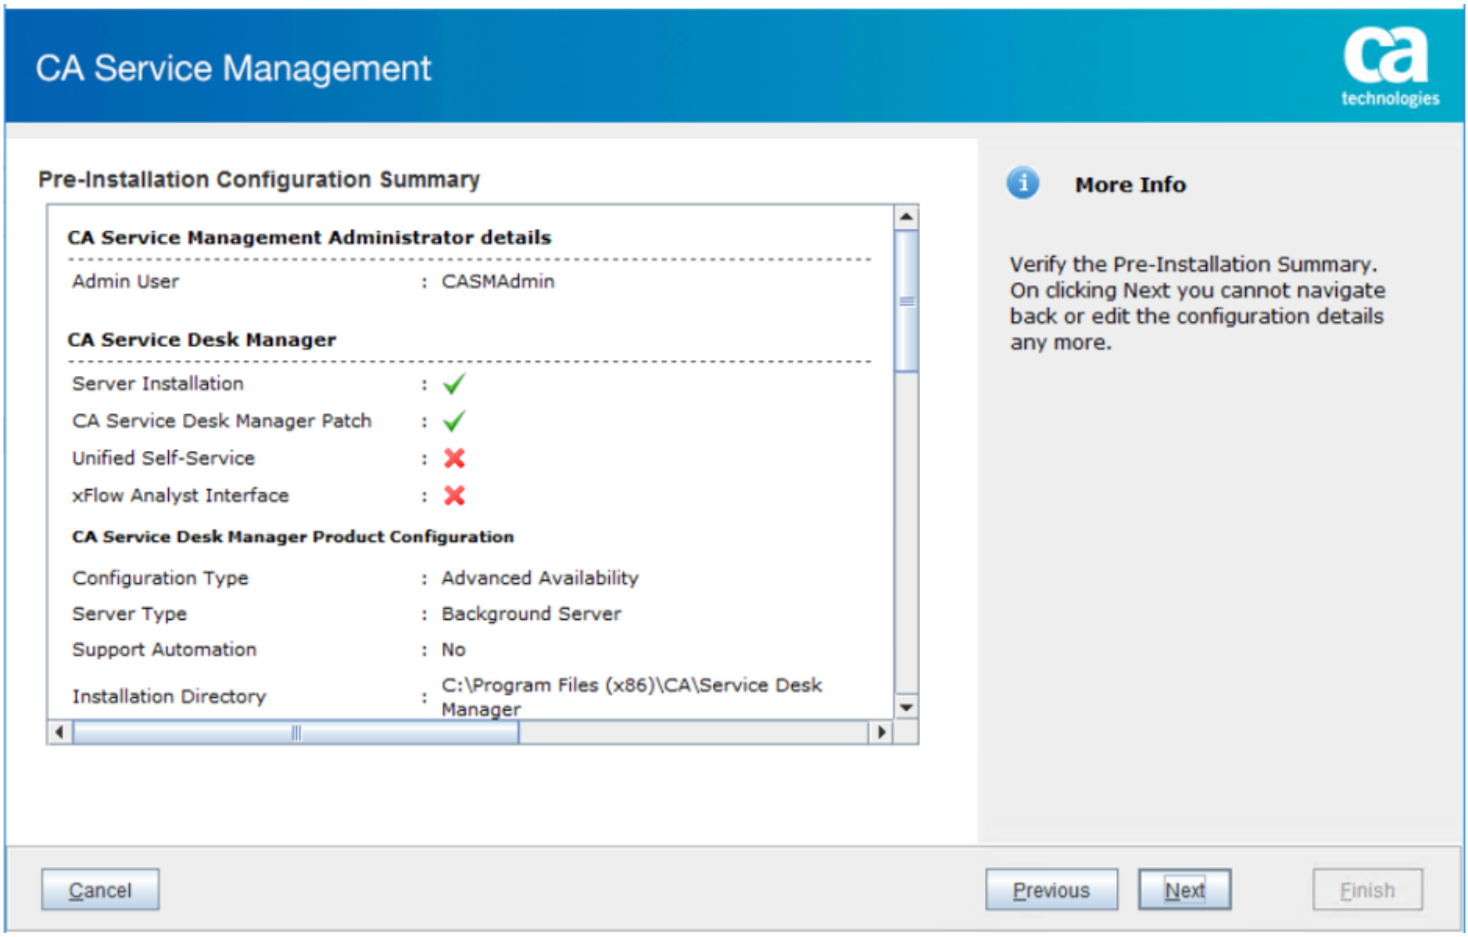
13. Enter CA EEM Admin Password.



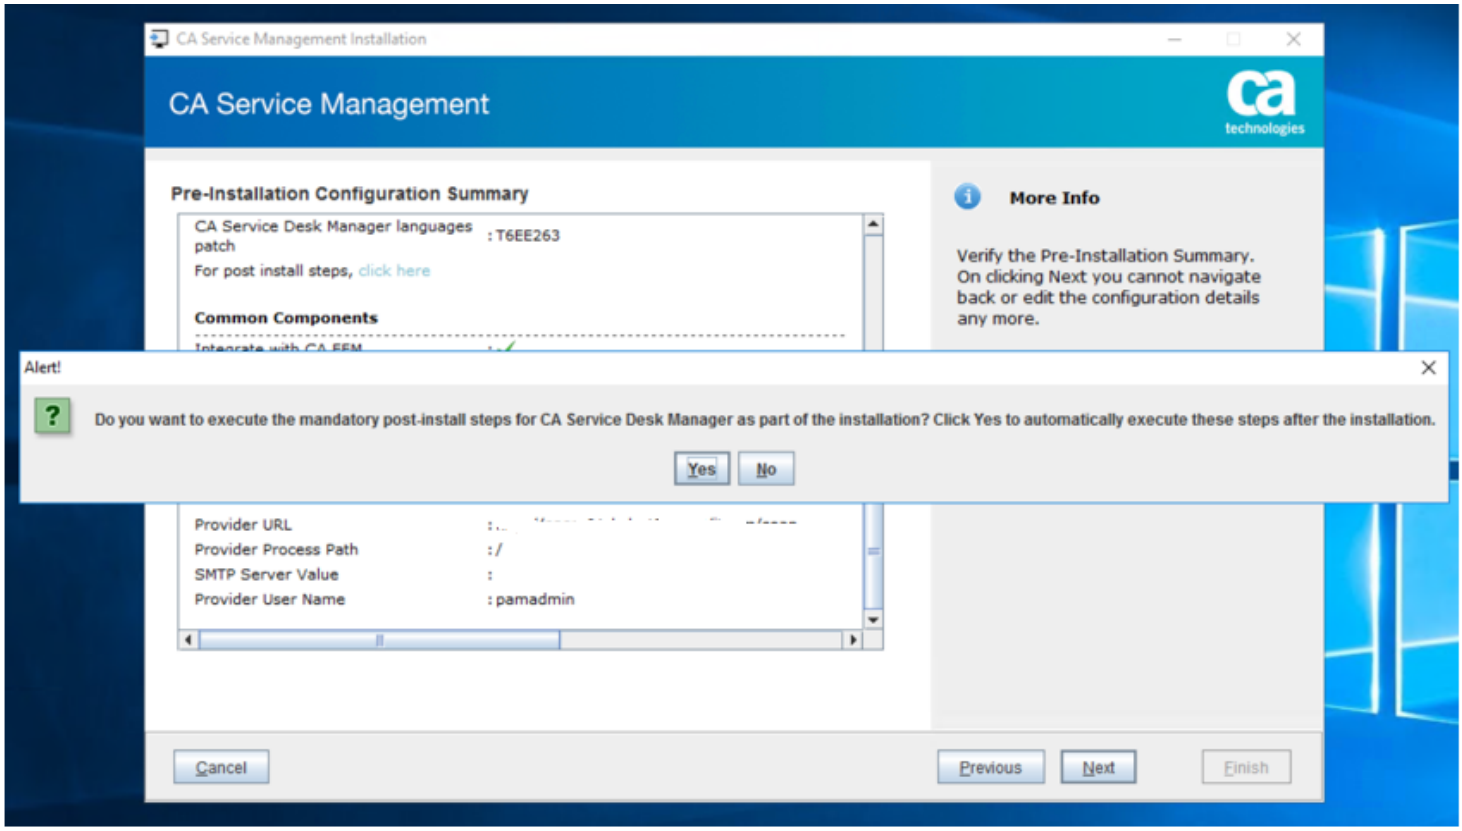
14. Enter CA Process Automation Workflow Provider name.



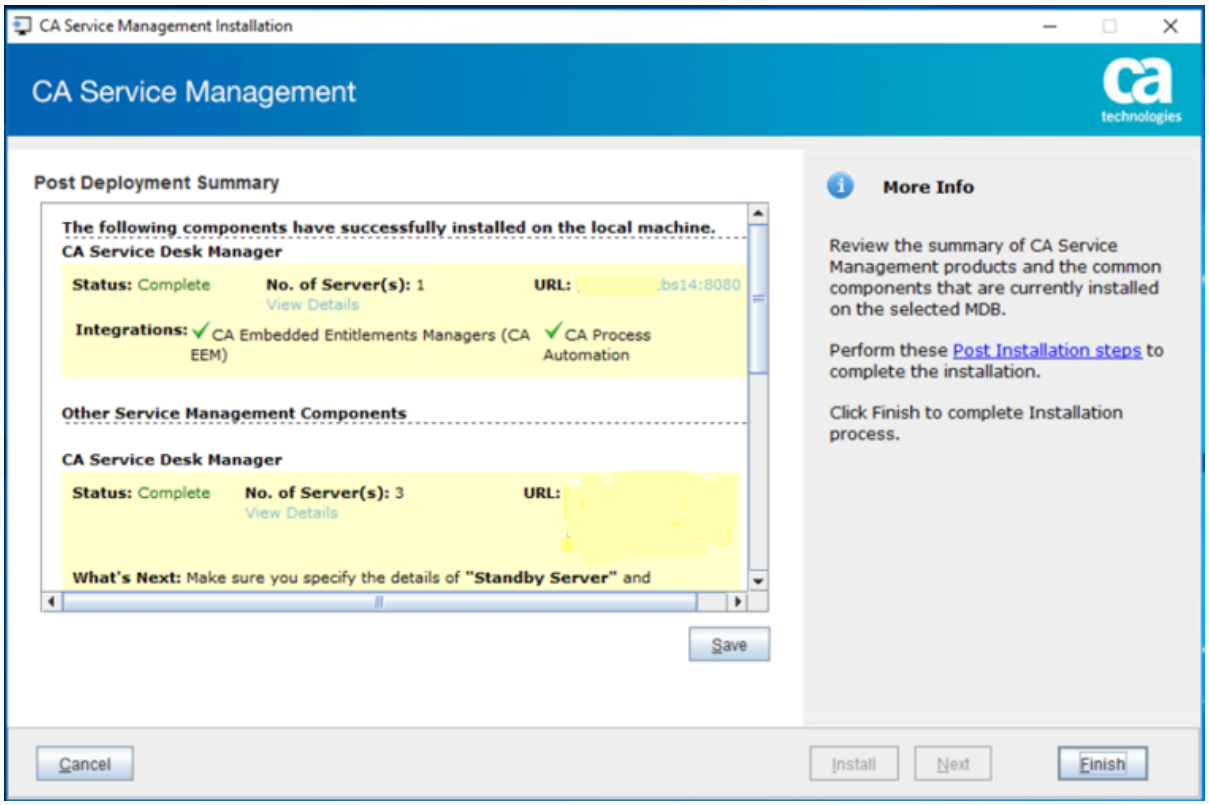
15. Review the pre-installation configuration summary.



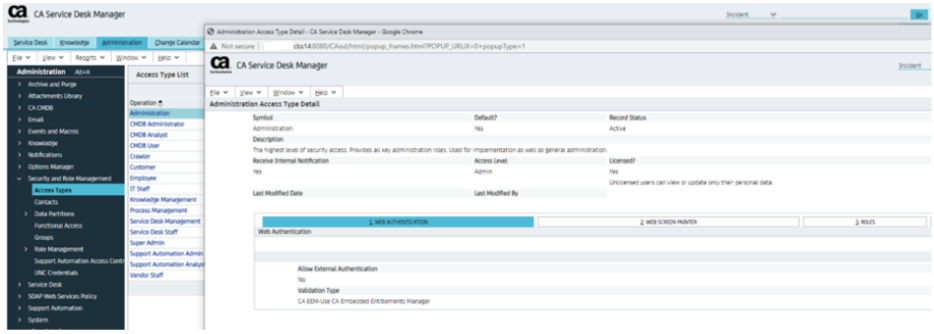
16. To perform manual post-installation steps, click **Yes**. Click **No** to perform manual post-installation steps.



17. Click **Install** to begin the installation process.
18. Click **Finish** to complete the installation.
19. Review the post-installation summary.



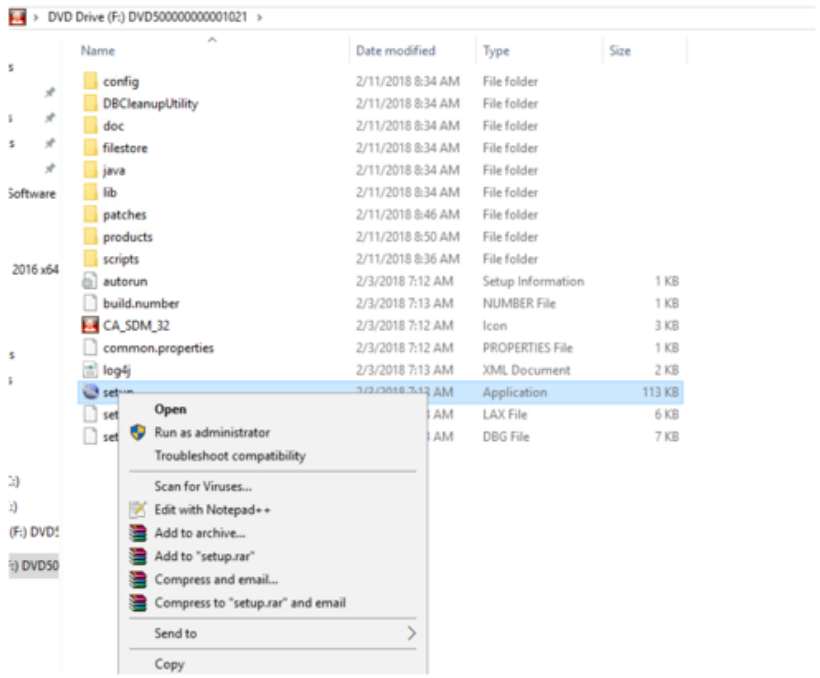
20. Launch the CA SDM Web Interface and enter login credentials.



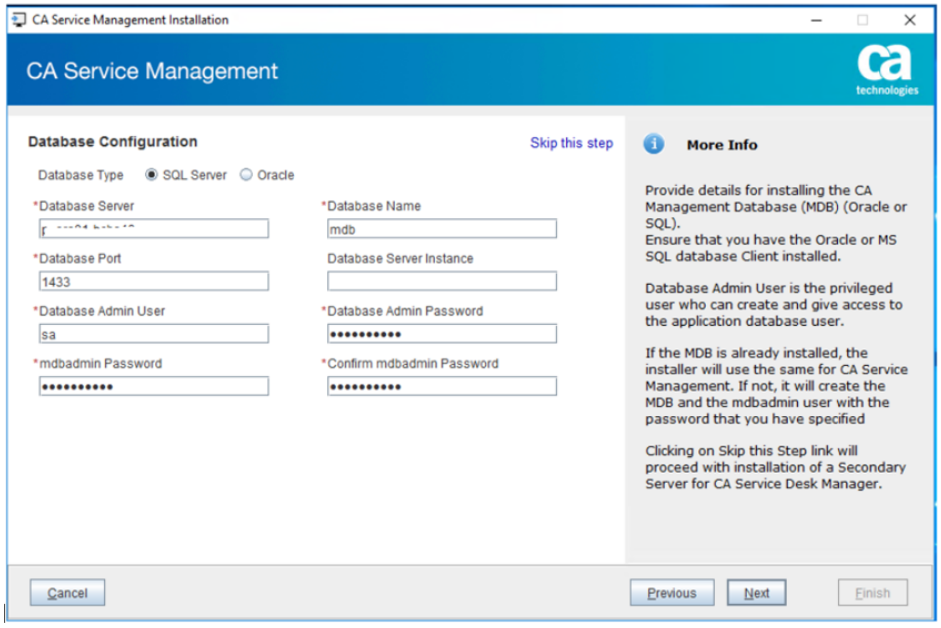
Install CA Service Catalog (testqa-sc-new)

Perform the following steps to install and configure CA Service Catalog:

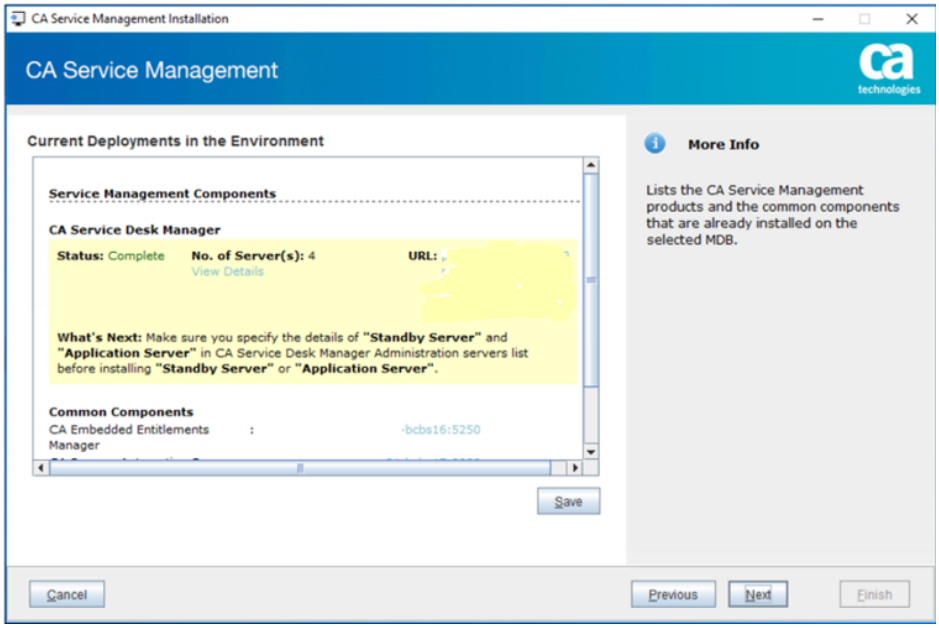
1. Login to Broadcom Support and download the CA Service Catalog 17.4 installer.



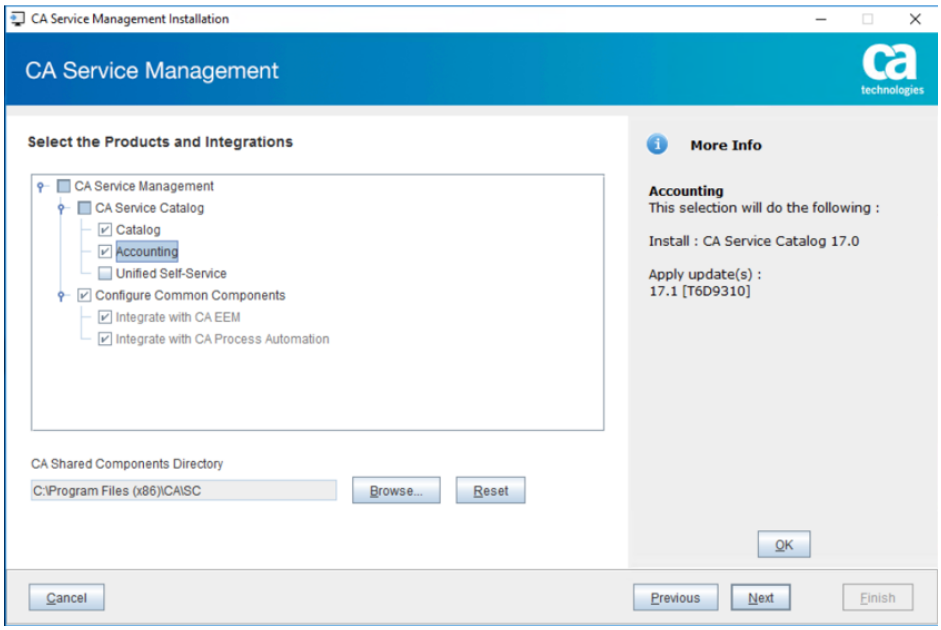
2. Right-click the **setup.exe** file and select "**Run as Administrator**".
3. Select **English** as Language.
4. Select **CA Service Management** to run the CA Service Management installer wizard.
5. Review and accept the license agreement.
6. Select Database Type as SQL Server. Enter the Database Details for Microsoft SQL Server database.



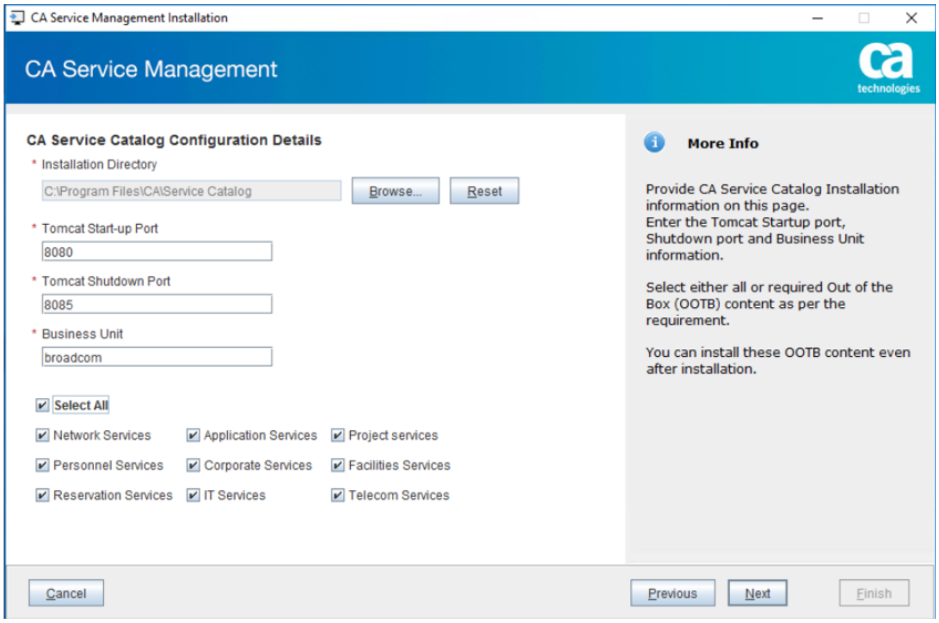
7. Review the Current Deployment details.



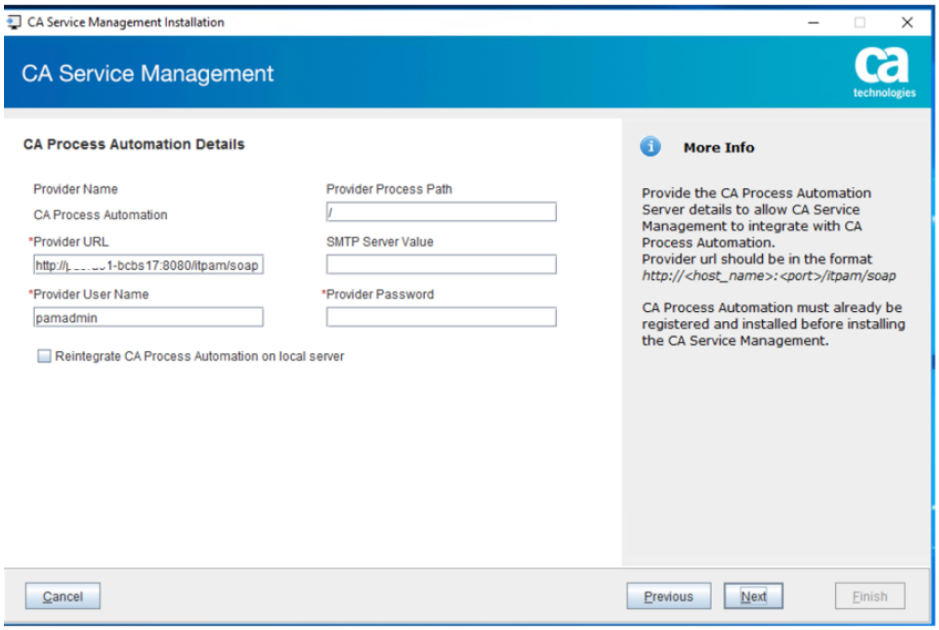
8. Select CA Service Catalog components. For example:**Accounting**.



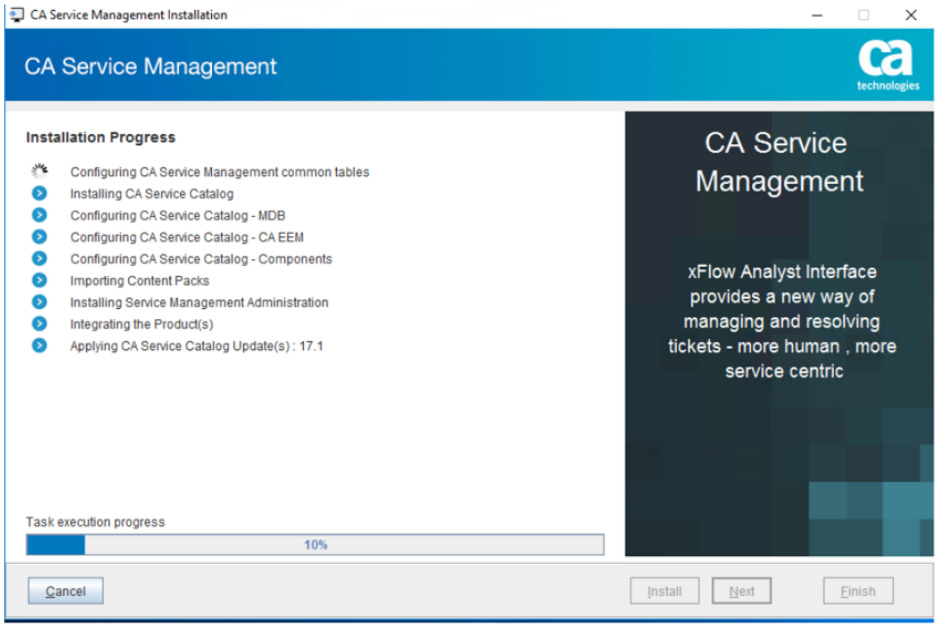
9. Review the installation prerequisites summary.
10. Provide CA Service Catalog Configuration Details.



11. Provide CA EEM details.
12. Provide the CA Process Automation Workflow provider details.



13. Review the pre-installation configuration summary.
    Click**Next**.
14. Installation progress begins.



15. Click **Next**. Follow the installation wizard.
16. Click **Finish** once installation completes.
17. Review the post- installation summary details.
18. Now, launch the CA Service Catalog web interface and login to CA Service Catalog.

CA Service Catalog Installation is complete.

CA Service Management Solution Integration

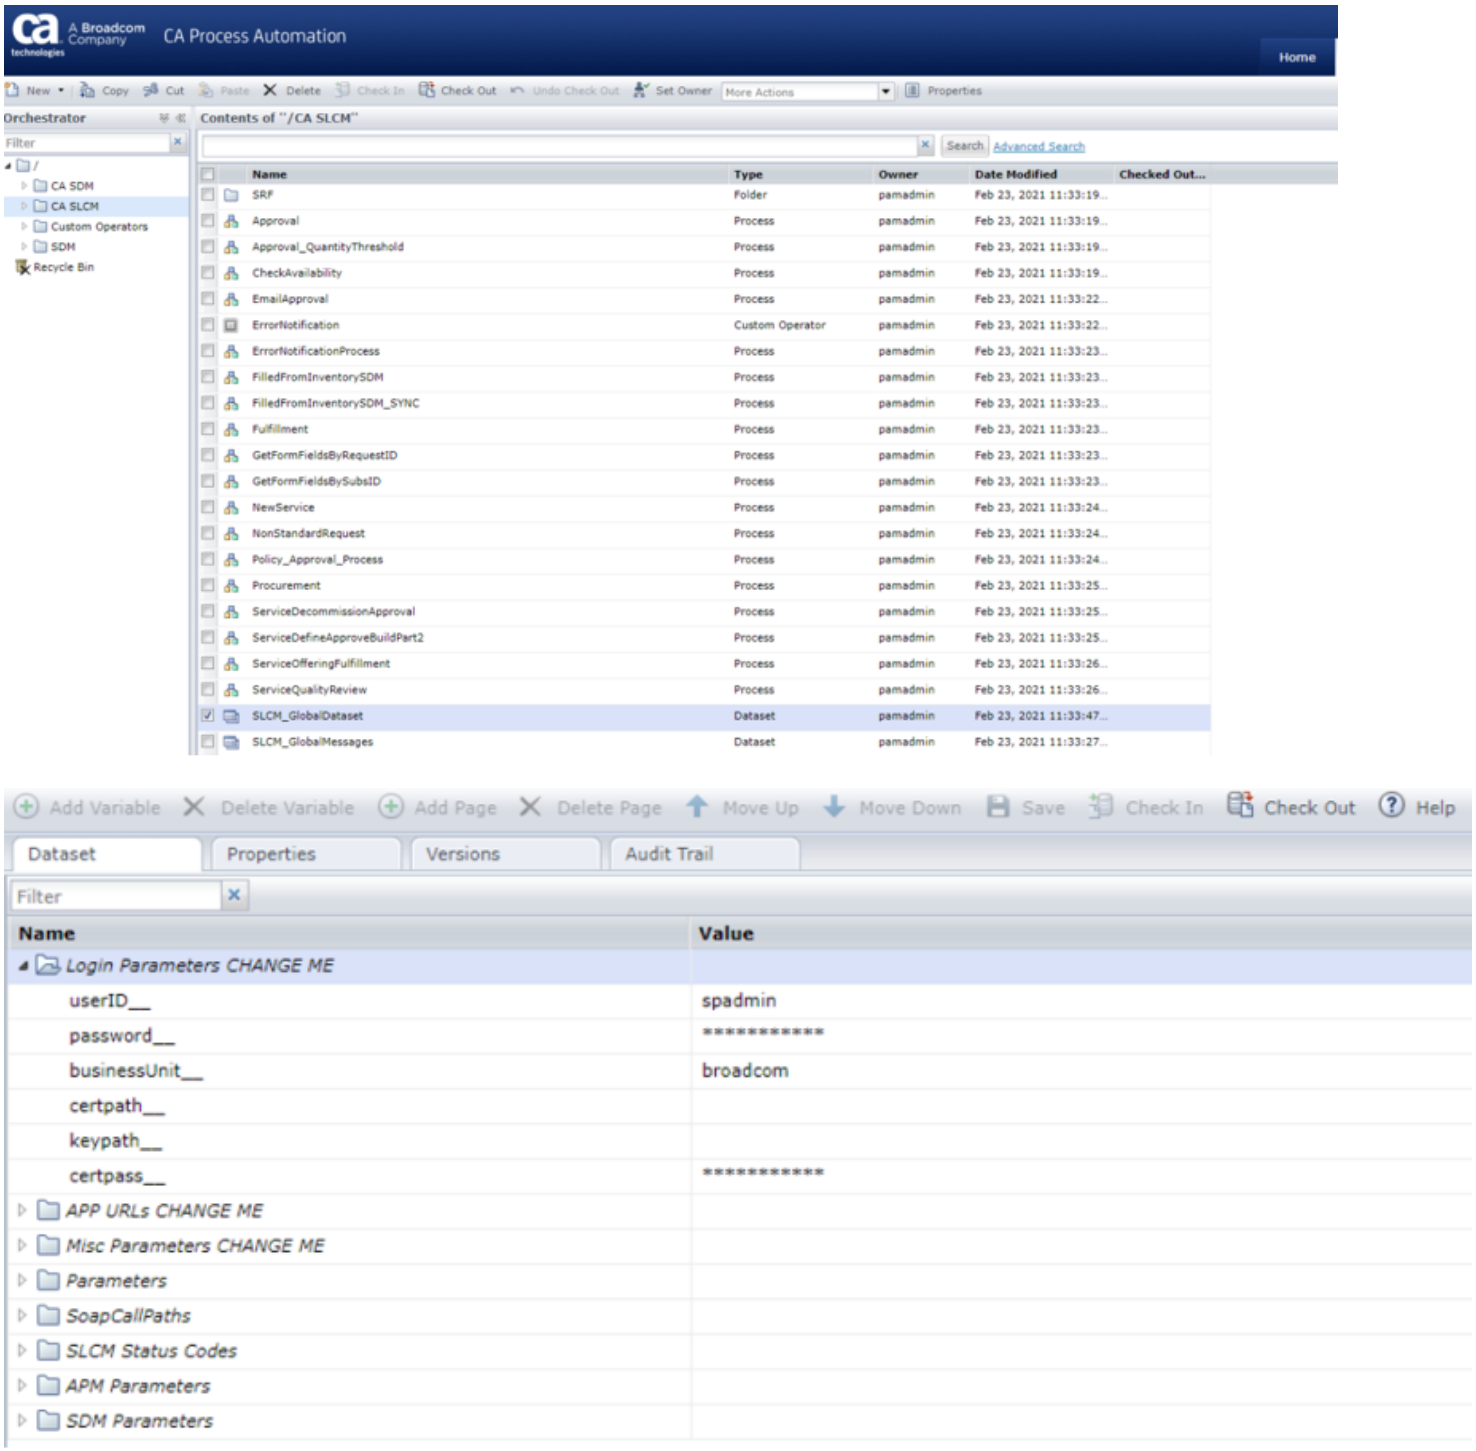
> **NOTE**
> If both CA Service Catalog and ITPAM are SSL enabled, to load the OOTB content of CA Service Catalog into ITPAM, the administrator has to import the certificate of PAM into the truststore of CA Service Catalog.

This article describes CA Service Management Solution integration with the following:

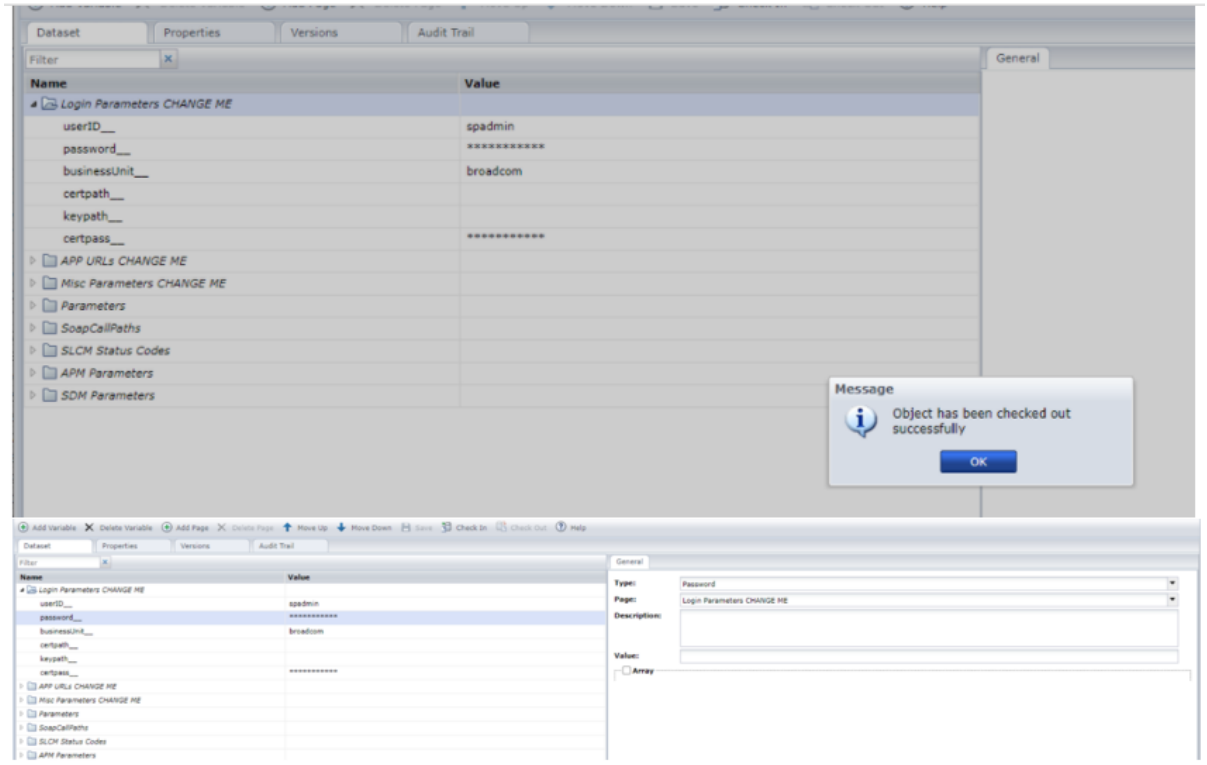
Updating the Service Catalog and SDM entries in Process Automation

Perform the following steps:

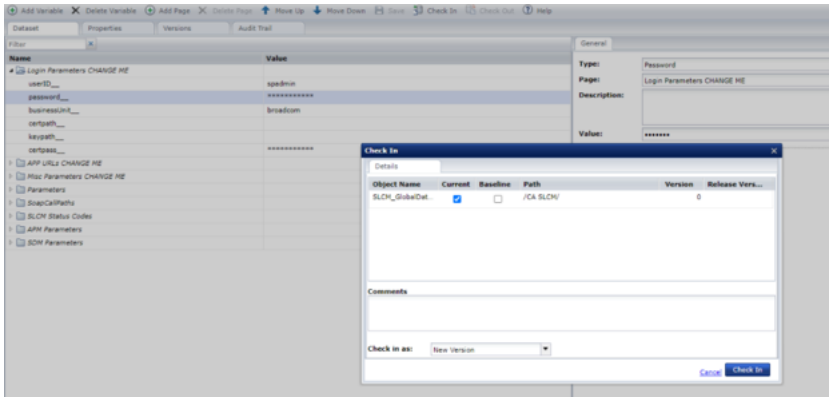
1. Login into CA Process Automation Interface: (*http://testqa-pam-new:8080/itpam*).
2. Navigate to Library, CA SLCM folder, Click **SLCM_GlobalDatasheet** dataset.



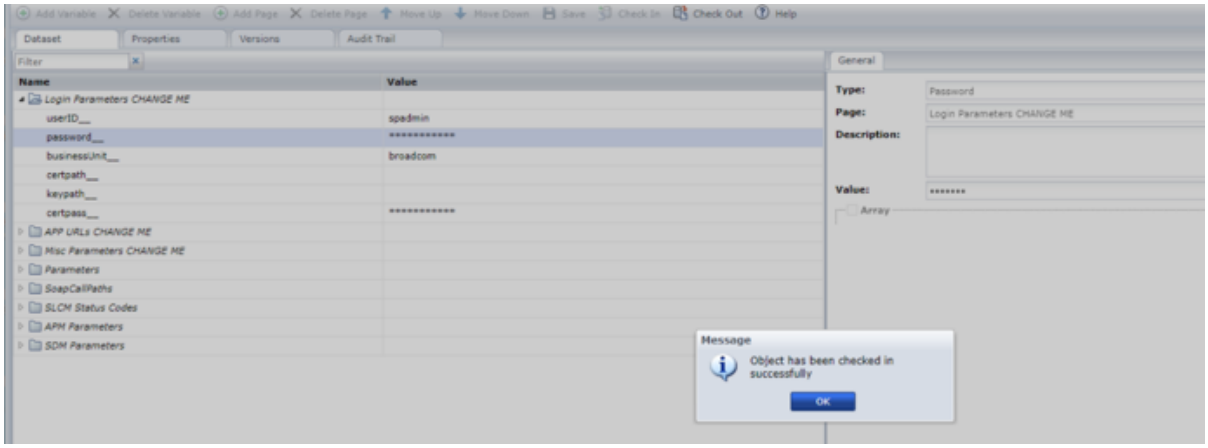
3. Click the **Checkout** link.



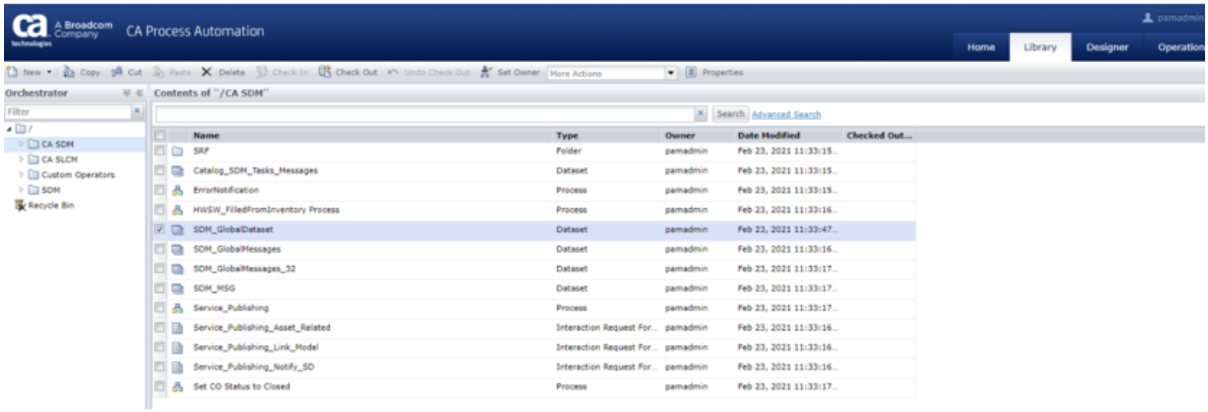
4. Update the entries **userID_**, **Password_**,**businessUnit_** parameters. Click **Save** and **Check in**.



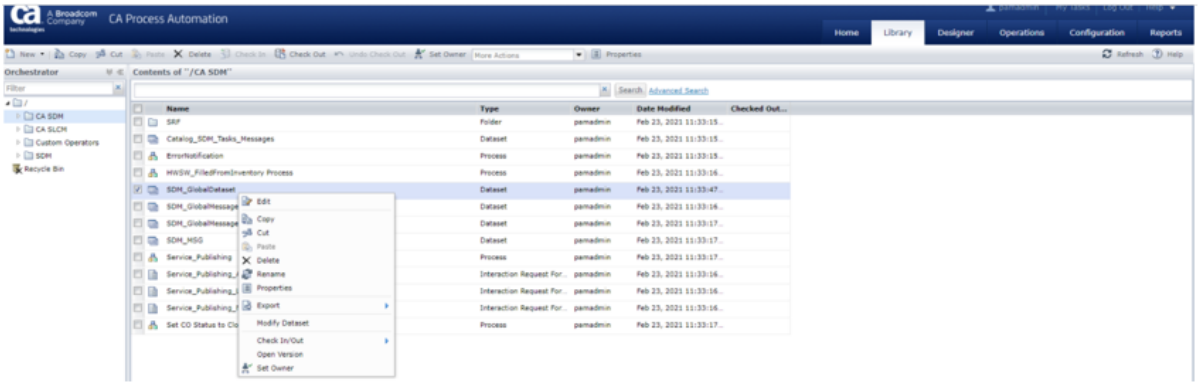
5. Click **OK** to update the above mentioned entries.

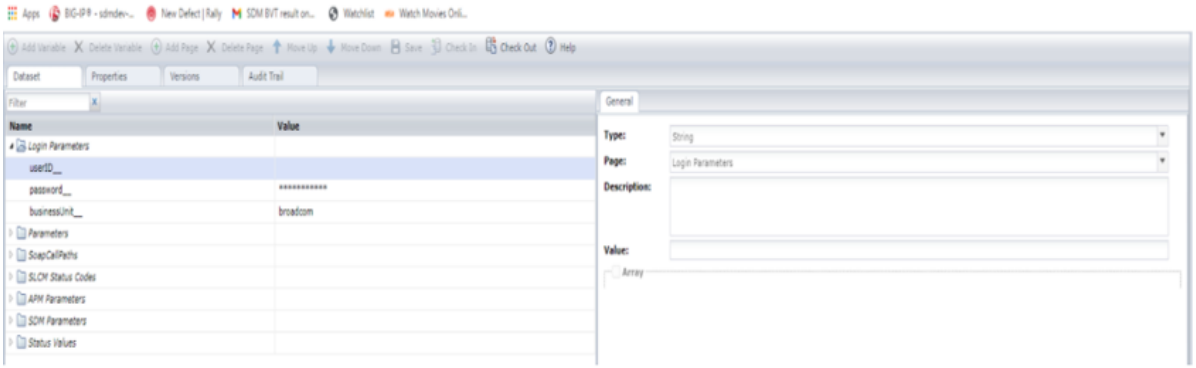


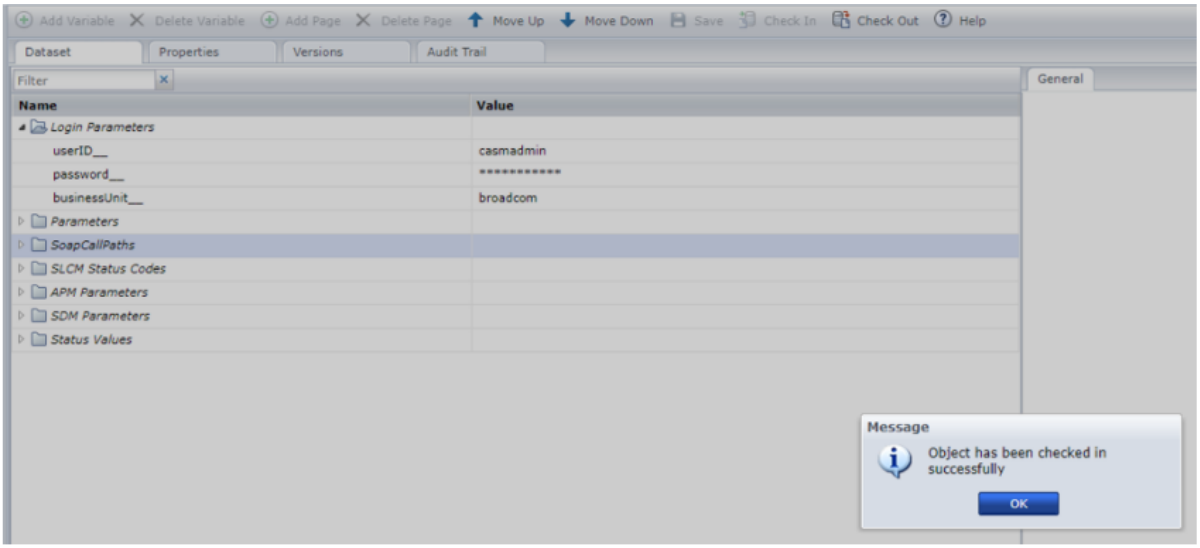
6. Navigate to **Library**, **CA SDM**, **SDM_GlobalDataset**.



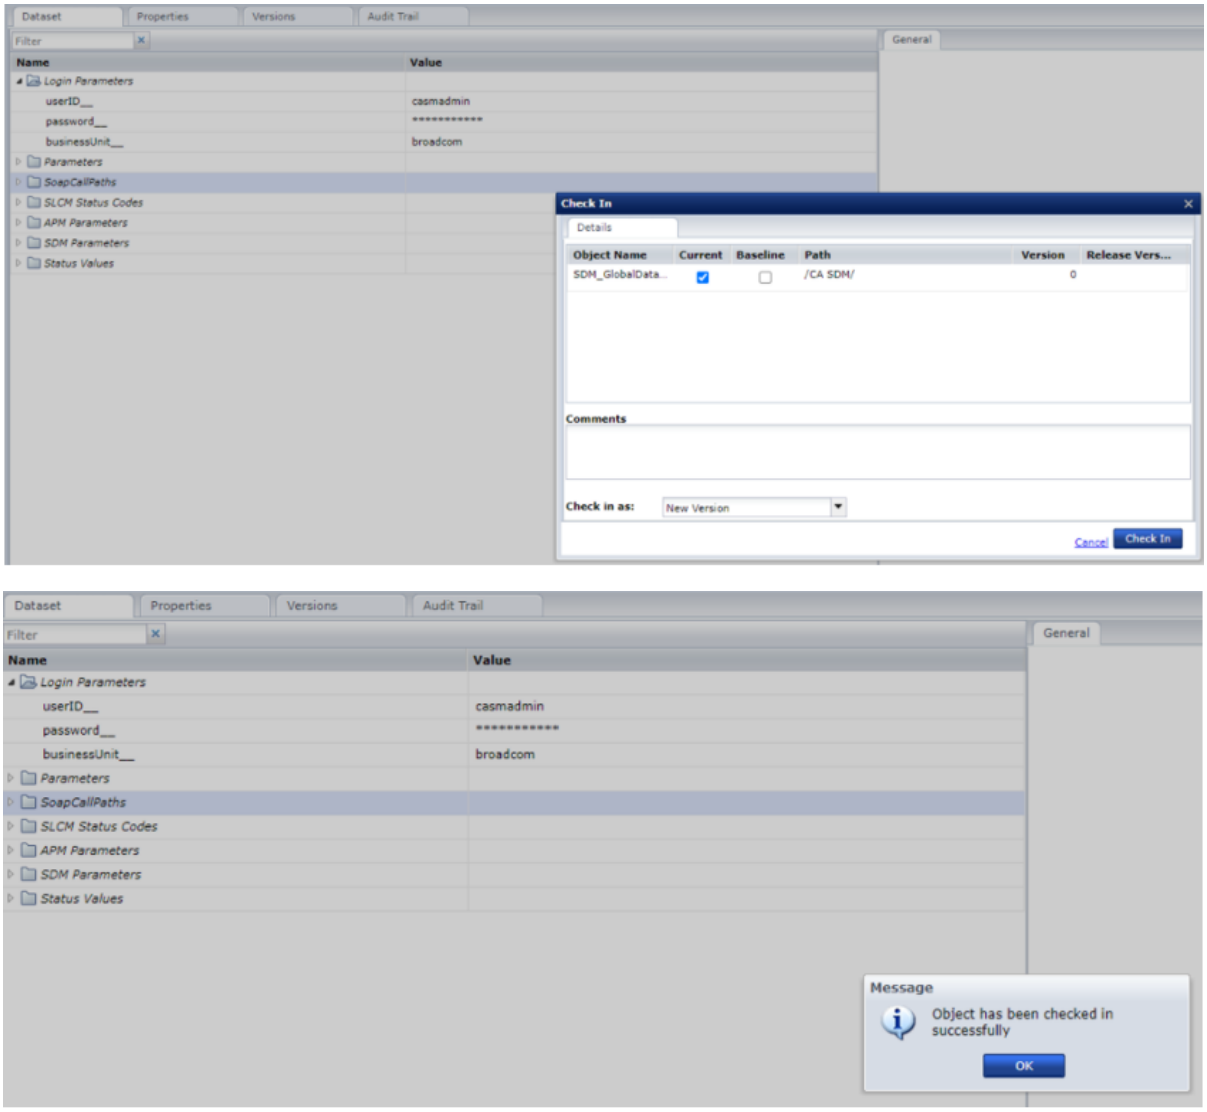
7. Click **Edit SDM_GlobalDataset**.







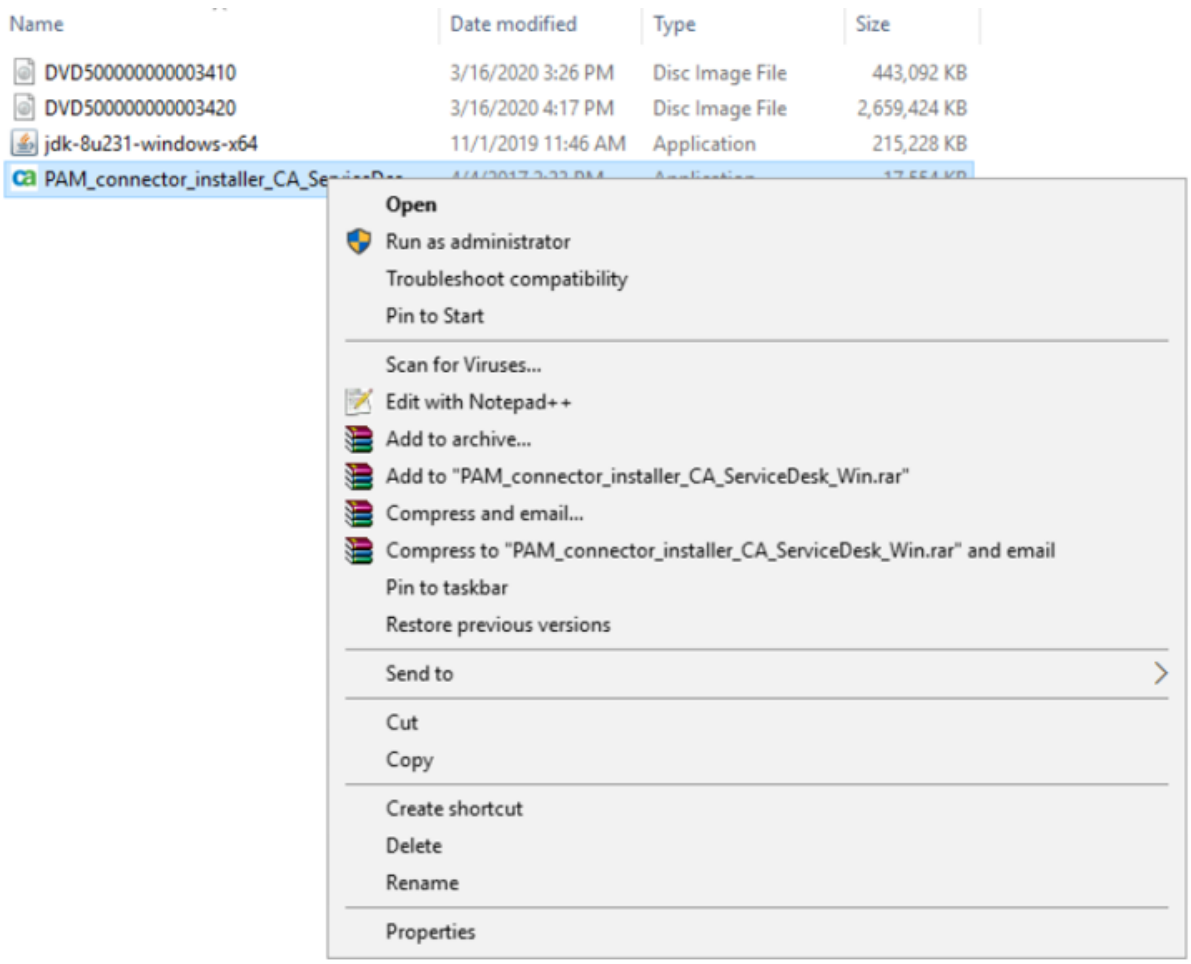
8. Update the entries of **UserID**, **Password**, and **businessUnit_values**. Click **Save** and **Check In**.



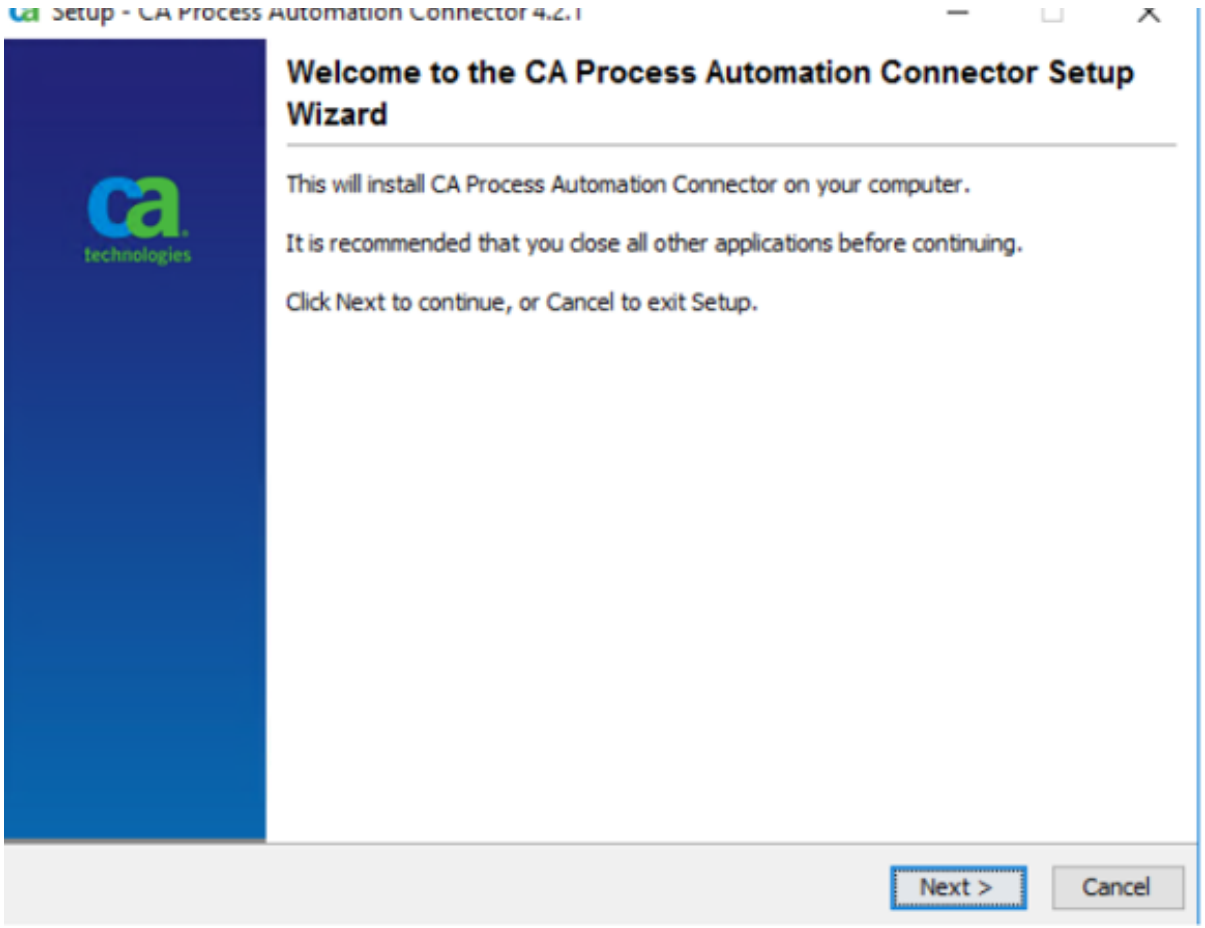
Install PAM Connector for SDM (testqa-pam-new)

Perform the following steps:

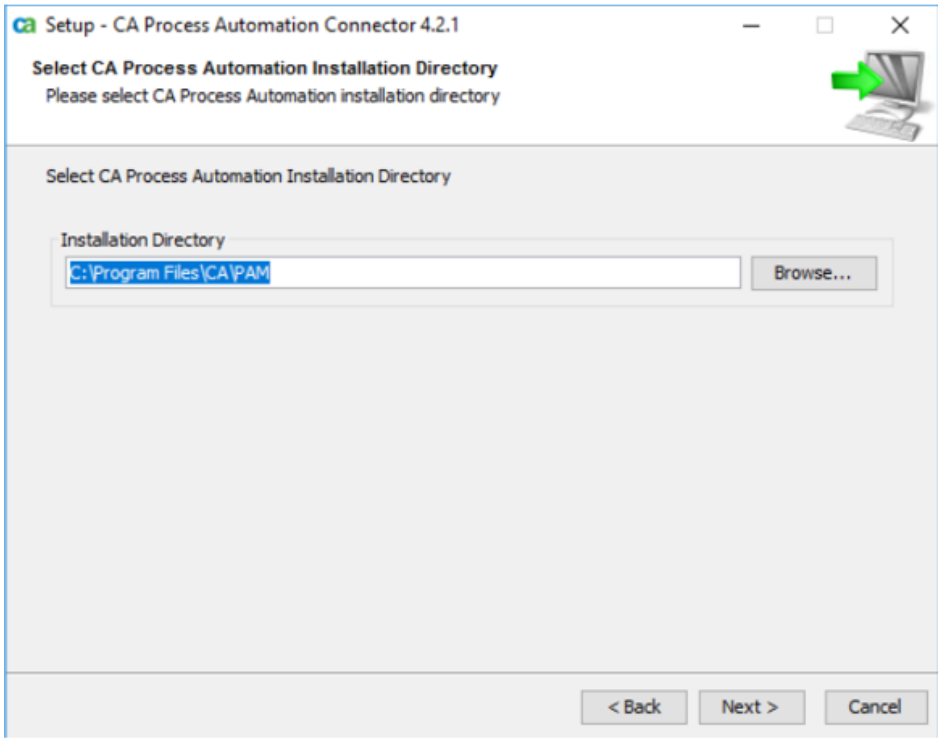
1. Stop CA Process Automation Service on **testqa-pam-new** and install the PAM connector for SDM.
2. Login to Broadcom Support and download **PAM_connector_installer_CA_ServiceDesk_Win.exe** on **testqa-pam-new**.



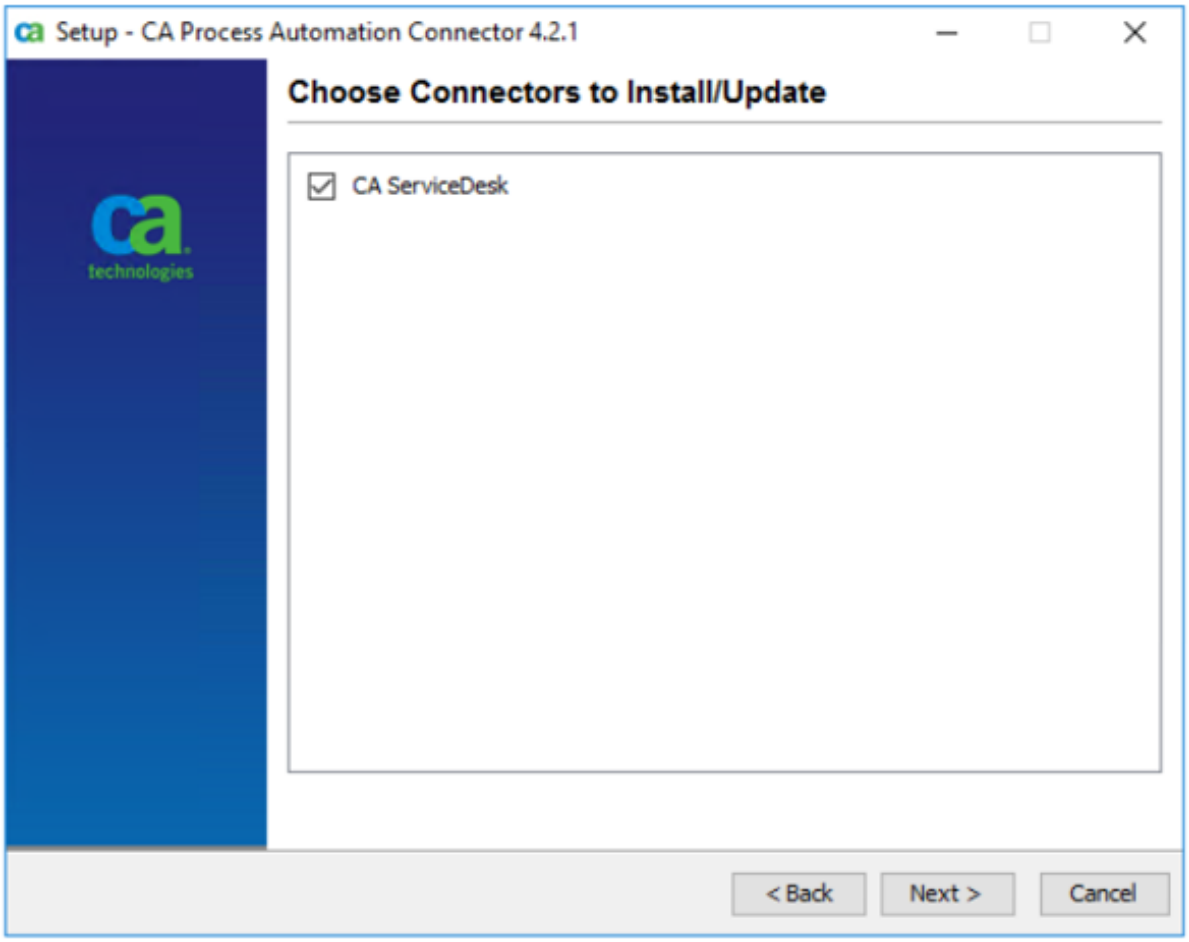
3. Right click the **setup.exe** and Select **Run as Administrator**.
4. CA Process Automation Connector 4.2.1 Installation process begins.



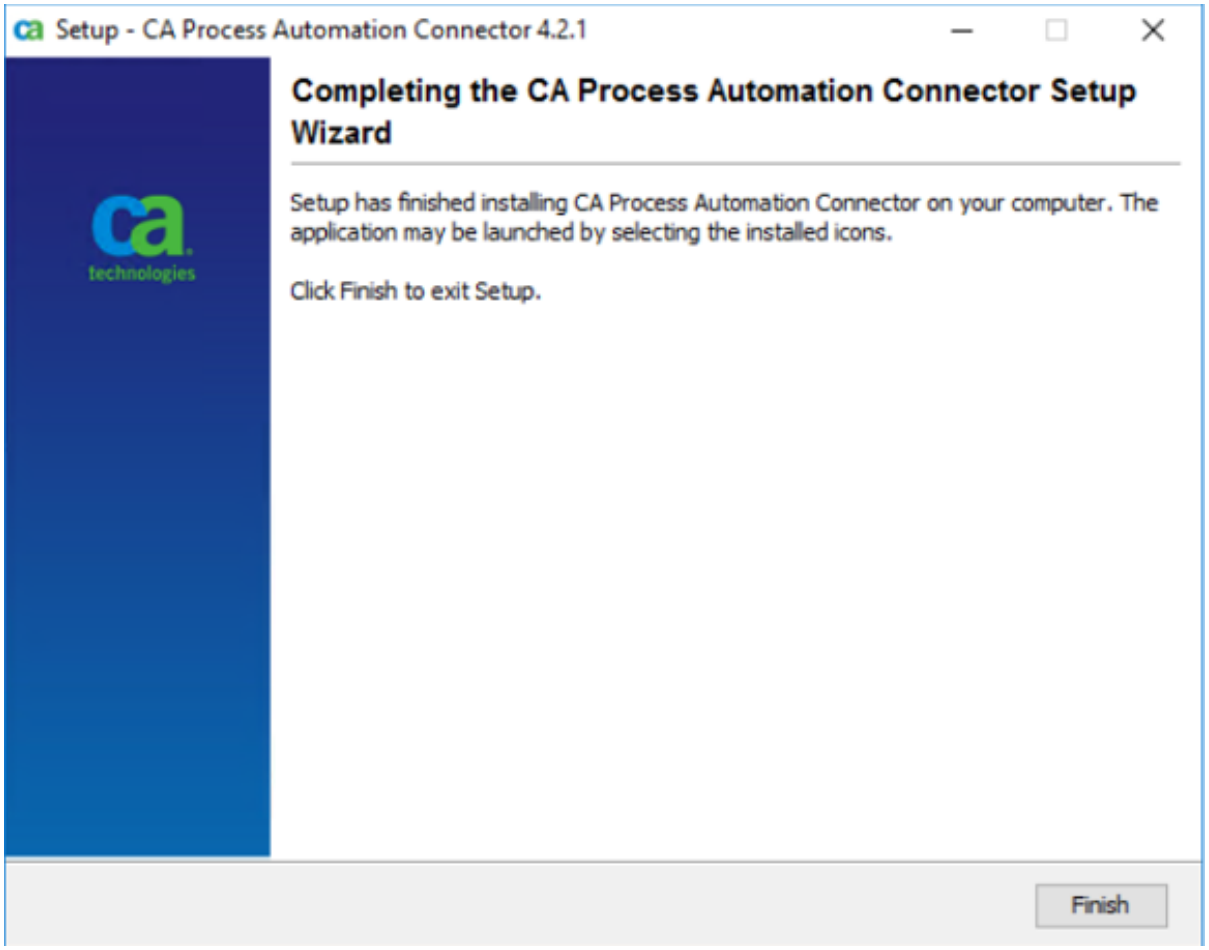
5. Review and accept the license agreement.
6. Provide the installation directory path.



7. Select CA Service Desk Manager.
   Click Next.



8. Click**Finish** to complete the Process Automation Connector Setup Wizard.



9. CA Process Automation Connector Installation is complete.
   Start the ITPAM Services on **testqa-pam-new** and then start the below services:
   1. Stop Catalog and Start the Catalog Services on **testqa-sc-new**.
   2. Stop and start the SDM Application services in the BG Server on **testqa-bg-new**.
   3. Stop and start the SDM Application services in the Standby Server on **testqa-sb-new**.
   4. Stop and start the SDM Application services in App1 Server on **testqa-app1-new**.
   5. Stop and start the SDM Application services in App2 Server on **testqa-app2-new**

Moving MDB Data from the Source (testqa-mdb) to the Target System (testqa-mdb-new)

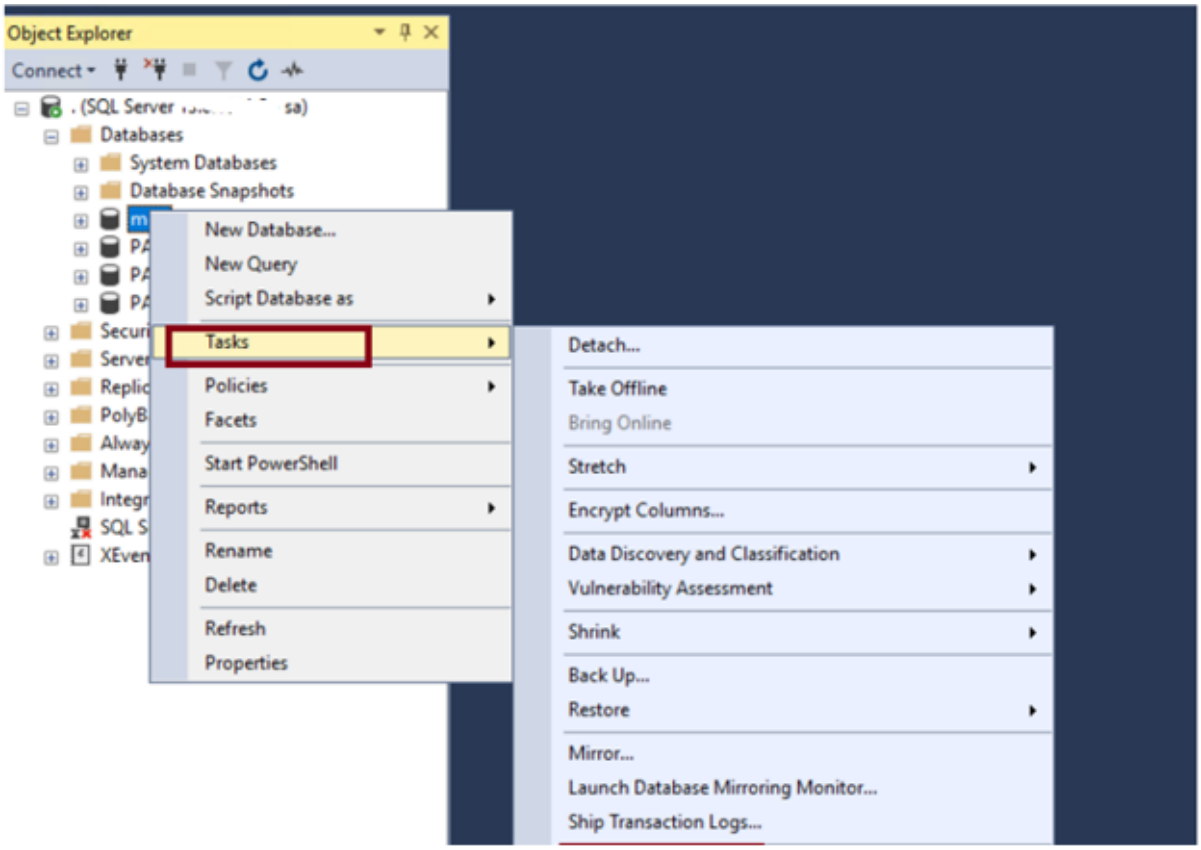
Perform the following steps:

1. Review the following CA Service Management Tables on **testqa-mdb-new** to ensure that these tables have system-specific configuration. For more information, see CA Service Management - Impacted Tables.

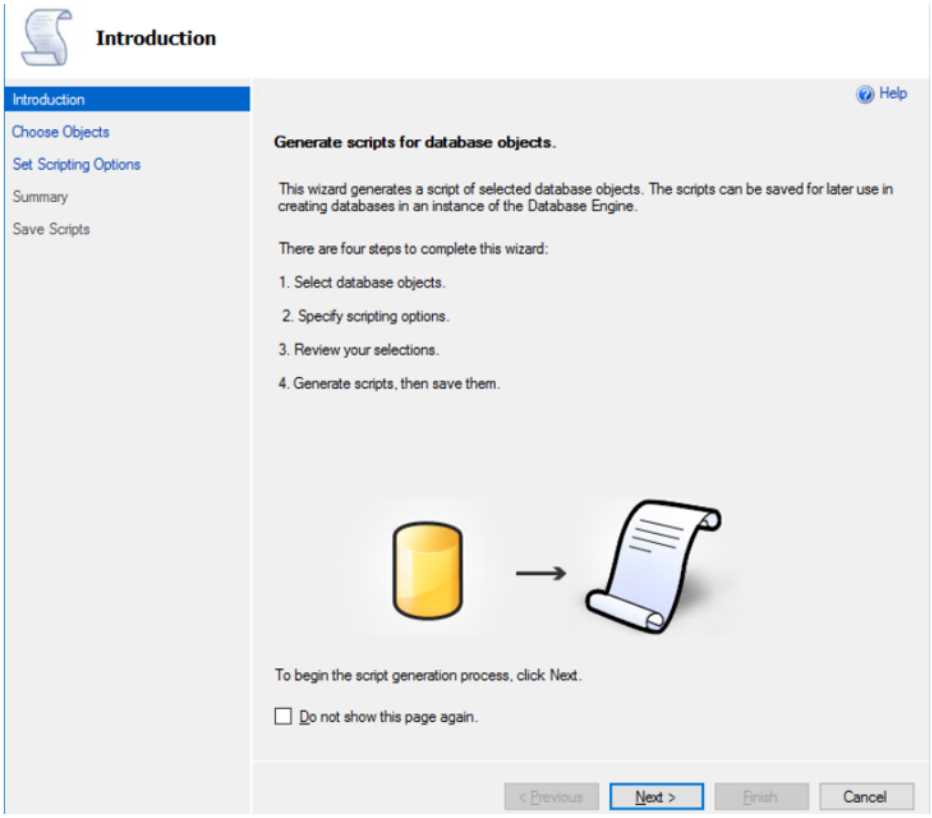
CA Service Management Tables:

Common Tables	CA SDM	CA Service Catalog
al_cdb_comp_installstate_bkup al_cdb_componentinstallstate al_cdb_config_params_backup al_cdb_configurationparameters al_cdb_files ca_application_registration	ci_mdr_provider options sapolicy usp_servers object_promotion promo_hist usp_configuration usp_webeng_domsrvr usp_webengine usp_webeng_alias usp_domsrvr	usm_configuration

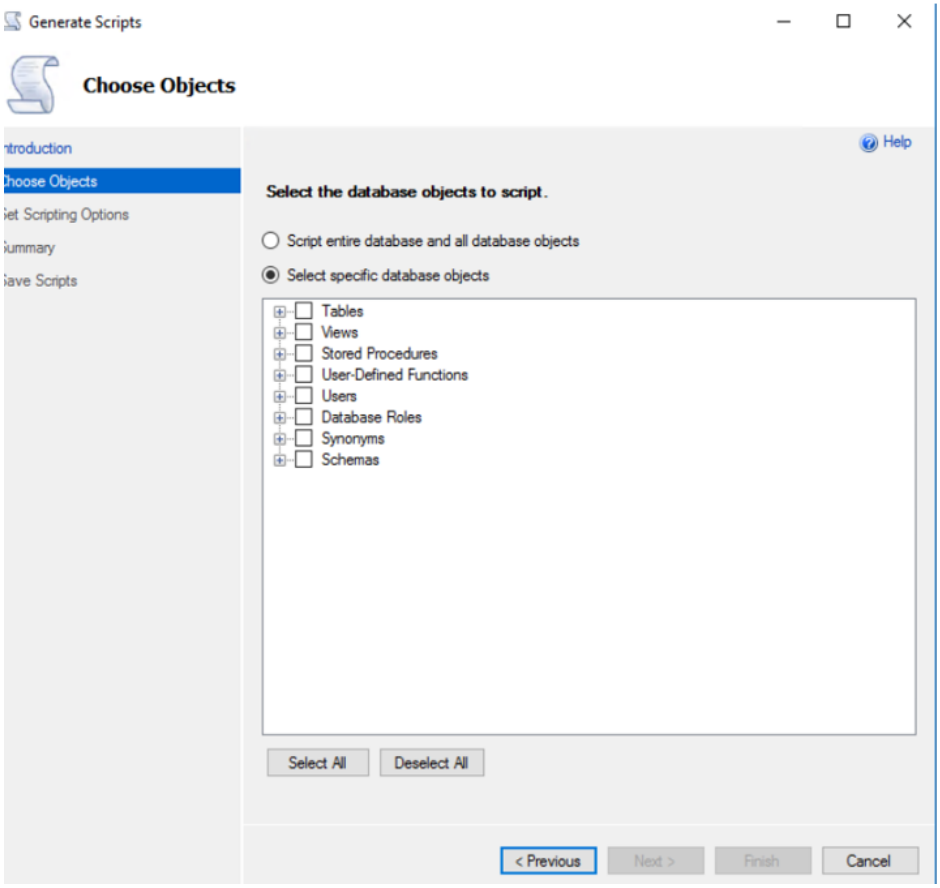
2. Stop the following CA Service Management services on both the source and target servers:
   a. **CA SDM**: CA Service Desk Manager Server (Background, Standby, and Application)
   b. **CA Service Catalog**: CA Service Accounting, CA Service Catalog and CA Service Management Admin (Catalog Server)
   c. **CA Process Automation**: CA Process Automation Orchestrator (CA Process Automation Server)
3. On the source system (**testqa-mdb**), backup MDB. Copy the MDB backup file to the target system (**testqa-mdb-new**).
4. On the target system (**testqa-mdb-new**), perform the following steps to backup the tables which are mentioned in the CA Service Management Tables in step 1.
5. Navigate to Microsoft SQL Management Studio, right-click MDB (or the appropriate MDB instance name applicable for your system), and select **Tasks**, **Generate Scripts**.



6. Click **Next**.



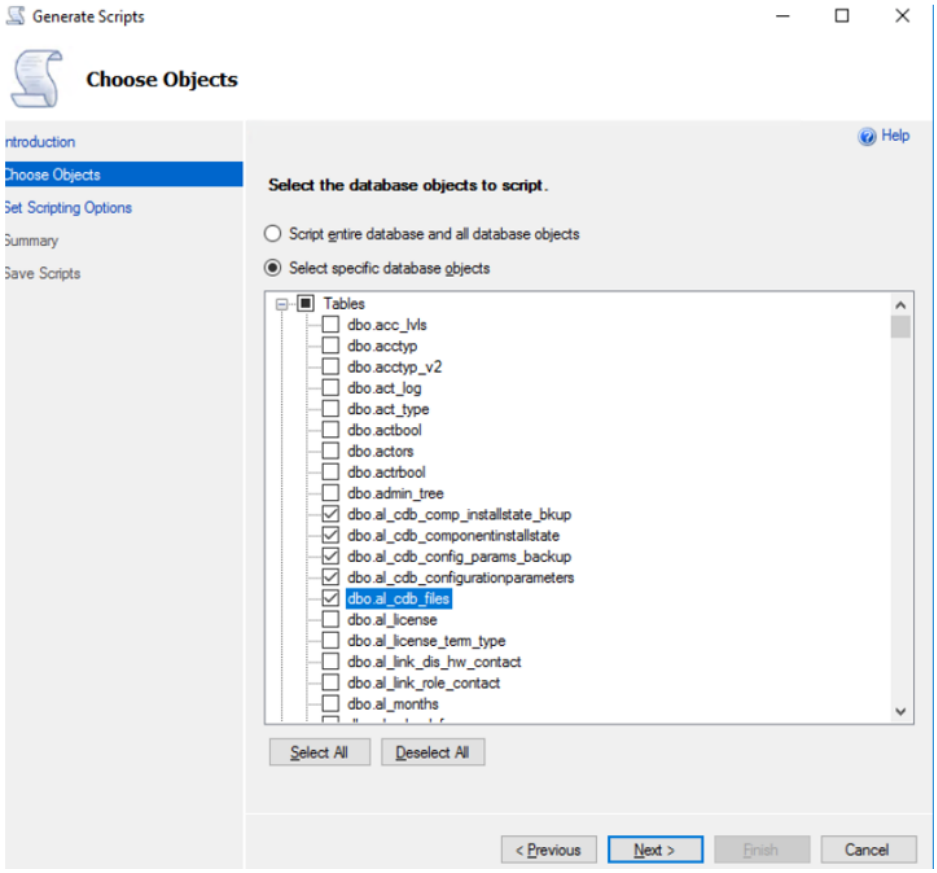
7. Click Select Specific database objects.



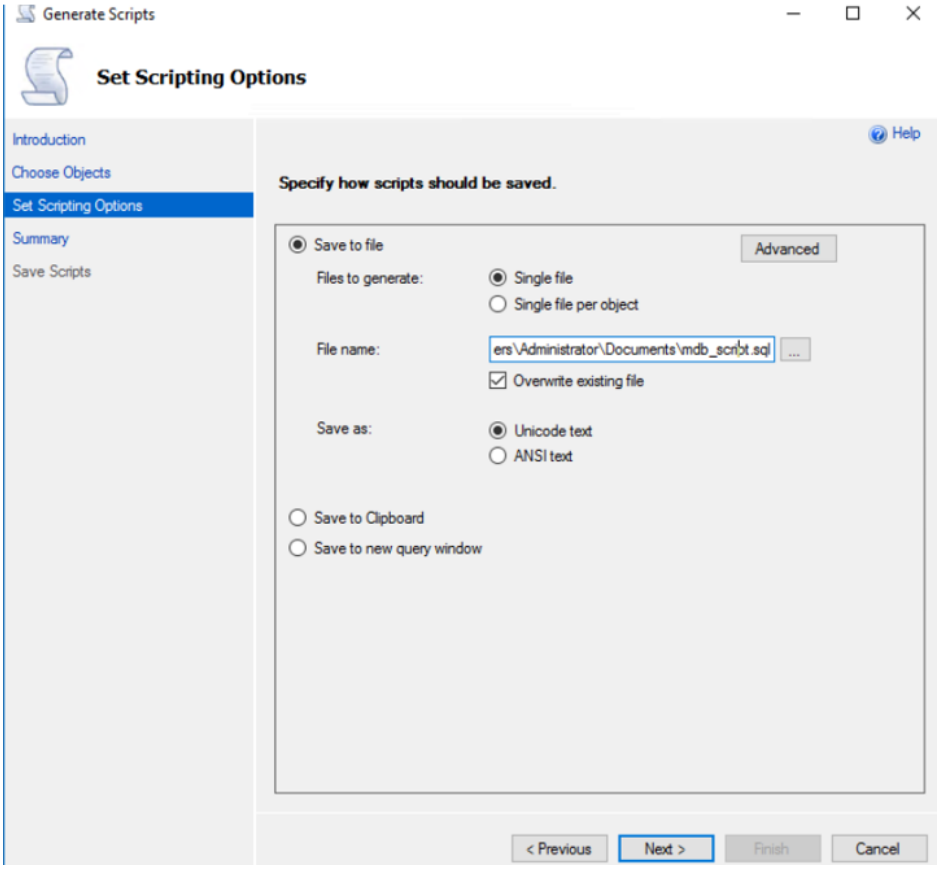
8. Below are the steps to take a backup of the CA Service Management Tables and then, generate scripts.
   a. Select the Tables option and choose the appropriate tables.
   b. Select list of tables from the CA Service Management Tables.

Common Tables	CA SDM	CA Service Catalog
al_cdb_comp_installstate_bkup al_cdb_componentinstallstate al_cdb_config_params_backup al_cdb_configurationparameters al_cdb_files ca_application_registration	ci_mdr_provider options sapolicy usp_servers object_promotion promo_hist usp_configuration usp_webeng_domsrvr usp_webengine usp_webeng_alias usp_domsrvr	usm_configuration

NOTE
Following example image shows few selected tables but you must select all the **18** tables (mentioned in step 8) to proceed further.

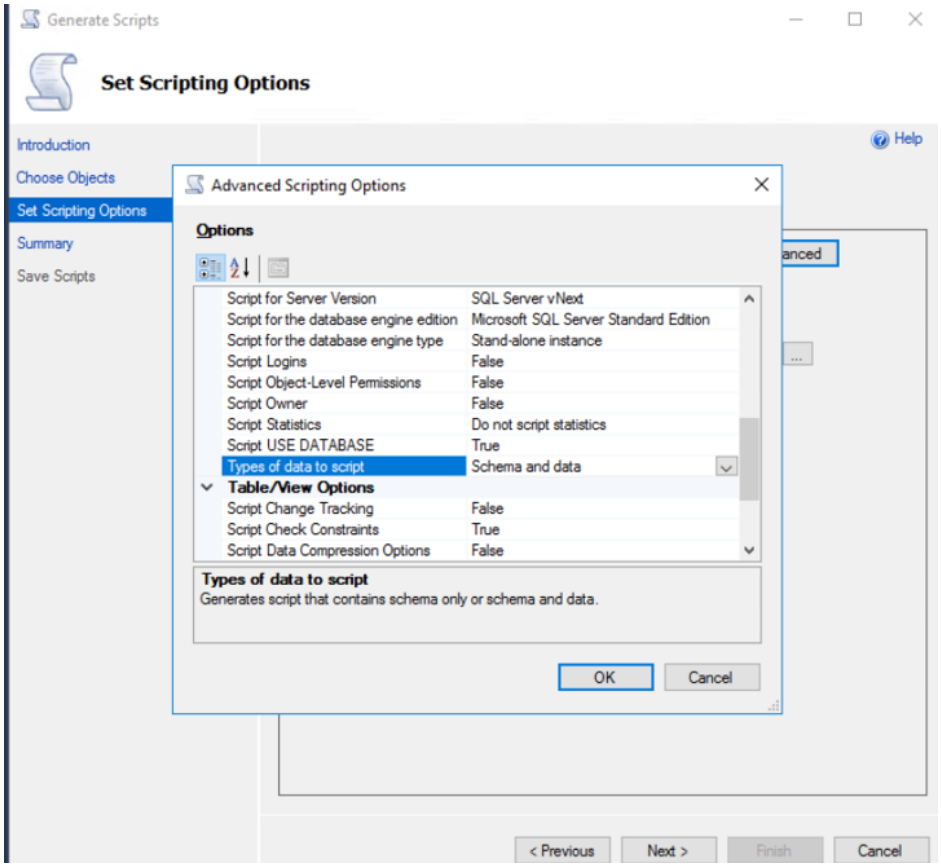


c. Click**Next**.
Select the Advanced tab on the upper right corner (image) and navigate to Types of Data.

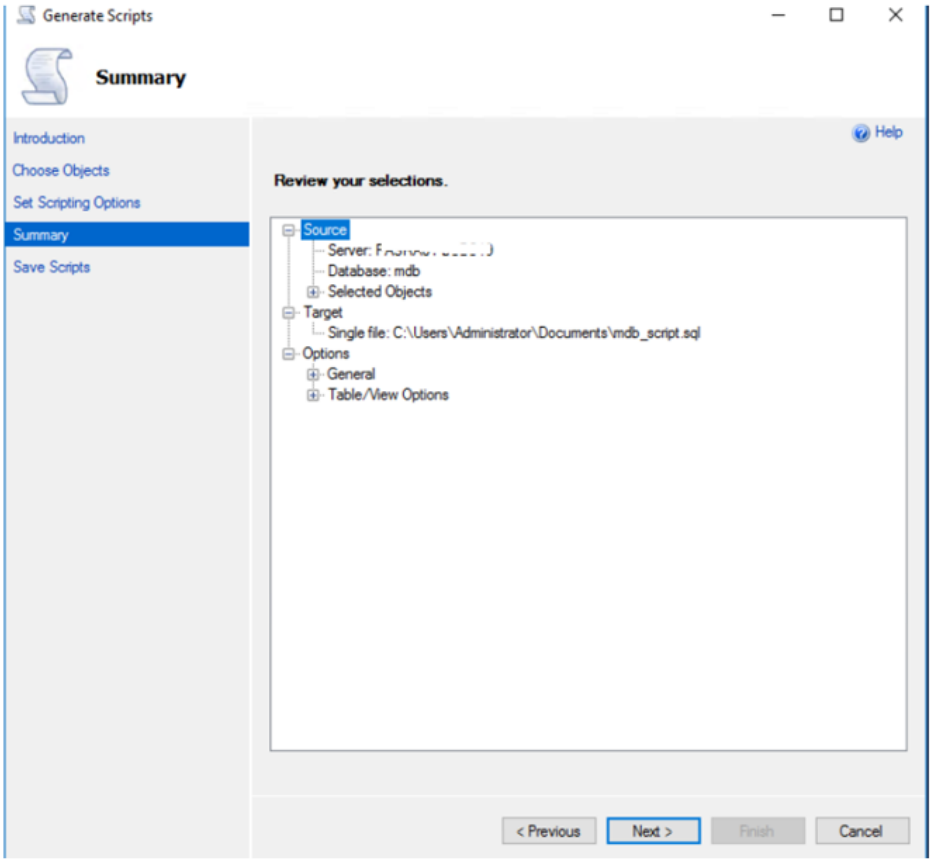


9. Change the Types of data to script option value from **Schema Only** to **Schema and Data**, and click **OK**. Your selection is now saved to a file *%user%\documents\mdb_script.sql*.

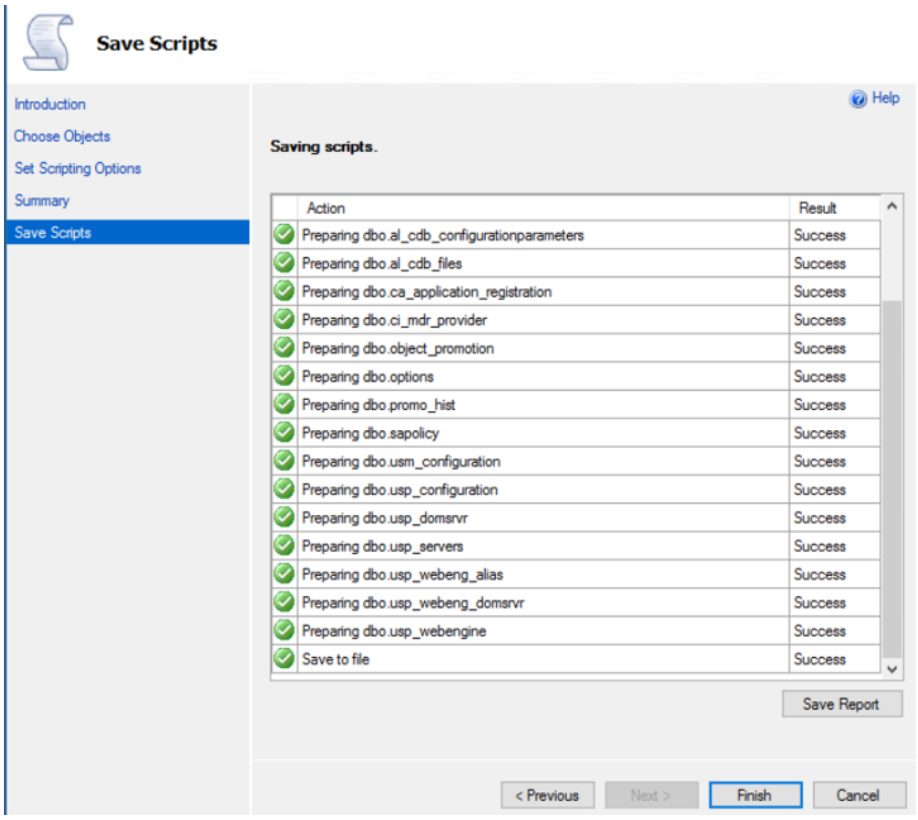
   NOTE
   It's recommended to use non-default file names. By default, the file name is **script.sql**.



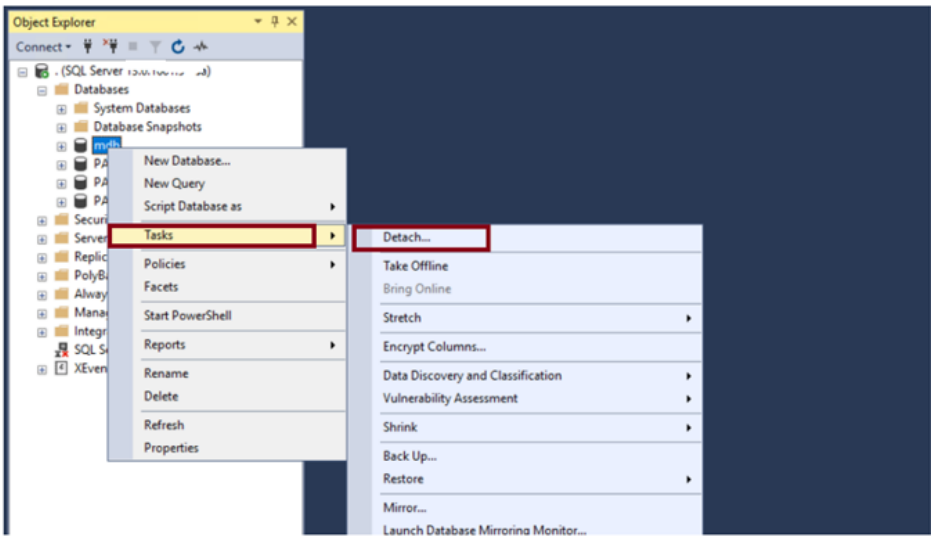
10. Click **Next**.



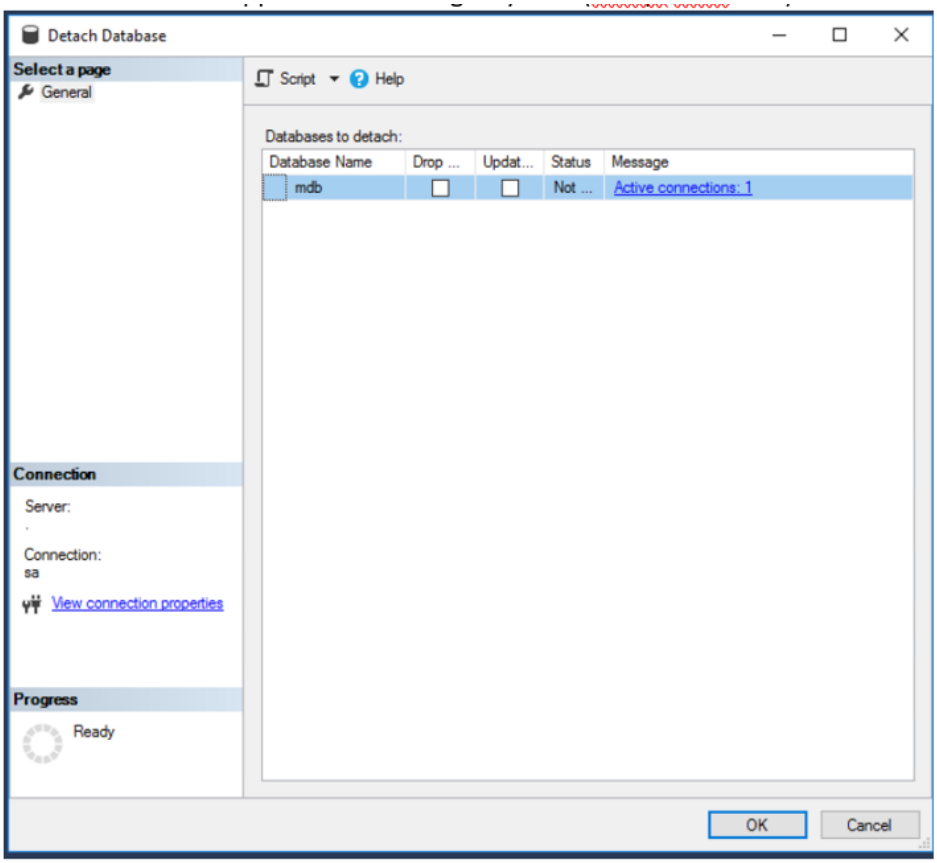
11. Click **Finish**.



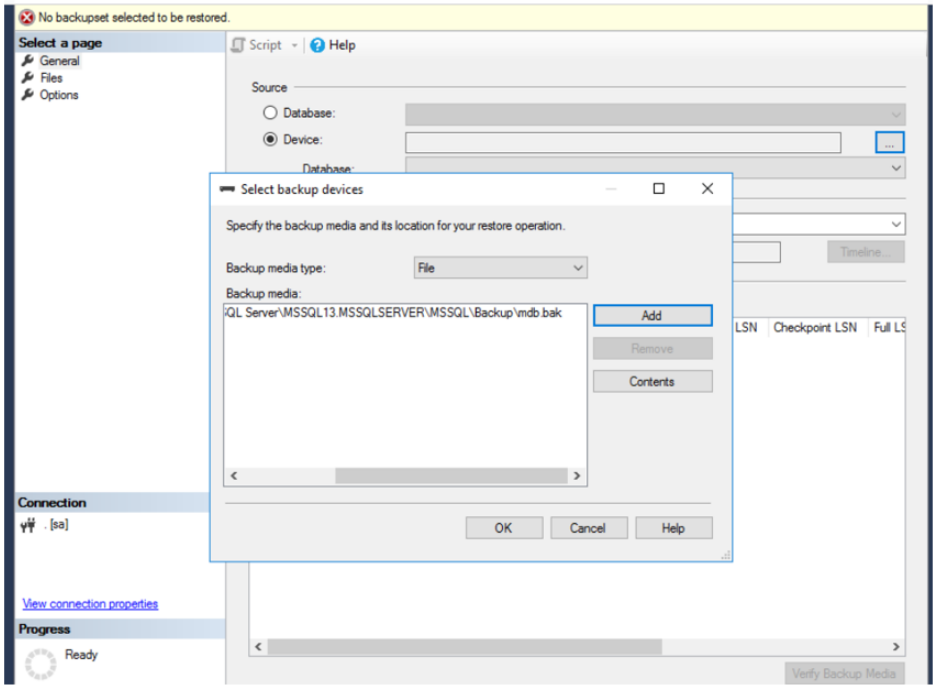
12. On the Detach Database screen, check the**Drop Connections** checkbox.



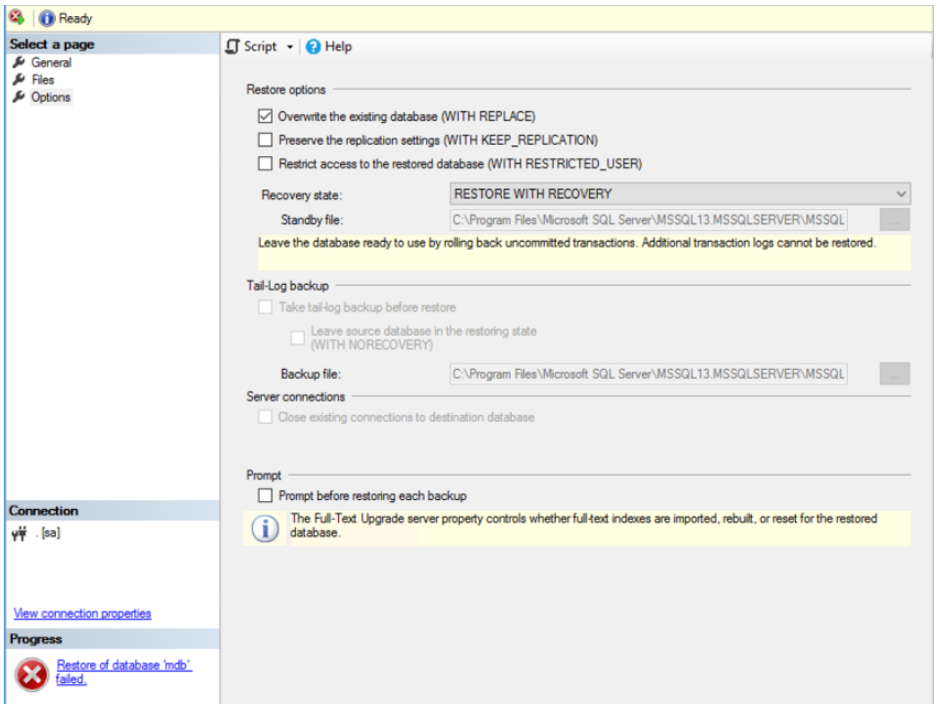
13. Check the **Drop** Checkbox and click OK.
    MDB instance is dropped from the target system (**testqa-mdb-new**).



14. To restore MDB backup into the target system (**testqa-mdb-new**) which was copied from the source system (**testqa-mdb**).
    a. Open the SQL Management studio with DB Admin credentials (**sa**).
    b. Navigate to Databases option, right-Click and select the **Restore Database** option.
    c. Select the **Device** Radio button in the Restore database screen.
    d. Click **Browse (...)**. Click **Add** and select the backup file where you have copied from source system.
    For example: \Program Files\Microsoft SQL Server\MSSQL13.MSSQLSERVER\MSSQL\Backup\mdb.bak)
    e. Click "**options**" on the Restore Database Screen.

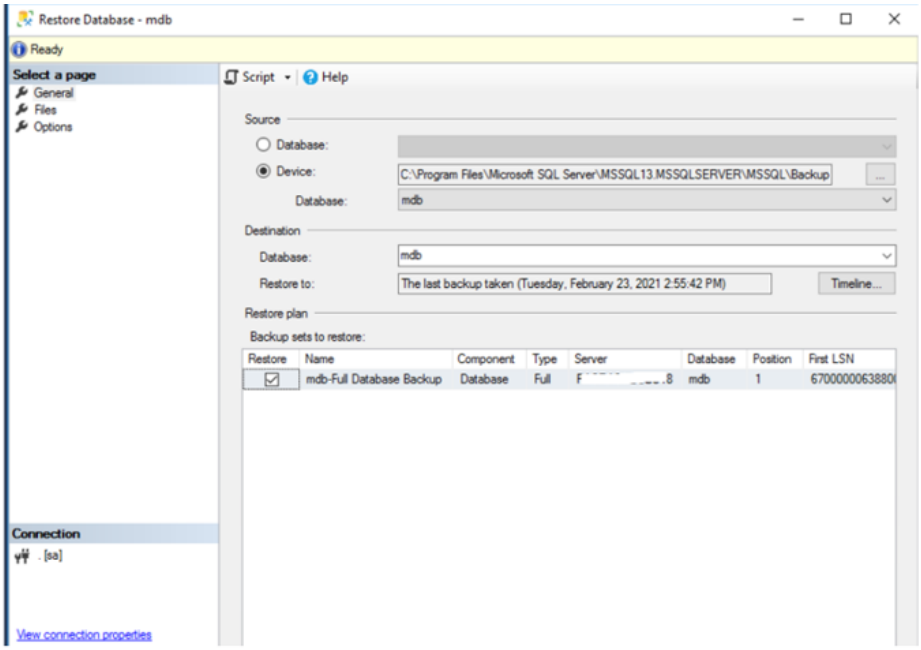


15. Check the checkbox of Overwrite the existing database (WITH REPLACE). Ensure that the database name on the target system is retained.



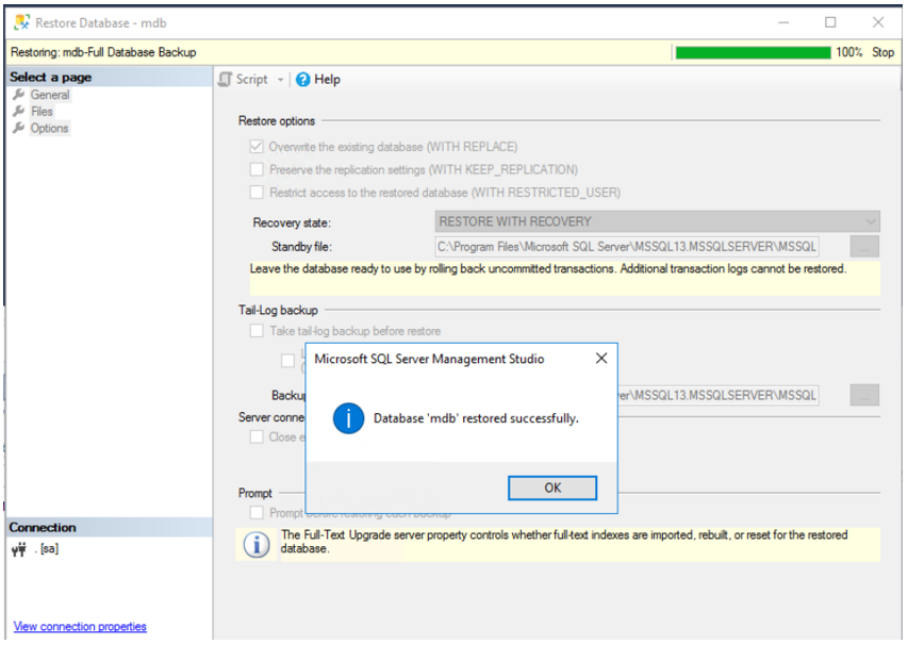
Click Ok.

16. The restore database name on the target system (**testq-mdb-new**) is retained and successful.



Click OK.

17. Click OK.



Database “mdb” is restored successfully.

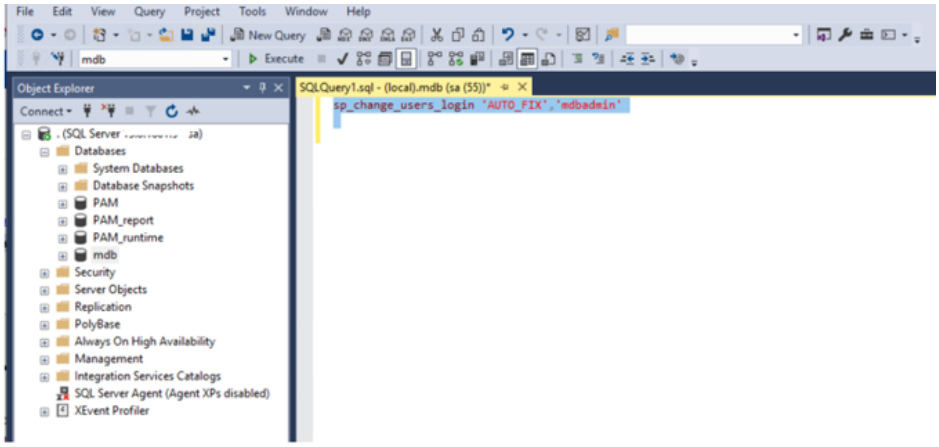
NOTE

Provide read and execute privileges to the mdb.bak file that you copied from the source database (testqa-mdb) to the SQLServerMSSQLUser$$MSSQLSERVER service account on the target MDB server (testqa-mdb-new). Failure to grant the read and execute privilege to mdb.bak may result in error “file folder cannot be located or it does not have the adequate permissions”.

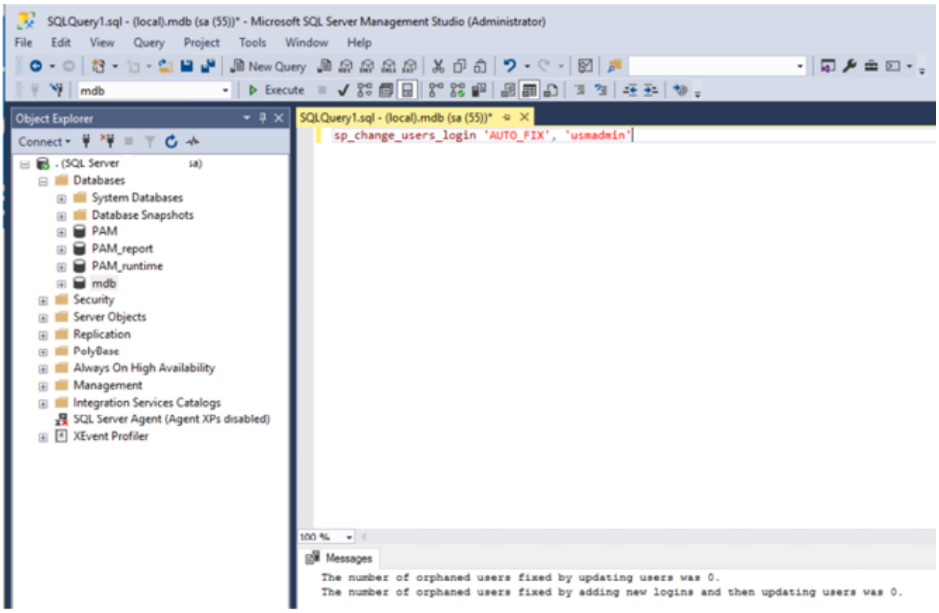
NOTE

Restore must complete without errors

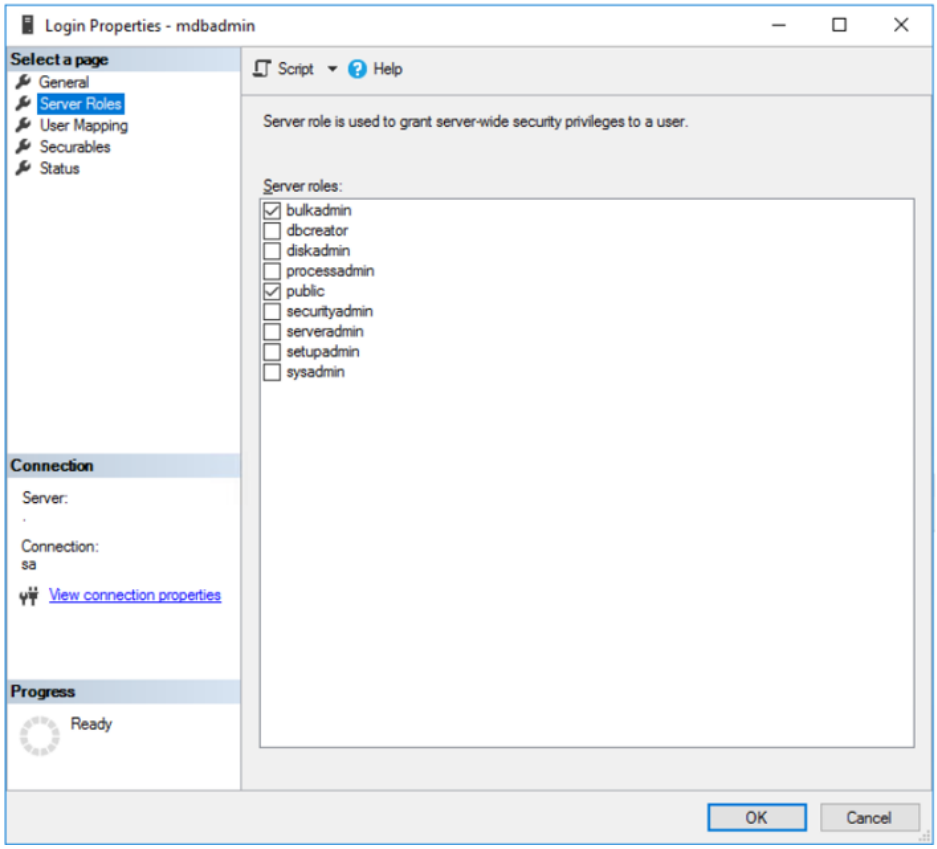
18. Run the following Microsoft SQL auto_fix_user script for the mdbadmin user: sp_change_users_login 'AUTO_FIX','mdbadmin'.



19. sp_change_users_login 'AUTO_FIX', 'usmadmin' (Applicable only if CA Service Catalog is installed and upgraded from previous release versions).



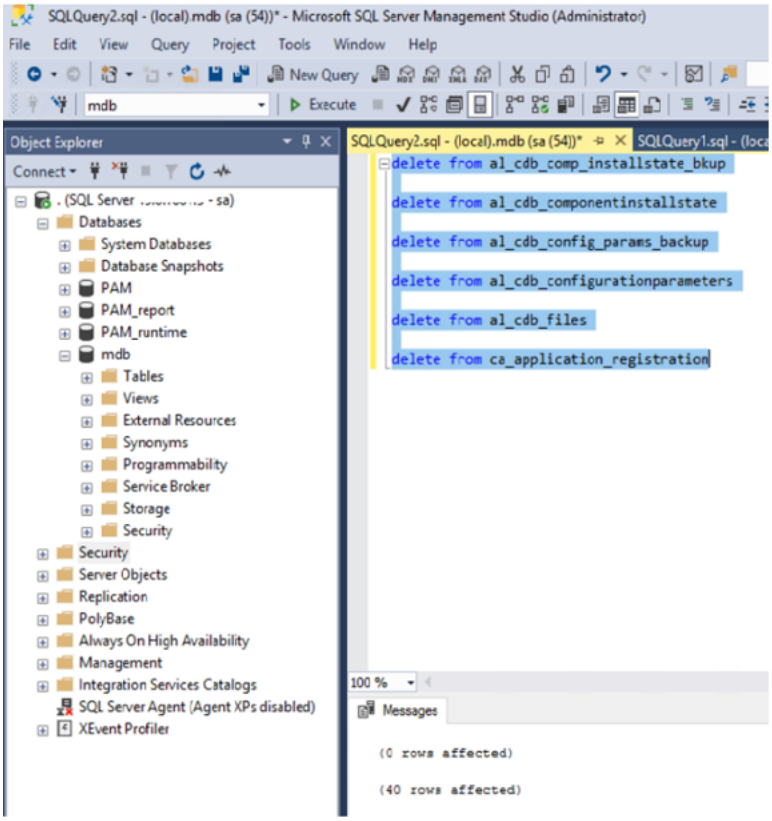
20. Verify that the mdbadmin is now mapped to mdb and have bulk admin, public roles.



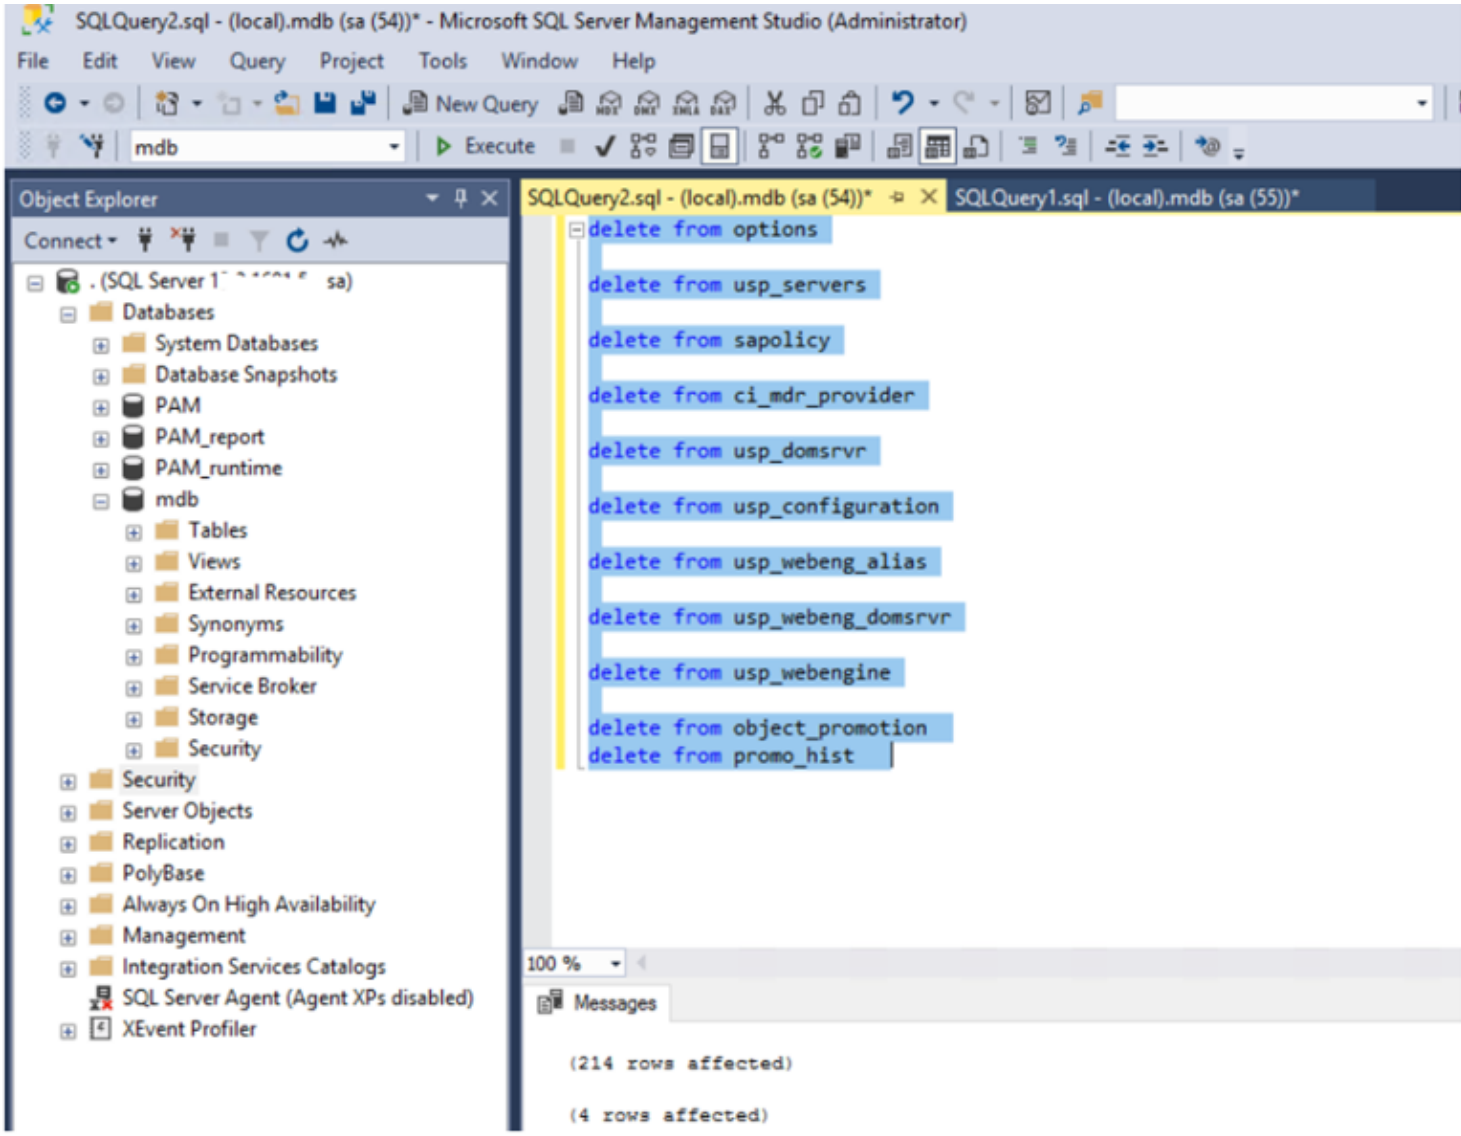
21. On the target system (**testqa-mdb-new**), delete data from the following tables and commit the changes:
    a. Use mdb and run the following queries to delete data from the required tables:

       Common Tables:

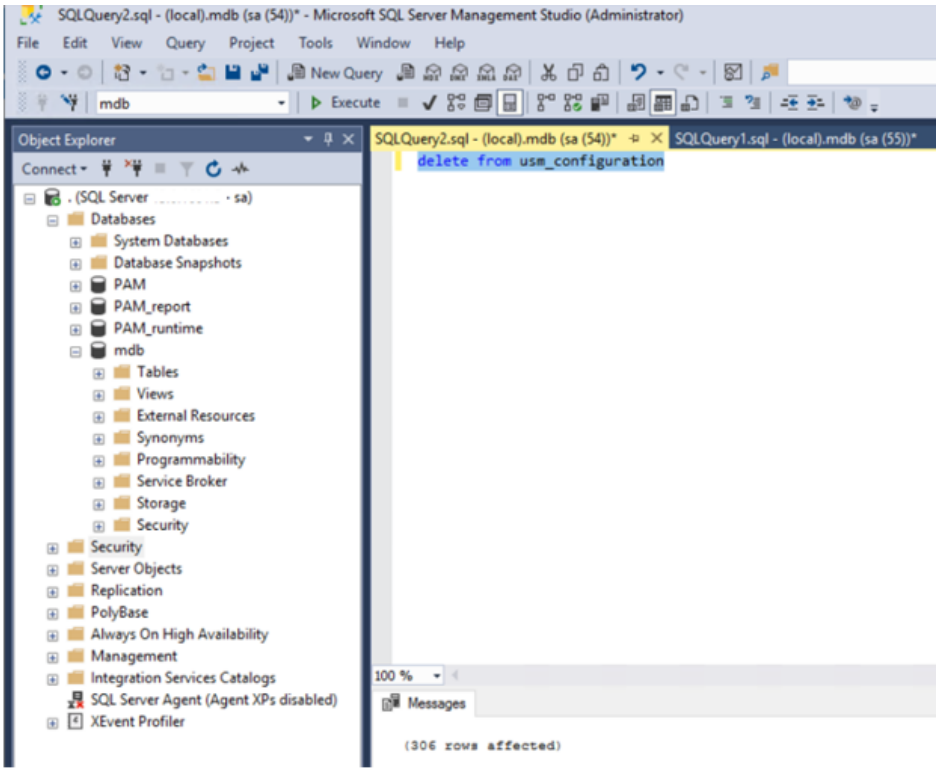
       - delete from al_cdb_comp_installstate_bkup
       - delete from al_cdb_componentinstallstate
       - delete from al_cdb_config_params_backup
       - delete from al_cdb_configurationparameters
       - delete from al_cdb_files
       - delete from ca_application_registration



22. CA SDM Tables:
    - delete from options
    - delete from usp_servers
    - delete from sapolicy
    - delete from ci_mdr_provider
    - delete from usp_domsrvr
    - delete from usp_configuration
    - delete from usp_webeng_alias
    - delete from usp_webeng_domsrvr
    - delete from usp_webengine
    - delete from object_promotion
      (applicable only if CA Service Management 14.1.02 is installed)
    - delete from promo_hist
      (applicable only if CA Service Management 14.1.02 is installed)



23. CA Service Catalog Tables: Delete from **usm_configuration**.



24. Execute the **mdb_script.sql** scripts that were created.

    IMPORTANT
    Ignore the warning message during execution “There is already an object named in the Database”.

CA Service Desk Manager (SDM) Customizations

Perform the following steps:

1. Copy the site/mods directory and tblobj.cfg and ddict.sch files from the source CA SDM server to the target CA SDM server:
   a. Source BG (**testqa-bg**) to the target BG (**testqa-bg-new**).
   b. Source Standby (**testqa-sb**) to the target Standby (**testqa-sb-new**).
   c. Source Application Server (**testqa-app1**) to the target Application Server (**testqa-app1-new**)

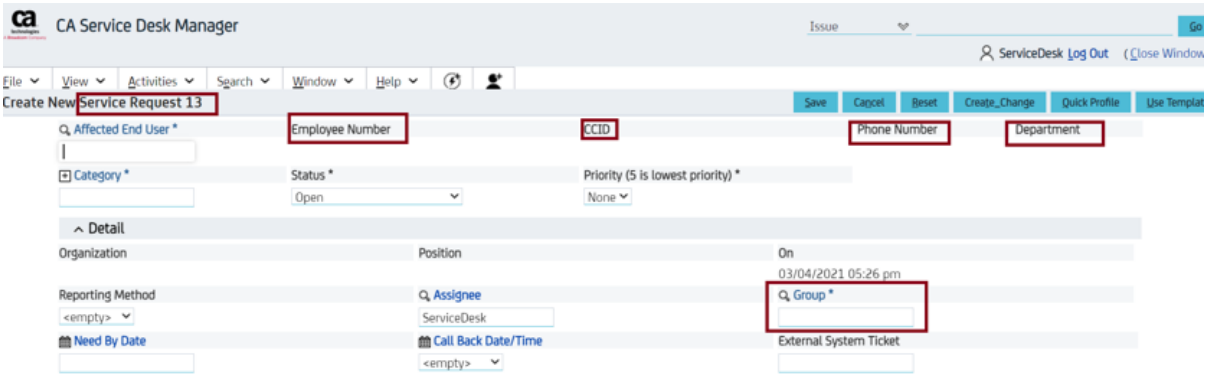
      NOTE
      Perform on all application servers in an environment.

      NOTE
      These steps are applicable only if your application environment is customized. This is not applicable for the out-of-the-box (OOTB) content.
2. Run **pdm_configure -S** on BG Server (**testqa-bg-new**). It configures silently. Monitor the progress of pdm_configure using NX_ROOT/logs/configure.log file. Perform the following steps:
   a. Launch the CA SDM BG URL as an Administrator (*http://testqa-bg-new:8080*).
   b. Navigate to **Administration** tab, **Security and Role Management**, Access Types link and click the **Administration** link.
   "CA EEM-Use CA Embedded Entitlements Manager" value should be displayed in the validation type list box.
   c. Verify that the new EEM server name (**testqa-eem-new**) is available in the NX_ROOT/NX.env file.
   d. Run **pdm_configure** on Standby Server (**testqa-sb-new**). Verify that the new EEM server name (**testqa-eem-new**) is available in the NX_ROOT/NX.env file in the Standby Server.

e. Run the **pdm_configure** on two application servers (**testqa-app1-new**) and (**testqa-app2-new**). Verify that the new EEM server name (**testqa-eem-new**) is available in the NX_ROOT/NX.env file for these two Application Servers.

f. Execute the **pdm_k_reindex** command on the CA SDM target system of BG Server **testqa-bg-new** to index knowledge documents that are created and copied from the source system of BG Server machine **testqa-bg**.

g. Login and ensure the target environment with CA Service Desk 17.1 is running with data and customizations from the source system.
For example, the below image shows customized items in the target system. Login to CA SDM, Navigate to **Service Desk**,**File**, **New Issue**.



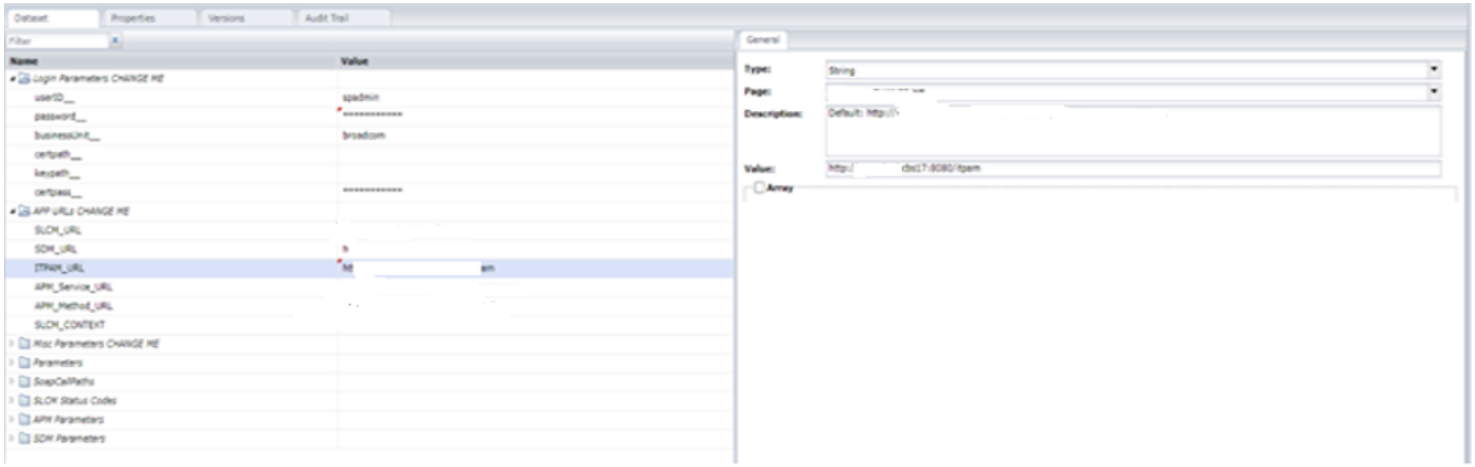
3. CA SDM Attachments (applicable only if you have NOT used the OOTB attachments path):
   a. Copy all the attachments using upload Path of all the repositories from a source server to the same path in a target server.
   For Example: Service Desk repository upload path is: <NX_ROOT>/site/attachments/default/servicedesk/file on source server. Copy the attachments from a source server to the target server.
4. CA SDM Repositories (applicable only if you have NOT used the OOTB repositories):
   a. Log in to CA SDM URL as an administrator.
   b. Navigate to **Administration**, **Attachments Library**, **Repositories**.
   c. Open the repositories one by one and update the target CA SDM server name in the Servlet Server and Repository Server fields.

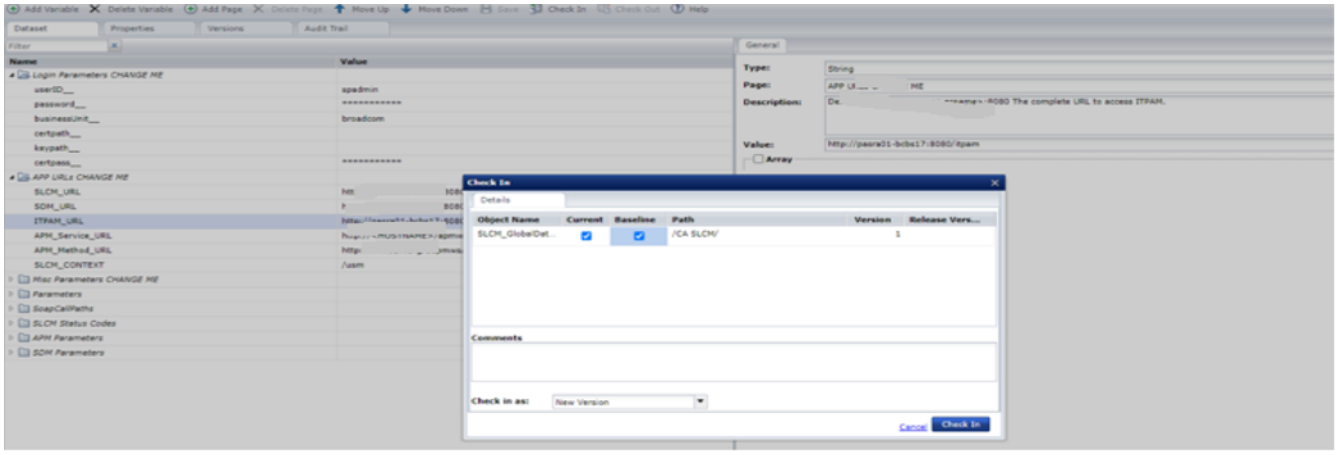
NOTE
Update the CA SDM server name in all the repositories (in the out-of-the-box and Created Repositories)

CA Process Automation

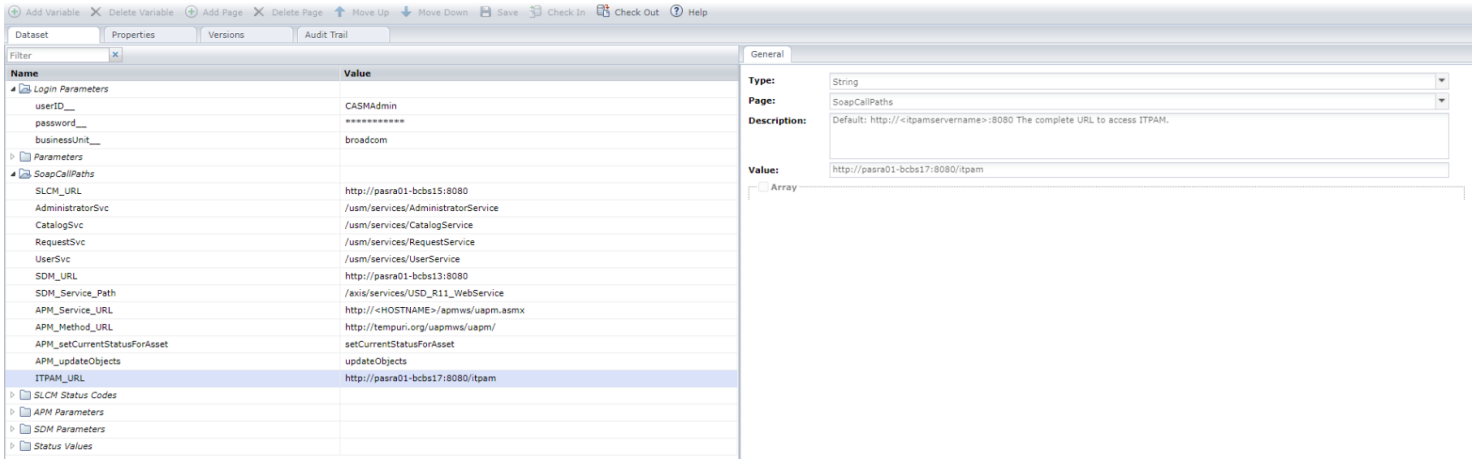
After successful installation, perform the following steps for CA Process Automation to ensure integration is seamless:

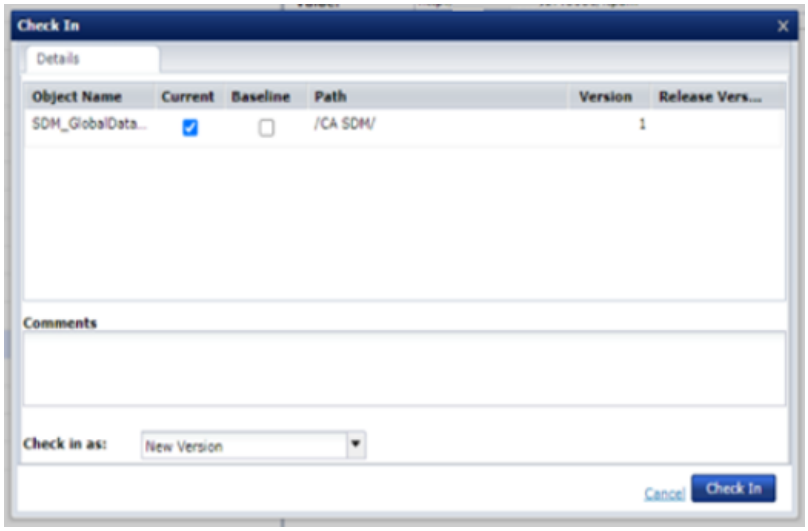
1. Start the CA Process Automation Service on **testqa-pam-new**.
2. Launch the CA Process Automation server (*http://testqa-pam-new:8080/itpam*) and access **SLCM_Globaldataset**.
3. Navigate to**Library**, **CA SLCM** folder, Click **SLCM_GlobalDatasheet** dataset.
4. Update Password, Catalog URL (**testqa-sc-new)**, SDM App URL (**testqa-app1-new**) and CA Process Automation (**testqa-pam-new**) URL of the target machines.





5. Access SDM_Globaldataset and Update password, Catalog URL, SDM URL and ITPAM URL of target machines: (*http://testqa-pam-new:8080/itpam*) and access **SDM_Globaldataset**.
6. Navigate to **Library**, CA SDM folder, Click **SDM_GlobalDatasheet** dataset.





Update Password, Catalog URL (**testqa-sc-new**), SDM App URL (**testqa-app1-new**) and CA Process Automation (**testqa-pam-new**) URL

7. Perform the following steps before you start the CA Service Catalog services on **testqa-sc-new**:
   a. If your ITPAM source system (t**estqa-pam**) has customized CA Process Automation content, export all relevant CA Process Automation content from the source CA Process Automation server (**testqa-pam**) and import to the target CA Process Automation server (**testqa-pam-new**). Complete the required configurations for CA Process Automation content.
   b. If your EEM source system (**testqa-eem**) has customized CA EEM policies, export all the relevant CA EEM policies from the source CA EEM server (**testqa-eem**) and import to the target CA EEM server (**testqa-eem-new**).

CA Service Catalog in-flight (waiting state) CA Process Automation Process

This section describes how to regenerate your waiting state CA Service catalog Process Automation workflow type requests from the source server to your target server. In-flight specifies running, waiting, suspended, blocked and so on. This document describes only the "**Waiting State**".

Approval Process

> **NOTE**
> In this example, the use case is for the "**Approval**" process instance in CA Process Automation, also known as Pending Approval request status in CA Service Catalog.

Perform the following steps:

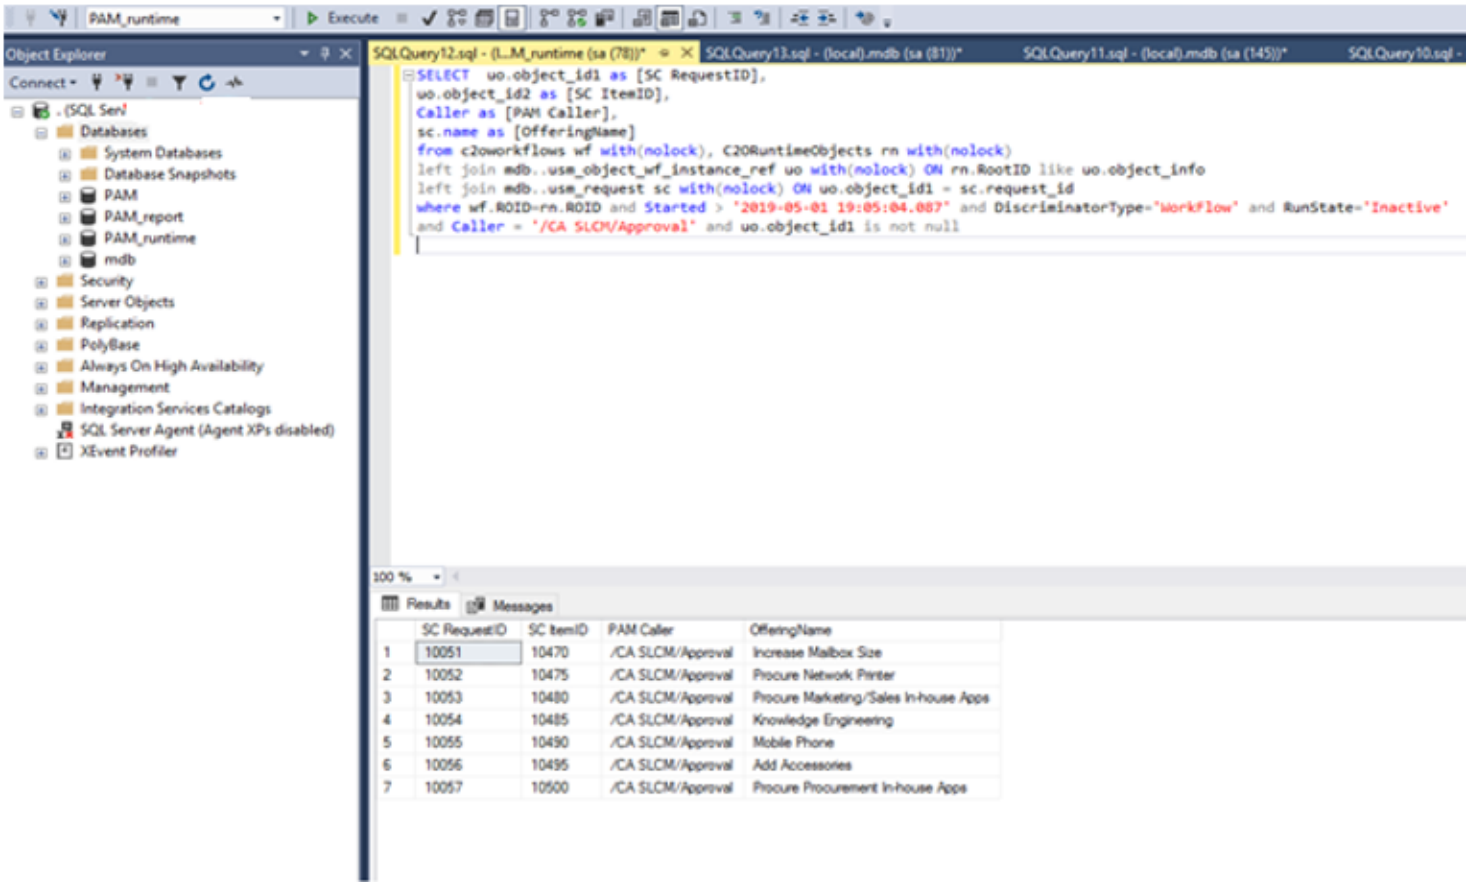
1. Ensure that the Service Catalog request is in **pending** status with the CA Process Automation Workflow instance on your source server (**testqa-mdb**).
2. Run the below database query on **testqa-mdb** to fetch pending CA Service Catalog request status by selecting the **PAM_runtime** database name:

```
DB query:
SELECT     uo.object_id1 as [SC RequestID]
uo.object_id2 as [SC ItemID],
Caller as [PAM Caller],
sc.name as [OfferingName]
from c2oworkflows wf with(nolock), C2ORuntimeObjects rn with(nolock)
left join mdb..usm_object_wf_instance_ref uo with(nolock) ON rn.RootID like uo.object_info
left join mdb..usm_request sc with(nolock) ON uo.object_id1 = sc.request_id
```

```
where wf.ROID=rn.ROID and Started > '2019-05-01 19:05:04.087' and DiscriminatorType='WorkFlow' and
 RunState='Inactive'
and Caller = '/CA SLCM/Approval' and uo.object_id1 is not null
```

NOTE
In the above query, the following parameters can be changed as required:

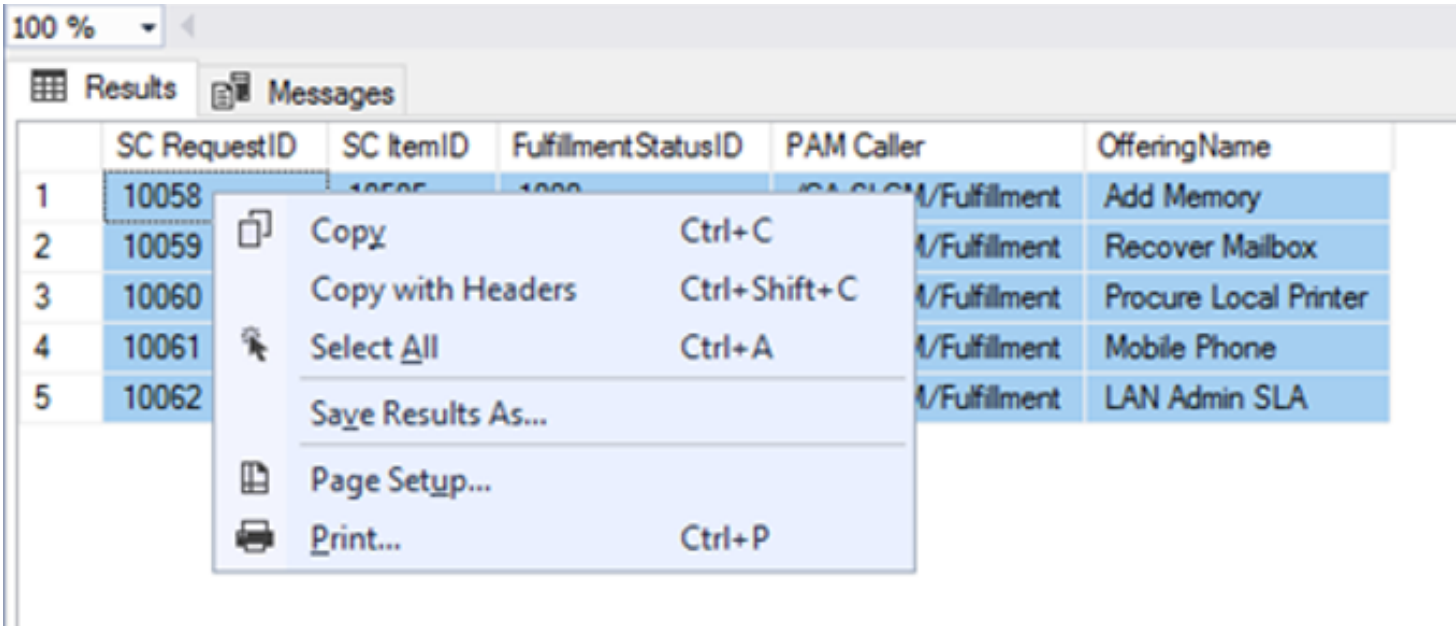
- Change the date and time as required.
  For example:
  Given **Started > '2019-05-01 19:05:04.087'**can be changed as required.
- Caller path value can be changed as per the CA Process Automation workflow process.
  For example:
  OOTB approval process : Given **Caller = '/CA SLCM/Approval'**.
- For the Out-of-the-Box (OOTB) Approval instance, input parameters are: **RequestID**, **ItemID,** and offering name. These input parameters can be changed based on a custom-defined process.



3. Copy the output values from step 2 (see image).
   Create the **catalog_approval.csv file as following:**
   a. Select the results data for the Approval or Fulfillment query and then select option as “**Copy**”.

      NOTE
      Ensure that **step 2** is performed on a server where Microsoft Office (Excel) is available.

   b. Open a new excel file and paste the results in the excel file.



c. Click on "**Save as**" excel file and select:
   a. SLCM_CSV_Filepath # E:\\Catalog_Data
   b. SLCM_CSV_FileName # **catalog_approval.csv**
   Click **Save**.

   c. Click **Yes**.

   d. Click **Save**.
   File is generated as a CSV file (**catalog_approval.csv**).
   Ensure this file is copied or available in CA Process Automation Target Server (**testqa-pam-new**).

4. Import the **PAM-InflightProcess.xml**.

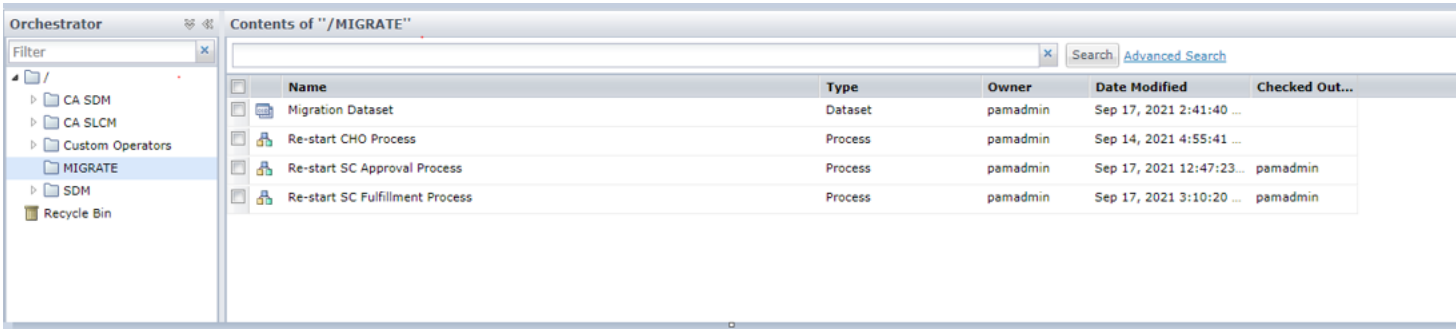
IMPORTANT
This file is provided with the Run book.

a. Perform the following Steps to import the file:
   a. Login to CA Process Automation target server (**testqa-pam-new**) with Admin privileges.
   Example: **pamadmin**
   b. Navigate to **Home**, **Library**.
   c. Right-click the root folder, select the **Import** option from the menu.

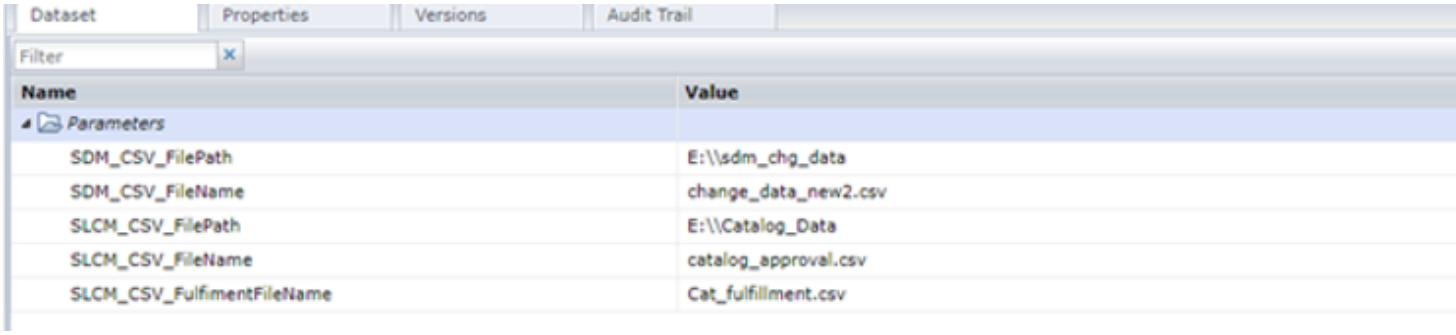
   d. Click **Import**.
   e. Click **Browse** to select the file (from the Import window, see the image in step 4 iii).

   f. Click **Submit**.

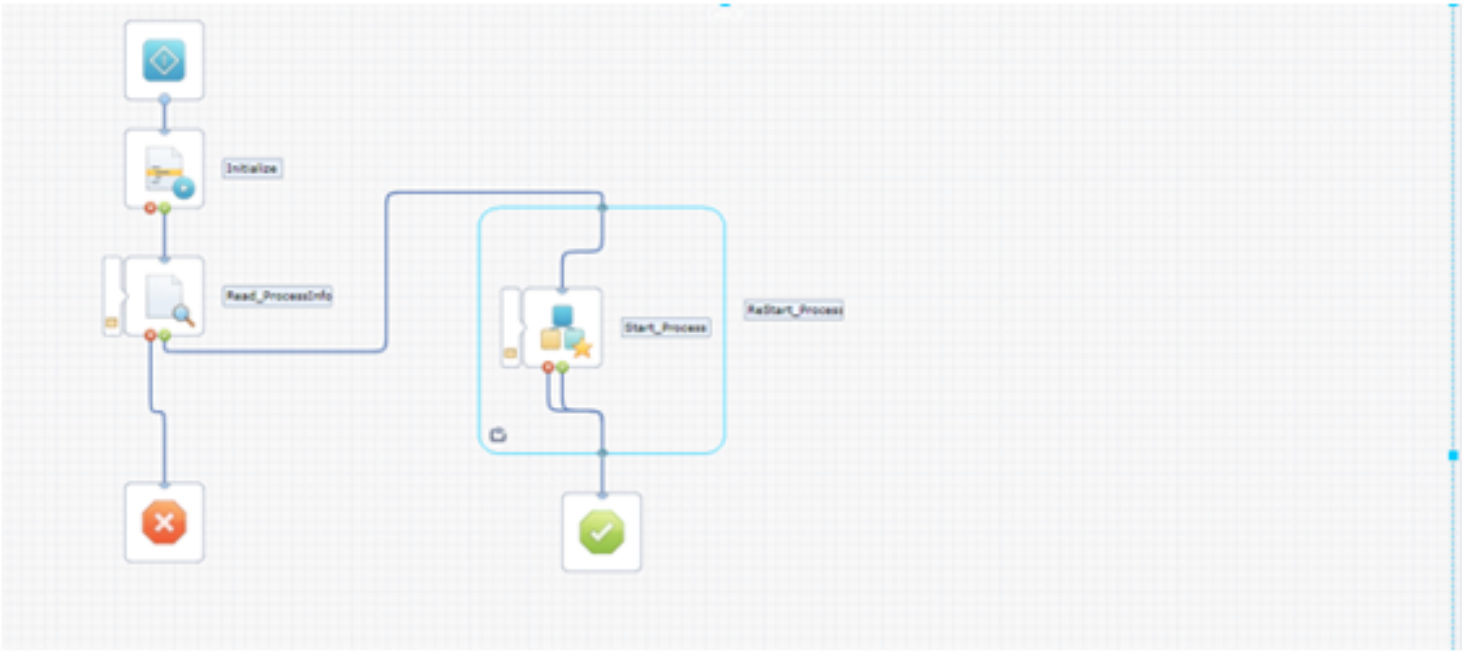
5. After successful import on the Process Automation target server (**testqa-pam-new**), the "**MIGRATE**" folder is added with three workflow processes in Process Automation:
   a. Migration Dataset
   b. Re-start CHO Process
   c. Re-start SC Approval Process
   d. Re-start SC Fulfillment Process



6. Edit the Migration Dataset and then update the below entries:
   a. SLCM_CSV_FilePath # E:\\catalog_data
   b. SLCM_CSV_FileName # **catalog_approval.csv**
   Click **Save**.



7. Edit "**Re-start SC Process**" process and click **Start**.
   It will now create the Process Automation workflow Process instances in "**waiting**" state.



8. Login to CA Service Catalog and verify the catalog request status on the target server (**testqa-sc-new)**. Approve the request to move the request status from one state to another. Example: pending approval to pending fulfillment.

Fulfillment Process

NOTE
In this example, the use case is for the “**Fulfillment**” process instance in CA Process Automation, also known as **Pending Fulfillment** request status in CA Service Catalog.

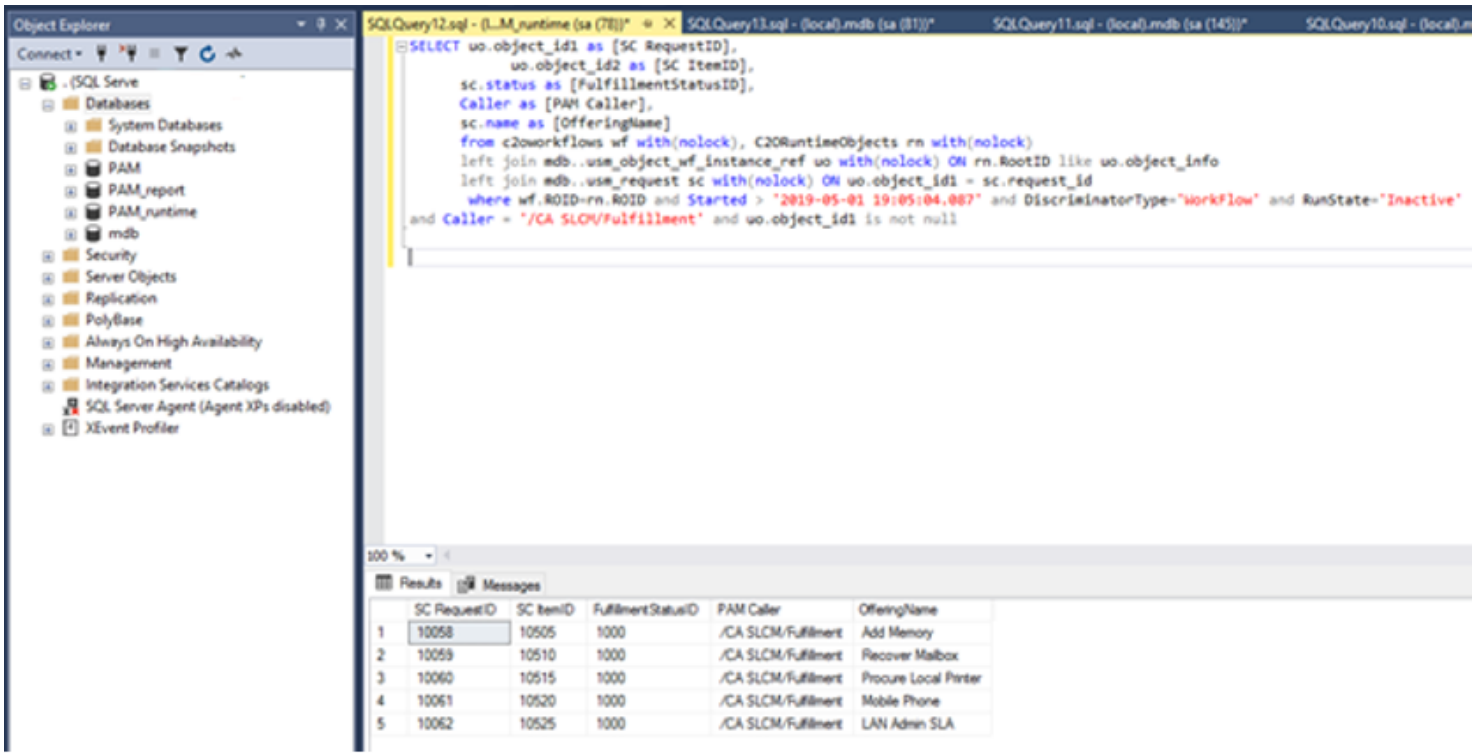
Perform the following steps:

1. Run the below query:

```
  DB Query:
----------------
    SELECT uo.object_id1 as [SC RequestID],
           uo.object_id2 as [SC ItemID],
      sc.status as [FulfillmentStatusID],
      Caller as [PAM Caller],
      sc.name as [OfferingName]
      from c2oworkflows wf with(nolock), C2ORuntimeObjects rn with(nolock)
      left join mdb..usm_object_wf_instance_ref uo with(nolock) ON rn.RootID like uo.object_info
      left join mdb..usm_request sc with(nolock) ON uo.object_id1 = sc.request_id
       where wf.ROID=rn.ROID and Started > '2019-05-01 19:05:04.087' and DiscriminatorType='WorkFlow' and
 RunState='Inactive'
and Caller = '/CA SLCM/Fulfillment' and uo.object_id1 is not null
```

NOTE
In this query, the following parameters can be changed as required.

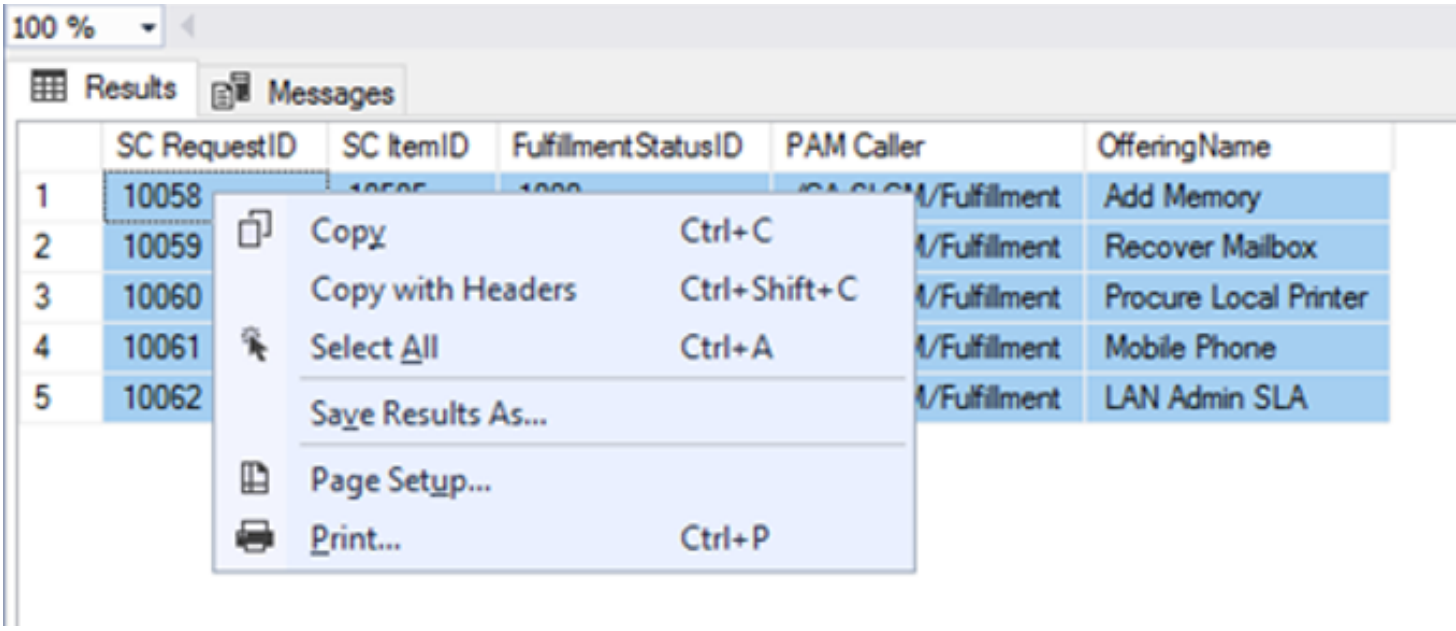
- Change the date and time based on requirement. For example:
  Given Started > '2019-05-01 19:05:04.087.
- Caller path value can be changed based on the PAM process. For example:
  Given Caller = '/CA SLCM/Fulfillment'
- For the Fulfillment instance, input parameters like RequestID, ItemID, FulfillmentStatusID and offering name. These input parameters can be changed based on a custom-defined process.



2. Copy the above output values and create it as **Cat_fulfillment.csv** on the CA Process Automation server target machine. Record the CSV file path. (ex: E:\\Catalog_Data).
   a. Create a **Cat_fulfillment.csv** file as shown below on the CA Process Automation target server (**testqa-pam-new**) and save it. For example: E:\\Catalog_Data
   Create a CSV File:
   b. Select the results data for the Approval or Fulfillment query and then select option as “**Copy**”.

      NOTE
      Ensure that step 2 is performed on a server where Microsoft Office (Excel) is available.

   c. Open a new excel file and paste the results in the excel file.

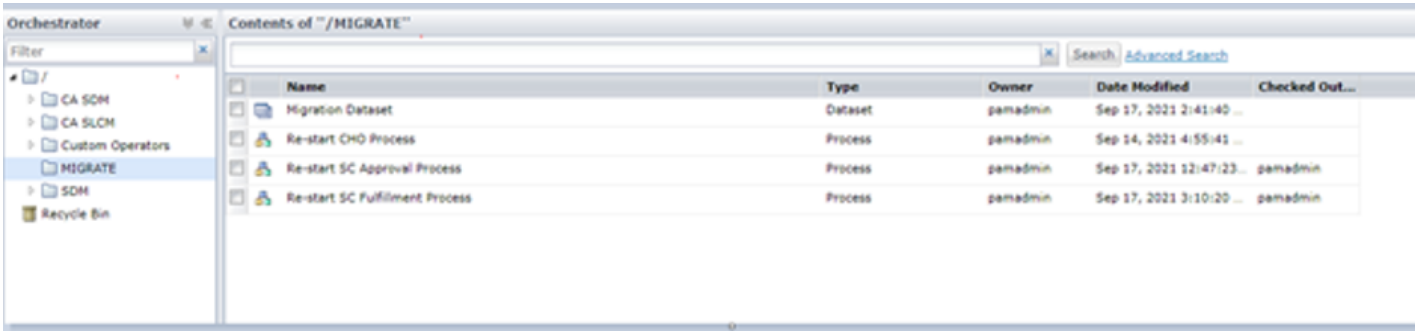


d. Click on "**Save as**" excel file and select:
   a. SLCM_CSV_FilePath # E:\\catalog_data
   b. SLCM_CSV_FulfillmentFileName # **cat_fulfillment.csv**
   c. Save as type " CSV(Comma delimited) (*.csv).
   Click **Save**.

   d. Click **Yes**.

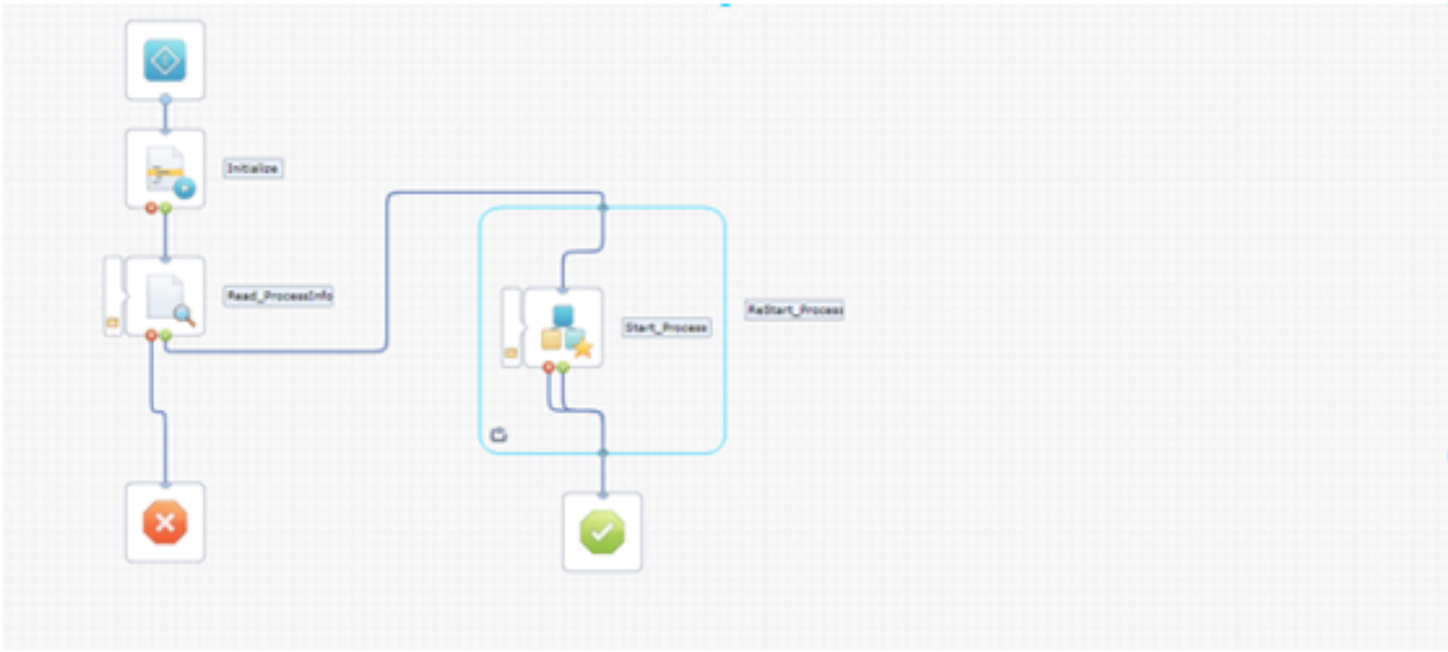
   e. Click **Save**.
   File is generated as a csv file (**catalog_approval.csv**).

NOTE
Ensure this file is copied or available in CA Process Automation Target Server (**testqa-pam-new**)



3. Edit the Migration Dataset as seen in the above image. Update the below entries. Click **Save**.
   a. SDM_CSV_FilePath # E:\\catalog_data
   b. SLCM_CSV_FulfillmentFileName # **cat_fulfillment.csv**
   Click **Save**.

   c. Edit "**Re-start SC Fulfillment Process**" process and click **Start**.
   It will now create the Process Automation workflow Process instances instances in "**waiting**" state.



4. Login to CA Service Catalog and verify that the catalog request status is pending fulfillment on the target server (**testqa-sc-new**). Fulfill the request to move the request status from one state to another. Example: pending fulfilment to completed.

NOTE
CA Process Automation Process instances names shows as "**unknown**" in the CA service catalog request tracking tab when the instances are moved from Source CA service Catalog server (**testqa-sc**) to Target CA Service Catalog server (**testqa-sc-new**). However, as part of inflight process, after regenerating a new process instance with the same request ID on the CA Process Automation Target server (**testqa-pam-new**), the requests are able to move from one state to another and subsequent process instance names are displayed on the CA Service Catalog Request Tracking tab.

CA SDM In-flight CA Process Automation Process for Change Order

This section describes how to regenerate change orders with "waiting" state of theProcess Automation workflow of CA Service Desk Manager (SDM), from a source server (testqa-pam) to a target server (**testqa-pam-new**) to a target server (**testqa-pam-new**). In-flight here specifies running, waiting, suspended, blocked and so on. This document describes only the “**Waiting State**”.

Change Order Process

NOTE
In this example, the use case is for “Order PC” (Out-of-the box) process instance in CA Process Automation, also known as Change Order in CA SDM.

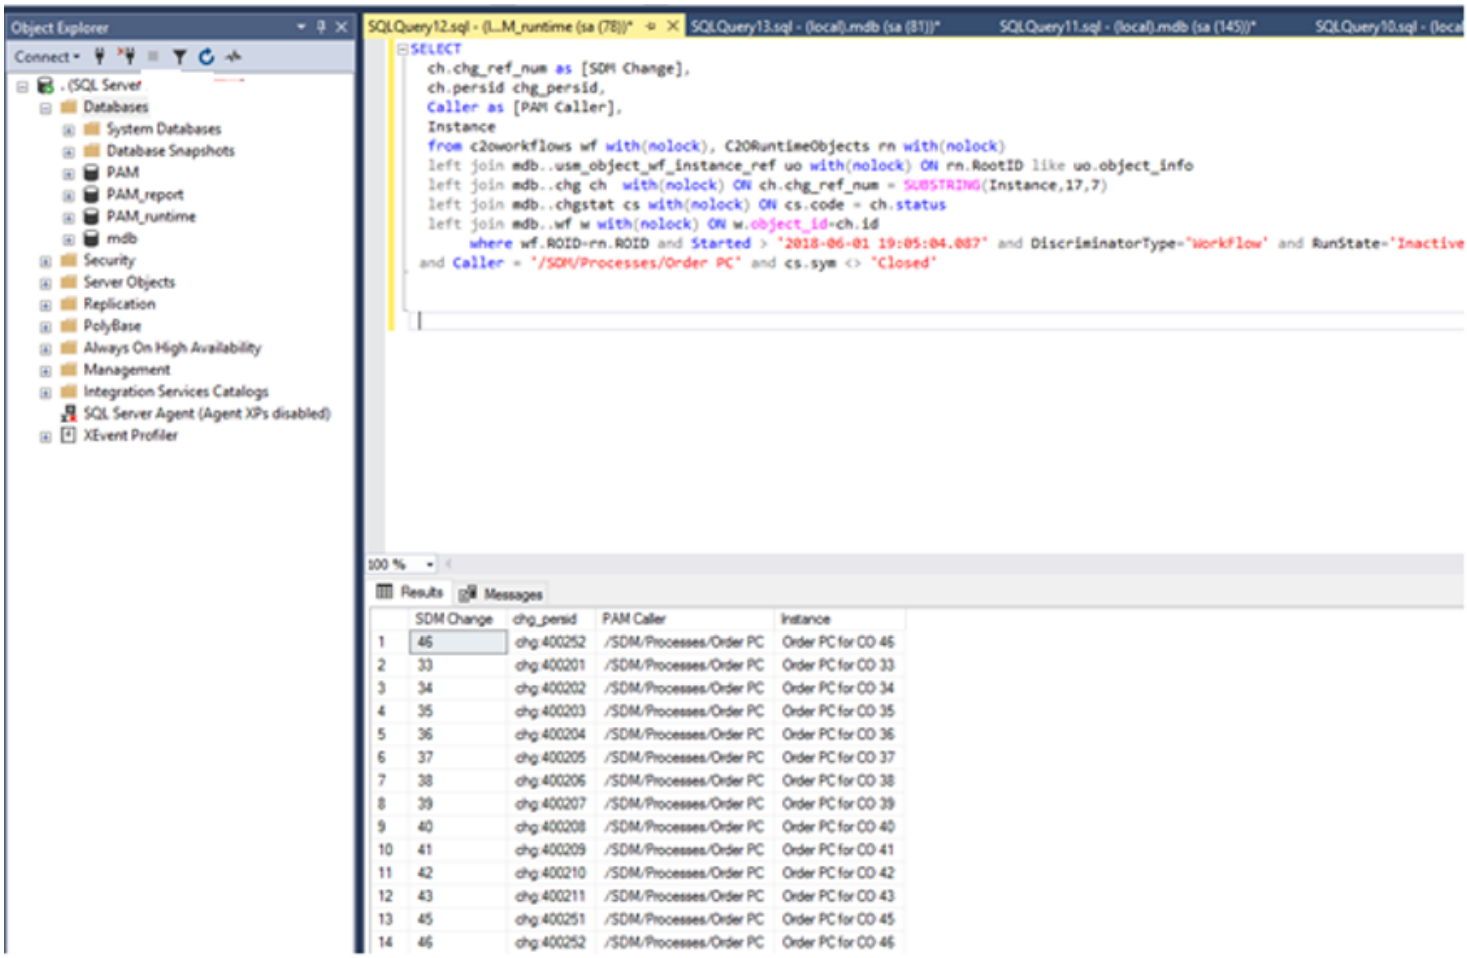
Perform the following steps:

1. Ensure that you have few Change Orders with categories in the Process Automation Workflow (**Add.IT.Other**) on any of the source SDM application servers (**testqa-app1**).
2. Run the below database query on the source database server (**testqa-mdb**) to get the CA Process Automation workflow process list for change order by selecting the **PAM_runtime** database name.

```
 SELECT
 ch.chg_ref_num as [SDM Change],
 ch.persid chg_persid,
 Caller as [PAM Caller],
 Instance
 from c2oworkflows wf with(nolock), C2ORuntimeObjects rn with(nolock)
 left join mdb..usm_object_wf_instance_ref uo with(nolock) ON rn.RootID like uo.object_info
 left join mdb..chg ch  with(nolock) ON ch.chg_ref_num = SUBSTRING(Instance,17,7)
 left join mdb..chgstat cs with(nolock) ON cs.code = ch.status
 left join mdb..wf w with(nolock) ON w.object_id=ch.id
      where wf.ROID=rn.ROID and Started > '2018-06-01 19:05:04.087' and DiscriminatorType='WorkFlow' and
RunState='Inactive'
and Caller = '/SDM/Processes/Order PC' and cs.sym <> 'Closed'
```

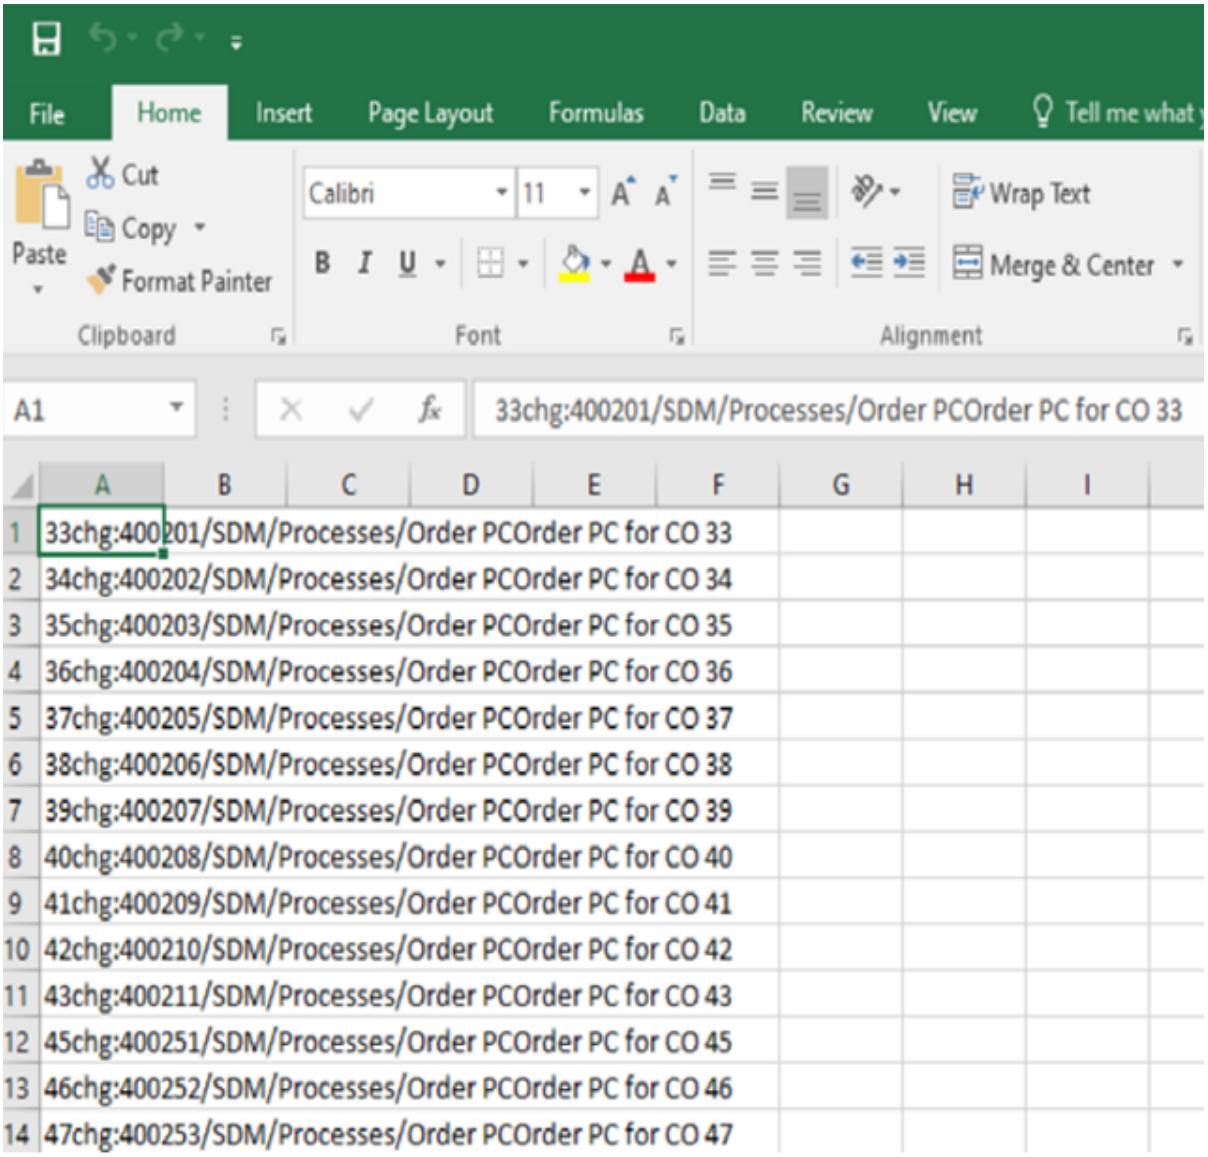
NOTE
In this query, the following parameters can be changed as required:

- Change the date and time based on requirement. For example:
  Given Started > '2018-06-01 19:05:04.087
  This can be changed based on the requirement.
- Caller path value can be changed based on the PAM process. For example:
  Given Caller = '/SDM/Processes/Order PC'
- For the OOTB Order PC instance, input parameters are: **chg_persid** and**chg_ref_num**. These input parameters can be changed based on a custom-defined process.



3. Copy the above output values and create it as **change_data_new2.csv** format on the target Process Automation server (**testqa-pam-new**). Record the csv file path
   (For example: E:\\s**dm_chg_data**)
   Example of CSV File
   .
   – 33,chg:400201,/SDM/Processes/Order PC,Order PC for CO 33
   – 34,chg:400202,/SDM/Processes/Order PC,Order PC for CO 34
   – 35,chg:400203,/SDM/Processes/Order PC,Order PC for CO 35
4. Copy the above output values as shown in the image above.
   a. Create a **change_data_new2.csv** file as shown below on the CA Process Automation target server (testqa-pam-new) and save it. For example: \ex: E:\\sdm_chg_data
      Create a CSV File as following:
      a. Select the results data for the change order query and then select option as “**Copy**”.

         NOTE
         Ensure that the below step is performed on a server where Microsoft Office (Excel) is available.
      b. Open a new excel file and paste the results in the excel file.

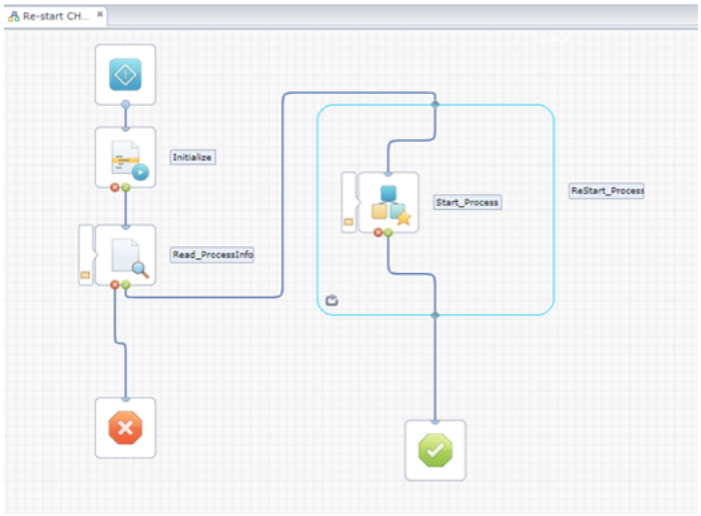


c. Click “**Save as**” excel file and select: For example: Filename as “**change_data_new2.csv**”
   a. Save as type “ CSV(Comma delimited) (*.csv)
   b. Save file.

   c. Click **Yes**.
   d. Click**Save**.
   File is generated as a csv file (**change_data_new2.csv**).

NOTE
Ensure that this file is copied or available in the CA Process Automation Target Server (testqa-pam-new).

5. Edit the Migration Dataset. Update the below entries.
   Click **Save**.
   a. SDM_CSV_FilePath # E:\\sdm_chg_data
   b. SDM_CSV_FileName # **change_data_new2.csv**
6. Edit "**Re-start CHO Process**" process and click **Start**.



Process Automation workflow Process instances are in the "**waiting**" state.

7. Update the list of **Instance_Id** in the table **usp_caextwf_instances** of MDB database with the latest ROID in the table C2ORuntimeObjects of **PAM_runtime** database on the target database server (**testqa-mdb-new)**.

```
Update uci
 set uci.instance_id=rn.ROID
  from c2oworkflows wf with(nolock), C2ORuntimeObjects rn with(nolock)
  left join mdb..usm_object_wf_instance_ref uo with(nolock) ON rn.RootID like uo.object_info
  left join mdb..chg ch  with(nolock) ON ch.chg_ref_num = SUBSTRING(Instance,17,7)
  left join mdb..usp_caextwf_instances uci with(nolock) ON uci.object_persid = ch.persid
  left join mdb..chgstat cs with(nolock) ON cs.code = ch.status
  left join mdb..wf w with(nolock) ON w.object_id=ch.id
       where wf.ROID=rn.ROID and Started > '2018-06-01 19:05:04.087' and DiscriminatorType='WorkFlow' and
 RunState='Inactive'
 and Caller = '/SDM/Processes/Order PC' and cs.sym <> 'Closed'
```

NOTE
In the above query, the following parameters can be changed as required. Change the date and time as required. Example: Given Started > '2018-06-01 19:05:04.087' can change based on requirement.
Caller path value can be changed based on the PAM process: Ex: Given Caller = '/SDM/Processes/Order PC'

8. Restart SDM services on all the target servers (**testqa-bg-new**, **testqa-sb-new**, **testqa-app1-new**, and**testqa-app2-new**).
9. Verify the CA SDM Change Order status.
   By default, the status is Open and it will be changed to another status based on the actions taken on the Process Automation target server (**testqa-pam-new**).

CA EEM Policies Backup and Restore on CA Service Catalog server

Perform the following steps to backup CA EEM data on source Catalog server (**testqa-sc**):

1. Open the CA Service Catalog command prompt by clicking Start, Programs, CA, Service Catalog, usm Command Prompt (that is, *%usm_home%\usm.cmd*) from the Catalog 17.1 installed source server **testqa-sc**.
2. Run the following command:

   ```
   ant backup-eem-app
   ```

   – During execution, provide input parameters like EEM password and so on.
   – After successful completion, "eem-backup.xml" file is generated in the *%USM_HOME%* directory.

   NOTE
   If you have multiple CA Service Catalog computers, perform this step on the first CA Service Catalog computer. Run this command once, regardless of how many CA Service Catalog system your environment may have.

   – Perform the following steps to restore CA EEM on the target Catalog server (**testqa-sc-new**):
   a. Copy the file (**eem-backup.xml**) from testqa-sc to the testqa-sc-new in the %USM_HOME% folder.
   b. Run the following command:

      ```
      ant restore-eem-app
      ```

   c. After successful completion related entries are updated in CA EEM.
   d. Restart CA Service Catalog services.

CA Service Catalog Customization

Perform the following steps:

1. Copy filestore, custom directory from the source CA Service Catalog server (**testqa-sc**) to the target CA Service Catalog server (**testqa-sc-new**).

   NOTE
   This is applicable only if customization is carried out in the application environment. This is not applicable for the OOTB content.
2. In the Catalog customizations, we have only one file, that is, **requestprofile.xsl** for customization in this environment.
3. Start the following CA Service Catalog services:
   a. CA Service Accounting
   b. CA Service Catalog

After completing the above, CA Service Management customizations are successfully moved.

Upgrade CA Service Management 17.1 to CA Service Management 17.4

After successful installation of CA Service Management 17.1, upgrade it to CA Service Management 17.3 first and then update it to CA Service Management 17.3.0.2, and upgrade to CA Service Management 17.4:

Prerequisites

1. Shutdown all CA Service Desk and Service Catalog services.
2. CA EEM Services must be up and running on **testqa-eem-new**.
3. CA ITPAM application services must be up and running on **testqa-pam-new**.
4. Download “Joint JS”.
   For more information about download and installation instructions, see JointJs.

   NOTE
   Take a backup of your customizations before upgrading from CA Service Management 17.3.0.2 to 17.4.

Upgrade from CA Service Management 17.1 to CA Service Management 17.3

Perform the following steps:

1. Start upgrade to CA SDM 17.3, then update to 17.3.0.2 in a sequence.
   a. Start the upgrade on the BG server (**testqa-bg-new**)
      Ensure that BG Server is up and running after successful installation.
   b. Start upgrade on the Standby Server (**testqa-sb-new**).
   c. Start upgrade of **Appserver1**, **Appserver2**and install **Appserver3**:
      a. Appserver1 (**testqa-app1-new**):
         Components: SDM Server with Visualizer
      b. Appserver2 (**testqa-app2-new**):
         Components: Only SDM Server
      c. Appserver3 (**testqa-app3-new**) (Newly added server as part of CA Service Management 17.3 and 17.3.0.2 installation): Components: SDM Server, xFlow Interface/Service Point

         NOTE
         For more information, see Installing CA Service Desk Manager.
2. Start install Search Server on **testqa-es-new**and during installation of search server, follow the steps to configure search server.
3. Start installing Virtual Analyst on **testqa-rasa-new**.
   For more information, see Install and Configure Virtual Analyst.
   a. Train the RASA NLU Sever.
      For more information, see How to train the NLU Server Train the NLU Server.
4. Configure Virtual Analyst in Service Desk Manager. For more information, see Train the NLU Server to configure Virtual Analyst.
5. Start the upgrade process on CA Service Catalog Server (**testqa-sc-new**).
   a. For more information, see Install CA Service Catalog .
   b. Perform CA Service Catalog Post-installation steps.

      NOTE
      Make sure to merge all customizations with CA Service Management 17.3, and 17.3.0.2.

      NOTE
      Ensure that all CA SDM and Service Catalog application Services are up and running after successful Upgrade with configurations and customizations.
6. Now, apply CA Service Management 17.4. Follow the below installation process sequence:

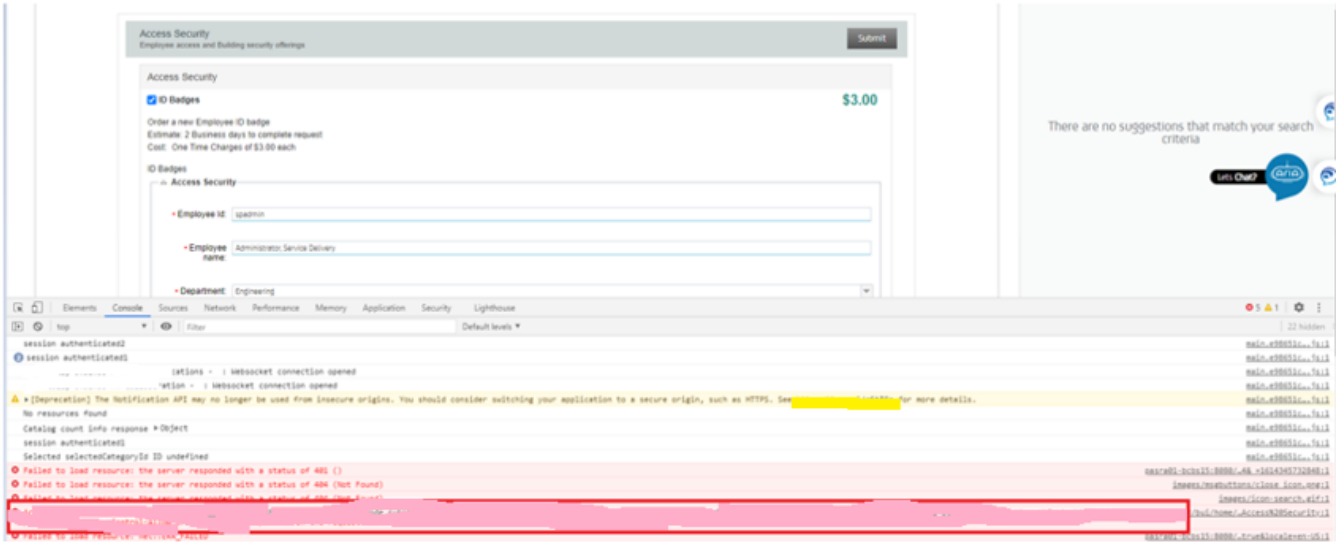
   NOTE
   Stop all CA SDM and Service Catalog Servers.
   a. Start updating CA Service Management 17.4 on BG Server (t**estqa-bg-new**).
      Ensure that BG server is up and running after successful installation.
   b. Start updates to CA Service Management 17.4 on Standby Server (**testqa-sb-new**).
7. Start updates to CA Service Management 17.4 on Appserver1, Appserver2 and Appserver3:
   a. Appserver1 (**testqa-app1-new)**:
      Components: SDM Server with Visualizer
   b. Appserver2 (**testqa-app2-new**)
      Components: Only SDM Server
   c. Appserver3 (**testqa-app3-new**)
      Components: SDM Server, xFlow Interface/Service Point
8. Start Update of CA Service Management 17.4 on Search Server (**testqa-es-new**).
9. Start update of CA Service Management 17.4 on Catalog Server (**testqa-sc-new**).
   For more information, see CA Service Catalog Post-installation steps.

   NOTE
   Ensure to merge all customizations with CA Service Management 17.4

10. After successful configuration, ensure that all applications are up and running.
11. Enable/Configure Active directory in CA EEM.
12. Ensure CA SDM, xFlow Interface, and Catalog server functionality is working fine with the Active directory integration.

Troubleshooting

Problem: Unable to submit CA Service Catalog request from service point as a result getting the following error message on Chrome browser Version V80 + only.

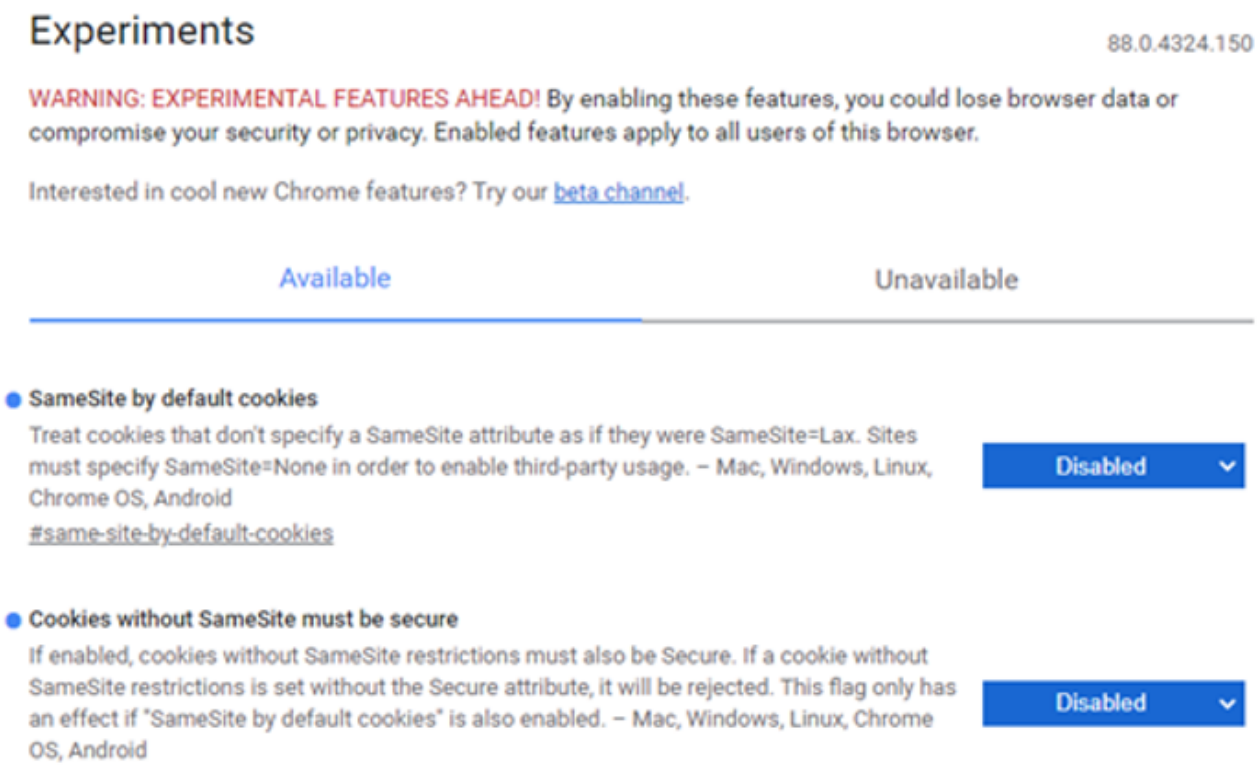


Solution: Chrome provides the following flags to disable this constraint:

- SameSite by default cookies.
- Cookies without SameSite must be secure.

Perform the following steps to disable the Chrome browser flags:

1. Open Chrome Browser.
2. Enter Chrome://flags.
3. Search with above flags and disable.



Use Case 2 – CA Service Management 17.4 Swing Box Move from the Production to the Target Server

This article describes the Swing Box Move procedure for CA Service Desk Manager (CA SDM) 17.4 from a Production to a Target (Test) Server with enhanced system configurations by adding CA Service Catalog also into the target server.

Server Terminology
In this example use case, the following terminology is used for the Production and Target servers:

- Production MDB database host name: **testqa-mdb**
- Target MDB database host name: **testqa-mdb-new**

Implement the Swing-Box method in your environment to move CA MDB data from the Production server (**testqa-mdb**) to a target server (**testqa-mdb-new**).

Production System (CA Service Management 17.4)	Target System (CA Service Management 17.4)
Remote MDB: **testqa-mdb**	Remote MDB: **testqa-mdb-new**
CA Service Desk Manager: **Advanced Availability with Multi-Tenancy and NTLM Authentication**	CA Service Desk Manager: **Advanced Availability with Multi-Tenancy**
Background Server (BG Server): **testqa-bg**	Background Server (BG Server): **testqa-bg-new**
Standby Server: **testqa-standby**	Standby Server: **testqa-standby-new**
Application Server 1: **testqa-app1**	Application Server 1: **testqa-app1-new**
Standby Server: **testqa-sb**	Standby Server: **testqa-sb-new**

Application Server 1: **testqa-app1**	Application Server 1: **testqa-app1-new** CA EEM Server: **testqa-eem-new**
CA Service Catalog Server: **testqa-sc**	CA Service Catalog Cluster with Automic Integration and F5 Load Balancer Configured: • testqa-catalog-new • testqa-catalog-new2 Reconfigure NTLM for CA Service Management (CA SDM, xFlow Interface, and CA Service Catalog)

Perform the following steps:

1. Maintain the similar number of Windows Servers in your Production as well as your target environment.
2. Install CA Service Desk Manager (SDM) 17.4 on Windows 2016/ 2019/ 2022 Server pointing to Microsoft SQL 2019/ 2022 Database Server in your target environment.

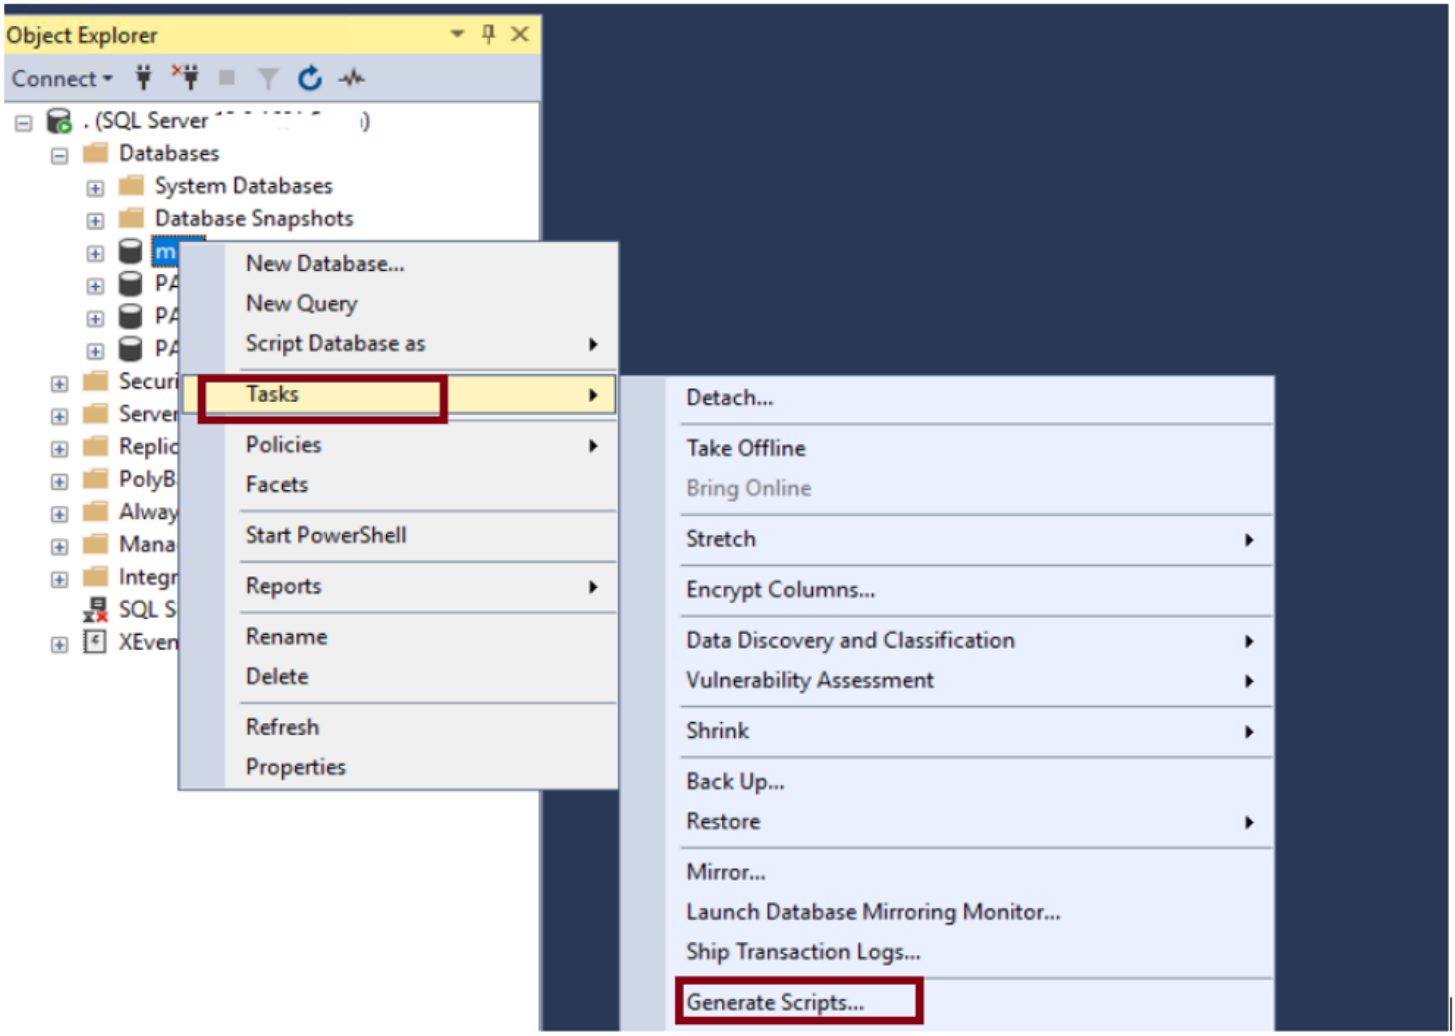
   NOTE
   Download the CA Service Desk Manager 17.4 installer DVD from Broadcom Support.

   - CA SERVICE MANAGEMENT SDM PACKAGE 17.4 FOR WINDOWS (WITH CATALOG).iso
   - CA SERVICE DESK MANAGER 17.4 FOR WINDOWS (WITHOUT CATALOG).iso

   Refer Installing CA Service Desk Manager and Installing CA Service Catalog.
3. After successful completion of step 1 and 2, enable multi-tenancy. Tenant name must be your production tenant name. Example: Tenant1
4. Review the following CA Service Desk Manager Tables on your test server (testqa-mdb-new) to ensure that these tables have system-specific configurations.

Common Table	CA SDM
al_cdb_comp_installstate_bkup	ci_mdr_provider
al_cdb_componentinstallstate	options
al_cdb_config_params_backup	sapolicy
al_cdb_configurationparameters	usp_servers
al_cdb_files	object_promotion
ca_application_registration	promo_hist
	usp_configuration
	usp_webeng_domsrvr
	usp_webengine
	usp_webeng_alias
	usp_domsrvr

5. Stop the following CA Service Desk Manager services on both the Production and target servers:
   CA SDM: CA Service Desk Manager Servers (Background, Standby, and Application Servers (xFlow application).
6. On the Production system (**testqa-mdb**), backup your MDB database. Copy the MDB backup files to the target system (**testqa-mdb-new**).
7. On the target system (**testqa-mdb-new**), perform the following steps to backup CA Service Desk Manager Tables (shown in Step 4).
8. Navigate to Microsoft SQL Management Studio, right-click MDB (or the appropriate MDB instance name applicable for your system), and select **Tasks**, **Generate Scripts**.



Object Explorer

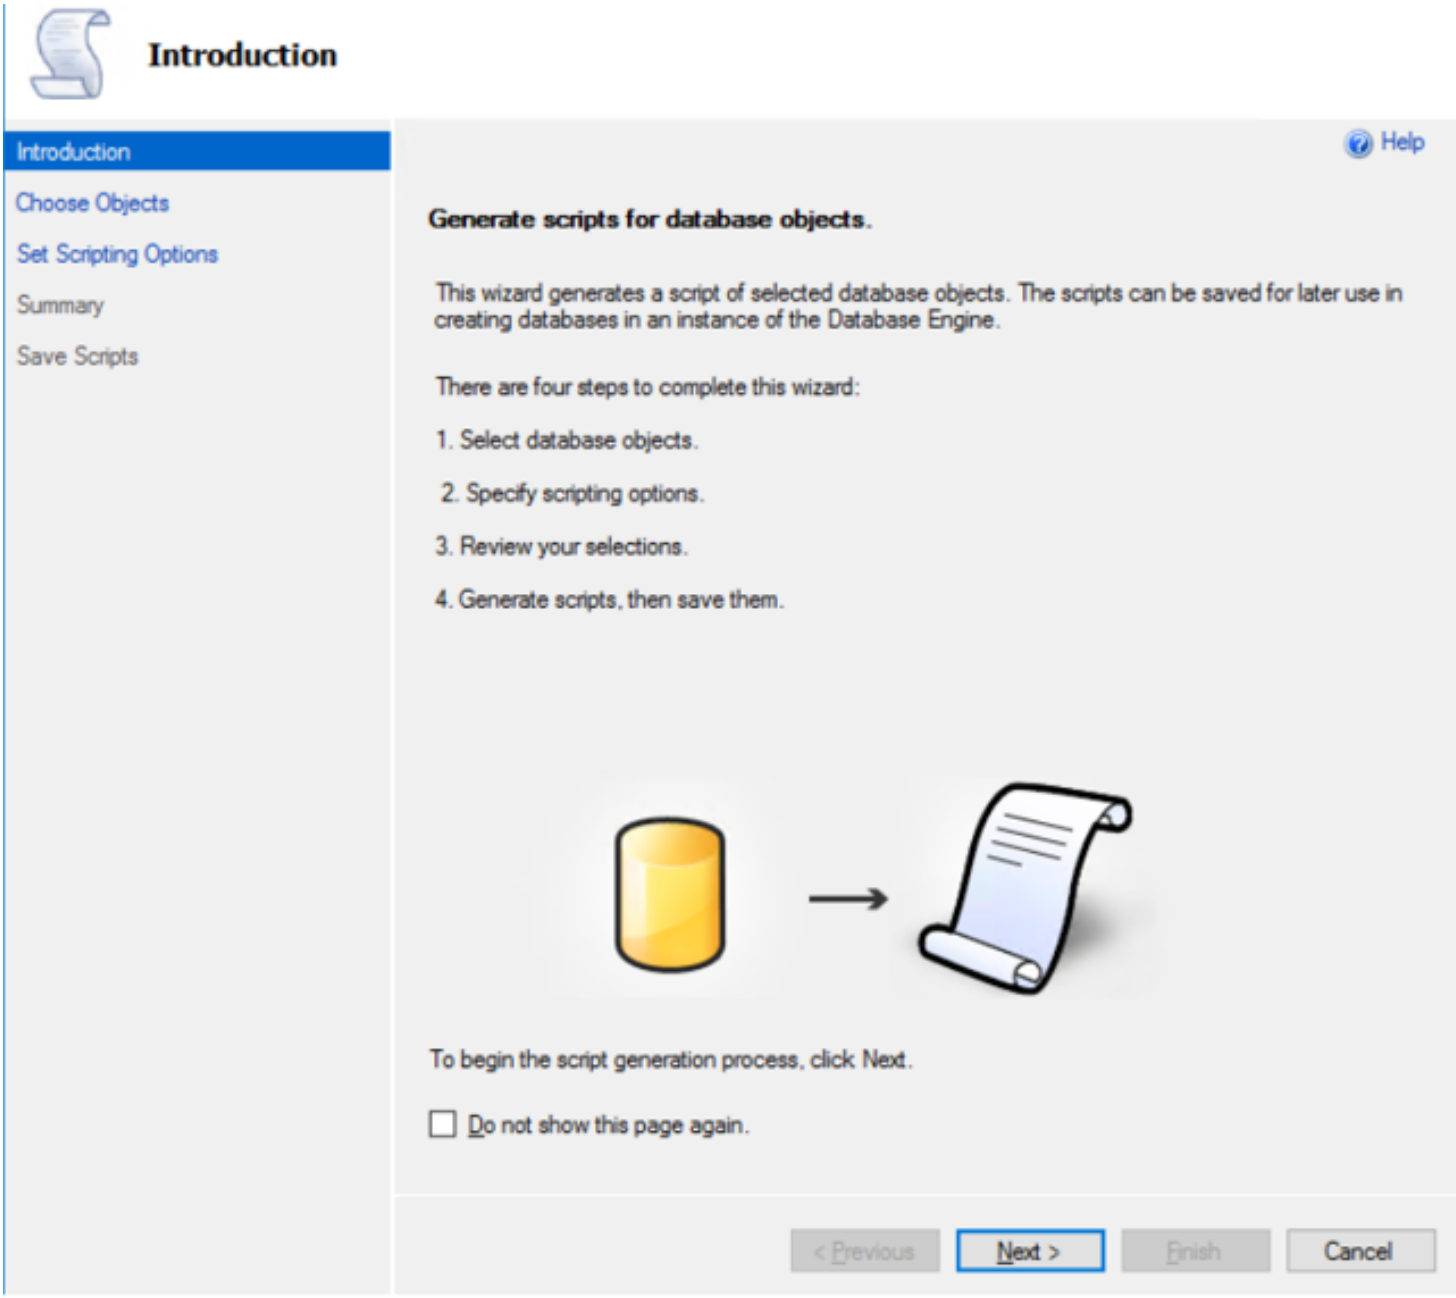
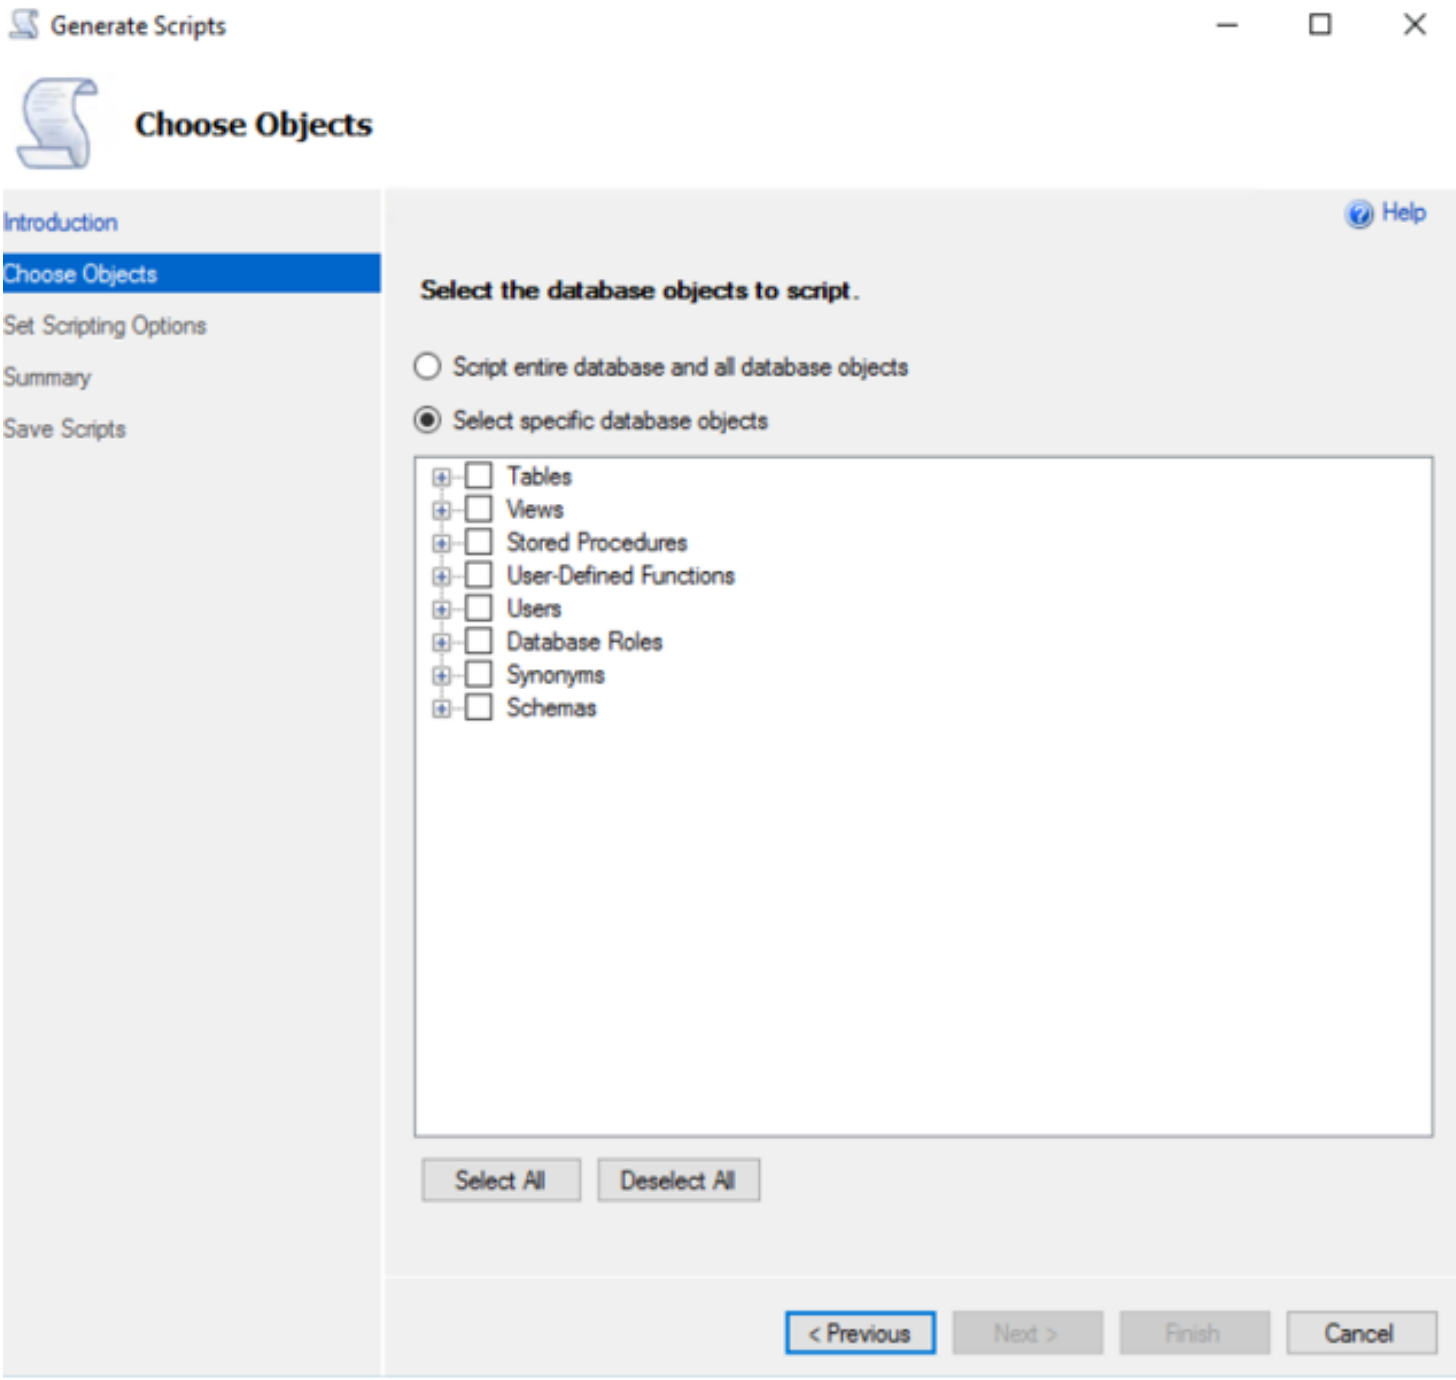
Generate Scripts...

a. Click **Next**.



b. Select Specific database objects.



c. Take a backup of the CA Service Desk Manager Tables (see step d below) and then, generate the scripts.

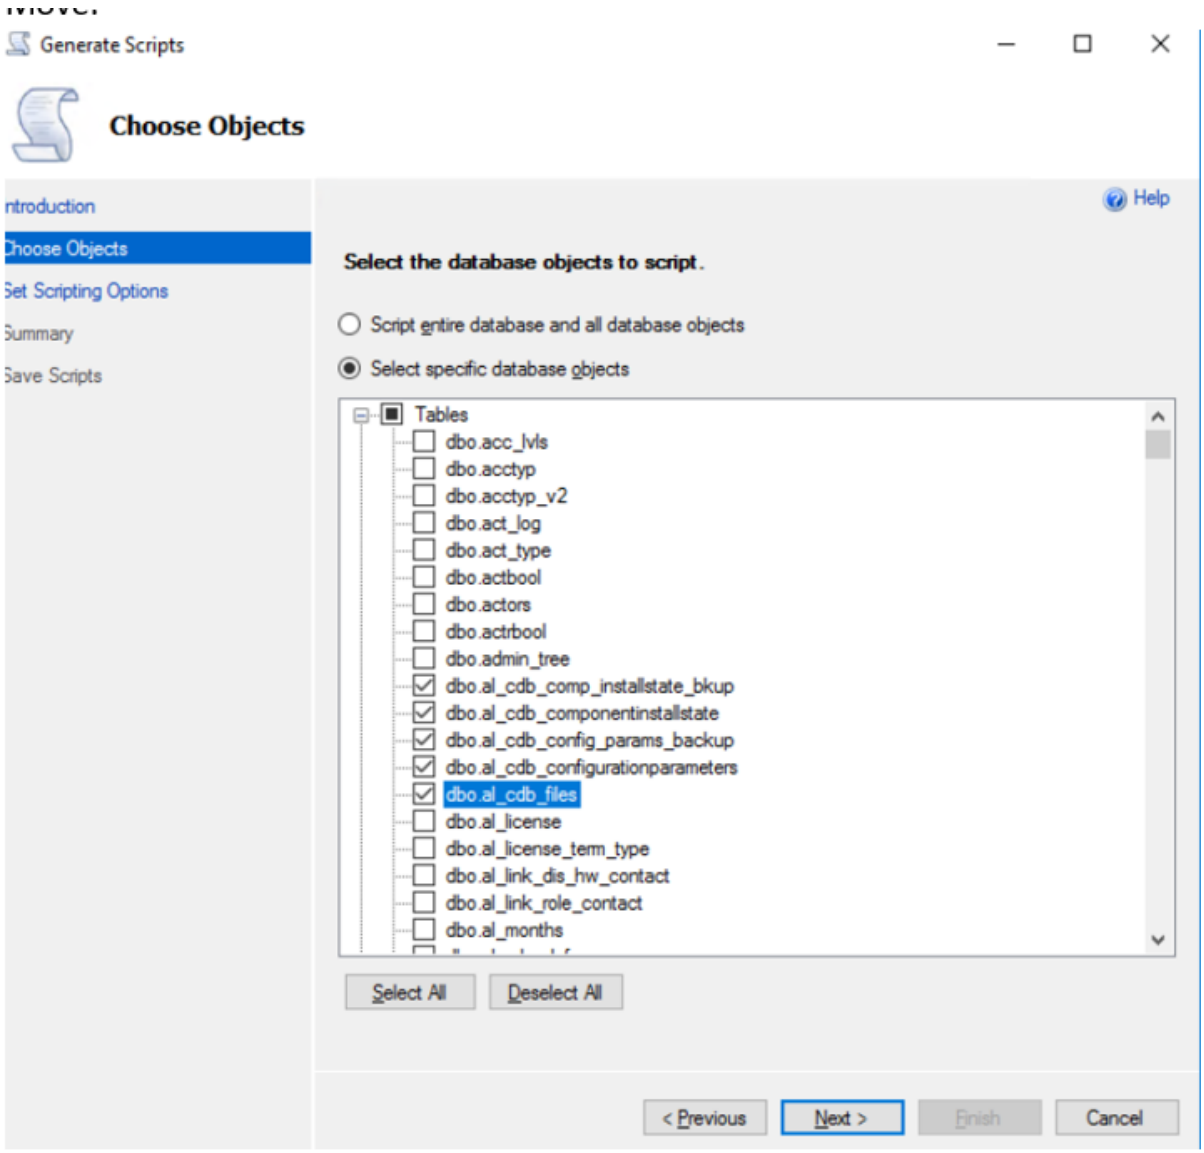
d. Select the list of tables from CA Service Desk Manager Tables:

Common Table	CA SDM	xFlow Interface
al_cdb_comp_installstate_bkup	ci_mdr_provider	usp_es_servers
al_cdb_componentinstallstate	object_promotion	l1admin_general_config
al_cdb_config_params_backup	>options	
al_cdb_configurationparameters	promo_hist	
al_cdb_files	sapolicy	
ca_application_registration	usp_servers	
	usp_configuration	
	>usp_domsrvr	
	usp_webeng_alias	
	usp_webeng_domsrvr	
	usp_webengine	

e. Select the Tables option and choose the appropriate tables. Select list of tables from above CA Service Desk Manager Tables.

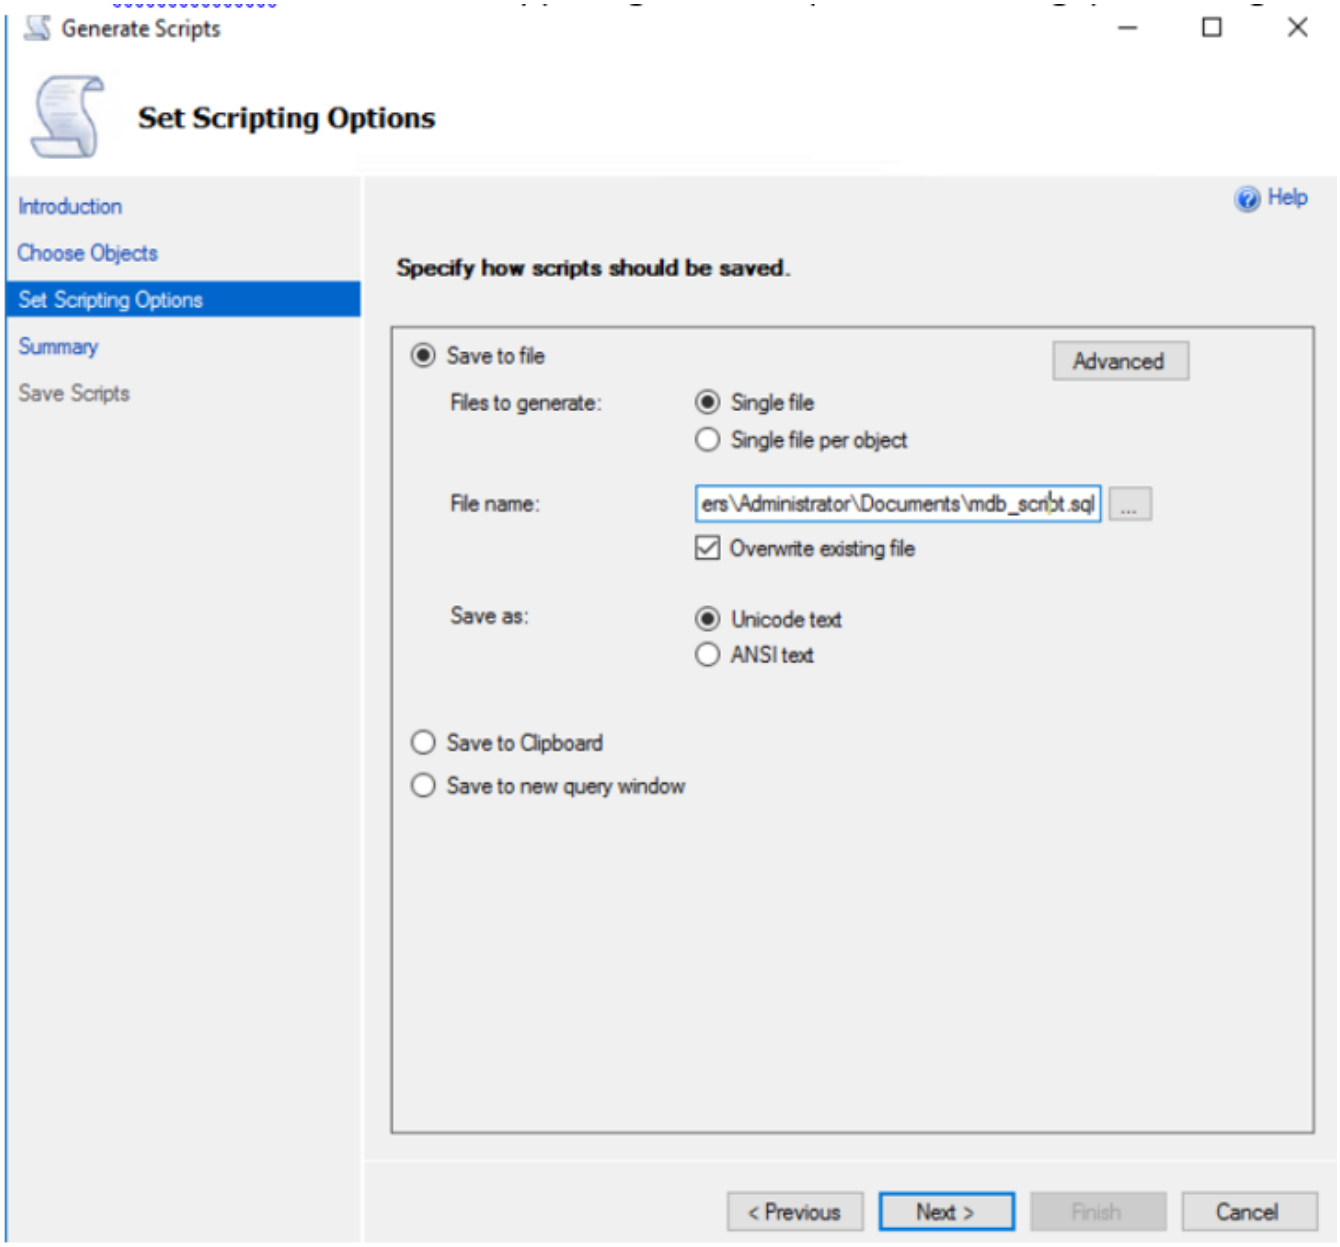
NOTE

The following screenshot shows few selected tables but ensure to select all the**19** tables (mentioned in **step d**) to continue with the Swing Box Move.



Click **Next**.

f. Select the **Advanced** tab from the upper right corner (see below image) and navigate to Types of Data.



g. Change the Types of data to script option value from Schema Only to Schema and Data.
h. Click **OK**.
Your selection is now saved to a file %user%\documents\mdb_script.sql

NOTE
It's recommended that you use non-default file names. By default, the file name is script.sql.

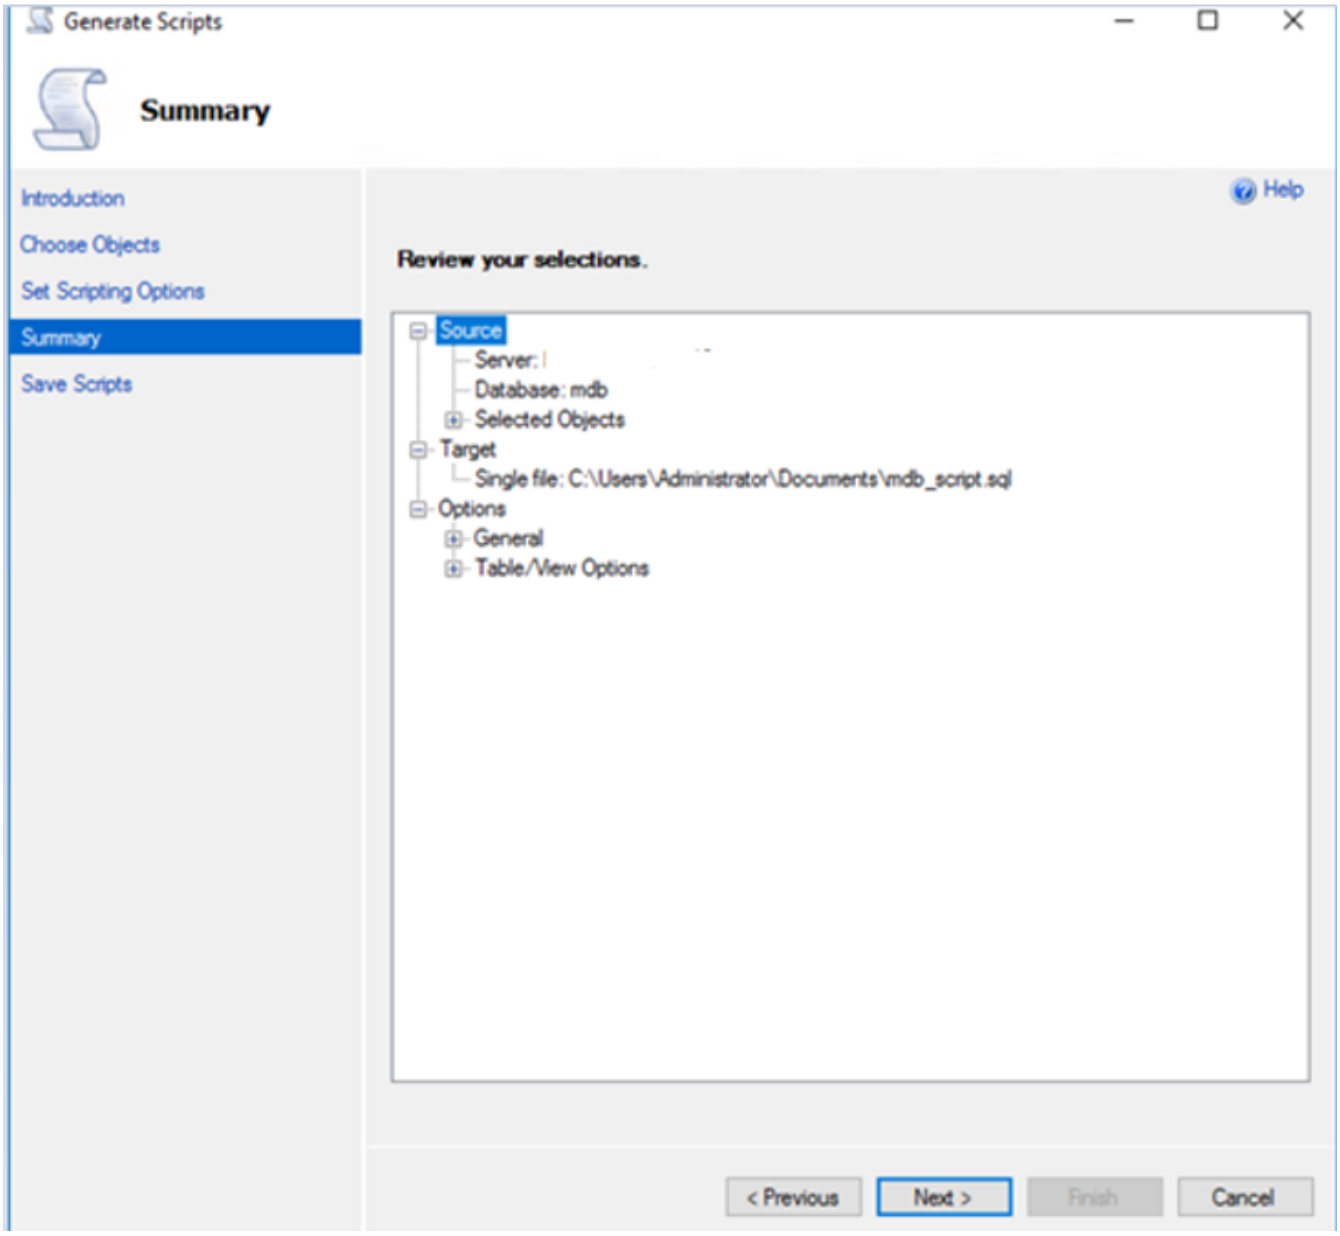
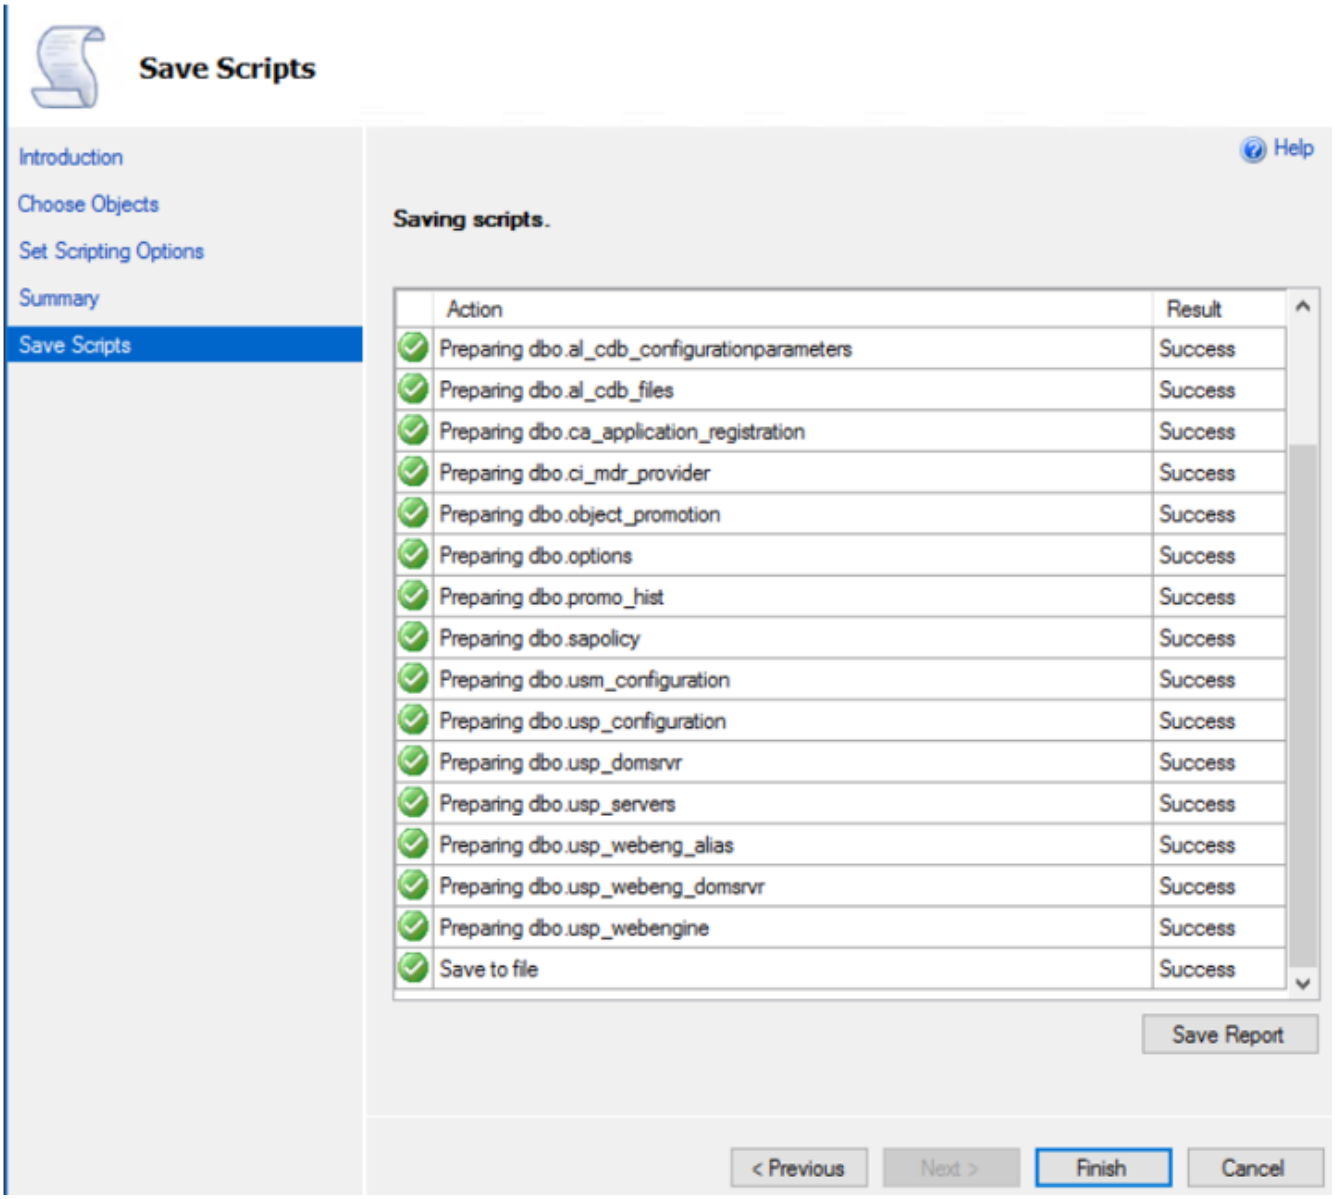
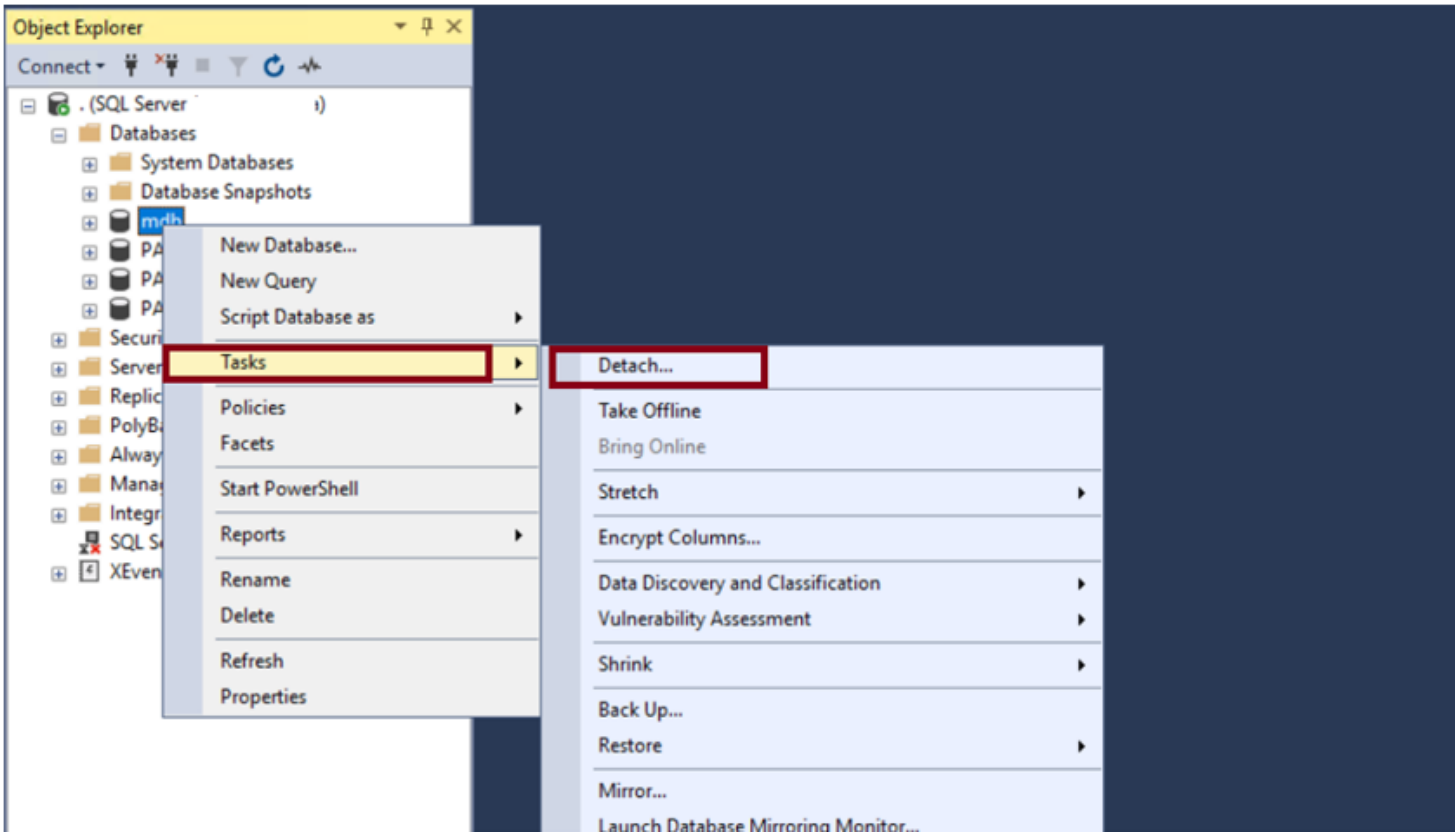
i. Click Next.



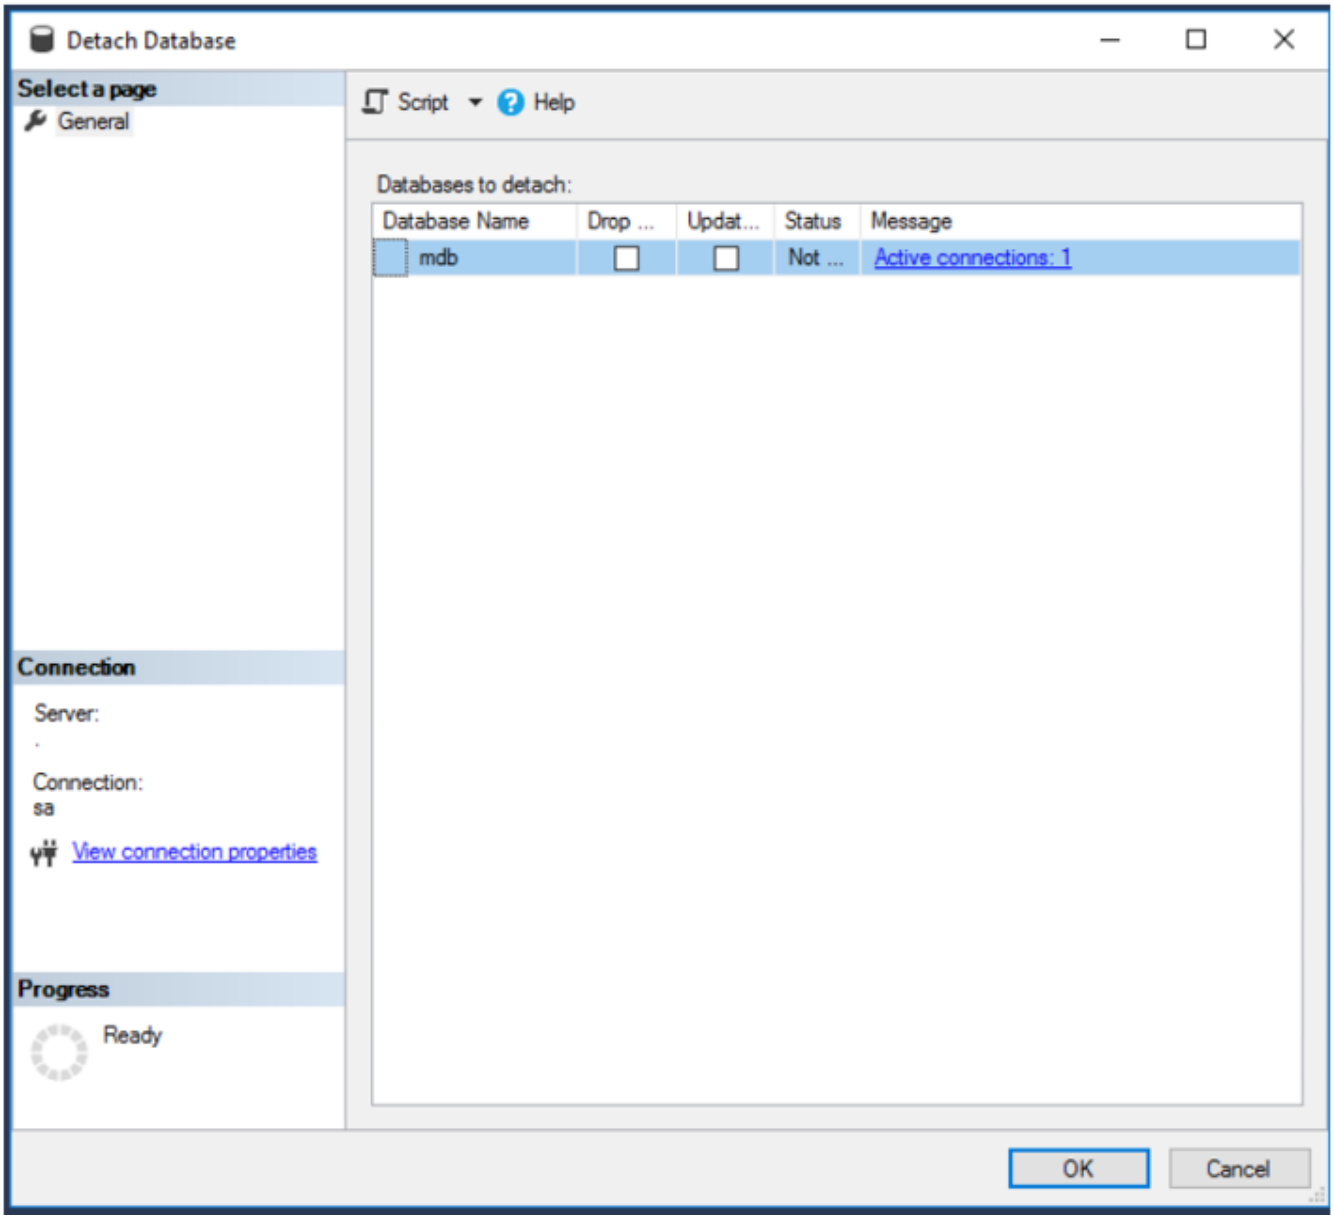
j. Click**Finish**.



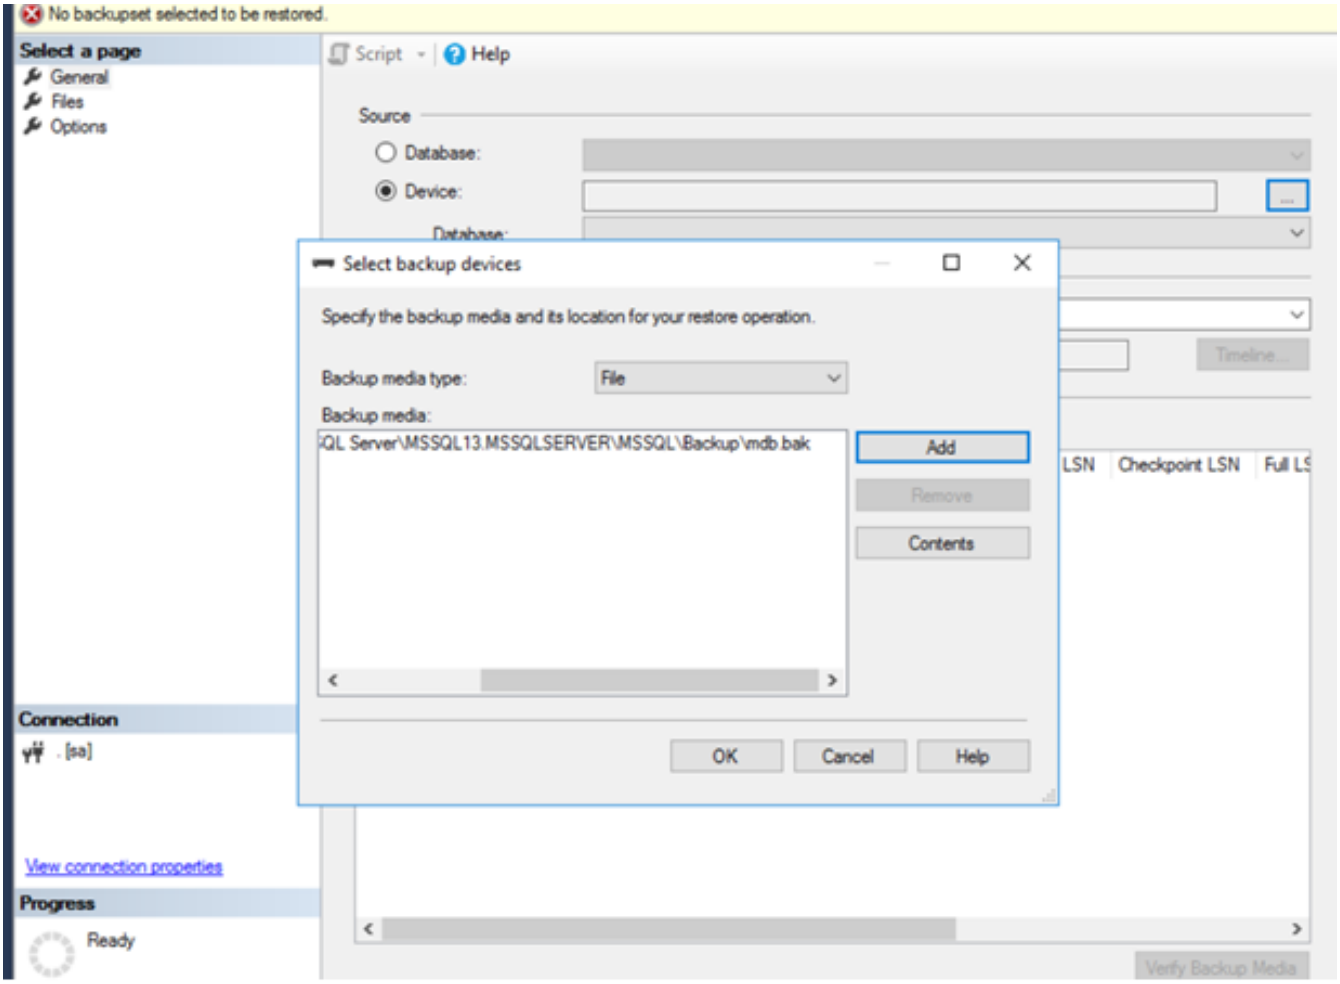
k. From the Detach Database screen, check the Drop Connections checkbox.



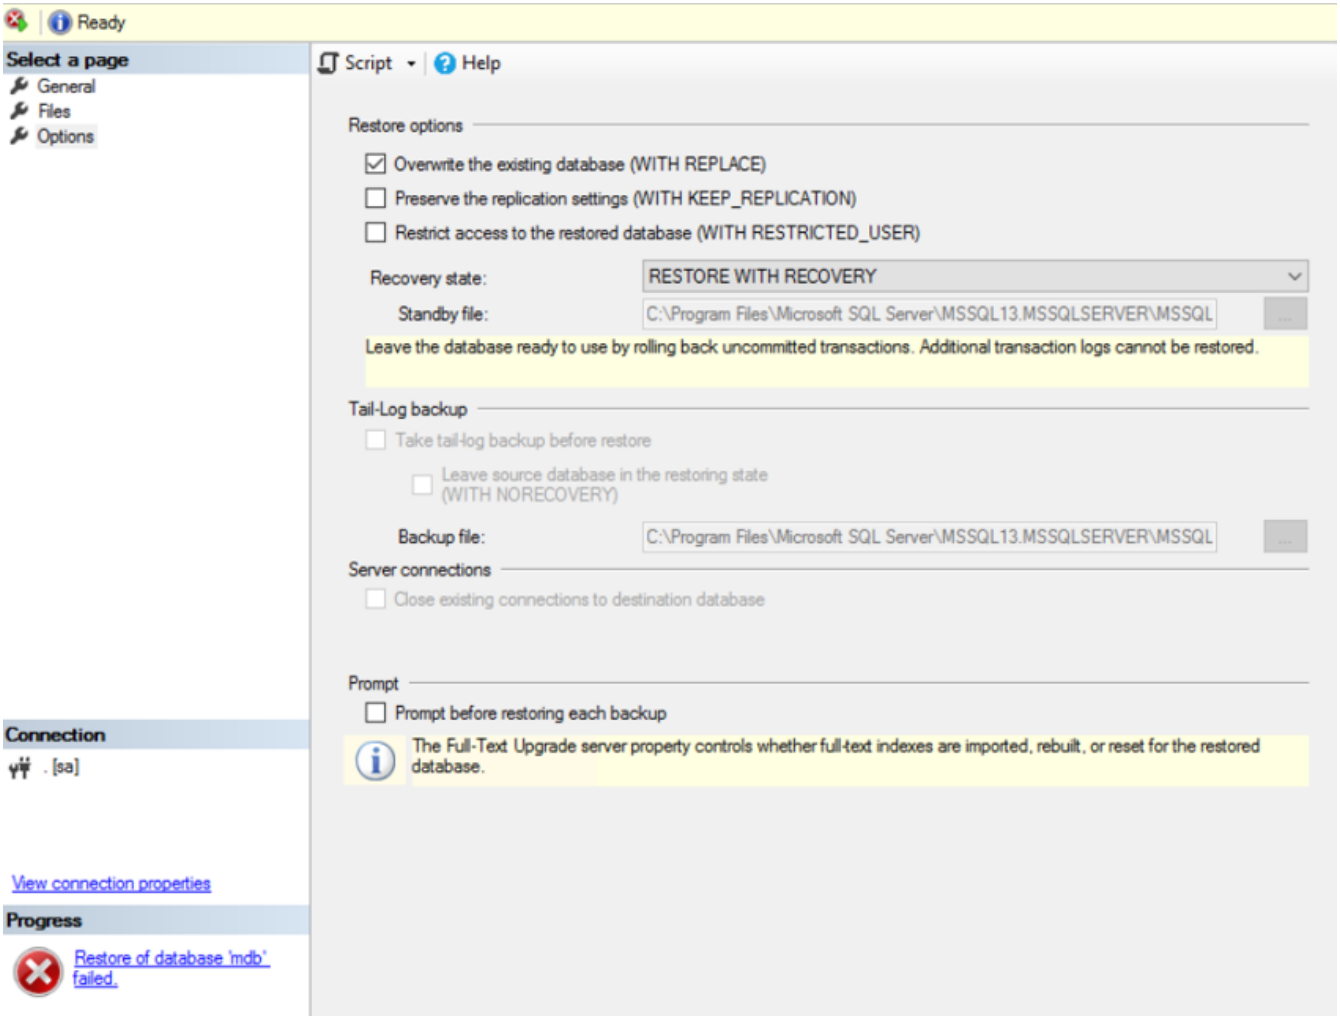
l. Select the **Drop Checkbox** and click **OK**.



9. MDB instance is dropped from the target system (testqa-mdb-new).
10. To restore MDB backup to the target system (testqa-mdb-new) which was copied from the Production system (testqa-mdb), perform the following steps: Important: Provide read and execute privileges to the mdb.bak file that you copied from the Production database (testqa-mdb) to the SQLServerMSSQLUser$$MSSQLSERVER service account on the target MDB server (testqa-mdb-new). Failure to grant the read and execute privilege to mdb.bak may result in error “file folder cannot be located or it does not have the adequate permissions”.
    a. Open the Microsoft SQL Management studio with Database Admin credentials (sa).
    b. Navigate to Databases option, right-click and select the Restore Database option.
    c. Select Device Radio button in the Restore database screen.
    d. Click Browse (...). Click Add and select the backup file where you copied from the Production system: For example: C:\Program Files\Microsoft SQL Server\MSSQL13.MSSQLSERVER\MSSQL\Backup\mdb.bak)
    e. Click "**Options**" on the Restore Database Screen.



f. Select the checkbox Overwrite the existing database (WITH REPLACE).
Ensure that the database name on the target system is retained.



Click OK.

g. The restore database name on the target system (**testq-mdb-new**) is retained and successful.

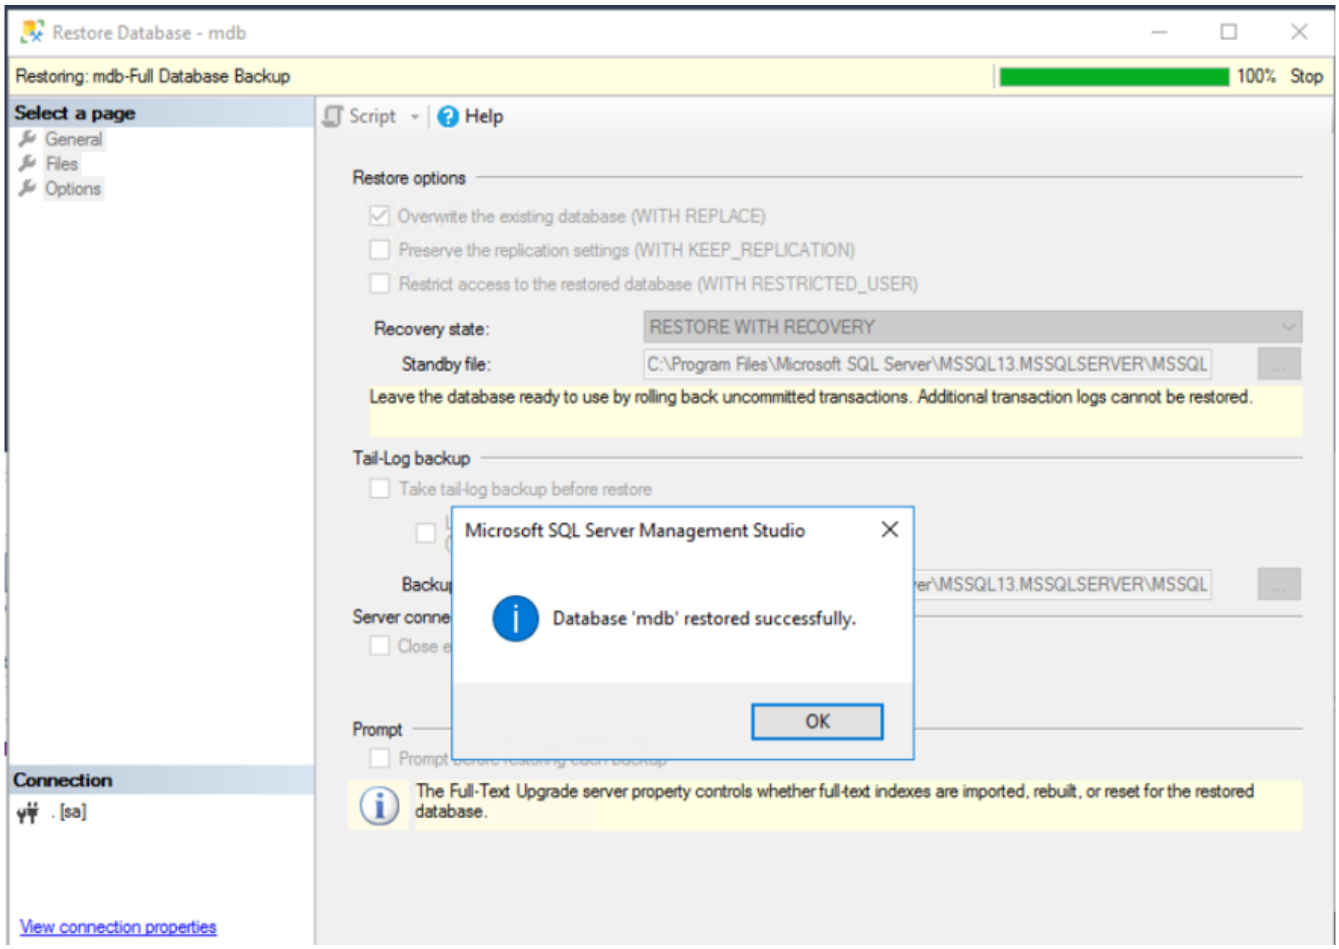
h. Click OK.



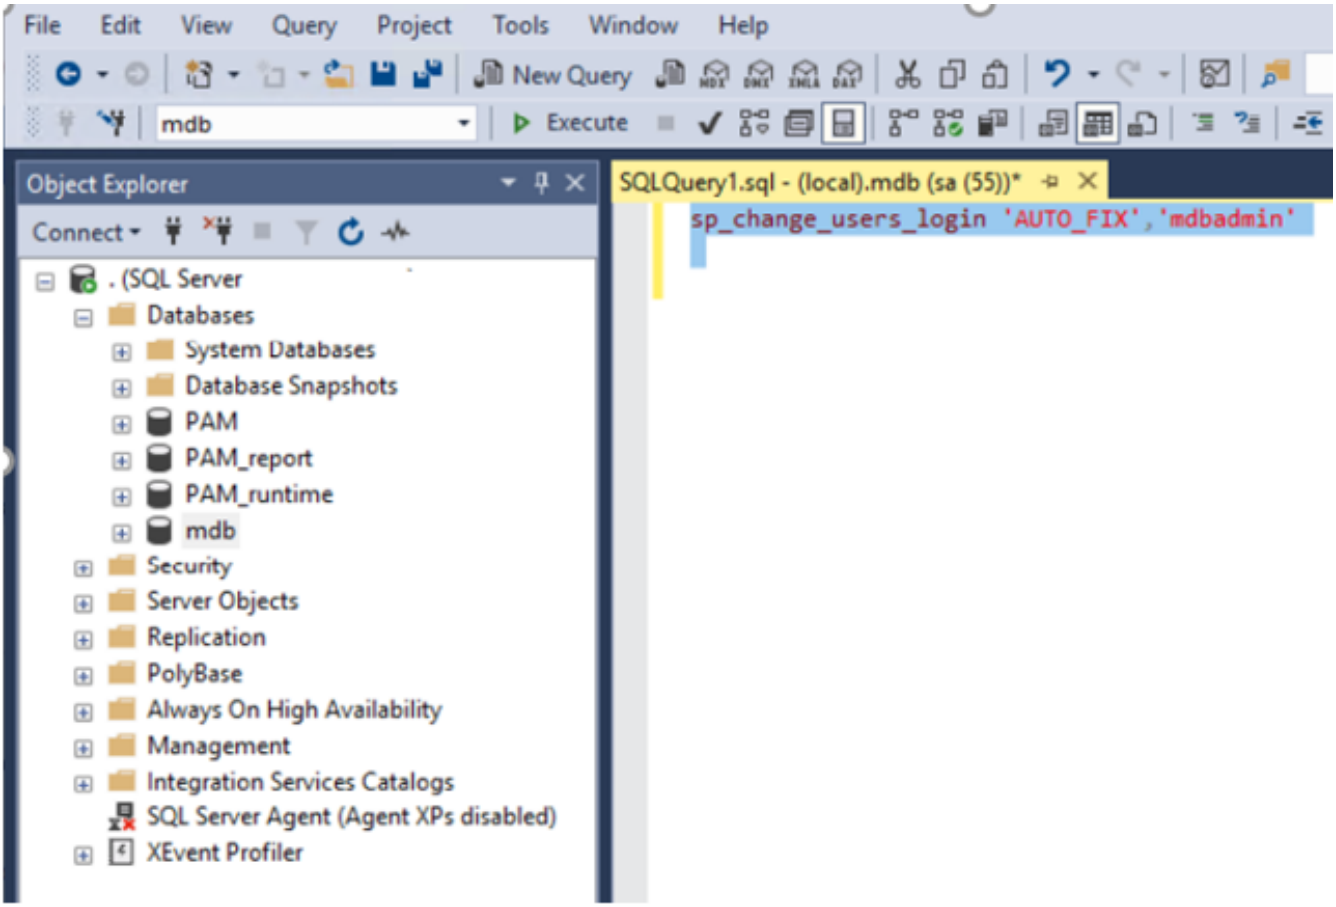
11. Database “mdb” is restored successfully. Important: Provide read and execute privileges to the mdb.bak file that you copied from the Production database (testqa-mdb) to the SQLServerMSSQLUser$$MSSQLSERVER service account on the target MDB server (testqa-mdb-new). Failure to grant the read and execute privilege to mdb.bak may result in error “file folder cannot be located or it does not have the adequate permissions”.

    NOTE

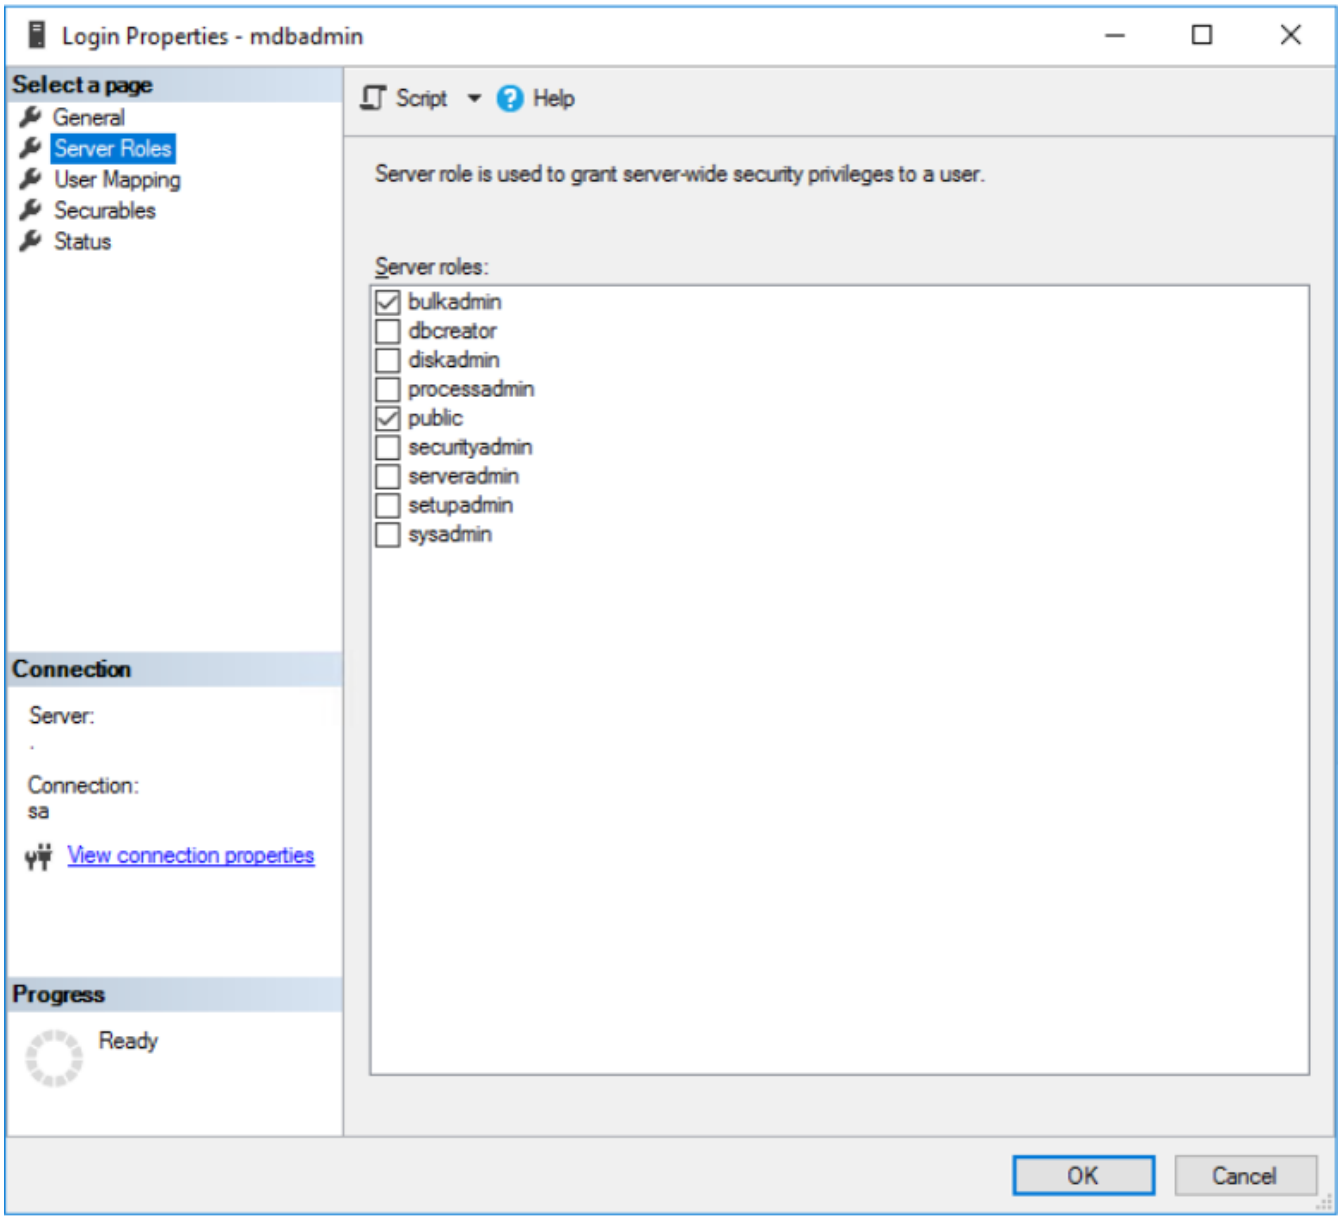
    Restore must complete without errors.

12. Run the following Microsoft SQL auto_fix_user script for the mdbadmin user:

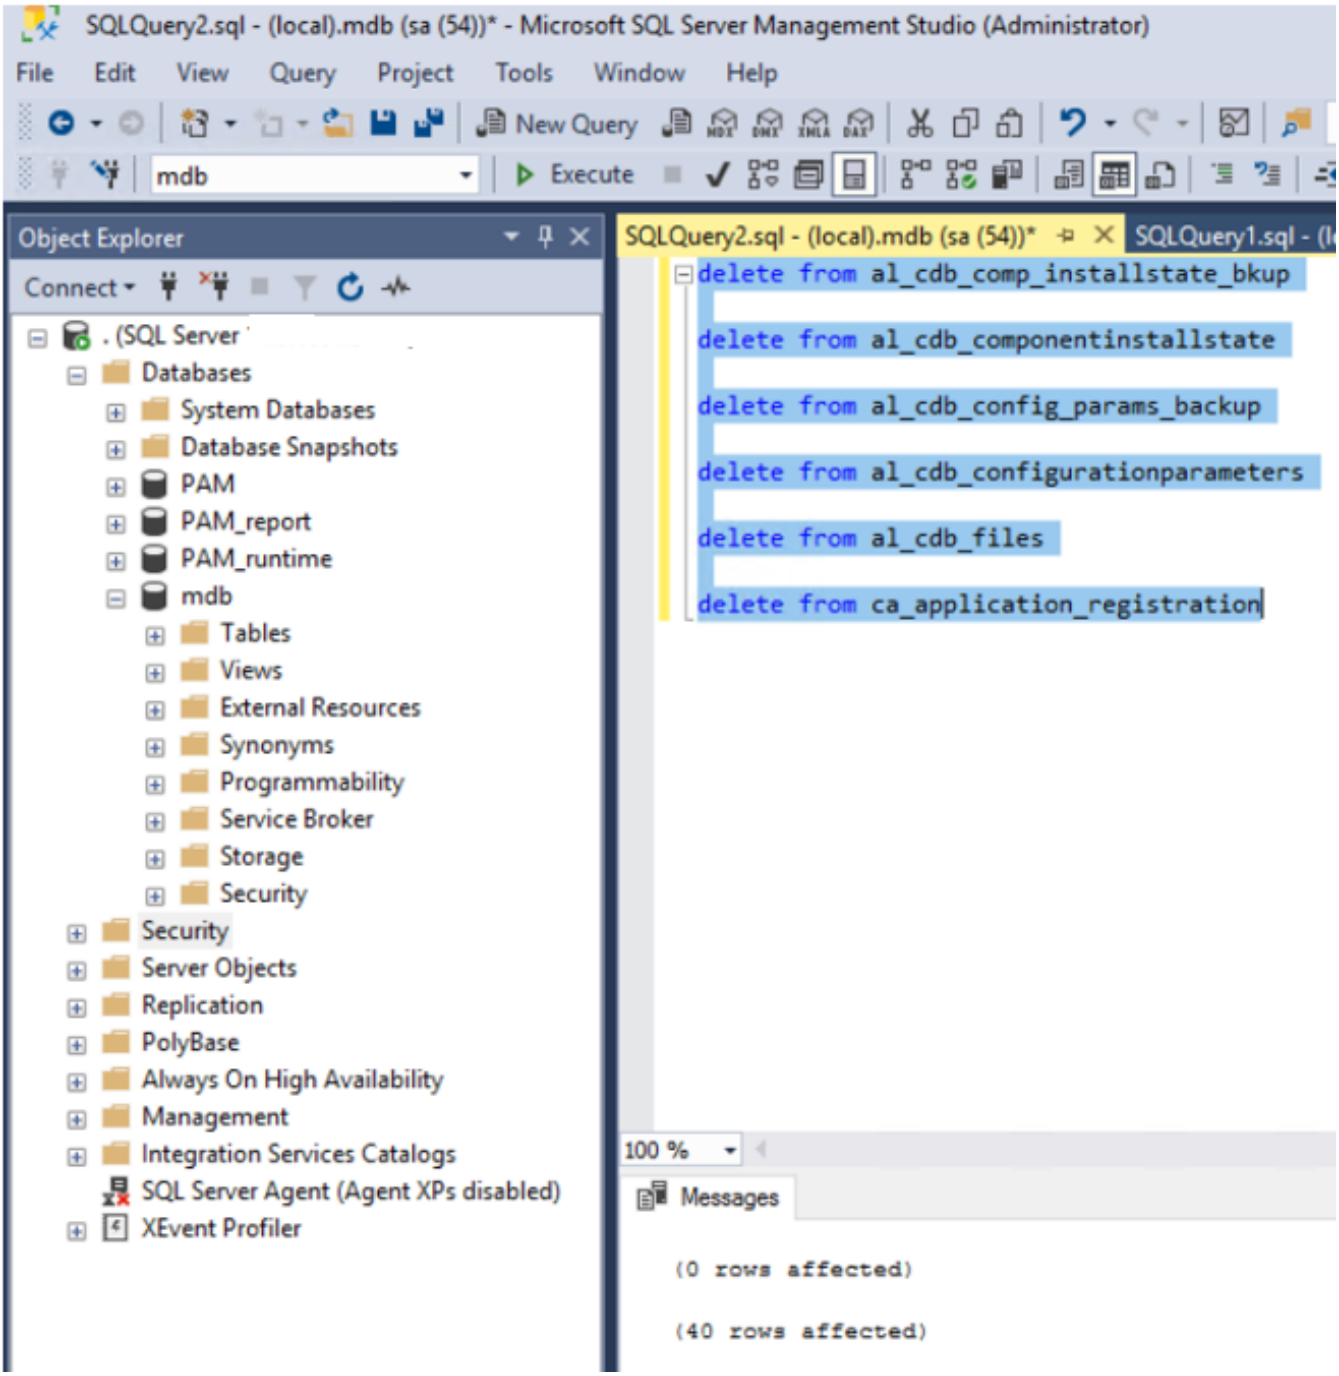
```
sp_change_users_login 'AUTO_FIX','mdbadmin'
```



13. Verify that the mdbadmin is now mapped to mdb and has the bulk admin and public roles.

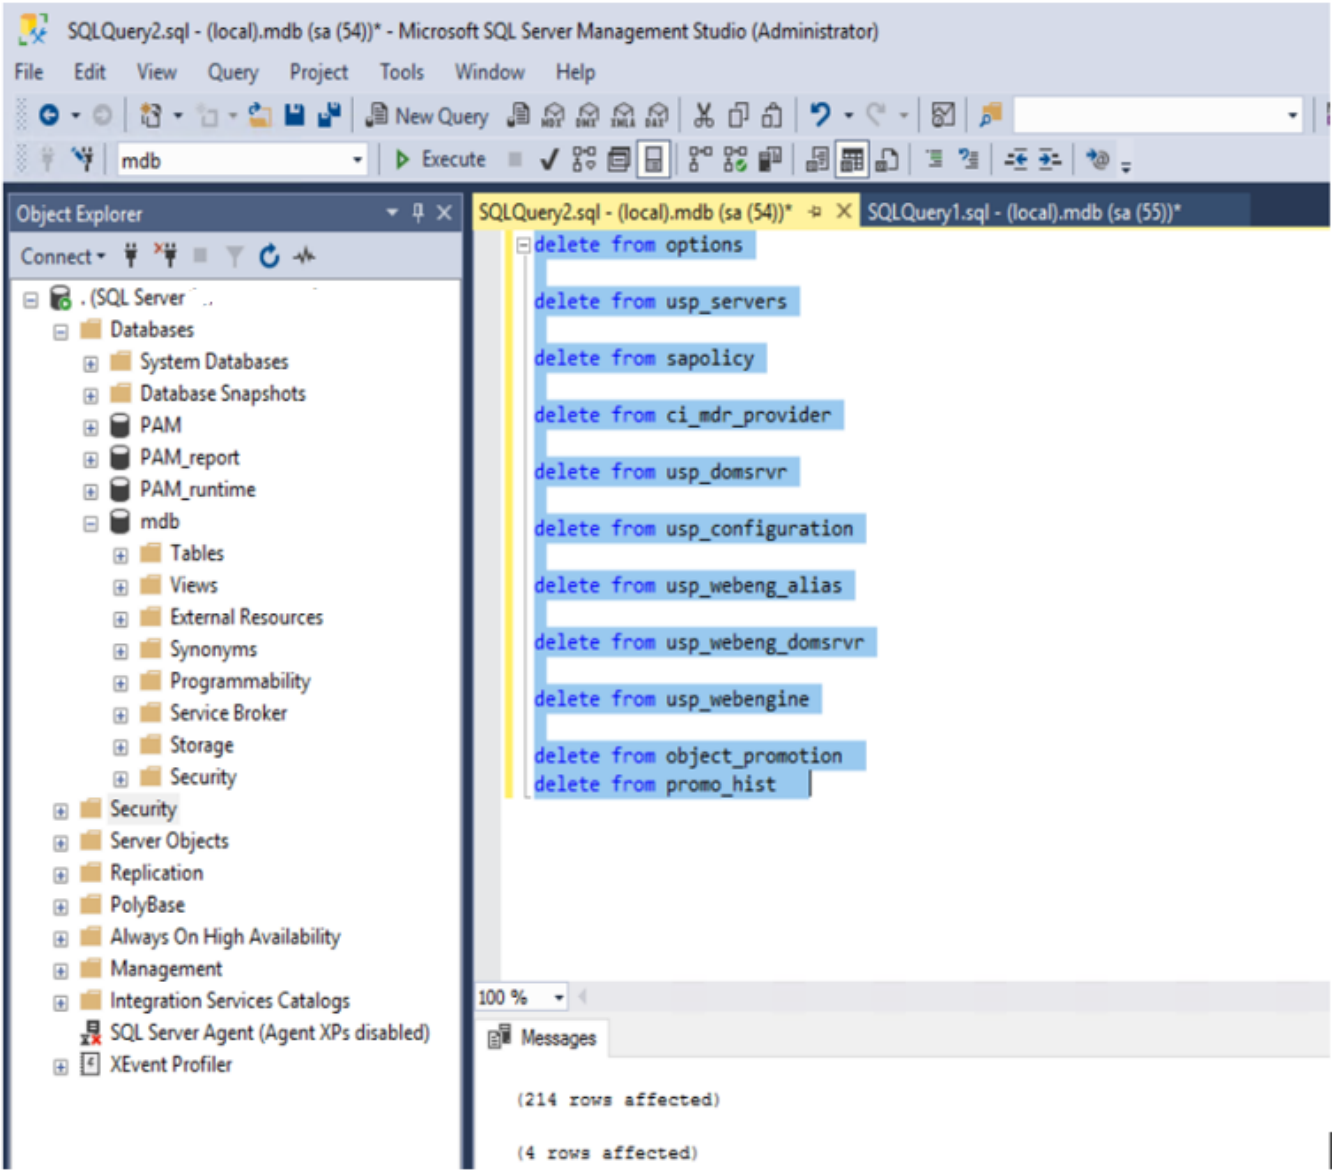


14. On the target system (testqa-mdb-new), delete data from the following tables and commit the changes:
    a. use mdb and run the following queries to delete data from the required tables:
    Common Tables
    - delete from al_cdb_comp_installstate_bkup
    - delete from al_cdb_componentinstallstate
    - delete from al_cdb_config_params_backup
    - delete from al_cdb_configurationparameters
    - delete from al_cdb_files
    - delete from ca_application_registration



b. CA SDM Tables:
   a. delete from options
   b. delete from usp_servers
   c. delete from sapolicy
   d. delete from ci_mdr_provider
   e. delete from usp_domsrvr
   f. delete from usp_configuration
   g. delete from usp_webeng_alias

h. delete from usp_webeng_domsrvr
i. delete from usp_webengine
j. delete from object_promotion
k. delete from promo_hist



c. **xFlow Interface Tables**:
   a. delete from usp_es_servers
   b. delete from l1admin_general_config
   c. From the File Menu, Select Open, Select File, now select mdb_script.sql (created in step 8, sub step i) and click the Execute button.

      NOTE
      Ignore the warning message during execution: “There is already an object named in the Database”.

Merge Customizations from CA SDM Production to Target Server

If you have customizations in your environment that needs to be moved, copy the site/mods directory and tblobj.cfg and ddict.sch files from the Production CA SDM server to the target CA SDM server perform the following steps:

> **IMPORTANT**
> These steps are applicable only if your application environment is customized. These are not applicable for the out-of-the-box (OOTB) content.

1. From the Production background server (testqa-bg) to the target background server (testqa-bg-new).
2. From the Production Standby (testqa-standby) to the target Standby (testqa-standby-new).
3. From the Production Application Server (**testqa-app1**) to the target Application Server (testqa-app1-new) (Perform on all application servers in an environment).

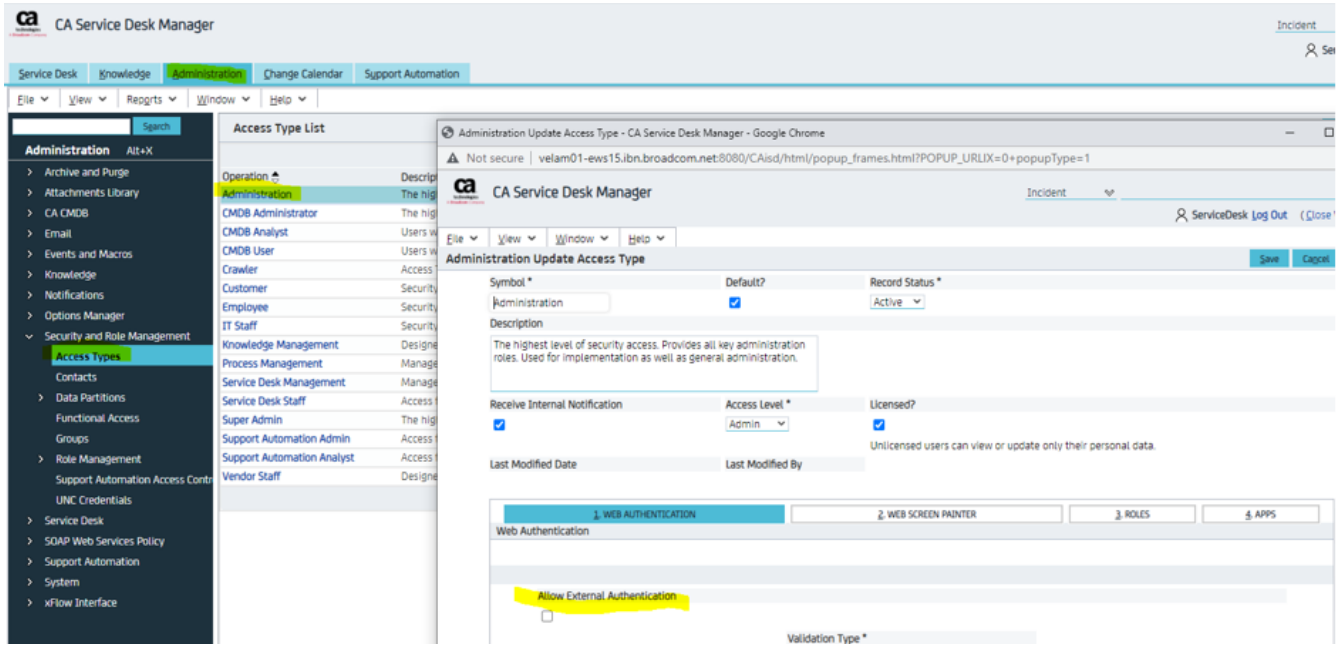
1. Run pdm_configure -S on the target background server (**testqa-bg-new**). It will configure silently:
   a. Monitor the progress of pdm_configure using NX_ROOT/logs/configure.log file.
   b. Launch the CA SDM Background URL as an Administrator (http://testqa-bg-new:8080/CAisd/pdmweb.exe).
   c. Run pdm_configure on the Standby Server (testqa-standby-new).
   d. Run pdm_configure on all application servers (testqa-app1-new and testqa-app2-new, and so on).
   e. Execute the pdm_k_reindex command on the target background server (testqa-bg-new) to index knowledge documents that are created and copied from the Production background server (testqa-bg).
2. CA SDM Repositories (applicable only if you have NOT used the OOTB repositories):
   a. Log in to CA SDM URL as an administrator.
   b. Navigate to Administration, Attachments Library, Repositories.
   c. Open the repositories one by one and update the target CA SDM server name in the Servlet Server and Repository Server fields.

      > **NOTE**
      > Update the CA SDM server name in all the repositories (in the out-of-the-box and Created Repositories).
3. CA SDM Attachments (applicable only if you have NOT used the OOTB attachments path):
   a. Copy all the attachments using upload Path of all the repositories from a Production server to the same path in a target server
      For Example: Service Desk repository upload path is: <NX_ROOT>/site/attachments/default/servicedesk/file on Production server. Copy the attachments from a Production server to the target server.
4. Customizations are now moved to the target server.

Disable NTLM on CA SDM servers

Perform the following steps:

1. Open BG SDM URL, Uncheck the “Allow External Authentication” and Click on Save Button.



2. Restart the services of all SDM,xFlow servers (BG, Standby and Application servers, xFlow application).

   IMPORTANT

   If you have plan to do archive and purge of the historical data later in the production, perform the steps in the pre-prod environment also.

   For more information, see How to Archive and Purge Historical Data .

   IMPORTANT

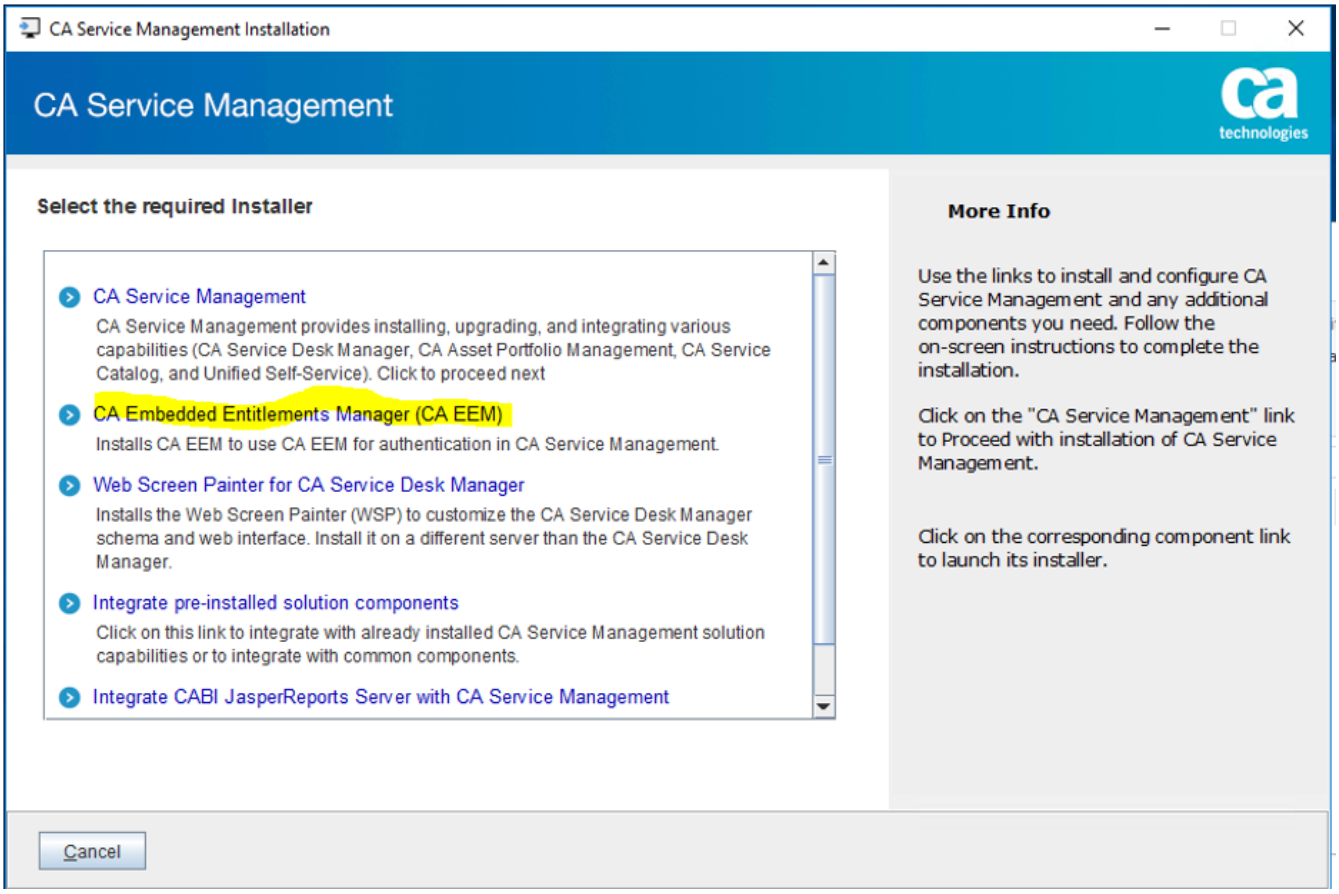
   Rebuild index execution time may vary based on the data in the MDB.
3. Run the rebuild index (pdm_es_rebuildindex.bat) from Search server machine.
4. Verify the installation of CA SDM,xFlow Interface and Service Point application.
5. Launch the CA SDM Background URL as an Administrator (http://testqa-bg-new:8080/CAisd/pdmweb.exe) and verify the ticket creation flow.
6. Launch the xFlow/ServicePoint URL : *http://testqa-app-new:9002/#/login*
   a. Login as an analyst to create a ticket from global search in the xFlow application.
   b. Login as an end user to create a ticket from service point application.
7. After successful SDM swing box migration, take snapshots of all above servers.

You have now completed the CA SDM Swing box migration successfully without CA EEM and LDAP integration.

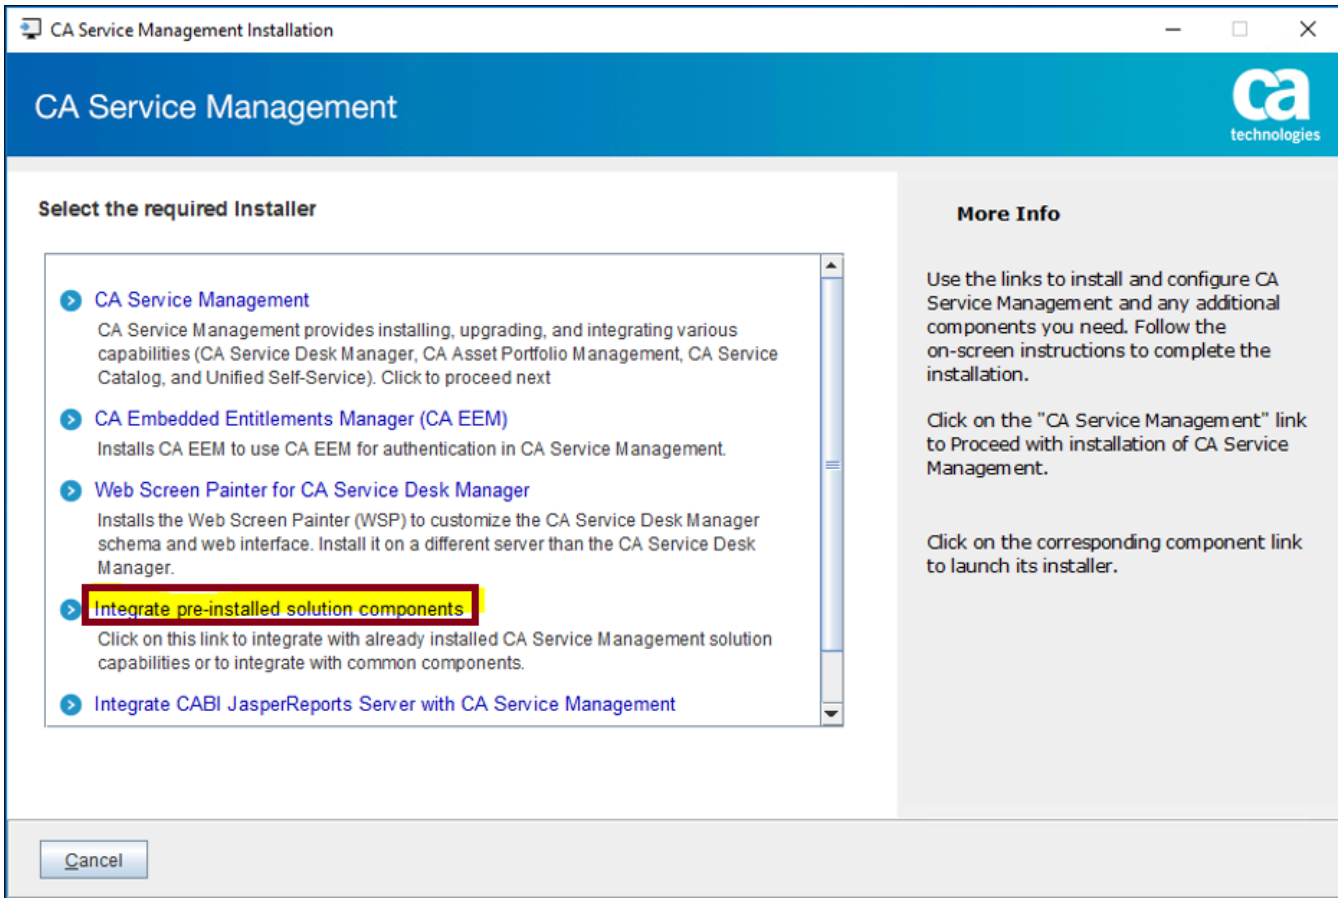
CA EEM installation and Integration with CA SDM

Perform the following steps:

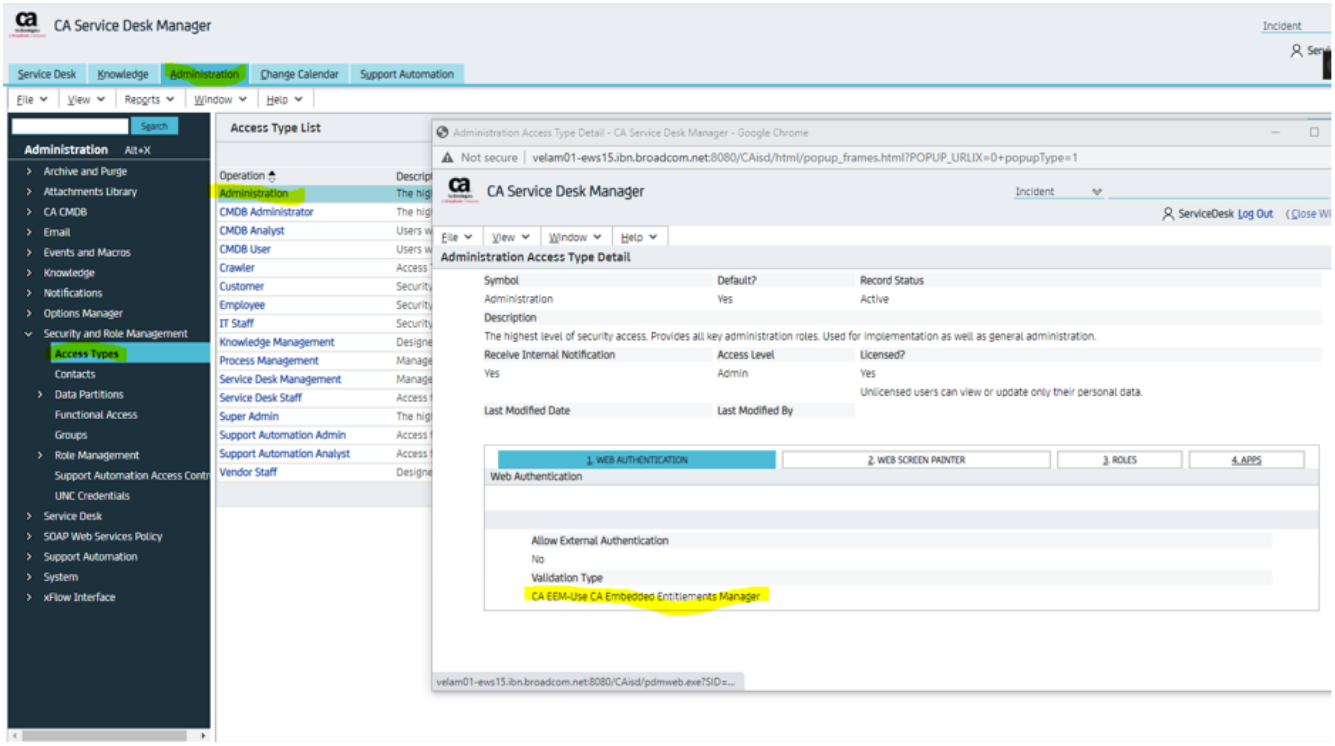
1. Install EEM application using 17.4 iso image on testqa-eem-new.



2. To Configure EEM application with BG server, launch the CA Service Management ISO image on BG server, that is, testqa- bg-new and Click "Integrate pre-installed solution components" and complete remaining steps.



3. To synchronize the EEM application information with other SDM servers, restart the services of SDM Standby and all application servers.
4. Validation check points:
   a. Ensure that Eiam details are updated in the NX.env file on SDM servers. For Example:
      a. @NX_EIAM_HOSTNAME= testqa-eem-new
      b. @NX_USE_EIAM_AUTHENTICATION=Yes
      c. @NX_EIAM_CERT_PASSWORD=aMgRLqnrDkGdtVKszPoC9d3Hcn5bzGYnYG8/dh4YAVM2+5Qh6nfTVv0G7/e5bP4T
      d. @NX_EIAM_APPINST_LABEL=
   b. Open the CA SDM Interface URL. Navigate to Administration, Security and Role management, Access types: Administration::: Validation type as: CA EEM-Use
   c. CA Embedded Entitlements Manager



d. Basic Sanity test after integration with EEM:
   a. Create tickets from SDM application.
   b. Create ticket from the global search in xFlow Interface.
   c. Create ticket from Service Point.

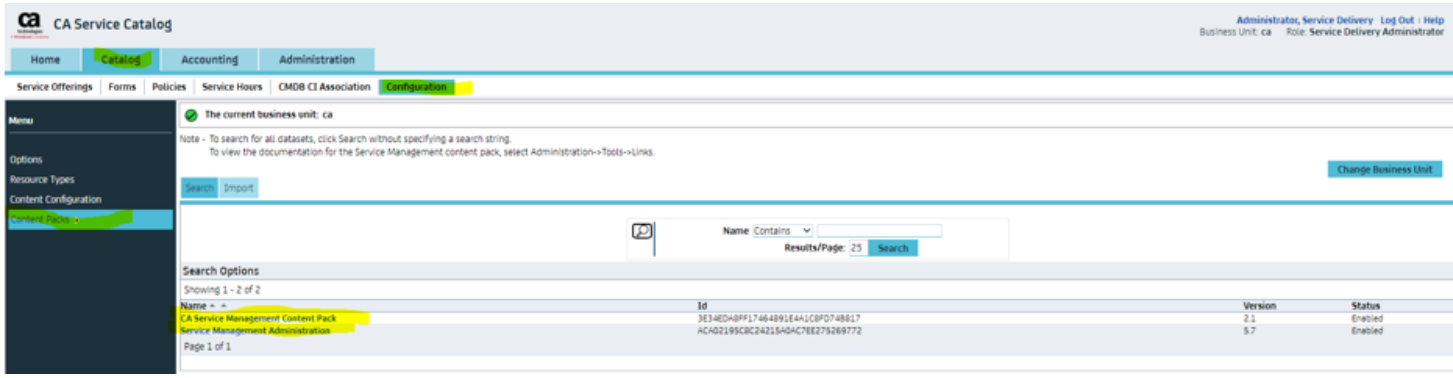
5. CA SDM is now integrated with EEM successfully.

NOTE
It's recommended that you take snapshots of all the above-mentioned servers.

Install CA Service Catalog

Perform the following steps:

1. Install CA Service Catalog 17.4 pointing to the same EEM server (testqa-eem-new) on new machine**testqa-catalog-new** and pointing to the same mdb on **testqa-mdb-new** machine.
   For more information, see Install CA Service Catalog.
2. Update CA Service Catalog post-installation steps for 17.4 on**testqa-catalog-new**.
3. Restart catalog services on testqa-catalog-new.
   a. CA Service Catalog
   b. CA Service Accounting
4. Import the content packs in the catalog application URL: Import the below content packs from the location %usm_home%/filestore/contentpacks on catalog installed machine (testqa-catalog-new).
   a. "CA Service Management Content Pack 2.0"
      "Service Management Admin Content Pack for SQL"
   b. Login to CA Service Catalog application with admin credentials (spadmin/spadmin).
   c. Navigate to Home, Catalog, Configurations.
   d. Click on content packs, Import.
   e. Select the content packs from step 4 of Install CA Service Catalog section and then import.
   f. Ensure that after successful import, the content pack names are displayed as mentioned in the following image:



5. Basic Sanity test on Catalog: Create a catalog request with admin credentials (For example: spadmin/spadmin)

Install Multiple Catalog Cluster Nodes

> **NOTE**
> If you are adding CA Service Catalog Nodes to an existing CA Service Catalog Cluster Node before Installing/ Upgrading, perform the following steps. For more information, see CA Service Catalog Clustering.

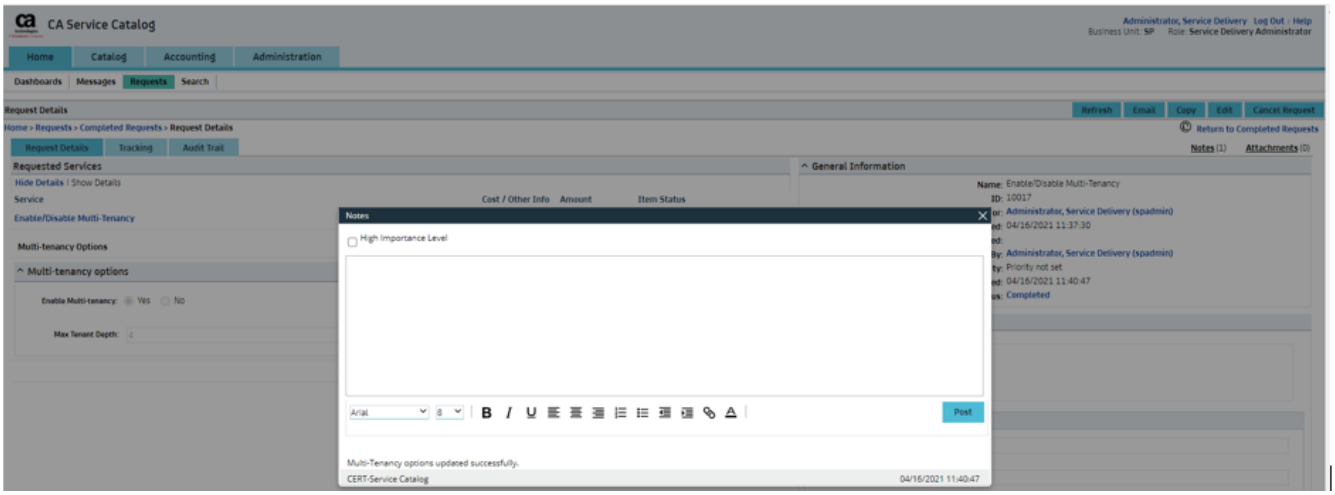
Perform the following steps:

1. Navigate to where you have downloaded and extracted CA Service Management ISO.
2. Install CA Service Catalog 17.4 pointing to the same EEM server (testqa-eem-new) on new machine **testqa-catalog-new2**and pointing the same MDB on **testqa-mdb-new** machine. For more information, CA Service Catalog Installation.
3. Restart catalog services on testqa-catalog-new2:
   a. CA Service Catalog
   b. CA Service Accounting
4. Add multiple catalog node(s) by following Step 1- Step 3(Section Name: “Install Multiple Catalog Cluster Nodes”).

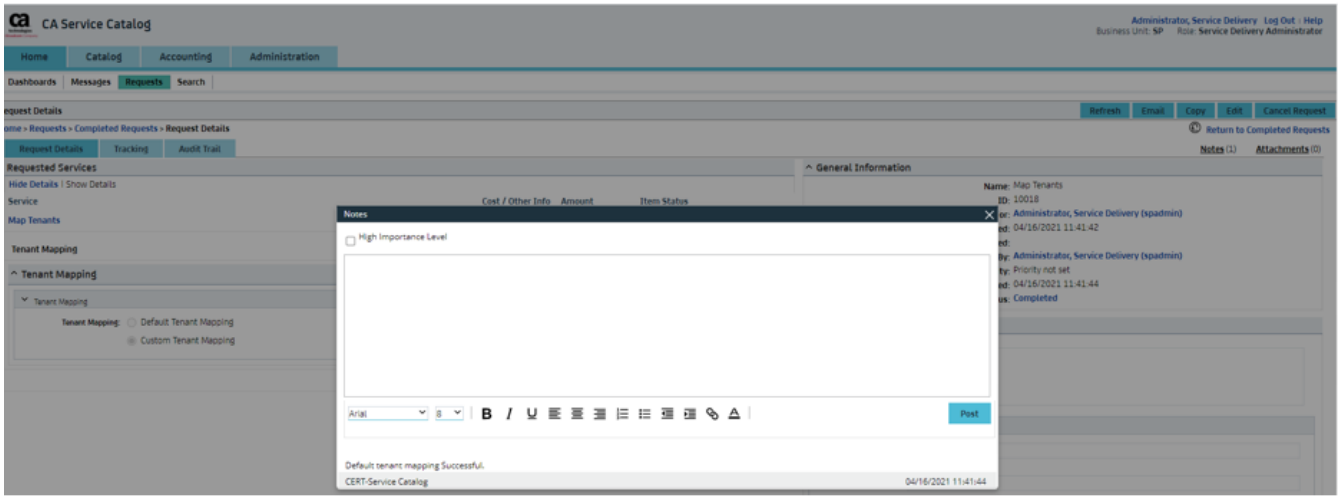
Enable Multi Tenancy in CA Service Catalog

Prequisite: Ensure that “CA Service Management Admin” service is up and running.
Perform the following steps to enable multi-tenancy in CA Service Catalog:

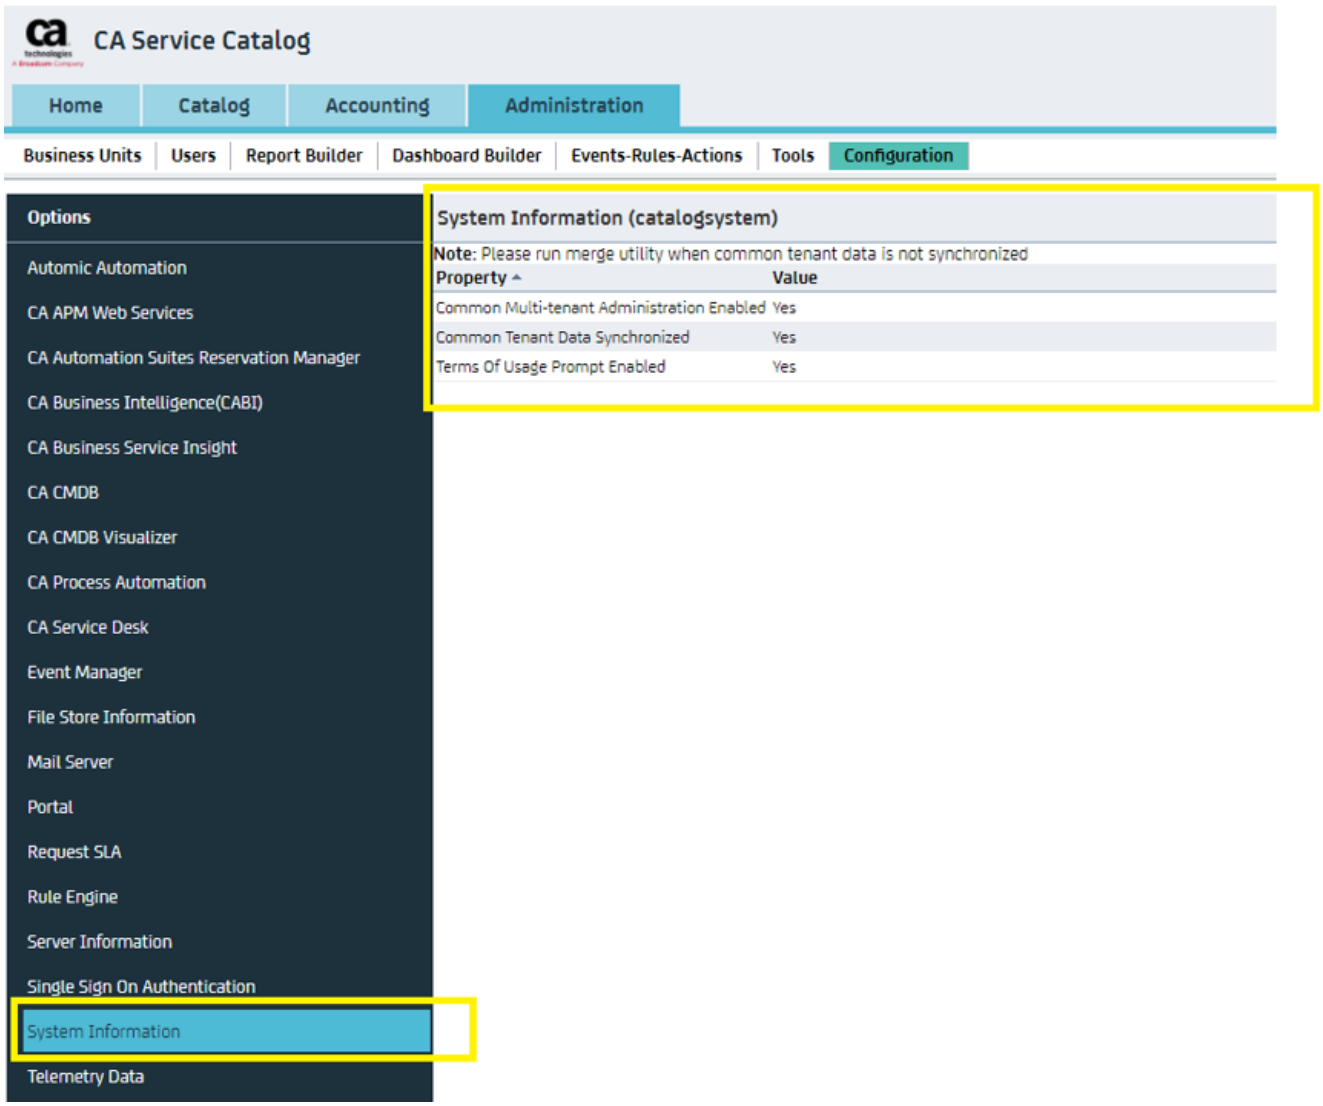
1. Login to CA Service Catalog with admin privileges (for example: spadmin/spadmin).
2. Navigate to Home, Requests, Click on Service Management Administration. Select offering as “Enable/Disable Multi tenancy” and then, submit request.



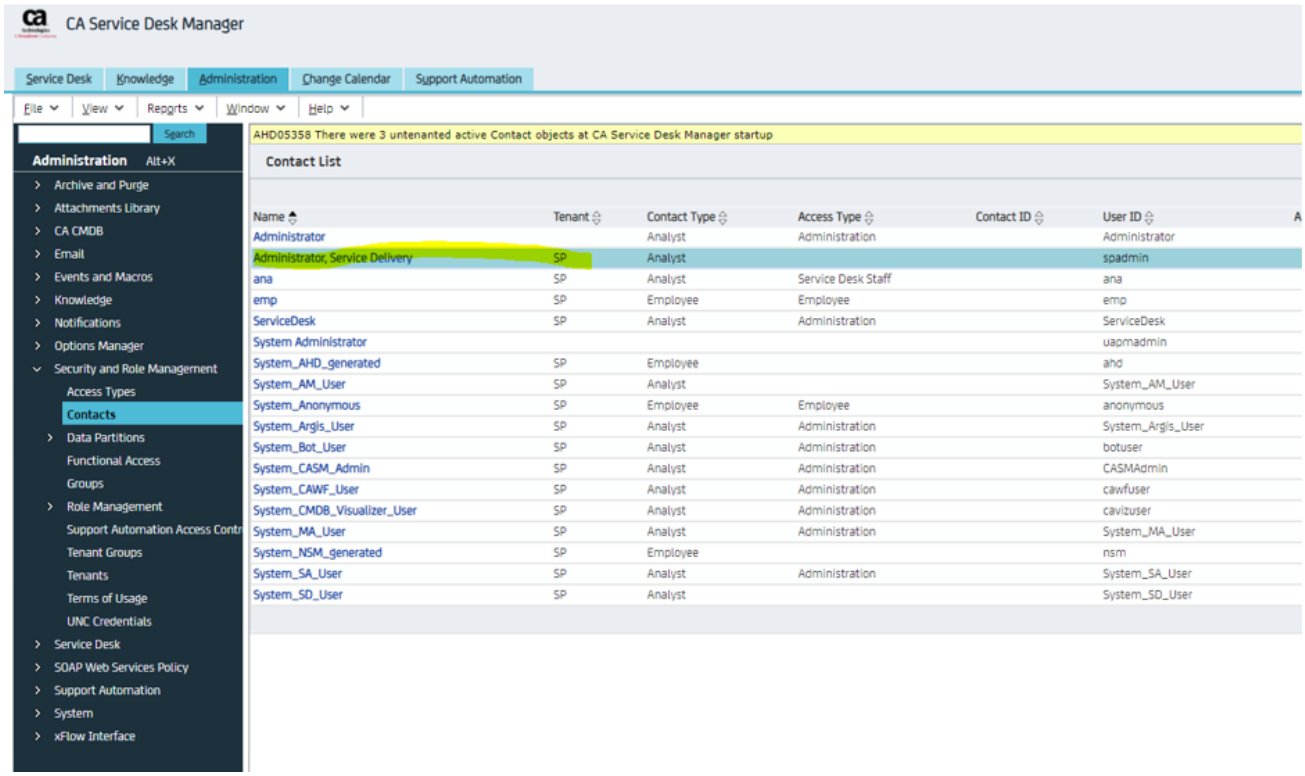
3. Navigate to Home, Requests. Click **Service Management Administration** and select offering as “**Map tenants**” and select custom tenant mapping option and then, submit the request.



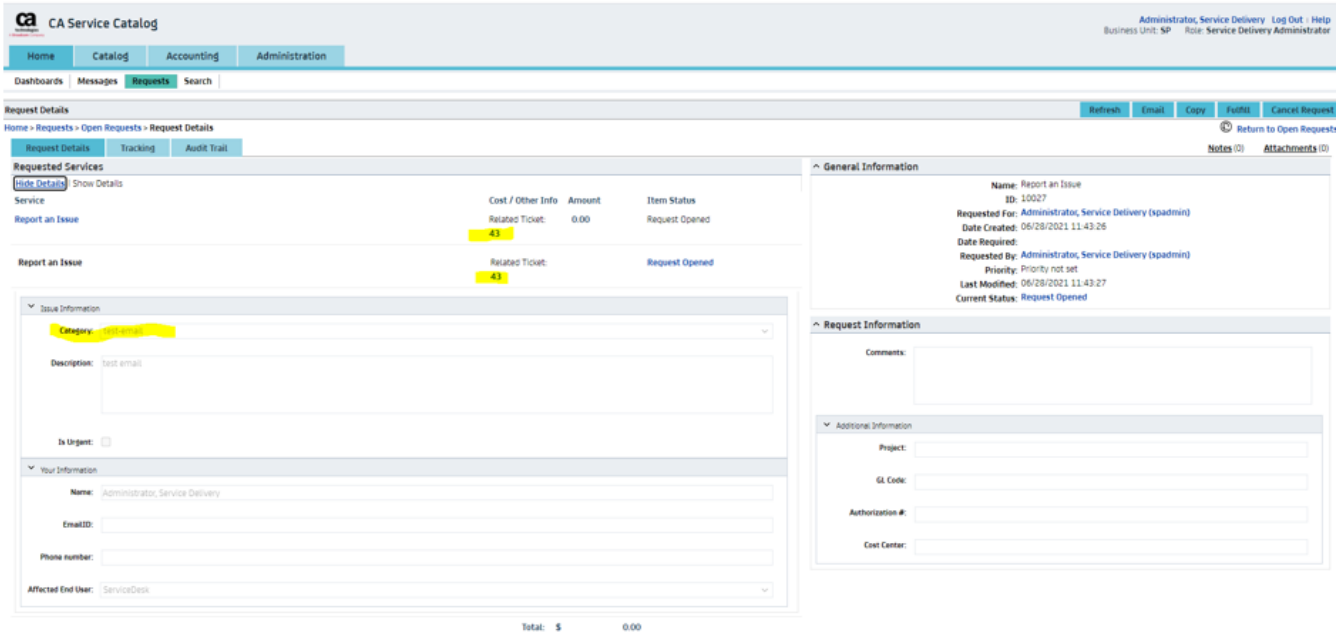
4. Restart the below CA Service Catalog services:
   a. CA Service Catalog
   b. CA Service Accounting
5. Validation Check: After successful configuration with multi-Tenancy. Below values are set as “**Yes**” in CA Service Catalog as mentioned in the image below:



6. Functional Sanity check with SDM. Pre-requisite: Please make sure that Service catalog default user (i.e., **spadmin**) should have tenant associated in SDM (see image):



7. Validation Check: Create a request with “report an issue” offering from catalog application and verify the incident number is available in the request details page. Same Incident is available in the SDM application as well.

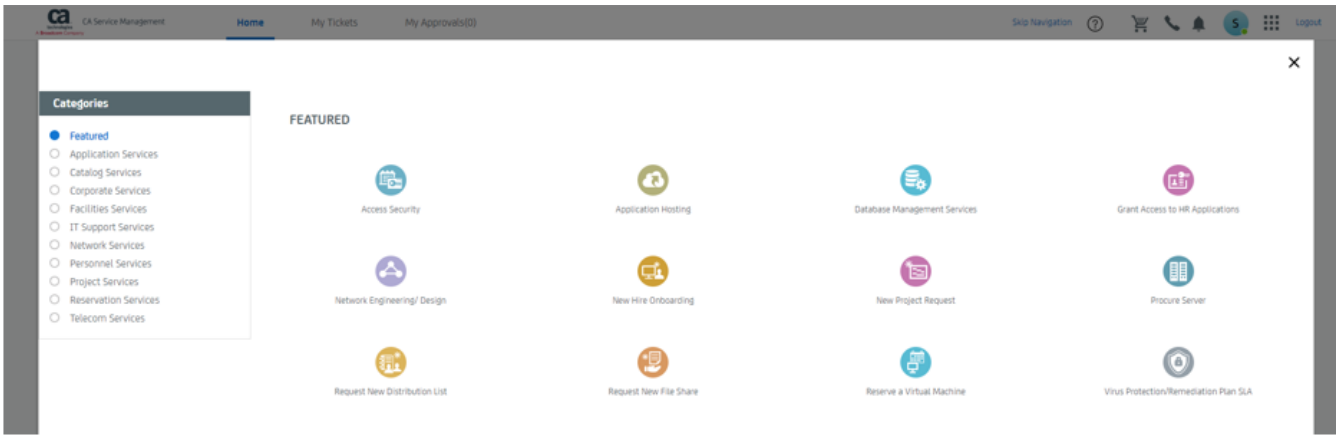


8. If you are unable to view the catalog offerings in the service point, perform the steps for the following sections from CA Service Catalog Troubleshooting:
   a. Validate CA Service Catalog Integration and Configurations
   b. Validate xFlow Interface and CA EEM Integration

NOTE
Rebuild index execution time will vary based on the data in the MDB database.

9. Run the pdm_es_rebuildindex.bat from command prompt on search server installed machine (testq-xflow-new).
10. Restart CA Service Desk Manager, xFlow Interface, and CA Service Catalog services.
11. Access the xFlow Interface application and validate the catalog offerings from service point application.

    NOTE
    In Service Point, catalog offerings are now with Policy driven approval as we don't have integration with Automic or Process Automation.
12. Follow the steps mentioned in Use Policies to Manage Requests to enable in service catalog offerings.



13. After successful Integration with CA SDM, xFlow Interface, and CA Service Catalog, take snapshots of all the servers.

CA Service Catalog Customizations

To maintain common file store location or setup custom shared location for shared files across all the catalog nodes, see Setup a Single Location for Shared Files.

- Set Up a Custom Location for Shared Files
- Set Up Single Location for Shared Files

Configure F5 Load Balancer for CA Service Catalog

To configure F5 Load Balancer with CA Service Catalog, see Configure F5 Load Balancer for CA Service Catalog Server. After enabling F5 load-balancer, update CA Service Catalog F5 Load balancer URL link in CA SDM. Perform the following steps:

1. Login to CA Service Desk Manager.
2. Navigate to **Administration**,**Options Manager**, CA Service Catalog, **casc_endpoint**.
3. Restart the CA SDM, xFlow Interface, and CA Catalog services.

Integrate CA Service Catalog with CA Automic

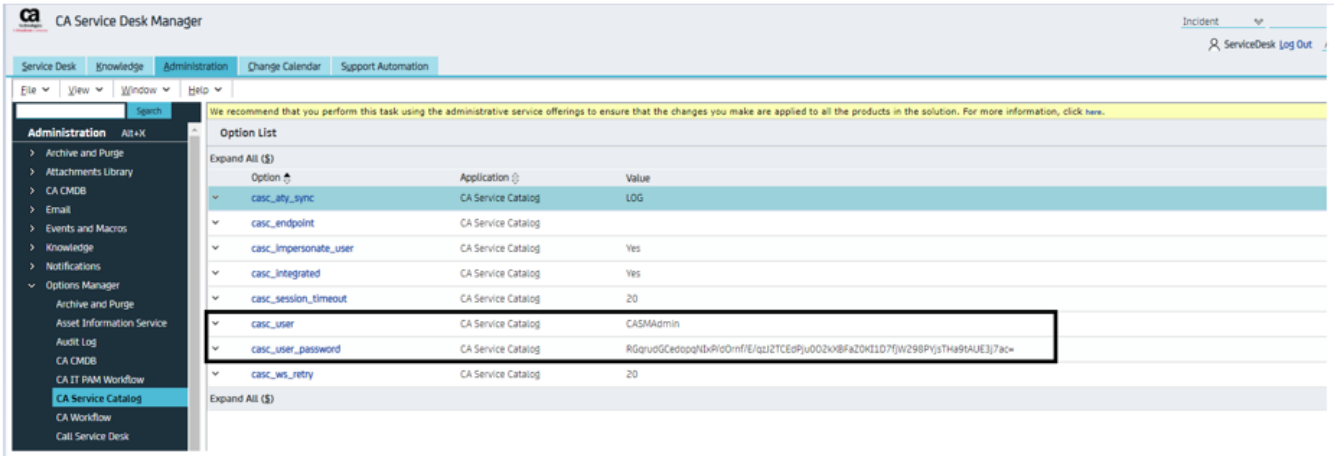
To integrate CA Service Catalog and CA Service Automic, see Automic Service Orchestration and refer the section "**Parameters**, **Automic Automation**".
After successful completion of the above steps, CA Service Catalog is integrated with Automic.

Reconfigure CA Service Catalog and CA SDM with NTLM and LDAP

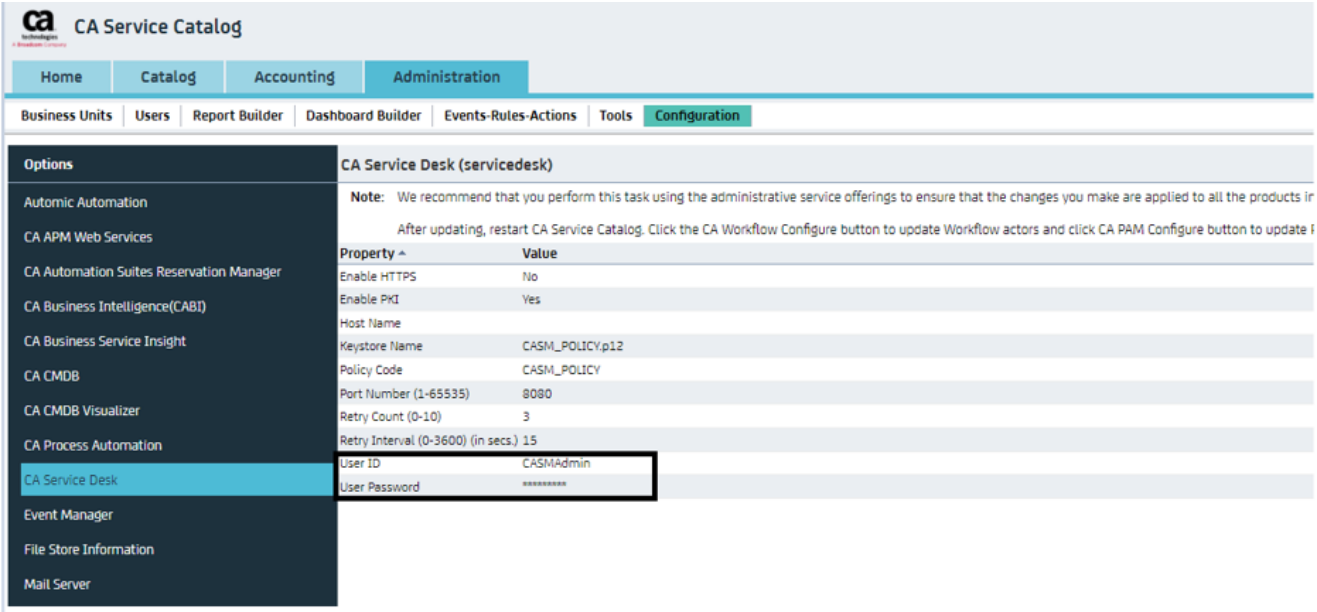
Perform the following steps:

1. Enable NTLM with SDM, xFlow Interface, and CA Service Catalog.
2. Enable LDAP in CA EEM.

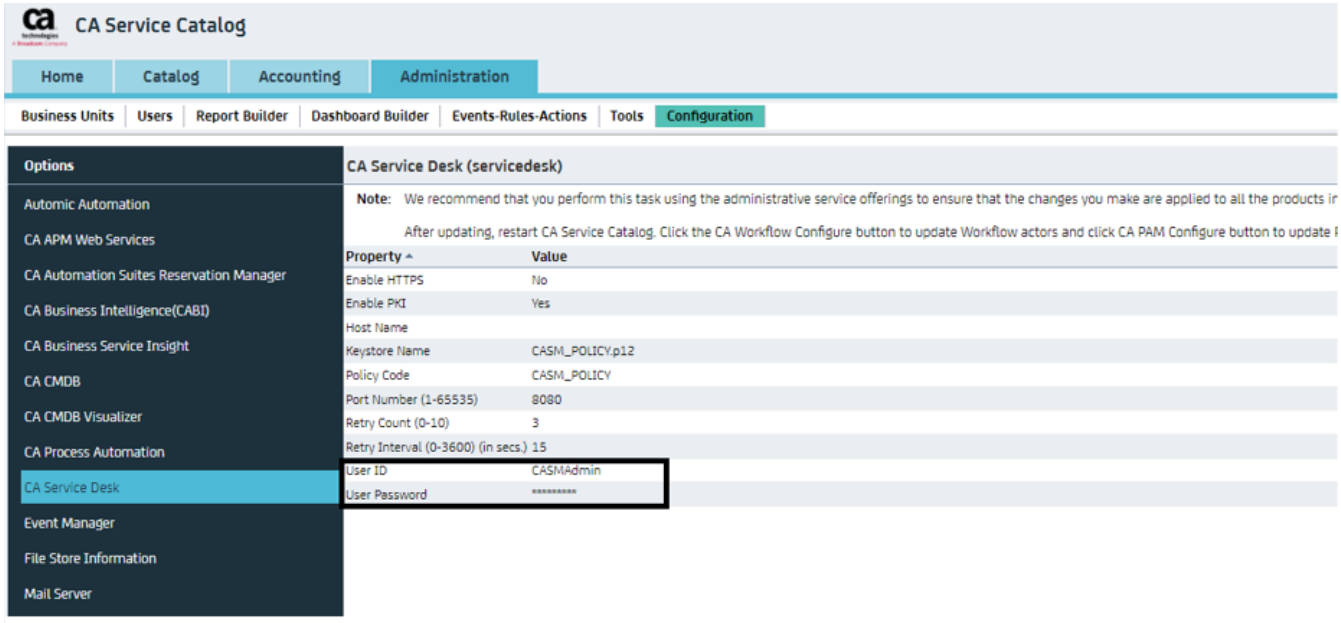
3. Update the Username and Password of LDAP account for Service Catalog under SDM Options Manager. Restart the SDM services in the all machines (BG, Standby and All application Server Servers).

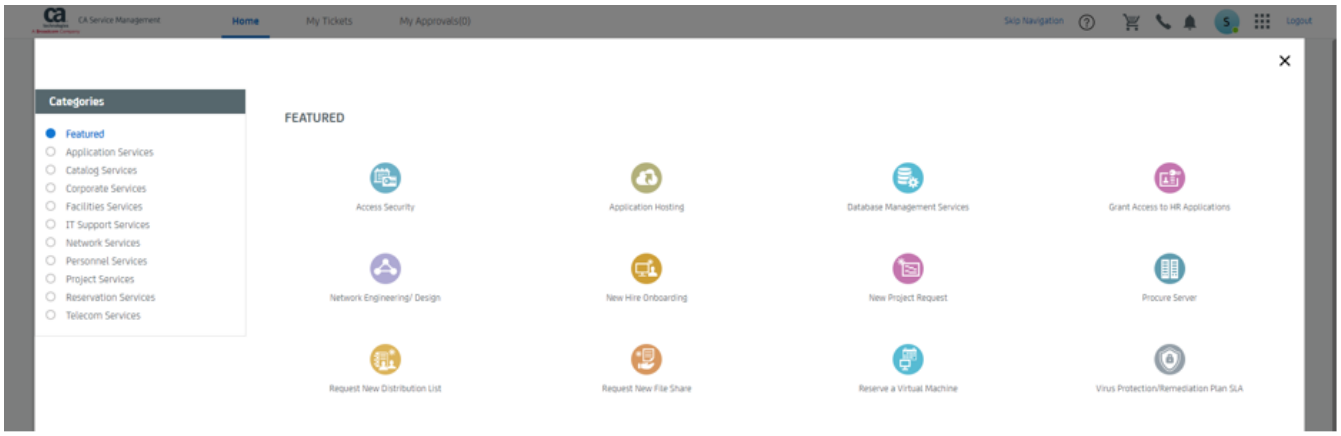


4. Restart xFlow Interface Analyst Services.
5. Update username and password for LDAP in CA SDM, xFlow Interface, and CA Service Catalog.



6. Run the **pdm_es_rebuildindex.bat** from the search server installed machine (**testqa-xflow-new**).
7. Try to access xFlow Interface and validate the catalog offerings from Service Point.





8. After successful Integration and configuration of NTLM and LDAP with CA SDM, xFlow Interface, and CA Service Catalog, take snapshots of all above servers.

Administering CA Service Management

CA Service Management provides the ability to perform several administrative tasks that are common to the integrated products from a single interface. Earlier, it was required to manage tenants, users, roles, and other configurations such as CA EEM integration from the respective products' interfaces. However, with CA Service Management, you can manage all the common administrative tasks from the same interface.

Each administrative and configuration task is a service offering that you can access from CA Service Catalog. The configurations you make are applied to all the installed products of the solution.

As an Administrator, if you want to move MDB from the production to a pre-production environment, you can move the database from the source system and configure it to work on the target system. For more information, see Moving the CA MDB Data from the Source to the Target Systems

WARNING

Any “modifications” or “adaptions” or “configurations” that are done administratively through the interface (web browser, command-line, Web Screen Painter) are “supported”, meaning CA Support can assist with

basic suggestions and trouble-shooting. CA Support does not do the changes for the customer, they are the customer's responsibility. For example, adding a field to a table and putting the field on a form through Web Screen Painter is a fully supported "modification". Another example, installing or uninstalling a feature through the Options Manager administration is a fully supported "configuration".

Anything to do with SPEL code, Java scripting (or any language scripting), or a customer-specific change to the underlying base code-line (done by CA Services or a Partner), is not supported by CA Support. The customer can do these things, but the customer is responsible for the support, maintenance, and trouble-shooting when things go wrong. If such "customizations" affect expected out-of-the-box behavior, CA Support will ask the customer to remove the customizations and see if the behavior persists.

NOTE

The common administration service offerings are available only when you install CA Service Catalog as part of the solution.

You can perform the following tasks using the service offerings:

- Manage tenants
  Create a new tenant and map tenant structures across integrated products to specify a single tenant structure.
- Manage roles
  Create service management roles and map roles across integrated products.
- Manage users
  Add existing users to the solution; create new users and assign roles to the users.
- Configure LDAP server settings
  Add LDAP servers to the solution to import and synchronize contacts from LDAP user records.
- Configure common components
  Manage component settings that are required to integrate CA Service Management products. Components that you can manage include CA EEM, CA Business Intelligence, CA Process Automation, and mail server.
- Manage product integrations
  Manage the settings of integrated products in the solution.

To view a list of available administrative service offerings and learn how to use them, see Administrative Service Offerings.

When to Use the Solution Administration Capability

It is important to understand the scenarios in which you can leverage the solution administration capability:

Scenario 1: When you install a single product

If you install CA Asset Portfolio Management or CA Service Desk Manager, the common administration service offerings are not applicable. You must perform any administrative tasks through the respective product's administration page.

However, if you install CA Service Catalog only, you can use the administrative service offerings to perform administrative tasks of CA Service Catalog.

Scenario 2: When you install a combination of products

- CA Service Desk Manager and CA Asset Portfolio Management
  The common administration service offerings are available only when you install CA Service Catalog. In this scenario, you must use the respective product's administration pages to perform any administrative tasks. For example, to create a user you must create separate users in CA Service Desk Manager and CA Asset Portfolio Management.
- CA Service Desk Manager and CA Service Catalog (or) CA Asset Portfolio Management and CA Service Catalog
  You can use the administrative service offerings to perform administrative tasks.
- CA Service Desk Manager, CA Asset Portfolio Management, and CA Service Catalog
  You can use the administrative service offerings to perform administrative tasks.

Administrative Service Offerings

Administrative service offerings let you perform administrative tasks that are common to the products in the solution from a single location. Each service offering has a life cycle and has several phases. By default, the administrative service offerings life cycle has no approvals. To understand more about the request life cycle, see Request Life Cycle.

The table below lists the administrative service offerings and the tasks you can perform:

Service Offering	Task Description
Enable/Disable Multi-tenancy	Enable or disable tenancy management.
Add Tenant	Create a new tenant to access the capabilities of the solution.
Map Tenants	Map the existing tenant structures across integrated products to create a single logical tenant structure.
Manage Tenants	View and update tenants in your organization.
Add Role	Add a role that specifies permissions across products in the solution.
Manage Roles	Search and update CA Service Management roles to change what the user sees after logging in to the product. Map the CA Service Management roles to appropriate roles in integrated products.
Add User	Add new users to the solution and assign roles to the users.
Manage Users	Search and update details of users of the solution.
Add LDAP Server	Add an LDAP server to import a list of users from an external user store.
Synchronize Users	Automatically create users and assign roles to the users of a product in the solution, that earlier did not have any roles in other products
Manage LDAP Servers	View and update LDAP servers that you have integrated with solution.
Import Users from LDAP	Import a list of users from an external user store such as an active directory.
Configure Components	Manage settings of CA EEM, CA Business Intelligence, CA Process Automation, and mail server.
Manage Integrations	Manage the settings of integrated products in the solution.

Manage Tenants

This article contains the following topics:

Multi-tenancy is the ability for multiple independent tenants (and their users) to share a single implementation of CA Service Management. Through CA Service Management, you can create and manage the tenants of products in the solution from a single location. As part of tenancy management, you can perform the following tasks by using the administrative service offerings:

- Create new tenants.
- Map tenancy structures across integrated products.
- Search for a list of available tenants.
- Update tenant details.

Enable or Disable Multi-tenancy

To mange tenants in the solution, you must enable multi-tenancy. You can disable multi-tenancy when you have no tenants in the solution or when you do not want to manage tenants.

NOTE

When you disable multi-tenancy, tenant related data is available to everyone who has access to the application.

Create Tenant

You can define as many tenants as required to manage multiple separate enterprises that provide support to clients. When you create a new tenant, the tenant views the CA Service Management implementation as solely for its own use and cannot update or view another tenant's data.

View and Update Tenants

You can view a list of all the tenants that you manage in your organization. When required, you can make changes to tenant details. For example, you can change the terms of usage of a tenant to meet the new terms. If you no longer want to manage the tenant, you can inactivate it.

NOTE

You cannot update the parent details of the tenant using the administrative service offerings. To update the parent details, you must access the respective product's user interface.

Map Tenancy Structures across Products in the Solution

As a solution Administrator, if you installed CA Service Management with a combination of products, you must map tenancy structures across the products to create a single tenant structure. If you already have more than one product in your environment and have implemented multi-tenancy, you can leverage your existing tenancy data for performing tenant management from a single location. It is possible that you have named your tenants differently in different products. So, as a first step, you map the tenants in different products and specify how to match them.

For example, *Tenant1* in CA SDM corresponds to *BusinessUnit3* in CA Service Catalog and *Tenant4* in CA APM. Hence, you specify the mapping information to simplify your tenancy management tasks. Once you perform the mapping, you can manage tenants from a single location.

Follow these steps:

1. Step 1: Know When to Map Tenancy Structures.
2. Step 2: Review Your Existing Tenancy Structures.
3. Step 3: Understand Default and Customized Tenancy Mapping.
4. Step 4: Complete the Tenancy Mapping.

Know When to Map Tenancy Structures

It is important to map tenancy structures in the following scenarios:

- You upgraded older versions of your products to CA Service Management. For example, you upgraded CA SDM 12.9 and CA Service Catalog 12.9 to CA Service Management.
- You first installed CA Service Management, but not all the products. However, you choose to integrate another product. For example, you initially installed CA SDM and CA APM as part of the solution. At a later point of time, you decided to install CA Service Catalog.

Review Your Existing Tenancy Structures

Before you perform any of the tenancy management tasks, it is important to review your existing tenant structures in each of the products you installed.

Follow these steps:

1. To view the tenants and the tenant structure in CA SDM, complete the following steps:
   a. Log in to CA SDM as an Administrator
   b. On the Administration tab, select Security and Role Management.
   c. Click the tenant to view the tenant information
   For more information, click Multi-tenancy in CA Service Desk Manager.
2. To view the tenants and the tenant structure in CA APM, complete the following steps:
   a. Log in CA APM as an Administrator.
   b. Click Administration, Tenancy Management.
   The Multi-Tenancy Administration page appears.
   c. On the left, click Tenant.
   d. Click Go to view all the tenants.
   e. Click the tenant to view the tenant information.
   For more information, click Implementing Multi-tenancy.
3. To view the tenants and the tenant structure in CA Service Catalog, complete the following steps:
   a. Log in to CA Service Catalog as an Administrator.
   b. Select Administration, Business Units.
   c. Expand the business unit tree and find the business unit that you want.
   d. Click a business unit to view the business unit information.
   For more information, click Multi-tenancy in CA Service Catalog.

Understand Default and Custom Tenancy Mapping

When you map tenancy structures across the products in the solution, you can choose to automatically map tenants or map them manually. You must understand the different mapping processes and identify the one that better suits your requirements.

Default Tenancy Mapping

In the automatic tenant mapping process, you can choose to automatically map your tenancy structures. Tenant structures are mapped as follows:

- Service Providers of the products are first mapped to each other.
- Based on the names and database IDs of the tenants, each tenant is mapped to tenants in the other product.
- If the number of tenants at a level are different in the products, a new tenant is created. For example, at level 2, CA SDM has four tenants but CA Service Catalog has five tenants. A new tenant is created and is mapped to the fifth tenant in CA Service Catalog.
- Tenants are mapped only if they are at the same level in the products. For example, a first-level tenant in CA Service Desk Manager is mapped only to first-level business unit in CA Service Catalog.

WARNING

When you choose to map tenant structures automatically, the mapping is successful only if all the products you upgraded to CA Service Management have the same database. If the products are installed on different databases, tenant information on databases other than the CA Service Management database is not migrated. For example, you installed CA SDM 12.9 and CA Service Catalog 12.9 on *database_server1* and *database_server2* respectively. While upgrading, you installed the solution on *database_server1*. Hence, tenant information on *database_server2* is not considered.

Custom Tenancy Mapping

You can map tenancy structures manually to meet your business requirements. Map your tenancy structures using the following rules:

- Do not map tenants that are at different levels. For example, do not map a seventh-level business unit in CA Service Desk Manager to a third-level tenant in CA Service Catalog.
- Do not map the same tenant more than once.
- Do not map a child without mapping all its parents. Map the parents from the tenant level directly above the child through the level directly under the Service Provider tenant.
- Verify that tenant names are unique across all products. For example, if you have a tenant named AAA in CA Service Desk Manager and CA Service Catalog, rename at least one of them to a unique, meaningful name.
- Verify that CA Service Catalog has no duplicate tenant names within its own tenant structure.

Complete the Tenancy Mapping

The Map Tenants service offering lets you perform the tenancy mapping.

Follow these steps:

1. In the Home page, click Request a Service.
   NOTE
   You can access the service offerings from the CA Service Catalog user interface.
   The Request Page Appears.
2. Under Categories, click Service Management Administration.
3. Click Map Tenants.
4. To map tenancy structures automatically, complete the following steps:
   a. Select Default Tenant Mapping.
   b. Click Submit.
5. To map tenancy structures manually, complete the following topics:
   a. Select Custom Tenant Mapping.
   b. Perform the mapping to meet your requirements and click Update Mapped Tenants.
   c. Click Submit.

Manage Service Management Roles

This article contains the following topics:

User Role defines the tasks that a user typically performs. You define roles to control security and user interface navigation. Each role defines a focused view of the system by exposing only the functionality necessary for users in that role.

A user's default role determines the system view that is presented upon login. Users with multiple role assignments can switch from one role to another to see different views of the system without having to log out and log back in again.

CA Service Management lets you define service management roles that span across multiple products in the solution. A service management role is group of product roles that lets you assign multiple product roles to user at once. In the solution, you manage several service management roles. For example, System Administrator is a service management role. The System Administrator is responsible for managing configurations and administering roles and users of the individual products in the solution. Earlier, the role of an administrator was different in different products in the solution. Now, through the solution, you create a System Administrator service management role that defines the role of an administrator without having to create the roles separately in each of the products.

You can create and manage roles of integrated solutions from a single location. As part of role management, you can perform the following tasks by using the administrative service offerings:

- Define service management roles.
- Map the service management roles to appropriate roles in integrated products.
- Search for roles.
- Update role details.

Define a Role

You can create a service management role to meet your business requirements.

When you create a service management role, identify the corresponding roles in the integrated products. The integrated product role is either a predefined role or a role that you manually created. For example, a service management role you create must define the following:

- Name of the service management role: Business User
- Tasks performed by the role: Requests services, reports issues, and collaborates for self-help.
- Role in CA SDM: Employee, Customer
- Role in CA Service Catalog: End User
- Role in CA APM: Default User

NOTE

Every service management role you create must have a corresponding role in at least one of the integrated products.

The solution provides several predefined service management roles. For more information on predefined service management roles and the corresponding integrated product roles, see Predefined Service Management Roles.

To see predefined roles in the each of the installed products, see the following information:

- Predefined roles in CA SDM
- Predefined roles in CA Service Catalog
- Predefined roles in CA APM

Predefined Service Management Roles

The solution provides several predefined service management roles. When you add a new role from predefined service management roles, the solution automatically identifies the corresponding roles in the integrated products.

The table details the predefined service management roles:

Service Management Role	Description	Roles in other products
System Administrator	System Administrators are responsible for managing configurations and administering roles and users of the individual products in the solution.	• CA SDM role: System Administrator • CA Service Catalog role: Administrator • CA APM role: System Administrator
Business User	Business users request services, report issues, and collaborate for self-help for issues related to IT.	• CA SDM role: Employee, Customer • CA Service Catalog role: End User • CA APM role: Default User
Approver	Approvers manage the change order process, but typically not the analysts who work on change order tickets.	• CA SDM role: Process Manager • CA Service Catalog role: Request Manager • CA APM role: NA

Service Catalog Administrator	Service Catalog Administrators create, define, and manage services for a specific tenant or business unit.	• CA SDM role: NA • CA Service Catalog role: Catalog Administrator • CA APM role: NA
Service Desk Administrator	Service Desk Administrators administer CA Service Desk Manager.	• CA SDM role: Administrator • CA Service Catalog role: NA • CA APM role: NA
L1 Analyst	L1 Analysts provide first-line support within your organization.	• CA SDM role: Service Desk Staff • CA Service Catalog role: Request Manager • CA APM role: Default User
L2 Analyst	L2 Analysts provide second-line support within your organization, which requires more advanced subject matter expertise.	• CA SDM role: IT Staff • CA Service Catalog role: Request Manager • CA APM role: Default User
Configuration Analyst	Configuration Analysts perform tasks within the configuration item life cycle process and second-line CMDB support within your organization.	• CA SDM role: CMDB Analyst • CA Service Catalog role: Request Manager • CA APM role: Asset Technician
Asset Manager	Asset Managers manage asset life cycle and asset fulfillment.	• CA SDM role: NA • CA Service Catalog role: Request Manager • CA APM role: Asset Fulfiller
Asset Management Administrator	Asset Management Administrators administer CA IT Asset Manager.	• CA SDM role: NA • CA Service Catalog role: NA • CA APM role: System Administrator
Service Owner	Service Owners are responsible for managing a specific IT service.	• CA SDM role: CMDB Administrator • CA Service Catalog role: Catalog Administrator • CA APM role: NA
Executive User	Executive users are decision makers, who would be primarily interested in metrics to understand performance and efficiency. The users must have view-only access to reports and dashboards.	• CA SDM role: Employee • CA Service Catalog role: End User • CA APM role: Default User

View and Update Roles

You can search for the available roles in the solution. When required, you can make changes to the role details. For example, you can change the name of the service management role.

You can also map the service management roles to appropriate roles in integrated products. For example, you first created a service management role with the following role definitions:

- Role in CA SDM: Employee, Customer
- Role in CA Service Catalog: End User
- Role in CA APM: Default User

However, at a later of point of time you decided to change the role in CA APM to Asset Technician.

Follow these steps:

1. You can access the service offerings from the CA Service Catalog user interface.

2. In the Home page, click Request a Service.
   The Request Page Appears.
3. Under Categories, click Service Management Administration.
4. Click Manage Roles.
5. Search for the list of available roles.
6. Select the role that you want to update and click Update.
7. Update the role details and click Update.
8. Click Submit.

Manage Users

This article contains the following topics:

An important part of CA Service Management administration is to define the users accessing the solution. You must establish user security when you add new users to the product and assign a user ID and password. CA Service Management lets you create and manage users of integrated products from a single location. As part of user management, you can perform the following tasks by using the various administrative service offerings:

- Define users.
- Import user details from LDAP.
- Assign roles to users.
- Update user details.

Create a User

You can add a new user and define solution access rights to the user. When you create a user, the user details are available across the integrated products. For example, if you installed CA Service Desk Manager and CA Service Catalog, you can create a user and the user information is available in both the products.

When you add a new user, assign a role to the user. You can choose any predefined service management role or a custom role service management that you created.

If you have configured LDAP servers, you can also import the list of users. For more information, see Import Users Details from LDAP.

Import User Details from LDAP

You can import a list of users from an external user store such as an active directory. Importing users helps you save time when defining your users and makes it easy to synchronize contacts with network user data.

You can import user details from only those LDAP servers that you configure with the solution. Therefore, before you import user details from an LDAP server, ensure that you add the LDAP server to the solution. For more information, see Add LDAP Servers.

> **NOTE**
>
> To ensure user authentication, the LDAP server from which you import user details must be integrated with CA EEM.

When you add or create user details in an active directory, ensure that the you review the user name policies (such as special characters, mandatory parameters) of all the integrated products in the solution and specify the appropriate details.

Synchronize User Details across Integrated Products

You can synchronize users in the following scenarios:

- You upgraded older versions of your products to CA Service Management. For example, you upgraded CA SDM 12.9 and CA Service Catalog 12.9 to CA Service Management.
- You first installed CA Service Management, but not all the products. However, you choose to integrate another product. For example, you initially installed CA SDM and CA APM as part of the solution. At a later point of time, you decided to install CA Service Catalog.

In both the scenarios, the users of one product do not have a role assigned in other products of the solution. To ensure, that the every user has a role in the solution, you must synchronize the users.

When you use the synchronize contacts service offering, users of a product in the solution, that earlier did not have a role in other products, are automatically assigned a role. To assign a role, the service offering performs the following tasks in the order mentioned below:

- Identify the current role of the user in the product. For example, the role of User1 in CA SDM is Employee.
- Determine the service management role that the user's role corresponds to. For example, Employee in CA SDM corresponds to Business User service management role.
- Identify the corresponding role in the other products of the solution. For example, a Business User has the role of End User in CA Service Catalog, and Default User in CA APM.
- Search for the user details in the other integrated products. If the user does not exist, create the user. For example, if User1 details are not available in CA APM, User1 is created.
- Assign the respective product roles to the user.

If a user doesn't have any role assigned, you must specify the default role to be assigned to the user. For example, you imported user details from an LDAP server, but did not assign roles to the users. You specify the default role to be assigned to the user and then synchronize the users.

NOTE

You can assign only a service management role as a default role.

View and Update User Details

You can search for the list of users and update the details, when required. For example, you initially imported users from an LDAP server and later want to change the email id of a few users. You can also inactivate a user when you do not manage the user or the user is no longer part of your organization.

Follow these steps:

1. You can access the service offerings from the CA Service Catalog user interface.
2. In the Home page, click Request a Service.
   The Request Page Appears.
3. Under Categories, click Service Management Administration.
4. Click Manage Users.
5. Search for the list of available users.
6. Select the user that you want to update and click Update.
7. Update the user details and click Submit.

Manage LDAP Servers

You can integrate multiple LDAP servers with CA Service Management. The administrative service offerings let you perform the following tasks:

- Add LDAP servers to the solution
- View and update LDAP server details, when required.

This article contains the following topics:

Add LDAP Server

CA Service Management allows you to import user details from an LDAP server. To import users from LDAP servers, you must first add the LDAP server to the solution. You can import users from only those LDAP servers that you added to the solution.

Follow these steps:

1. You can access the service offerings from the CA Service Catalog user interface.
2. In the Home page, click Request a Service.
   The Request Page Appears.
3. Under Categories, click Service Management Administration.
4. Click Add LDAP Server.
5. Specify the details of the LDAP server and click Submit

Manage LDAP Servers

You can view and modify the LDAP servers integrated with the solution. When you no longer want an LDAP server integrated with the solution, you can inactivate it.

Follow these steps:

1. You can access the service offerings from the CA Service Catalog user interface.
2. In the Home page, click Request a Service.
   The Request Page Appears.
3. Under Categories, click Service Management Administration.
4. Click Manage LDAP Servers.
5. Search for the list of available LDAP servers.
6. Select the LDAP server that you want to update and click Update.
7. Update the LDAP server details and click Submit.

For more information on how to manage LDAP servers using CA SDM, see How to integrate CA SDM with LDAP.

Configure Common Components

This article contains the following topics:

CA Common Components are the components that are shared by all the products in the solution and have specific functions to perform. For example, you can configure CA Business Intelligence to generate reports. You can install the components through the CA Service Management solution or install them separately when required.

You can manage the settings of the following common components:

- CA Process Automation
- CA Business Intelligence
- CA EEM

When to configure the Common Components

You configure the CA common components in the following scenarios:

- You upgraded older versions of your products to CA Service Management and the older versions of the products already use the components.
  In this scenario, you must specify the details of the installed common components. If you integrated each product with different instances of common components, you must identify the instance that you want to integrate with the solution. For example, you integrated CA SDM with CA EEM on *server1* but integrated CA APM with CA EEM on *server2*. You must determine the CA EEM server instance that you want to integrate with the solution.
- You installed CA Service Management for the first time and installed the common components separately.
  In this scenario, you must specify the details of the installed common components to integrate with the solution.
- You already specified the common component details but want to change the settings.

For example, you installed CA Process Automation on *server1* and it is scheduled for maintenance soon. To avoid any downtime, you install CA Process Automation on *server2* and integrate the solution with *server2*.

WARNING

After you configure the common components, restart the CA SDM and CA Service Catalog services. If you have installed CA APM, you must recycle the Application Pool.

How to Configure the Common Components

Follow these steps:

1. You can access the service offerings from the CA Service Catalog user interface.
2. In the Home page, click Request a Service.
   The Request Page Appears.
3. Under Categories, click Service Management Administration.
4. Click Configure Components.
5. To configure the settings of a component, select the respective tab.
   For example, to update CA EEM settings, click the CA EEM tab.
6. Specify the details and click Submit.
   Note: When you change CA EEM settings, you may experience issues with logging in to the products of the solution. To resolve these issues, you must manually integrate CA EEM with the individual products.

Manage Product Integrations

You can manage the settings of integrated products in the solution. After you integrated products in the solution, you can change several configuration settings of the integrated products. Based on the new settings, the products are automatically integrated. For example, you changed the host name of the server on which you installed CA SDM. You specify the new host name using the service offering and integration is performed automatically.

Follow these steps:

1. You can access the service offerings from the CA Service Catalog user interface.
2. In the Home page, click Request a Service.
   The Request Page Appears.
3. Under Categories, click Service Management Administration.
4. Click Product Integrations.
5. To configure the settings of a product, select the respective tab.
   For example, to update CA SDM settings, click the CA Service Desk Manager tab.
6. Specify the settings and click Submit.

7. (Optional) Any changes you make the CA SDM details are not updated in the *ca_registration* table in the MDB. If necessary, you must update the details in the table manually.
8. (Optional) If CA Process Automation is integrated with CA Service Catalog, any changes you make to the CA Service Catalog details are not updated in the CA SDM and CA Service Catalog datasets in CA Process Automation. You manually update the changes in CA Process Automation.

Business Value Dashboards

A Business value dashboard is a real-time graphical representation of an organization's Key Performance Indicators (KPI) that enables decision makers such as IT managers to make informed decisions. The dashboards represent detailed information about the following:

- Service support metrics such as the categories of incidents or requests, the associated volume, cost, and time spent for incident resolution.
- Operational and functional efficiency information such as, how support groups are occupied, information on ticket transfer from one group to another and the impact on time and cost.

Each dashboard is a service offering that is exposed through CA Service Catalog and accessible through the CA Business Intelligence interface.

As an Administrator, you are responsible for the following:

- Configuring the business value dashboard reports
- Defining the users and user access permissions to the dashboards
- Troubleshooting any issues related to business value dashboards

Complete the following steps to implement business value dashboards:

1. Know When the Business Value Dashboards are Available
2. Review the Business Value Dashboards Prerequisites
3. Determine the Business Value Dashboards User Permissions
4. Configure the Business Value Dashboard Reports
5. (Optional) Learn How to Schedule the Business Value Dashboard Reports
6. (Optional) Understand the Important Metrics

Know When the Business Value Dashboards are Available

It is important to understand the various scenarios when you can access the business value dashboards.

Installation Scenarios

The type of installation determines the type and availability of the dashboards.

Type of Installation	Dashboards Availability
New installation For example, as part of CA Service Management, you installed CA Service Catalog and CA SDM for the first time.	Dashboards are available automatically. No configuration is required.
Upgrade For example, you upgraded older releases of CA Service Catalog or CA SDM or both to release 14.1.	Dashboards are available automatically. No configuration is required.

You first installed CA Service Catalog and at a later point installed CA SDM.	Import the the CASM.biar file manually. The file is available at the following location: [ISO_ROOT\filestore\BOXI\biconfig] **Note:** Verify that CA Service Catalog and CA SDM BIAR files are already imported.

Products Installed

The dashboards and the comprising reports that are available to you are based on the products you installed as part of the CA Service Management solution.

Products Installed	Available Dashboards
CA Service Catalog only	Service Demand - Requests
CA Service Desk Manager only	Service Demand - Incidents Operational Effectiveness
CA Service Catalog and CA Service Desk Manager	Service Demand - Requests Service Demand - Incidents Service Demand Operational Effectiveness

Review the Business Value Dashboards Prerequisites

Before you use the dashboard reports, ensure that you considered the following prerequisites:

- Both CA Service Desk Manager and CA Service Catalog must use the same CA Business Intelligence server.
- Run the following queries on an Oracle MDB:

```
create or replace function MDBADMIN.left(str1 varchar2 :=NULL,num1 NUMBER)
RETURN VARCHAR2
as
ascii_chr varchar2(32767);
begin
ascii_chr:= substr(str1,1, num1);
return ascii_chr;
end;
Update report_labels set language_code ='en' where language_code='en ';
```

- Install the Arial Unicode MS font on the server where the BIAR file will be imported. Additionally, the same font must be available on the machine from where the reports will be viewed. The font files must be copied to the Windows font folder directory.
  Following code must be added to the fontalias.xml located in below location:
  <BusinessObjects Installation Path>\ SAP BusinessObjects Enterprise XI 4.0\win64_x64\fonts

```
<FONT NAME="Arial Unicode MS">
<FONTFAMILY PLATFORM="ttf" NAME="Arial Unicode MS">
<FONTATTRIBUTE BOLD="false" ITALIC="false" LOGICAL="Arial Unicode MS" PHYSICAL="ARIALUNI.TTF"/>
</FONTFAMILY>
<FONTFAMILY PLATFORM="win" NAME="Arial Unicode MS"/>
<FONTFAMILY PLATFORM="java" NAME=" 'Arial Unicode MS', 'Arial Unicode MS'"/>
<FONTFAMILY PLATFORM="html" NAME=" 'Arial Unicode MS', 'Arial Unicode MS'"/>
</FONT>
```

- Enable the Key Performance Indicators (KPIs) for Operational Effectiveness Dashboard.
  Enabling KPI for Operational Effectives Business Objects Dashboard is mandatory to retrieve the Group information when CA SDM incidents are transferred to multiple Groups for ticket resolution. Consider the following:

To show Support Groups Productivity and Functional Escalations in Operational Effectiveness dashboard, navigate to the CA SDM Administration tab, Options Manager, KPI and ensure that the status of kpi_ticket_data_table is installed.

- Configure the NX_KPI_TICKET_DATA_TABLE_DELAY variable to specify how frequently the incident data (for example, incident transfer) is updated in the database. The recommended value is 900 seconds.
  To configure the variable, complete the following steps in the order mentioned below:
  – Navigate to [SDM Root folder].
  – Open the NX.env file in notepad.
  – Search for @NX_KPI_TICKET_DATA_TABLE_DELAY and specify the value.
  For example, @NX_KPI_TICKET_DATA_TABLE_DELAY = 900.
- Make sure that every analyst is associated with a support group. Data related to an analyst with no support group is not displayed on business dashboard.
- Every time an analyst moves from one group to another, make sure to note down the analyst metrics in the previous group. The business dashboards display any metrics related to the older group as belonging to the new group.

Determine the Business Value Dashboards User Permissions

The role and user permissions determine the users accessing the dashboard and the users configuring the dashboards. To provide permissions to any user to configure the reports or access the dashboard, you must add the user to the CA Service Management group.

Important! You must add the *CASMAdmin* user to the CA Service Management group. The CASMAdmin user has the privileges to access the solution dashboard and also run the reports.

Follow these steps:

1. Log in Central Management Console as an administrator.
   http://cabi-hostname:Port_number/BOE/CMC
2. Under Organize, click Users and Groups.
3. Click User List.
4. Right-click the user you want to add to the CA Service Management group and click Join Group.
5. Select CA ServiceManagement and move it from Available Group(s) to Destination Group(s).
6. Click Ok and save the changes.

Configure the Business Value Dashboard Reports

This article contains the following topics:

Scheduled and On-demand Reports

CA Service Management provides you the flexibility of generating reports, when required. The report generation is classified as Scheduled reporting and On-demand reporting.

Scheduled Reporting

You can use the scheduled reports when your organization requires reports to be generated at frequent intervals. Also, when you have a large data to generate reports from, you can use the scheduled reports. For example, a report is to be generated on a weekly basis. So, you use the scheduled reports and configure them to generate reports once in a week.

Note: We recommend that you use scheduled reporting when the data size is more than 10,000 records.

On-demand Reporting

You can use the On-demand reports to generate the business value dashboards when required or to process small data. For example, your organization does not require reports to be generated at frequent intervals. However, you need to generate a report whenever an executive user requires you to generate it.

Note: We recommend that you use scheduled reporting when the data size less than 10,000 records.

To know the data size, identify the count of the following tables in your MDB:

- *usm_subscription_detail* for the number of requests
- *call_req* for the number of incidents

Dashboards and the Associated Reports

Each dashboard has several reports and sub-reports associated that you can view and configure to meet your requirements. The reports are accessible through the BusinessObjects Central Management Console.

Follow these steps to access the reports associated with the dashboards:

1. Log in Central Management Console as an administrator.
   http://cabi-hostname:Port_number/BOE/CMC
2. Navigate to Folders, All Folders, CA Reports, CA Service Management.
3. Do one of the following:
   - Click View on Demand Dashboard to view the reports that you can generate on-demand.
   - Click Scheduled Dashboard to view or schedule reports as per your requirement.
   - Click Sub Reports to view the sub reports of Service Demand and Operational effectiveness dashboards.

Learn How to Schedule the Business Value Dashboard Reports

This articles explains how to schedule dashboard reports and tasks you must perform before and after scheduling the reports.

Note: Perform these tasks only if you or the end user access the dashboards from the Unified Self-Service user interface.

Complete the following:

Configure the Business Value Dashboard Service Offerings

By default, the dashboard service offerings represent data generated by on-demand reports. To display scheduled reports, you must perform several configurations on service offerings.

Complete the following steps:

- Identify the Report ID
- Configure the Service Offering

Identify the Report ID

Follow these steps:

1. Log in to Central Management Console as an administrator or a user with permissions to schedule report generation.
   http://cabi-hostname:Port number/BOE/CMC
2. Navigate to Folders, All Folders, CA Reports, CA Service Management, Scheduled Dashboard.
3. Right click the report that you want to schedule and select Properties.
4. From the ID, CUID field, make a note of the CUID of the report.
   For example, in **ID, CUID:17810, ATKoKrurIjlCqTvnya20W1s**, the CUID is ATKoKrurIjlCqTvnya20W1s.

Configure the Service Offering

Follow these steps:

1. Log in to CA Service Catalog as an Administrator.

2. Navigate to Catalog, Service Offerings, Offerings.
3. Expand Service Management Dashboards.
4. Select the service offering that represents the dashboard for which you want to schedule a report.
   For example, Operational Effectiveness.
5. Click the copy icon.
6. Create a copy of the service offering in the same folder and specify the name of the new service offering.
   For example, Operational Effectiveness - Scheduled Report.
7. Click the new service offering copy.
   In this example, click Operational Effectiveness - Scheduled Report.
8. In the Details tab, set the Availability date.
9. In the Permissions tab, enable permissions for the appropriate roles.
10. In the Definition tab, click Edit Service Option.
11. From the Form field, make a note of the Form name.
12. Navigate to Catalog, Forms.
13. Expand Forms, Service Management Dashboards Forms.
14. Click the form that you earlier noted and create a copy of the form as you created a copy of the service offering.
15. Click the new form and the click Script.
16. Search for the following statement. In this example, the form is the Operational Effectiveness form.

```
cabiURL = 'http://' + ca_fd.js.cabiHostName + ':' + ca_fd.js.cabiPort + '/BOE/OpenDocument/opendoc/
openDocument.jsp?iDocID=AbEmxu8mNftBjHQIMRu2uLs&sIDType=CUID&sReportMode=weblayout&token=' +
 rows[0].value;
```

17. Replace the iDocID variable with the appropriate CUID that you earlier noted.
    For example, replace AbEmxu8mNftBjHQIMRu2uLs with ATKoKrurIjlCqTvnya20W1s.
18. Click Save.
19. In the new service offering you created, update the Form name in the Definition tab to the new form name.
20. Save the changes.

Schedule the Business Value Dashboard Reports

Schedule a report when the date size is more than 10,000 records. It is important to configure both the reports and the associated sub-reports.

To know the data size, identify the count of the following tables in your MDB:

- *usm_subscription_detail* for the number of requests
- *call_req* for the number of incidents

Follow these steps:

1. Log in to Central Management Console as an administrator or a user with permissions to schedule report generation.
   http://cabi-hostname:Port_number/BOE/CMC
2. **To schedule the Service Demand-Incidents dashboard, complete the following steps:**
   a. Navigate to Folders, All Folders, CA Reports, CA Service Management, Sub Reports.
   b. Right-click Incident Cost Details, Incident Effort Details, Incident Volume Details and select Schedule.
   c. Configure the appropriate parameters and click Schedule.
   d. Navigate to Folders, CA Reports, CA Service Management, Scheduled Dashboard, Service Demand – Incidents.
   e. Right-click Service Demand- Incidents and click Schedule.
   f. Configure the appropriate parameters and click Schedule.
      Note: Ensure you that parameter values you configure for reports and their sub-reports are the same.
3. **To schedule the Service Demand-Request dashboard, complete the following steps:**
   a. Navigate to Folders, All Folders, CA Reports, CA Service Management, Sub Reports.

b. Right-click Request Volume/Cost for Services and select Schedule.
c. Configure the appropriate parameters and click Schedule.
d. Navigate to Folders, CA Reports, CA Service Management, Scheduled Dashboard, Service Demand – Requests.
e. Right-click Service Demand- Requests and select Schedule.
f. Configure the appropriate parameters and click Schedule.
Note: Ensure you that parameter values you configure for reports and their sub-reports are the same.

4. **To schedule the Service Demand dashboard, complete the following steps:**
   a. Navigate to Folders, All Folders, CA Reports, CA Service Management, Sub Reports, Service Demand Scheduling.
   b. Right-click on each of the reports and select Schedule.
   c. Configure the appropriate parameters and click Schedule.
   d. Navigate to Folders, CA Reports, CA Service Management, Scheduled Dashboard, Service Demand.
   e. Right-click Service Demand and select Schedule.
   f. Configure the appropriate parameters and click Schedule.
   Note: Ensure you that parameter values you configure for reports and their sub-reports are the same.
5. **To schedule the Operational Effectiveness dashboard, complete the following steps:**
   a. Navigate to Folders, All Folders, CA Reports, CA Service Management, Sub Reports.
   b. Right-click FCR For Incident Categories, Groups By Effort Incurred On Resolution Functions, MTTR for Incident Categories and select Schedule.
   c. Configure the appropriate parameters and click Schedule.
   d. Navigate to Folders, CA Reports, CA Service Management, Scheduled Dashboard, Operational Effectiveness.
   e. Right-click Operational Effectiveness and select Schedule.
   f. Configure the appropriate parameters and click Schedule.
   Note: Ensure you that parameter values you configure for reports and their sub-reports are the same.

Verify the Scheduled Dashboards

After you schedule the report generation, you must verify if the dashboards are created correctly. Each dashboard is a service offering that is exposed through CA Service Catalog.

Understand the Important Metrics

The three parameters related to request and incidents/categories that are significant to decision makers are cost, effort, and volume.

It is important to understand how these parameters are calculated:

Effort

Effort is the time total time spent on an incident resolution. The time spent may be by one user or multiple users in resolving an incident. The effort is calculated only when the users appropriately log in the time spent on an incident. It is important that your organization recommends time logging.

The **Time Spent** field in the incident details determines the time spent on the incident.

Volume

Volume is the total number of requests/incidents in a specific category. It is important that each incident/request has a specific category associated with it. For example, Hardware, Networking, Applications are categories.

Cost

Cost is a function of effort spent and the resource rate. It is also the cost of a service.

Each incident/request has a category associated and the total cost of a category is the sum of all costs of incidents/requests in a specific category.

- For an incident, cost is calculated as follows:
  Cost of an incident = Total time spent (in hours) by a resource * Rate (per hour) of the resource
  The following example describes how the cost parameter is calculated for an incident involving multiple resources.

Data	Analyst_1	Analyst_2
Resource Rate (per hour)	$ 100	$ 75
Time spent (in hours)	10	15

  Total cost = ($100 * 10) + ($75*15) = $ 2125
  Note: The **Cost** field in the **Contact Details** page determines the resource rate.
- For a request, the cost is the cost field that you associate for a service offering.

Offline Reporting through Microsoft SQL Server Database Replication

CA Service Desk Manager lets you generate reports that help you analyze critical information. CA SDM accesses the database to fetch information whenever you create a report. When your database contains large volumes of data, the data retrieval process impacts the performance of your application. An effective way to reduce performance issues is to replicate or create an offline version of your database. While users continue to access the application to perform day-to-day tasks, the application accesses the replicated or offline database for any report generation activity.

NOTE

The database replication process is applicable only if you use Microsoft SQL Server in your environment.

This article contains the following topics:

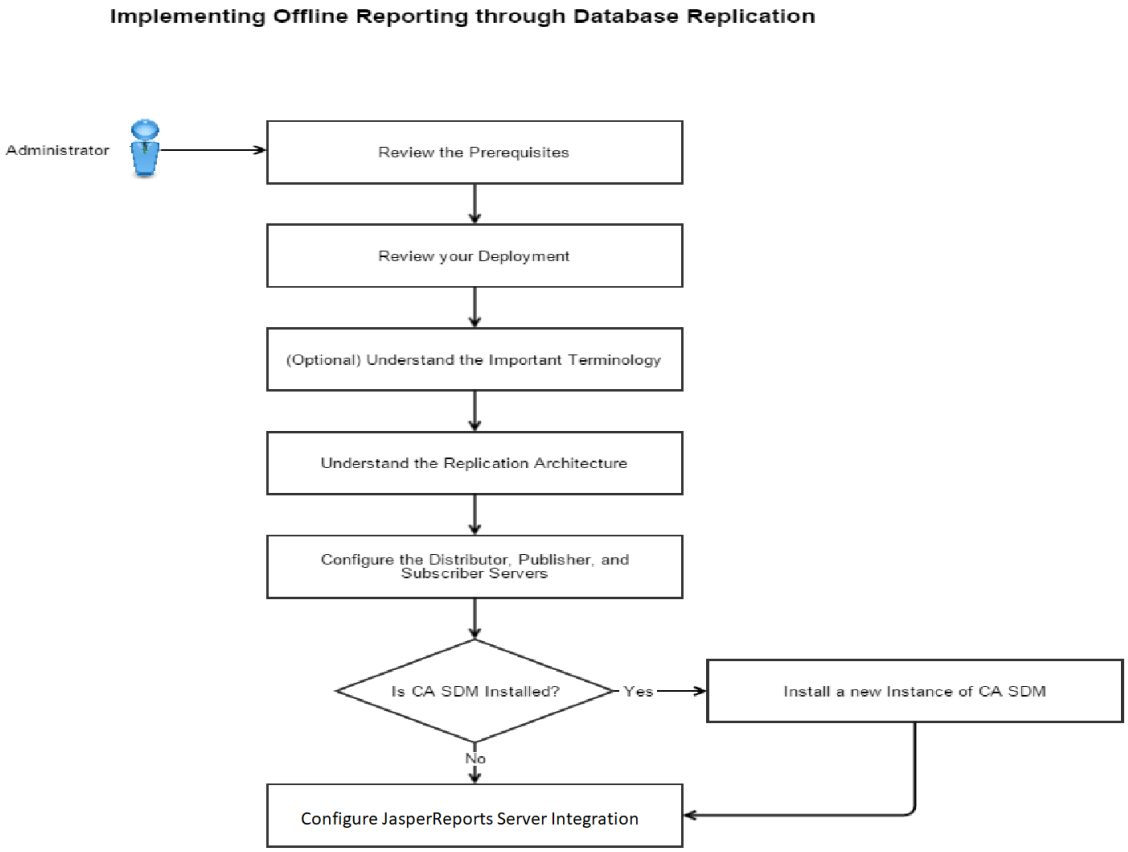
The Environment

You can implement offline reporting in the following environment:

- **Products installed**: CA Service Desk Manager 17.3.
- **Database:** Supported versions of Microsoft SQL Server. For more information on the supported versions, see Supportability Matrix.

The following diagram illustrates how a solution administrator implements database replication for offline reporting:

Figure 4: Implementing Offline Reporting through Database Replication

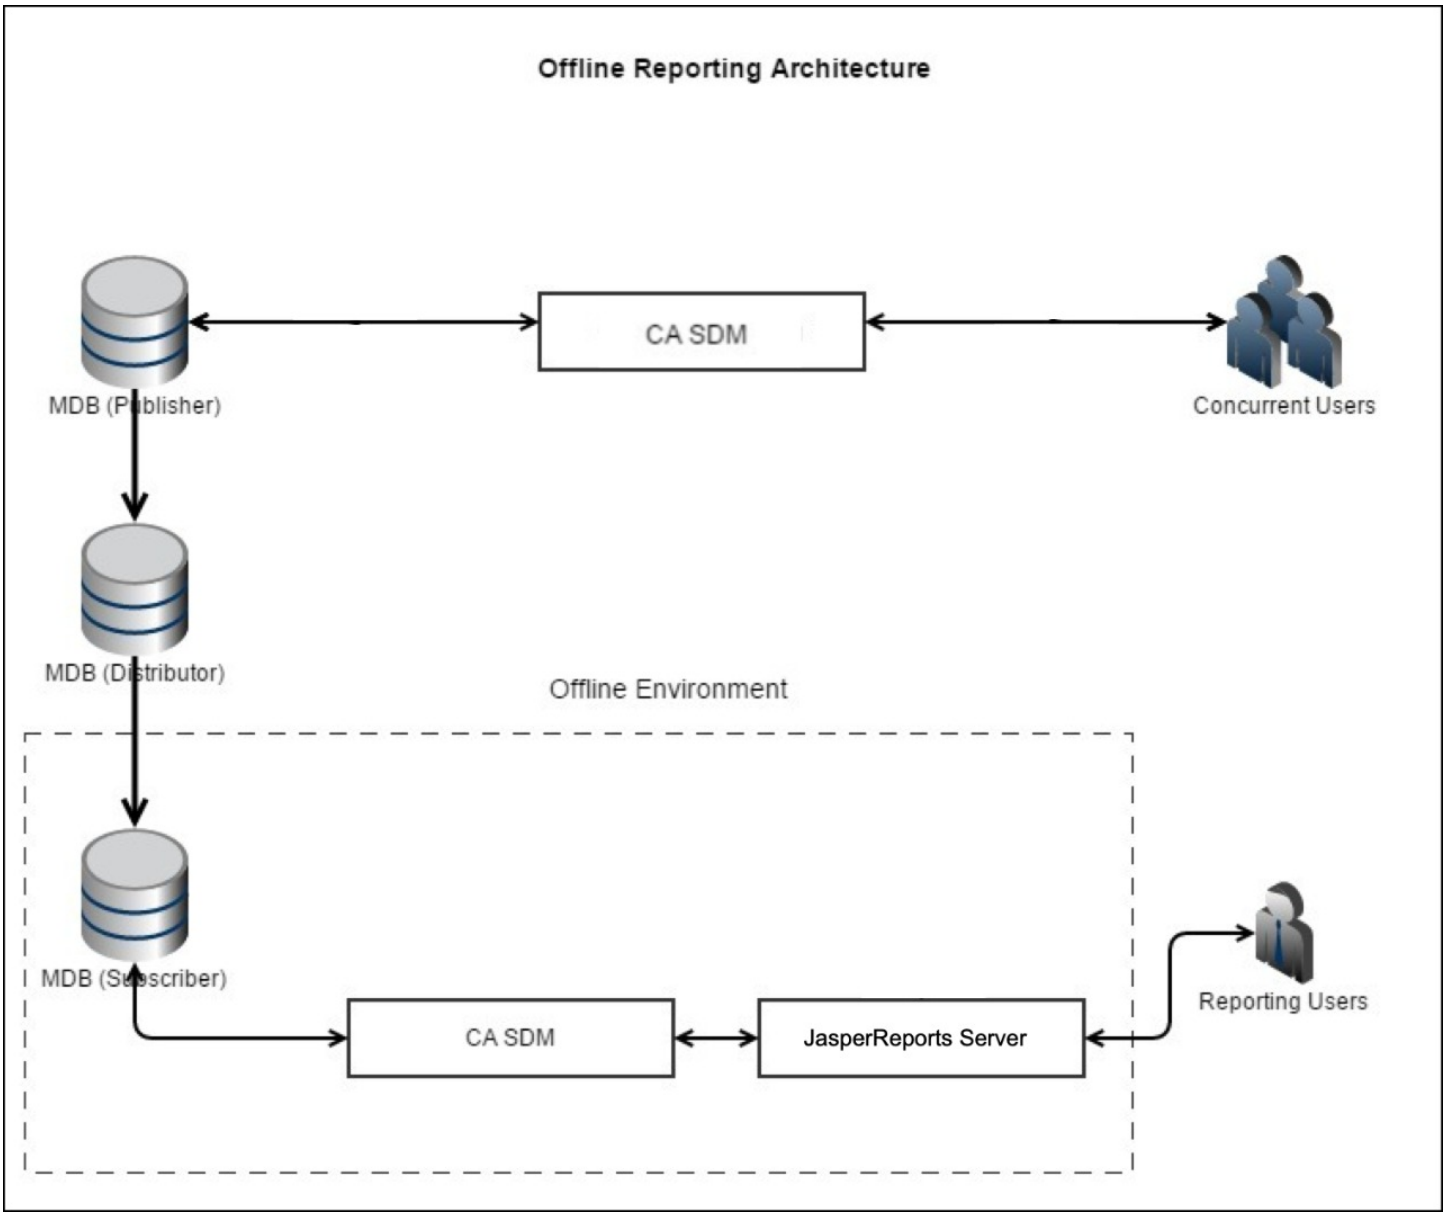


For more information about installing the Replication feature, see Microsoft SQL Server documentation.

The Architecture

The following diagram illustrates the architecture of a replicated database environment for offline reporting:

Figure 5: Offline Reporting Architecture



Benefits

Replicating the database through transactional replication has the following benefits:

- Incremental changes are propagated to the Subscribers as they occur.
- Report generation does not require any changes to be made by the Subscriber; thus, data need not be propagated back to the Publisher. In transactional replication, Subscribers are read-only and therefore do not affect the performance of your environment.
- Low latency between the time changes is made at the Publisher, and the changes arrive at the Subscriber.
- Effective management of high insert, update, and delete activity compared to other replication types.

NOTE

With support for transactional replication in CA Service Desk Manager, support for the merge replication process is deprecated. If you already implemented merge replication on CA Service Desk Manager, we recommend you disable it and implement transactional replication.

Best Practice

Scenario 1: New Installation of CA Service Desk Manager

If your environment follows the database replication process for the first time, you must install CA Service Desk Manager and enable transactional replication.

Scenario 2: Upgrade CA Service Desk Manager

If your environment follows the database replication process, you must disable the replication process (merge or transactional), upgrade the CA Service Desk Manager, and enable the transactional replication.

Scenario 3: Integration of CA Service Desk Manager Products

If your environment follows the database replication process, you must disable the replication process (merge or transactional), Integrate the CA Service Management products, and enable the transactional replication.

Glossary

The following terms are used frequently in the configuration information. Understand the meaning of the terms before you start configuring offline reporting:

Production Database

The production database refers to the database server that CA Service Desk Manager uses. This is the database from where you replicate another database for offline reporting.

A production database is typically the database server in a production environment.

Reporting Database

Reporting database refers to the database that you replicated from the production database. The reporting database is used only for offline reporting.

Publisher

The Publisher is a server that makes data available for replication to other servers. In addition to being the server where you specify the data to be replicated, the Publisher also detects the data that has changed and maintains information about all publications at that site.

The publisher is typically the production database server in the offline reporting scenario.

Distributor

The Distributor is a server that contains the distribution database and stores metadata, history data, and/or transactions. The Distributor can be a separate server from the Publisher (remote Distributor) or the same server as the Publisher (local Distributor).

Subscriber

A subscriber is a server that receives replicated data. Subscribers subscribe to publications, not individual articles within a publication, and they subscribe only to the publications they need, not necessarily all of the publications available from a Publisher.

Verify the Prerequisites

We recommend that you complete the checklist before you proceed.

1. Verify that CA Service Desk Manager 17.3 and above version is installed on the production and offline server.
2. You must have DBA privileges.
3. The following Windows services must be running. We recommend that you set the start mode to **Automatic**.
   - SQL Server
   - SQL Server Agent
   - SQL Server Browser
4. The SQL Server Agents must run on the publisher, distributor, and subscriber servers.
5. You can perform either of the following steps:
   a. **Use a domain account for every agent.** Add the domain account to the SQL Server logins and assign the sysadmin role. Set **Master** as the default database.
   b. **For each agent, create a local Windows account on the respective servers.** Add the Windows user account that you created to the SQL Server logins and assign the sysadmin role. Set **Master** as the default database.
6. Create a Snapshot Folder. Ensure that the Snapshot Folder is a network folder and not a local folder.
7. To implement replication, Microsoft mandates that every table is associated with a primary key. Hence, ensure any new table that you want to replicate has a primary key that is associated with it.
8. To connect to the database, the replication utility requires SQL server authentication-based login credentials. We recommend the default system admin account be used.

Back up and restore the existing MDB instance

Review the 3-step procedure to back up and restore the existing instance of MDB.

Step 1: Back up and Restore

Back up the production server database and restore it to the offline server. See information specific to CA Service Desk Manager on Moving the CA MDB Database on Microsoft SQL Server.

Step 2: Implement Replication

An effective way to reduce application performance issues is by replicating or creating an offline version of your database. The users can continue to access the application to perform day-to-day tasks, and the application accesses the replicated or offline database for any report generation activity. For more information, see How To Implement Replication.

Step 3: Configure CA SDM with offline MDB

Follow these steps:

1. Using a text editor, open the NX_ROOT\pdmconf\NX.env_nt.tpl file and perform the following steps:
   a. Use the following sample code to verify that auditing is commented out:

```
# Create audit log entry for field update.
! @NX_AUDIT_UPD=
# Create audit log entry for deletion.
! @NX_AUDIT_DEL=
```

   b. Add the following code and parameters at the end of the file:

```
@NX_EVENT_LOG_EXCLUDE=ALL
@NX_SESSION_LOG_EXCLUDE=ALL
#this is just a required comment
```

2. Using a text editor, open the NX_ROOT\samples\pdmconf\pdm_startup.tpl file.

3. Edit the file by changing the line *[default procset MAIN_PROCSET_REPLACE]* to *[default procset OFFLINE_REPORTING]*.
4. Save and close the file.
5. Configure CA SDM with replicated db and do not select “load-default’ data check box. To configure CA SDM run the following command on the command prompt.
   ```
   pdm_configure
   ```
6. Complete the following steps in Microsoft SQL Server Management Studio:
   a. Expand **Databases, MDB, Security, Users**.
   b. Right-click **mdbadmin** and select **Properties**.
   c. In the **Database User** window, next to **Default schema**, click the search option.
   d. In the **Select Schema** window, enter *[dbo]* and click **Browse**.
   e. In the **Browse for Objects** window, select the **mdbadmin** object and click **OK**.
   f. In the **Database User** window, select the following entries under **Role Members** and click **OK.**
   – • ams_group
   • db_ddladmin
   • db_owner
   • db_securityadmin
   • regadmin
   • service_desk_admin_group
   • service_desk_ro_group
   • usmgroup
   • workflow_admin_group
7. In the Windows command prompt, run the following command to view the status of the services:
   ```
   pdm_status
   ```
8. Configure JasperReports Server and integrate with the offline server (Offline MDB). JasperReports Server that you configured to access the production database must now access the reporting database. JasperReports Server does not access the production database directly. Configure JasperReports Server with CA SDM offline server to access the reporting database. For more information, see Integrate JasperReports Server 8.1.1 with CA Service Management.

   NOTE
   Access CA SDM reports from JasperReports Server.
9. To access the CA SDM reports, log in to JasperReports Server, create a user and add the contactUUID attribute.
   a. Log in to JasperReports Server.
      ```
      http://<machine_name>:< jaspereportsserver_port>/jasperserver-pro/login.html
      ```
   b. From the JasperReports Server home page, click **Manage** and select **Users**.
   c. From the left navigation select **casm_insights.**
   d. Click the **Add User** option.
   e. On the **Add User** form, fill in the fields.
   f. Click **Add User to casm_insights**.
   g. Select the newly created User.
   h. From the **Properties** pane, click **Edit**.
   i. From the **Attributes** tab, click **Add new attribute**.
   j. In the Name field, enter contactUUID.
   k. Click **OK** and **Save**.

   NOTE

   If multi-tenancy is enabled on the production instance of CA SDM, then manually install the same on the offline instance of CA SDM. For more information about allowing multi-tenancy, see How Multi-Tenancy Works.

Implement Replication

This article describes the process to implement replication.

> **TIP**
>
> Initiate the replication process during a planned maintenance window as it involves creating a snapshot of the database. While this process is in progress, access to your database is locked. The time period depends on the volume of data in the production database. For instance, time period for a new database is 5-6 minutes, whereas for a 112-GB database, it is 6 hours and 20 minutes.

Configure the Distributor, Publisher, and Subscriber Servers

You can configure the servers in one of the following ways:

- Run the Configuration Utility
- Manual Configuration

Perform the Validation Check

Perform the checks in Distributor/Publisher based on your configurations.

Follow these steps:

1. Navigate to Microsoft SQL Server Management Studio.
2. Expand **Databases,** and verify the new database "**Distribution**".
3. Expand **Security**, **Logins**, and verify the new login "**Distributor_admin**".
4. Expand **Server Objects**, **Linked Servers**, and verify the new linked server "**repl_distributor**".
5. Expand **SQL Server Agent, Jobs,** and verify the 6 new jobs that are created automatically.
6. Expand **Replication**, **Local Publications,** and verify the newly created publication.
7. Expand the **New Publication,** and verify the newly created subscription.
8. To confirm snapshot creation, right-click on the **Publication** and select **View Snapshot Agent Status.**

> **WARNING**
>
> Failure in the above steps indicates that the replication process is unsuccessful. In this case, the user must navigate to the log file created as part of replication and check for errors.

Run the Configuration Utility

This article explains the steps to download and run the configuration utility.

Select a Mode

You can either specify the details in the utility or perform a silent replication.

- Ensure you review the 'ReplicationInputData.csv' file for the interactive mode process to comprehend the required input values.
- For the silent replication process, ensure that you specify all the details in the 'ReplicationInputData.*csv'* file before you run the utility.

Download and run the configuration utility

>From the Broadcom Support portal, download the Configuration Utility.

Follow these steps:

1. Unzip the configuration utility file.
2. Run the *CreateReplication.bat* file.
3. Specify if you want to perform a silent replication.
   The replication process starts.
4. If you choose to specify the details in the utility, follow the on-screen instructions.
5. After you specify all the details, the replication process starts.
   The progress is displayed.
6. To understand whether the replication process was successful, view the *Replication.log* file.

Include/Exclude Tables for Replication

During the replication process, the configuration utility replicates only the tables that are part of CA Service Management. Tables that are related to other products are not replicated. For example, if you integrated CA SDM with JasperReports Server, the configuration utility replicates only CA SDM tables and not JasperReports Server tables. However, you can manually include these tables for replication.

Include a Table for Replication

Follow these steps:

1. In the configuration utility folder, open the **Creation Script** folder.
2. Open the *CreatePublication.sql* file using a text editor.
3. Copy the following code:

```
IF (EXISTS (SELECT * FROM INFORMATION_SCHEMA.TABLES WHERE TABLE_NAME = 'Table_Name'))
BEGIN
exec sp_addarticle @publication = N'publication_mdb', @article = N'Table_Name', @source_owner = N'dbo',
 @source_object = N'Table_Name', @type = N'logbased',
@description = null, @creation_script = null, @pre_creation_cmd = N'drop', @schema_option =
 0x000000000803509F, @identityrangemanagementoption = N'manual',
@destination_table = N'Table_Name', @destination_owner = N'dbo', @vertical_partition = N'false', @ins_cmd
 = N'CALL sp_MSins_dboxent_map', @del_cmd = N'CALL
sp_MSdel_dboxent_map', @upd_cmd = N'SCALL sp_MSupd_dboxent_map'
END
GO
```

4. Paste the code before the following entry in the file:

```
PRINT 'Publication created'
```

5. Replace 'Table_Name' in the code with the name of the table you want to include.

Exclude a Table for Replication

Follow these steps:

1. In the configuration utility folder, open the **Creation Script** folder.
2. Open the *CreatePublication.sql* file using a text editor.
3. Search for the name of the table and find the following entry. For example, if the name of the table is **xent_map**, you find the following code in the file:

```
IF (EXISTS (SELECT * FROM INFORMATION_SCHEMA.TABLES WHERE TABLE_NAME = 'xent_map'))
BEGIN
exec sp_addarticle @publication = N'publication_mdb', @article = N'xent_map', @source_owner = N'dbo',
 @source_object = N'xent_map', @type = N'logbased',
```

```
@description = null, @creation_script = null, @pre_creation_cmd = N'drop', @schema_option =
 0x000000000803509F, @identityrangemanagementoption = N'manual',
@destination_table = N'xent_map', @destination_owner = N'dbo', @vertical_partition = N'false', @ins_cmd =
 N'CALL sp_MSins_dboxent_map', @del_cmd = N'CALL
sp_MSdel_dboxent_map', @upd_cmd = N'SCALL sp_MSupd_dboxent_map'
END
GO
```

4. Delete the code and save the file.

Manual Configuration

You can manually implement database replication if you do not want to use the utility.

Complete the following steps:

1. Configure Distribution on the Production Database Server.
2. Create a Publication on the Production Database using Transactional Replication.
3. Update the Publication Properties
4. Configure Subscription on the Reporting Database.

Configure Distribution on the Production Database Server

For database replication, you must first configure the distributor. The distributor is the same server as the production database server.

Follow these steps:

1. In Microsoft SQL Server Management Studio, connect to the server that will be the Distributor (in many cases, the Publisher and Distributor are the same server), and then expand the server node.
2. Right-click the **Replication** folder, and then click **Configure Distribution**.
3. In the Distributor pane, select **'<ServerName>' will act as its own Distributor; SQL Server will create a distribution database and log** and click Next.
4. In the **SQL Server Agent Start** pane, select **Yes, configure SQL Server Agent service to start automatically** and click Next.
5. In the **Snapshot Folder** pane, specify a root snapshot folder (for a local Distributor), and click **Next**.
6. In the **Distribution Database** pane, review and edit the information, if necessary, and click **Next**.
7. In the **Publishers** pane, optionally enable other Publishers to use the Distributor and click **Next**.
8. In the **Wizard Action** pane, select an appropriate action, and click **Finish**.

Create a Publication on the Production Database using Transactional Replication

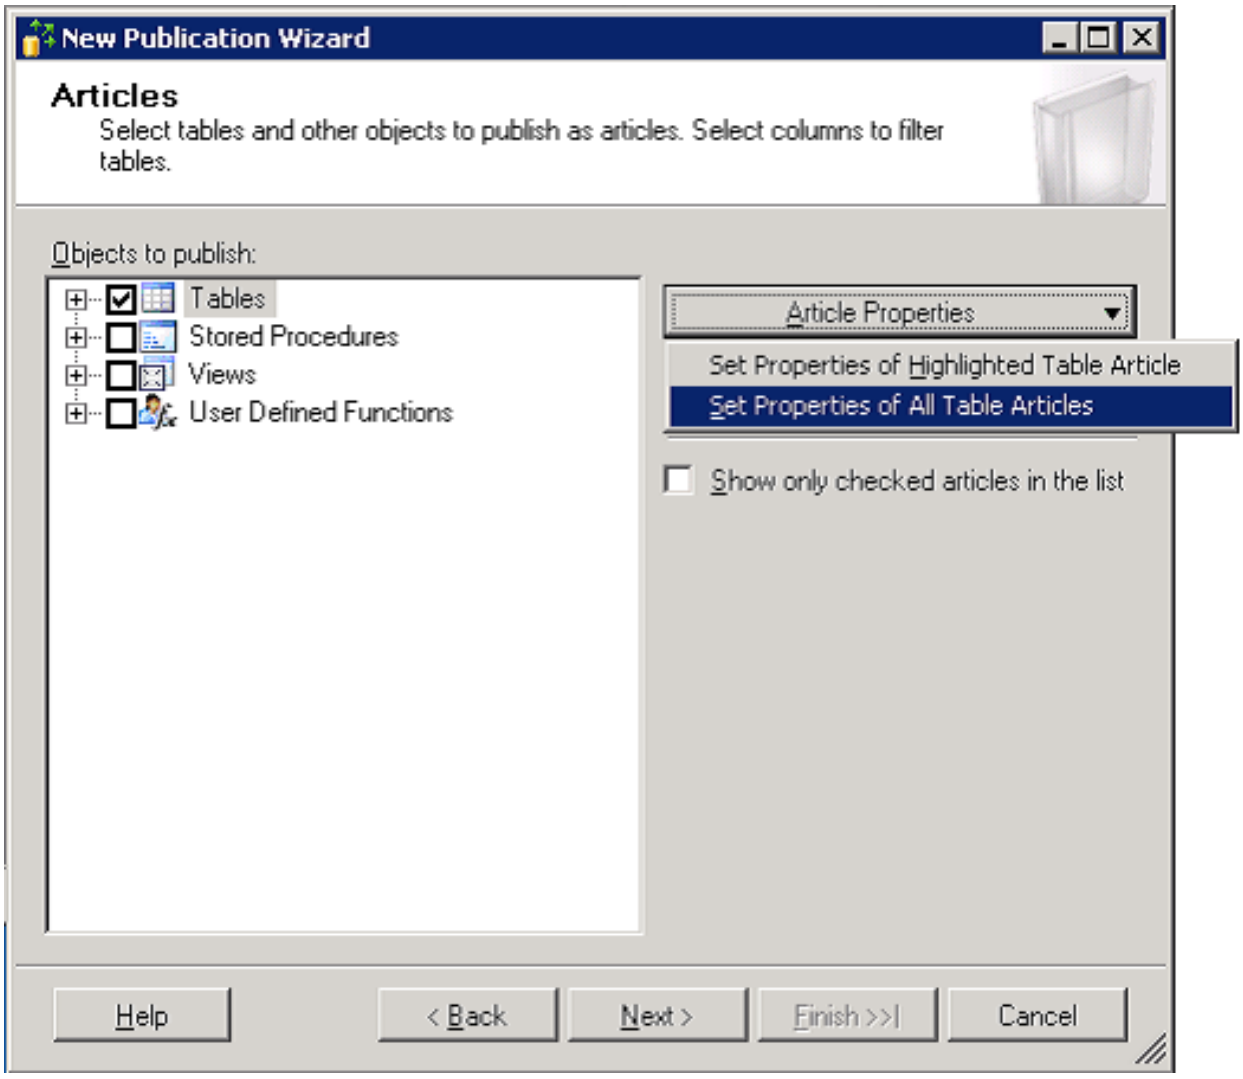
After you configure the distributor, you must create a publication on the publication database. The subscriber or the replication database shall subscribe to the publication for successful data replication.

Follow these steps:

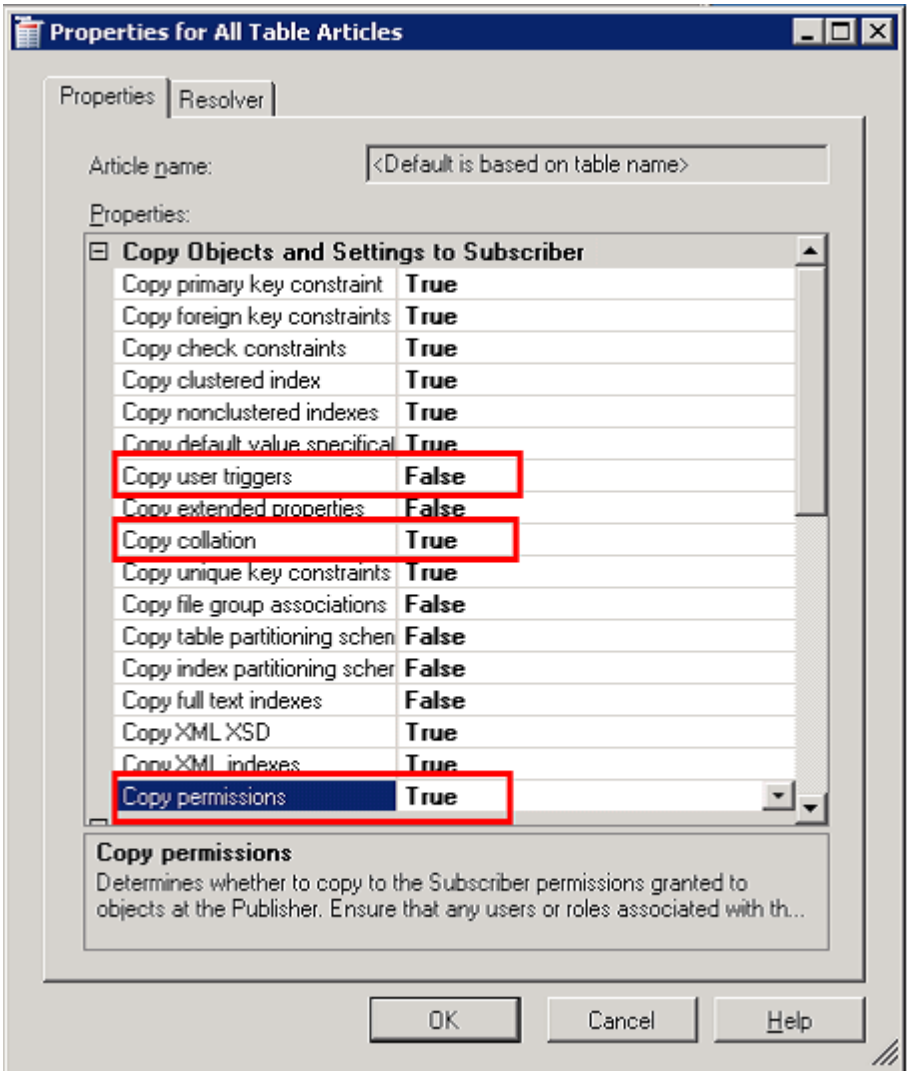
1. In the Microsoft SQL Server Management Studio, connect to the production database server.
2. Expand the **Replication** folder, right-click **Local Publications** and select **New Publication**.
3. In the **Publication Database** pane, select the database you want to replicate, and click **Next**.
4. In the **Publication Type** pane, under **Publication Type** select **Transactional publication** and click **Next**.
5. In the **Articles** pane, select **Tables**, expand **Tables** and *exclude* the following entries:

- ci_twa_ci
- dlgtsrv
- ebr_fulltext
- ebr_fulltext_adm
- ebr_patterns
- ebr_properties
- ebr_synonyms
- ebr_synonyms_adm
- options
- server_types
- usp_alias
- usp_bopsid
- usp_config_daemon_type
- usp_config_other_daemons
- usp_configuration
- usp_domsrvr
- usp_interval_log
- usp_mailbox
- usp_record_lock
- usp_servers
- usp_session_ext
- usp_webeng_alias
- usp_webeng_domsrvr
- usp_webengine

6. Click **Article Properties,** select **Set Properties for All Table Articles**.



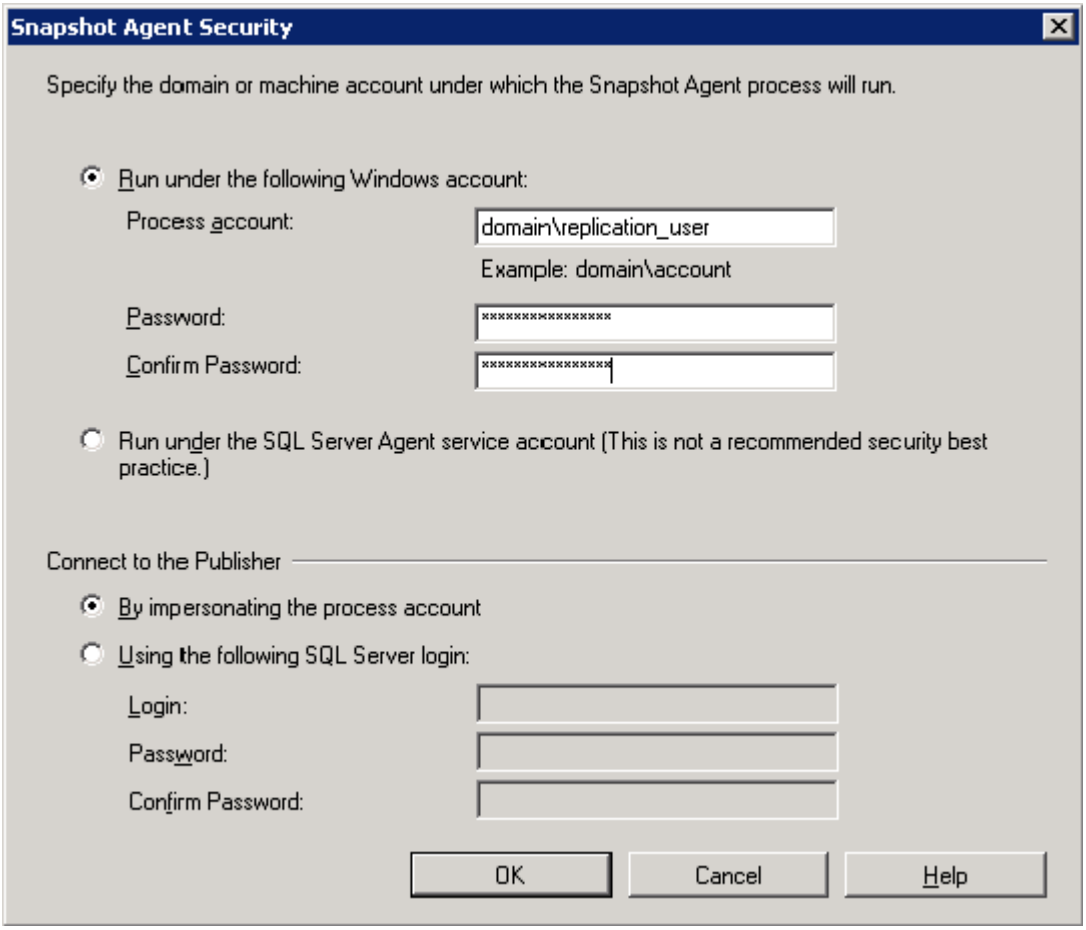
7. In the **Properties for All Table Articles** window, expand **Copy Objects and Settings to Subscriber**.



8. Perform the following steps:
   a. Set **Copy user triggers** to **False**.
   b. Set **Copy collation** to **False**.
   c. Set **Copy permissions** to **True**.
9. Click **OK** and then click **Next**.
10. In the **Filter Table Rows** ensure that you do not add any filters and click **Next**.
11. In the Snapshot Agent page, select **Create a snapshot immediately and keep the snapshot available to initialize subscriptions** and click **Next**.
12. In the **Agent Security** pane, click **Security Settings**.
    The **Snapshot Agent Security** window appears.
13. Select **Run under the following Windows account**, specify the details and click **OK.**

    NOTE

    For testing purposes, you can use a local administrator account that has access to the replication snapshot shared folder. Do not change the **Connect to the Publisher** option and retain the default value to impersonate the process account.



14. In the **Agent Security** pane, click **Next**.
15. In the **Wizard Action** pane, select **Create the Publication** and click **Next**.
16. In the Complete the Wizard pane, specify a name for the publication and click **Finish**.
    The publishing process begins.
17. Update the publication properties.

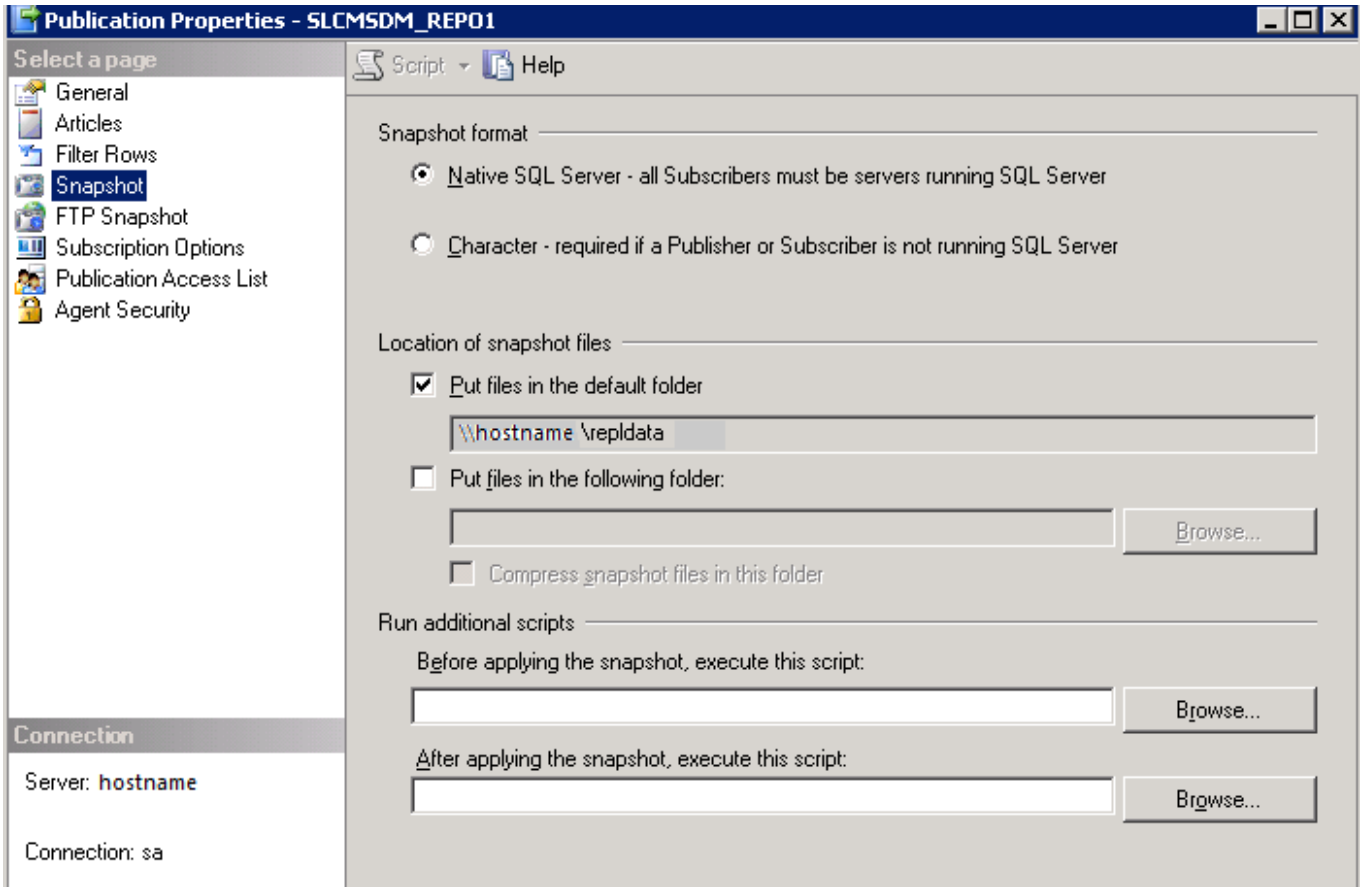
Update the Publication Properties

Follow these steps:

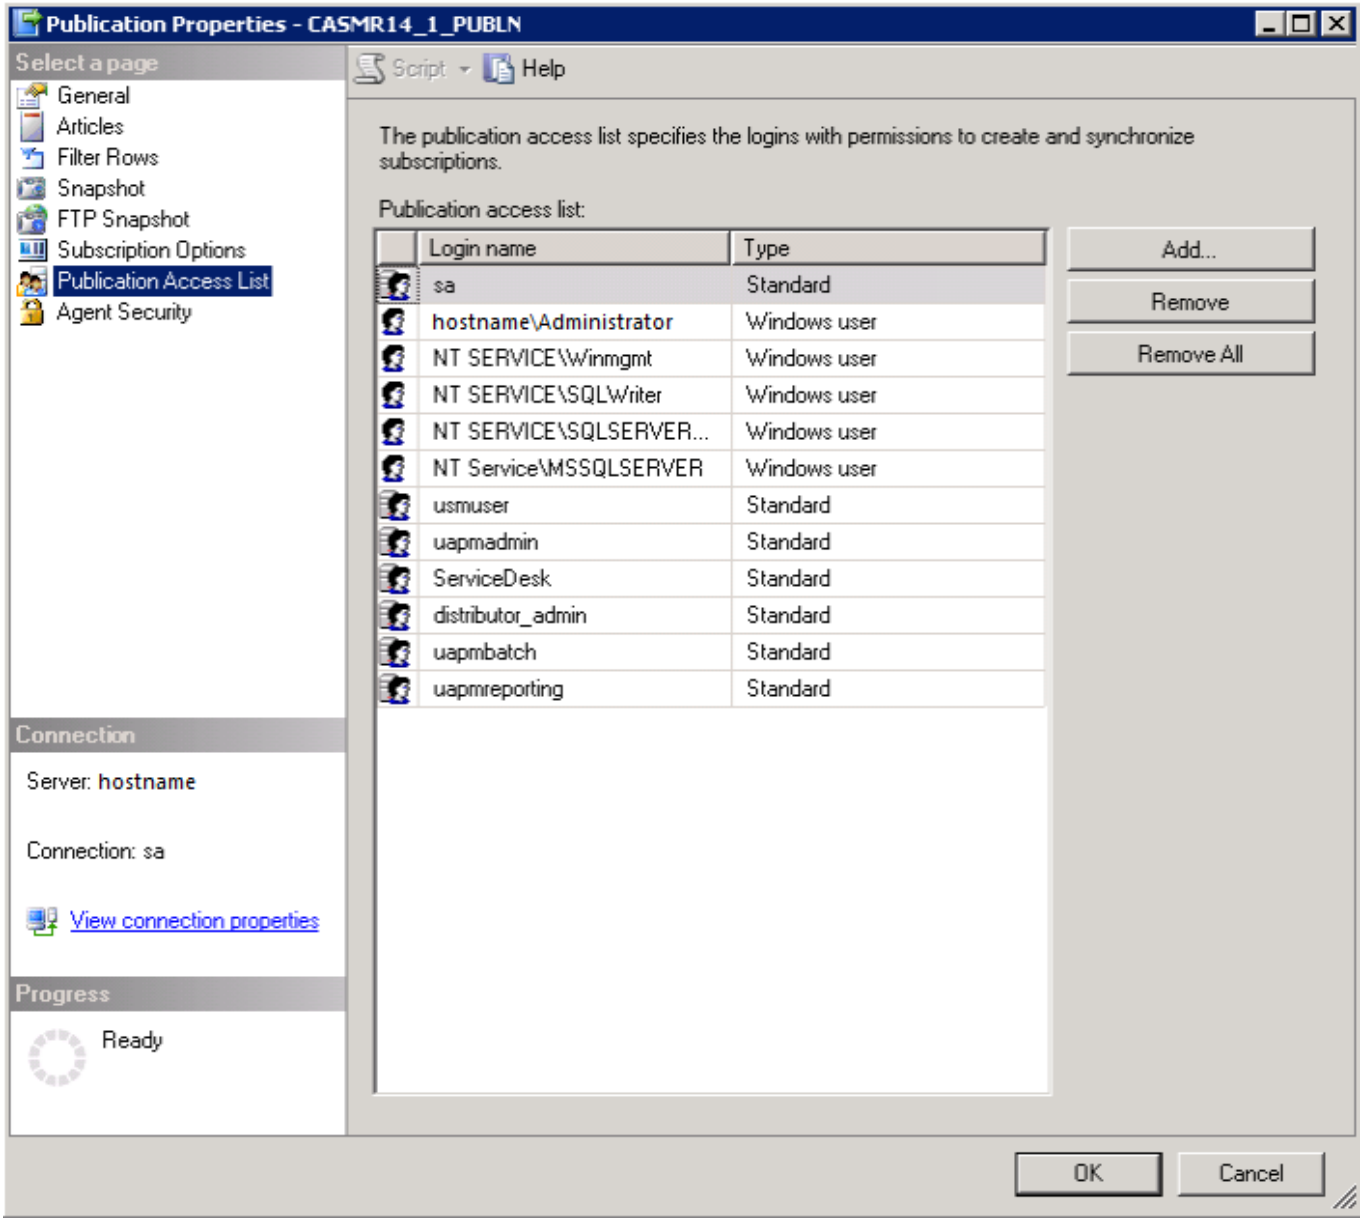
1. In the Microsoft SQL Server Management Studio, connect to the production database server.
2. Expand **Replication, Local Publications**.
3. Right-click the publication that you created and select **Properties.**

   NOTE
   If you change a property that requires the regeneration of the snapshot, you are prompted to regenerate the snapshot.

4. In the **Publication Properties** window, complete the following steps:
   a. In the tree on the left, click **Snapshot**.



b. Clear the **Put files in the default folder** check box.
c. Select the **Put files in the following folder** check box.
d. Specify the path to the file share.
e. In the tree on the left, click **Publication Access List**.



f. Click **Add**.
g. In the **Add Publication Access** window add *ServiceDesk, uapmadmin, uapmreporting, usmuser* (and *mdbadmin,* if available) users
h. Click **OK** and then click **Yes.**

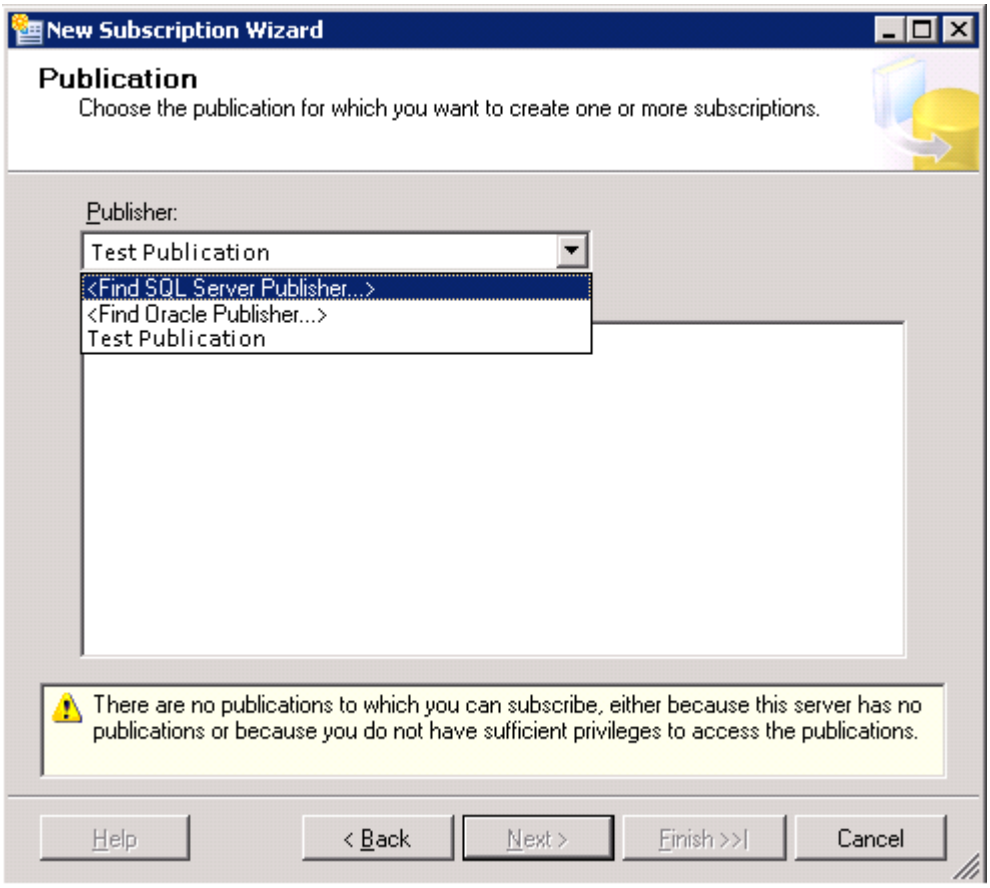
Configure Subscription on the Reporting Database

To replicate the database, the reporting database (subscriber) must subscribe to the specific publication of the publisher database.

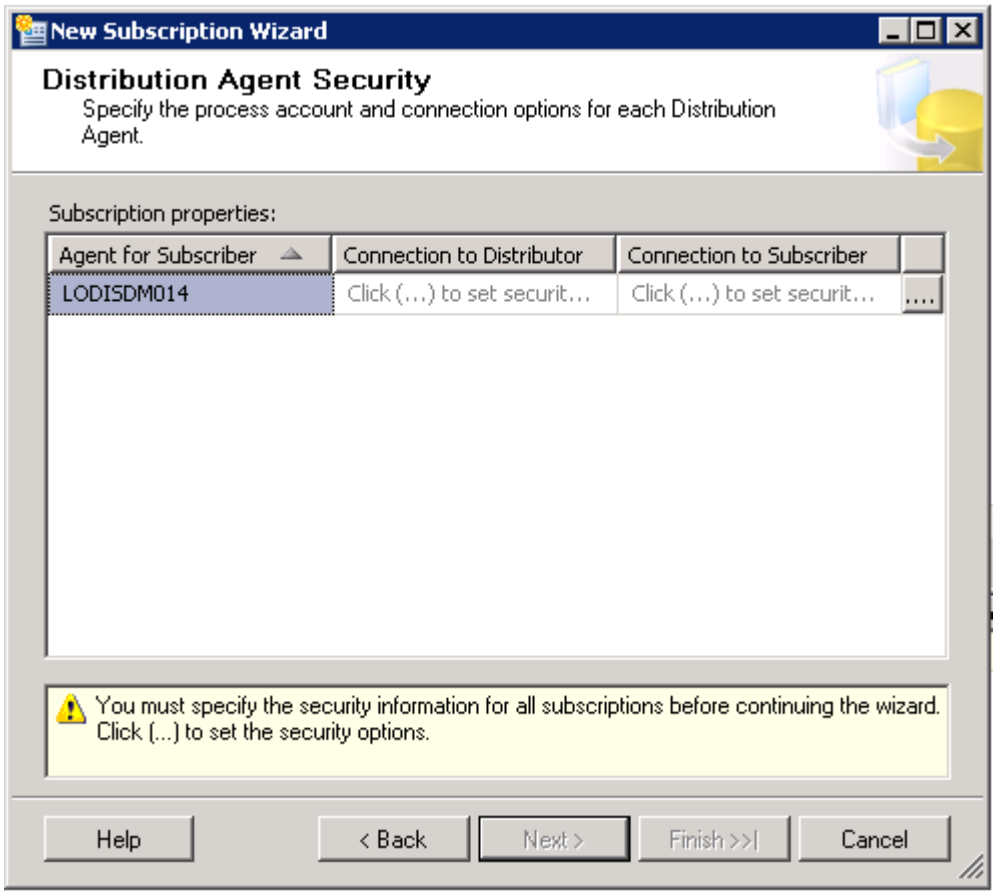
Follow these steps:

1. In the Microsoft SQL Server Management Studio, connect to the reporting database server.
2. Expand the **Replication** folder, right-click **Local Subscription** and select **New Subscription.**
3. In the **New Subscription Wizard** window, click **Next**.

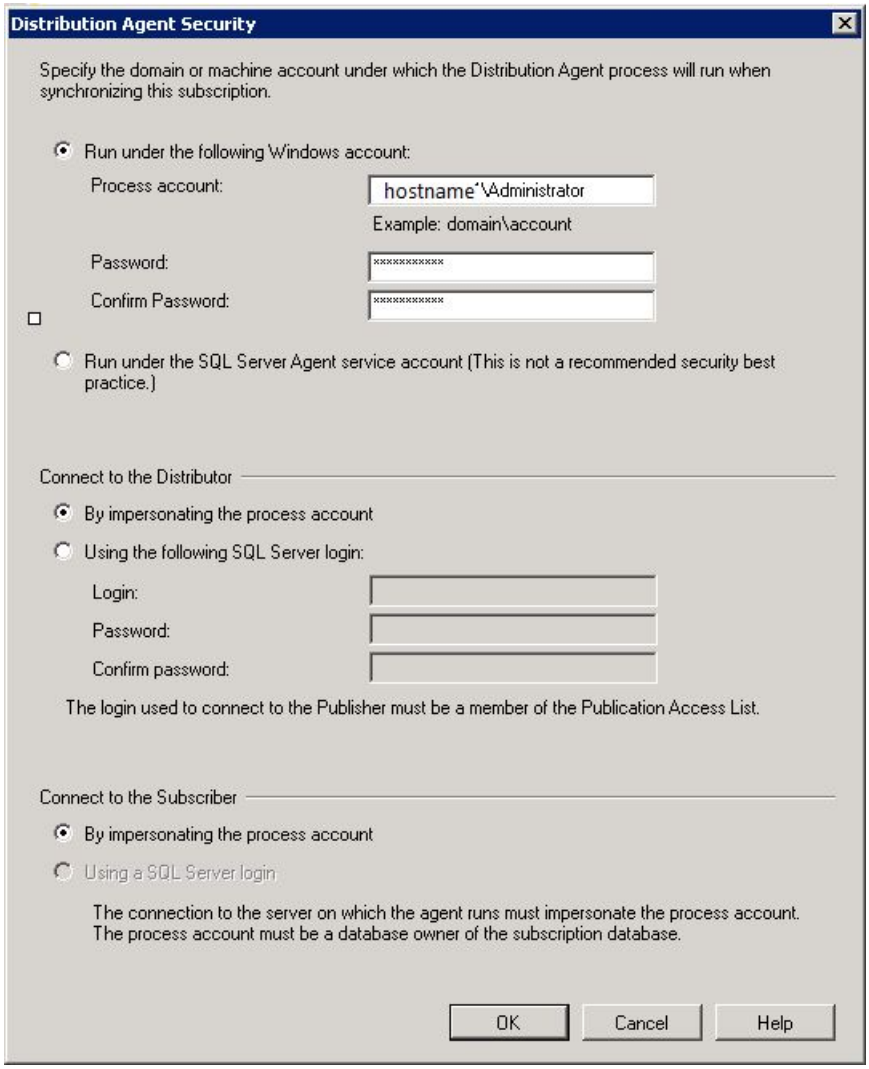
4. In the **Publications** pane, click **<Find SQL Server Publisher>** in the **Publisher** drop-down list.



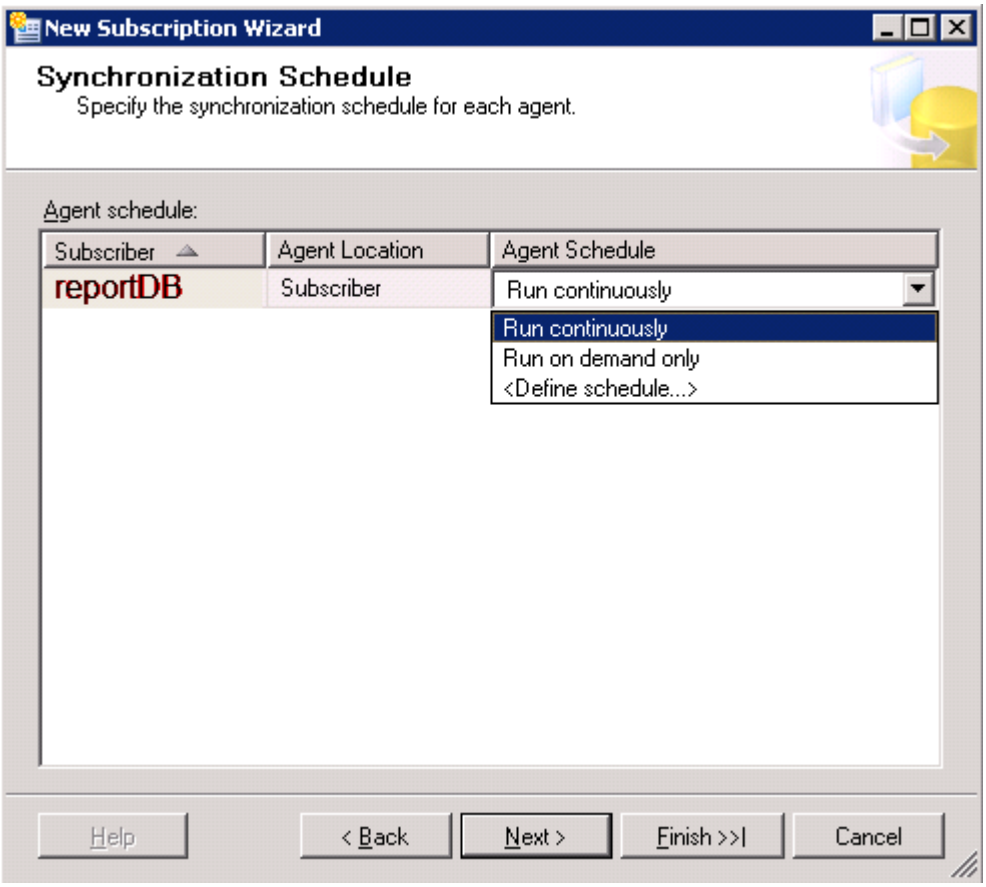
5. Specify the production database and the appropriate details and click **Connect.**
   After successful connection, the **Publication** pane displays all the available publications in the database server.
6. Select the publication that you previously configured and click **Next**.
7. In the **Distribution Agent Location** pane, select **Run each agent as its Subscriber (pull subscriptions)** and click **Next**.
8. In the **Subscribers** pane, ensure that **Subscription Database** is **mdb** and click **Next.**
9. In the **Distribution Agent Security** pane, click the button next to **Connection to the Subscriber**.



10. Specify the security credentials for the Subscriber Agent, click **OK,** and click **Next**.



11. In the **Synchronization Schedule** pane, under **Agent Schedule** select **Run continuously**.
    To schedule the replication process, select **Define Schedule**.



12. In the **Initialize Subscriptions** pane, click **Next**.
13. In the **Wizard Action** pane, select **Create the subscription** and click **Next**.
14. In the **Complete the Wizard** pane, click **Finish**.
15. After the subscription creation process is complete, click **Close**.

Troubleshoot offline reporting

The following topics explain how to troubleshoot the most frequent issues.

Replication Process Fails

When you run the configuration utility for the database replication, the replication process may fail for several reasons. To know why the replication process failed, you can view the *Replication.log* file available in the **Configuration Utility** folder.

For information about the error messages, refer to Microsoft SQL Server documentation for the respective error message.

After you understand the log messages, run the **DisableReplication.bat** file before you start the replication process again.

If database replication using the configuration utility fails repeatedly, perform the replication process manually. For more information see, Manual Configuration.

Unable to Copy Data to the Replicated Database

During replication, some information may not be copied to the subscriber server. Since data is not copied to the replication database, reports are not available.

This is a known issue. See the following Microsoft SQL Server documentation for more information.

Convert a PFX Keystore to a Java Keystore

This article describes how to convert a .pfx keystore to a Java keystore when configuring SSL in your CA Service Management environment.

Follow these steps:

1. Copy the .pfx file to the product root folder.
   For example, copy to <USM_HOME>
2. Open command prompt and execute the following command:
   ```
   keytool -importkeystore -deststorepass <pfx_password> -destkeystore "<$HOME>\.keystore" -srckeystore
   <pfx_file> -srcstoretype PKCS12 -srcstorepass <pfx_password>
   ```
   Replace the following parameters with the actual values: <pfx_password>, <pfx_file>, <$HOME>
3. Navigate to <$HOME>\viewService.conf and update the keystore password in the file.
   ```
   wrapper.java.additional.XX=-Djavax.net.ssl.trustStore="<$HOME>\.keystore"
   wrapper.java.additional.xx=-Djavax.net.ssl.trustPass="<password_for_.keystore>"
   ```
   Replace the <password_for_.keystore> and <$HOME> with the actual values. The vale for *xx* in the parameter is the sequence number for the parameter. For example, wrapper.java.additional.24=-Djavax.net.ssl.trustStore="<$HOME>\.keystore"
4. Navigate to the following folder and add the following content to the file: <$HOME>\view\conf\server.xml
   ```
   <Connector port="443" maxHttpHeaderSize="8192" maxThreads="150" minSpareThreads="25" maxSpareThreads="75"
   enableLookups="false" disableUploadTimeout="true" acceptCount="100" scheme="https" secure="true"
  keystorePass="<pfx_password>" clientAuth="false" sslProtocol="TLS" keystoreFile="<certificate_location>
  \.keystore"/>
   ```
   Replace the following parameters with the actual content: <pfx_password>, <certificate_location>
5. Save and close the file.
6. Restart the services.

Transparent Data Encryption for CA Service Management

This article describes the Transparent Data Encryption (TDE) procedures for CA Service Management Databases (Microsoft SQL Server and Oracle). The TDE procedures described in this article are in accordance with the GDPR and other compliance requirements mandated by the European Union (EU) law on data protection and privacy within the European Union (EU) and European Economic Area (EEA).

This article contains the following topics:

- Enabling Transparent Data Encryption for Microsoft SQL Server Database
- Enabling Transparent Data Encryption for Oracle Database

Enabling Transparent Data Encryption for Microsoft SQL Server Database

This article describes the Transparent Data Encryption (TDE) procedures for Microsoft SQL Server (2019, 2016, 2014, 2012, 2008, 2008 R2) database. TDE provides the ability to encrypt the CA Service Management MDB database schema. The procedure outlined in this article can be performed by Administrators/database administrators while performing a fresh installation or while upgrading an existing CA Service Management database.

This article contains the following topics:

How Transparent Data Encryption Works

TDE uses the Database Encryption Key (DEK) for encrypting. TDE protects data at the physical storage layer, that is, data at rest – data and log files. It performs real-time encryption of the database, associated backups, and transaction log files without requiring changes to the application. Since, protection is at the level of the physical device, it prevents risk of compromising the data. It provides the ability to protect data at the storage level as required by GDPR regulations and other compliance. In Microsoft SQL Server, keys and certificates are first created, and then, encryption must be set to **ON** in the database for the data to be encrypted. Data is encrypted using the AES and 3DES encryption algorithms without making any changes to existing applications. The data in the unencrypted data files can be read by restoring the files to another server.

NOTE

It is recommended that you review Microsoft Documentation for various TDE considerations and restrictions before implementing it on your CA Service Management production environment.

For example, if file groups associated with the database are set as read-only, TDE encryption fails. TDE does not protect data in memory or data transmitted between an application and the SQL Server.

Encrypt CA Service Management Database

Login to Microsoft SQL Server Database as a System Administrator (SA) and connect to the CA Service Management master database. Perform the following steps to encrypt the CA Service Management Database (for example, MDB). CA Service Management Solution Products (CA Service Desk Manager, CA Service Catalog, and CA Asset Portfolio Manager (CA ITAM).

1. Create a Master Key
2. Create a Certificate in the Master Database
3. Create a Database Encryption Key or Symmetric Key in the User Database
4. Enable Database for Encryption
5. Restore the Microsoft SQL Server Database on the Target or Destination Server

NOTE

Before enabling the TDE procedures, ensure that you have taken a backup of the CA Service Management Database (for example, MDB).

Create a Master Key

In Microsoft SQL Server 2012, 2014, 2016, 2019 the master key is encrypted using AES 256 with a user specified password. For Microsoft SQL Server 2008 and SQL Server 2008 R2, Triple DES algorithm is used.

Run the following command to create a Master key:

```
USE master;
GO

CREATE MASTER KEY
ENCRYPTION BY PASSWORD = '<Specifypassword>';
```

In the above command, <*Specifypassword*> specifies the password for the master key.

Verify the Data Master Key and Service Master Key

To verify that the the Data Master Key (DMK) is created, you can query the *sys.symmetric_keys catalog* view. The query results display both Data Master Key (DMK) and Service Master Key (SMK). Service Master Key is unique to each instance of database based on how it is generated. Microsoft SQL Server creates the Service Master Key automatically in the master database. Both DMK and SMK are based on the 256-bit AES encryption algorithm.

Run the following command to query the *sys.symmetric_keys catalog view* and verify that DMK is created:

```
SELECT name KeyName,
 symmetric_key_id KeyID,
 key_length KeyLength,
 algorithm_desc KeyAlgorithm
FROM sys.symmetric_keys;
```

Create the Certificate in the Master Database

NOTE

In case of Microsoft SQL Server database, even if the TDE Certificate is out of date, you can still export and import TDE enabled databases without any apparent issues on the destination or target server. It is only in the log files a message is logged that the certificate is out of date and expired. Hence, it is recommended that you validate the security of your data in all stages of its life cycle.

You can create and use a self-signed or external certificate as per your requirement. A self-signed certificate is an Asymmetric key created by the SQL Server database engine. A certificate protects the TDE database or encrypted Microsoft SQL Server backup. Create a self-signed certificate as shown below. Based on your environment requirements, you can also use any external certificate authority to generate a certificate.

Run the following command to generate a certificate:

```
CREATE CERTIFICATE <Cert Name>
WITH SUBJECT = 'Name of certificate or issuer name'
```

Verify the Certifcate

Run the following command to verify the certificate is generated:

```
SELECT name CertName,
  certificate_id CertID,
  pvt_key_encryption_type_desc EncryptType,
  issuer_name Issuer
FROM sys.certificates
WHERE issuer_name = 'Name of certificate or issuer name';
```

NOTE

For external certificate, database administrators have to ensure that the external certificates are copied to *sys.certificates* database. All certificates and associated private keys must be backed up.

Create the Database Encryption Key or Symmetric Key in the User Database

Create the Database Encryption Key (DEK) in the CA Service Management Database. Run the following query:

NOTE

You will receive a warning when the below query is executed. The warning is regarding taking a backup of certificates and private keys. Ensure to take a backup of certificates and private keys.

```
USE '<Product_Database>';
GO
```

```
CREATE DATABASE ENCRYPTION KEY
WITH ALGORITHM = AES_256
ENCRYPTION BY SERVER CERTIFICATE <Cert Name>;
```

In the above command, <Product_Database> specifies the name of your MDB database.

Verify the Database Encryption Key

Query the *sys.dm_database_encryption_keys dynamic management view* to verify that the Database Encryption Key (DEK) is created. Run the following command to verify DEK is created.

```
SELECT DB_NAME(database_id) DbName,
encryption_state EncryptState,
key_algorithm KeyAlgorithm,
key_length KeyLength,
encryptor_type EncryptType
FROM sys.dm_database_encryption_keys;
```

NOTE

If you are using Microsoft SQL Server 2008/2008R2, you must remove the ***encryptor_type*** *(Encrypt Type)* from the above query since ***encryptor_type*** is not supported by Microsoft SQL Server 2008/2008 R2 databases.

The above query will list the database where the values for "Encrypt State" are referencing the following:

```
0 : No database encryption key present, no encryption
1 : Unencrypted
2 : Encryption in progress
3 : Encrypted
4 : Key change in progress
5 : Decryption in progress
6 : The certificate or asymmetric key encrypting the DEK is being changed
```

Enable Database for Encryption

Turn on the database for encryption. Run the following query to enable database encryption:

```
ALTER DATABASE <Product_Database>
SET ENCRYPTION ON;
```

In the above command, **<Product_Database>** specifies the name of your MDB database or any custom name that you want to provide for your database as per your requirement.

Run the following command:

```
SELECT DB_NAME(database_id) DbName,
  encryption_state EncryptState,
  key_algorithm KeyAlgorithm,
  key_length KeyLength,
  encryptor_type EncryptType
FROM sys.dm_database_encryption_keys;
```

The above query shows the addition of a row on the *tempdb* database. When TDE is implemented on any user table, Microsoft SQL Server encrypts the *tempdb* database as well.The database contains items like temporary user objects, internal objects, and row versions (all of which may contain sensitive data).

Take a Backup of the Master Key and Certificate

Take a backup of the certificate and keys, preferably, right after creating the certificate and keys. This helps you to have access to the TDE protected database even after migrating to a different server. Take a backup of your Service Master Key (SMK) also. Specify a backup folder location for the backed up private keys.

```
Use master;
GO

BACKUP SERVICE MASTER KEY
TO FILE = 'C:\Backuplocation\SvcMasterKey.key'
ENCRYPTION BY PASSWORD = '<Specifypassword>'
```

Backup the Data Master Key

Take a backup of the Data Master Key (DMK). Run the following query to take a backup:

```
BACKUP MASTER KEY
TO FILE = 'C:\Backuplocation\DbMasterKey.key'
ENCRYPTION BY PASSWORD = '<Specifypassword>'
```

Backup the Certificate

Taking a backup of a certificate is little different from taking a backup of SMK and DMK. In case of certificate backups, you may want to take an explicit backup of the private key along with the certificate. To achieve this, it is recommended that you use a Backup Certificate statement that includes the private key clause. Run the following command to take a backup:

```
BACKUP CERTIFICATE <Cert Name>
TO FILE = 'C:\Backuplocation\ProductDBNameCert.cer'
WITH PRIVATE KEY(
 FILE = 'C:\Backuplocation\ProductDBNameCert.prvk',
 ENCRYPTION BY PASSWORD = 'Specifypassword'
);
```

NOTE

: In case of JasperSoft Aggegate/DataMart reports, you must perform the above steps separately on the Aggregate/DataMart database <database name> (For example: casm_dm).

Restore the Microsoft SQL Server on the Target or Destination Server

Perform the below steps to restore the Microsoft SQL Server database on the target server:

- Create a Master Key on the Target or Destination Server
- Create the Certificate Using the Backed Up Certificate Files from the Source Server

Create a Master Key on the Target or Destination Server

Run the following command to create a master key on the target server.

NOTE

Master key must be created by using the master database only.

```
USE master
GO
CREATE MASTER KEY ENCRYPTION BY PASSWORD = '<Specifypassword>'
```

Create the Certificate Using the Backed Up Certificate Files from the Source Server

For more information, see Create the Certificate in the Master Database. Run the following command to create a certificate using the backed up certificate files:

```
CREATE CERTIFICATE <certificateName>
FROM FILE = 'C:\backup\ ProductDBNameCert.cer'
WITH PRIVATE KEY(
FILE = 'C:\backup\ ProductDBNameCert.prvk',
DECRYPTION BY PASSWORD = '<Specifypassword>'
)
```

NOTE

In case of JasperSoft Aggegate/DataMart reports, you must perform the above steps separately on the Aggregate/DataMart database <database name> (For example: casm_dm).

Enabling Transparent Data Encryption for Oracle Database

This article contains the following topics:

Overview

Oracle Transparent Data Encryption (TDE) secures sensitive data within an Oracle database. It encrypts oracle database columns and manages encryption keys for CA Service Management Solution Products Database (CA Service Desk Manager, CA Service Catalog, and CA Asset Portfolio Management (CA ITAM)). Transparent Data Encryption is certified with Oracle Database 11gR2 and Oraycle 12c.

NOTE

TDE procedure documented in this article is applicable only for fresh installation of CCA Service Management Oracle database, say, CA Service Management 17.3 or 17.1.

How Transparent Data Encryption Works

NOTE

For more information about Transparent Data Encryption considerations and restrictions, see Oracle Documentation before you start implementing it on your production environment.

Transparent data encryption is a key-based access control system. The encrypted data cannot be understood until authorized decryption occurs. Authorized decryption is automatic for authorized users accessing the database table. To use transparent data encryption, you must have the ALTER SYSTEM privileges and a valid password to the Oracle wallet. If an Oracle wallet does not exist, create a new wallet. For more information, see Create a Wallet and Encrypted TableSpace.

Enabling Transparent Data Encryption for Oracle Database (Windows and Non-Windows)

To enable Transparent Data Encryption for Oracle Database for CA Service Management, perform the following steps using Command Line:

Create a Wallet and Encrypted TableSpace

Login into the Oracle 11gR2, 12c, 19c as database administrator. Create a wallet and update the WALLET_LOCATION parameter in the *sqlnet.ora* file as outlined in the procedure below:

> **NOTE**
>
> For Non-Windows, ensure that the *ORACLE_BASE* variable has been set. TDE best practices recommend using a wallet location outside of $Oracle_Base.

For **Windows**, perform the following steps:

1. Create a directory <*WALLET*> manually anywhere in your system:
   Windows: For example:
   ```
   C:\TDE\MDB\WALLET
   ```
   Non-Windows:
   ```
   /root/TDE/MDB/WALLET
   ```
2. Add the following content to *sqlnet.ora* file to create the encryption wallet keystore file in the specified directory.
   Navigate to *sqlnet.ora file location.*
   For example, on Windows: C:\app\Administrator\product\<Oracle_database_version>\dbhome_1\NETWORK\ADMIN\sqlnet.ora
   ```
   ENCRYPTION_WALLET_LOCATION
   (SOURCE =
   (METHOD = FILE)
   (METHOD_DATA =
   (DIRECTORY = C:\TDE\MDB\WALLET)
   )SQLNET.AUTHENTICATION_SERVICES = (NTS)
   ```
   For example, on Non-Windows: /opt/oracle/app/product/<*Oracle_database_version*>/dbhome_1/network/admin/sqlnet.ora
   ```
   ENCRYPTION_WALLET_LOCATION
   (SOURCE =
   (METHOD = FILE)
   (METHOD_DATA =
   (DIRECTORY = /root/TDE/MDB/WALLET
   )SQLNET.AUTHENTICATION_SERVICES = (NTS)
   ```
3. Create the wallet, along with a secure password, preferably containing a mix of alphanumeric characters.

   > **NOTE**
   >
   > The password is case-sensitive and must contain a mix of alphanumeric characters.
4. Navigate to Oracle Home/BIN. For example, on **Windows**: C:\app\Administrator\product\<*Oracle_database_version*>\dbhome_1\BIN
   For example, on **Non-Windows**: /opt/oracle/app/product/<*Oracle_database_version*>/dbhome_1/bin
   a. For **Windows**, run the following command:
      ```
      SQL> alter system set encryption key identified by <password>;
      ```

b. For **Non-Windows**, open shell/terminal, login as ORACLEUSER and export Oracle DB variables and enter the following command to connect to Oracle database:

```
$ sqlplus sys as sysdba
```

Provide the password and hit Enter. Now, you should be able to connect to database.

5. Verify the status of the Wallet that you created by running the following command:
   a. For **Windows**, run the following command:

```
SQL> select * from v$encryption_wallet;
```

   b. For **Non-Windows**, run the following command:

```
SQL > select * from v$encryption_wallet;
```

6. If the wallet status is CLOSE, open it by running the following command:
   a. For **Windows**:

```
SQL> alter system set wallet open identified by <password>;
System altered
```

   b. For **Non-Windows**:

```
SQL> alter system set wallet open identified by <password>;
System altered
```

7. Now, create an encrypted tablespace ***MDB_DATA_TEST DATAFILE*** by running the following command:
   For **Windows**:

```
create tablespace <tablespacename>

For example:
create tablespace MDB_DATA_TEST DATAFILE 'C:\app\Administrator\oradata\mdb\MDB_DATA_TEST.DBF' SIZE 100M
 autoextend on next 100M ENCRYPTION USING 'AES256' DEFAULT STORAGE (ENCRYPT);
```

   For Non-Windows:

```
create tablespace <tablespacename>

For example:
create tablespace MDB_DATA_TEST DATAFILE opt/oracle/app/product/<Oracle_database_version>/dbhome_1/bin
\MDB_DATA_TEST.DBF' SIZE 100M autoextend on next 100M ENCRYPTION USING 'AES256' DEFAULT STORAGE (ENCRYPT);
```

8. Similarly, create an encrypted tablespace index ***MDB_INDEX_TEST DATAFILE*** by running the following command (**Windows and Non-Windows**):
   For **Windows**:

```
create tablespace <indexname>

 For example:
create tablespace MDB_INDEX_TEST DATAFILE 'C:\app\Administrator\oradata\MDB\MDB_INDEX_TEST.DBF' SIZE 100M
 autoextend on next 100M ENCRYPTION USING 'AES256' DEFAULT STORAGE (ENCRYPT);
```

   For **Non-Windows**:

```
create tablespace <indexname>
```

```
For example:
create tablespace MDB_INDEX_TEST DATAFILE '/opt/oracle/app/oradata/MDB/MDB_INDEX_TEST.DBF' SIZE 100M
autoextend on next 100M ENCRYPTION USING 'AES256' DEFAULT STORAGE (ENCRYPT);
```

9. Now, create a user for the tablespace name that you created in step 7 For Windows/Non-Windows as:
   For **Windows/Non-Windows**:

```
create user for <tablespacename>

For example:

create user mdbadmin identified by <password> default tablespace MDB_DATA_TEST;
```

10. Similarly, alter a user for tablespace index that you created in step 8:

```
alter user for <indexname>

For example:

alter user mdbadmin identified by <password> default tablespace MDB_INDEX_TEST;
```

11. Alter the users with unlimited quota for tablespace.
    For example:

```
alter user mdbadmin quota unlimited on <MDB_DATA_TEST>;
```

12. Alter the users with unlimited quota for index.
    For example:

```
alter user mdbadmin quota unlimited on <MDB_INDEX_TEST>;
```

13. Now, grant required privileges to the user. Run the following command:

```
grant CREATE PROCEDURE to mdbadmin
grant CREATE SEQUENCE to mdbadmin
grant CREATE SESSION to mdbadmin
grant CREATE TABLE to mdbadmin
grant CREATE TRIGGER to mdbadmin
grant CREATE VIEW to mdbadmin
grant CONNECT to mdbadmin
grant RESOURCE to mdbadmin
```

14. Commit the changes. Run the following command:

```
Commit;
```

Verify Transparent Data Encryption is Enabled

Ensure that your tablespace is TDE enabled. Run the below command to confirm and verify whether your tablespace is TDE enabled or not encryption status of the database:

```
SELECT WRL_PARAMETER FROM V$ENCRYPTION_WALLET;
SELECT * FROM V$ENCRYPTED_TABLESPACES;
```

The output shows the list you the list of encryption table spaces where you can confirm whether the table space created by you is encrypted or not.

Configure Service Point

Service Point provides self-service capabilities with embedded assistive intelligence for business-users. Service Point uses Natural Language Processing (NLP) that provides business users with context-based solutions and suggestions.

Business users can perform the following actions using Service Point:

- Access knowledge
- Create, view, and modify tickets
- Contextually collaborate on tickets using live chat
- View allocated resources
- Manage ticket notifications

With a business-centric focus, Service Point helps an organization achieve the following:

- Broad adoption of services
- Context-based solutions
- Improved productivity
- Reduced costs
- Improved collaboration and knowledge sharing
- Elevated perception of IT organization

This article explains how to configure and manage Service Point from the CA SDM administrator interface. Perform the following steps to set up Service Point for the first time:

1. Define Permissions to set Service Point as the default app for a particular access type.
2. Define the User Context to display the most relevant information to the user in Service Point.
3. Define the Default Categories that appear on the Service Point.
4. Manage Ticket Attributes to be displayed while viewing a ticket.
5. Manage Features to customize the related features.
6. Set Up My Resources to list all the assets assigned to the user, along with asset information.
7. Manage CA Service Catalog Featured Offerings to appear on Service Point, after integrating CA Service Desk Manager and CA Service Catalog.
8. Manage Smart Search to optimize the search relevance.
9. (Optional) Enable the Guest Login
10. Add Additional Information

Implementing CA Service Management Virtual Analyst

This article describes the following topics:

- Overview
- Supported Virtual Analyst Services
- Use Case
- Additional Information
- Hardware Requirements

Overview

CA Service Management now provides the Virtual Analyst "ARIA" (Automated Response with Intelligent Automation). It provides the following capabilities:

- Interacts with business users through a chat Interface to resolve common IT support issues. The chat interface is available via Service Point.
- Ability to understand Natural Language using Machine Learning techniques.
- Provides real-time assistance to business users to resolve routine IT issues.
- Provides ticket update and can handle queries for CA Service Desk Manager (SDM) tickets (requests and incidents)

Supported Virtual Analyst Services

Business users can connect with the Virtual Analyst for assistance and interact with the service bot over a chat window. The service bot provides optimal transfer of issues to a Service Desk Manager agent to assist with queries and issues in the following supported scenarios:

- **Contextual scenario**, where the business user has already logged a ticket with IT support for a said issue and is looking for information pertaining to ticket status, details, resolution, and so on. When additional assistance or intervention is required, Virtual Analyst provides the business users with “**Connect to an Analyst**” option in the chat interface.
- **Non-Contextual scenario**, where there is no open ticket for an issue and a new ticket is opened by IT for a reported issue. In this case, a business user can request the bot to connect to a Service Desk Manager agent (when agent intervention is required).

A business user gets assistance for the following Services from the bot on Service Point:

- Get Ticket Status and Details
- Create a Ticket
- Self-Service through KB Solution
- Chat with an Analyst/Hand over the issue to an Analyst
- Provide Feedback to the Virtual Analyst.
- Reset Password
- Update Ticket
  - Close Ticket
  - Urgency
  - Ticket Description
  - Add Comment to a Ticket

NOTE
Starting from CA Service Management 17.4 or higher versions, you can use either RASA 3.0.6 or RASA 3.6.19. You can choose the version of you choice to use for the Virtual Analyst. For installing Virtual Analyst, refer to Automated Installation of Virtual Analyst for Windows.

Use Case

Business users can leverage the Virtual Analyst on Service Point for the following services:

- **Get Ticket Status and Details:**
  Users can inquire about the current status and specific details of any previously logged ticket.
- **Create a Ticket**:
  The Virtual Analyst provides the capability to create new tickets directly through the chat interface. When a user initiates this request, the Virtual Analyst will prompt for a description of the issue and any information corresponding to mandatory attributes configured for ticket creation.

Additionally, the system employs a smart search mechanism (identical to the one used in Service Point) to analyze the issue description. If the description matches a pre-configured system category, the ticket is automatically mapped accordingly. The Virtual Analyst will then request any additional information required by that category's specific attributes.

For example:

A user is unable to connect to Wi-Fi and needs to create a ticket. The organization requires an employee ID for all new tickets. This issue is mapped to the "Network" category, which requires the laptop's OS and firmware version.

- **User:** I want to create a new ticket.
- **Bot:** Can you provide the description for this new ticket?
- **User:** I'm unable to connect to wifi from my laptop.
- **Bot:** Please provide your employee id.
- **User:** <employee_id>
- **Bot:** What OS are you using?
- **User:** Linux (OpenSUSE)
- **Bot:** What is your laptop's firmware version?
- **User:** <firmware_details>
- **Bot:** Do you want to create the ticket? Please confirm Yes/No.
- **User:** Yes
- **Bot:** A ticket has been created successfully.

Self-Service through KB Solution

The Virtual Analyst's default workflow is to facilitate self-service by searching for relevant knowledge base documents. When a user describes an issue, the bot searches the system for existing knowledge documents that may provide a solution. For this functionality to operate as intended, it is recommended to train the bot with knowledge documents under the `search_kd` intent. For detailed instructions, please refer to: Virtual Analyst Intents.

Chat with an Analyst / Handover to an Analyst

If the automated solutions do not meet the user's needs, they can request a transfer to a live analyst. This process utilizes the standard Service Point transfer mechanism, which places the ticket in an analyst's queue to be manually accepted by the next available agent. For more information, refer to the Live Chat documentation.

Provide Feedback to the Virtual Analyst

Following the conclusion of a chat session with an analyst, users have the option to submit feedback regarding their experience directly within the Virtual Analyst interface.

Update Actions on a Ticket

The Virtual Analyst supports several update actions on existing tickets. To perform any of these actions, a ticket ID is required. If the ID is not available in the current chat context, the user will be prompted to provide one. The user will also be prompted for any additional information needed to complete the action. As these are write/update operations, the system will require user confirmation before executing the change.

Supported Update Actions:

- Close Ticket
- Update Urgency
- Update Ticket Description
- Add Comment to a Ticket

Hardware Requirements

> **NOTE**
> Recommendation is to install the Virtual Analyst on a separate server or on a server where Search Server is installed with adequate hardware requirements. For more information, see Search Server Installation Requirements.

- **CPU**: 4-8 Core CPU
  > **NOTE**
  > CPU must support AVX Instruction set. In general, CPUs manufactured on or after 2011 support AVX. For more information, see your CPU manual instructions.
- **RAM**: Minimum 16 GB. Recommended 32 GB
- Disk Space: 40 GB

Install Virtual Analyst

Virtual Analyst can be installed in two ways:

- Automated Installation of Virtual Analyst for Windows
- Manual Installation of Virtual Analyst for Non- Windows

Automated Installation of Virtual Analyst for Windows

Installation of RASA Server using installer script for Windows Environment.

Installation for 17.4 RU3

Create a folder in any drive, and copy the casmBot.zip file present in <17.4 RU3 DVD>/filestore\Virtual_Analyst and paste it in the created folder.
For rest of the process follow from step 2 in the section below.

Installation for 17.4 RU2

1. Create a folder in any drive, and copy the casmBot.zip file present in <17.4 RU2 DVD>/filestore\Virtual_Analyst and paste it in the created folder.
   > **NOTE**
   > For 17.4 GA the support site URL Virtual Analyst Installer (Automated) for CA Service Management.
2. Extract the casmBot.zip file, and follow these steps:
   a. Open requirements.txt file and copy the components at the end of *requirements.txt* file:
   ```
   setuptools==69.2.0
   pip==23.0.1
   wheel==0.43.0
   ```
   b. Save the file.
3. Run the installer.bat present in the casm-bot folder.
4. Select the locale. Refer the following example mentioned below:
   ```
   casm-bot>installer.bat
   This script installs all the dependencies for Virtual Analyst.
   Select a Language Option for Virtual Analyst.
   English (en)
   German (de)
   Spanish (es)
   Portuguese (pt)
   French (fr)
   Italian (it)
   ```

```
Enter your choice(en, de, es, pt, fr, it):_
```

5. Once the installation is done, if the locale is a language other than English follow these steps:
   a. Navigate to casm-bot folder -> config.yml file, open the file, and enter the chosen language in *language* and *model*, and save the file. For example:

```
recipe: default.v1
language: fr

pipeline:
  - name: "SpacyNLP"
    model: "fr_core_news_md"
    case_sensitive: False
```

   List of languages :

```
model[en]=en_core_web_md"
model[de]=de_core_news_md"
model[es]=es_core_news_md"
model[pt]=pt_core_news_md"
model[fr]=fr_core_news_md"
model[it]=it_core_news_md"
```

   b. Navigate to *casm-bot-> locale*, open the required language folder, and copy the *data* and *domain.yml* files, and replace them in casm-bot.
6. Now, run the following command to activate the virtual environment:

```
botenv\Scripts\activate.bat
```

7. Run the following command to Navigate to the casm-bot folder and train the RASA Model:

```
rasa_train.bat
```

8. Run the RASA Server:

```
rasa_run.bat
```

Manual Installation of Virtual Analyst for Non- Windows

To install and configure the Virtual Analyst Service Bot, perform the following steps:

> **NOTE**
> If you do not have Internet connectivity, you can opt to install the Virtual Analyst in an offline mode. For more information, see Offline Installation - CA Service Management Virtual Analyst.

Download and Install CA Service Management Virtual Analyst Using RASA Server 3.0.6

Perform the following steps to install RASA Server 3.0.6:

1. Download and Install Python 3.8.0. Make sure you enable the **ADD TO PATH** option during installation.
2. Install Rust Toolchain for the dependency compilations.
3. Locate the **casmbot.zip** (CA Service Management *DVD:\filestore\Virtual_Analyst\casm-bot.zip*).
4. Choose a directory to install Virtual Analyst and create a folder, for example, **VA**. Extract the contents of **casmbot.zip** to the casm-bot folder inside the VA directory.
   This directory structure will contain the virutal analyst scripts and the associated Rasa virtual environment that the virtual analyst will use.
5. Create a virtual environment for VA in the same folder with the following command:

```
python -m venv ./botenv
```

6. Run the following command to activate the virtual environment.

```
./botenv/Scripts/activate
```

7. Upgrade pip inside the virtual environment by running the command:
   ```
   python -m pip install --upgrade pip
   ```
8. Run the following command to install RASA v3.0.6:
   ```
   pip install rasa==3.0.6
   ```
9. Run the following command to install Spacy:
   ```
   pip install rasa[spacy]
   pip install websockets==10.0
   pip install protobuf==3.2.0
   ```
10. Download the spacy language model. Refer to the Virtual Analyst Supported Locale to download language models for other languages. (Ignore the step to link the model as linking is deprecated in latest spacy versions).
    ```
    python -m spacy download en_core_web_md
    ```
11. Navigate to casm-bot folder and train the RASA Model, by running the following command:
    ```
    cd casm-bot
    rasa_train.sh
    ```
12. Run the RASA Server.
    ```
    rasa_run.sh
    ```

Download and Install CA Service Management Virtual Analyst Using RASA Server 3.6.19 for 17.4.3.0

Perform the following steps to install RASA Server 3.6.19:

1. Download and Install Python 3.10.11, and make sure you enable the **ADD TO PATH** option during installation.
2. Install Rust Toolchain for the dependency compilations.
3. Locate the **casmbot.zip** (CA Service Management *17.4.3.0:\filestore\Virtual_Analyst\casm-bot.zip*).
4. Choose a directory to install Virtual Analyst and create a folder, for example, **VA**. Extract the contents of **casmbot.zip** to the casm-bot folder inside the VA directory.
   This directory structure will contain the virutal analyst scripts and the associated Rasa virtual environment that the virtual analyst will use.
5. Create a virtual environment for VA in the same folder with the following command:
   ```
   python -m venv ./botenv
   ```
6. Run the following command to activate the virtual environment.
   ```
   ./botenv/Scripts/activate
   ```
7. Upgrade pip inside the virtual environment by running the command:
   ```
   python -m pip install --upgrade pip
   ```
8. Run the following command to install RASA v3.6.19:
   ```
   pip install rasa==3.6.19
   ```
9. Run the following command to install Spacy:
   ```
   pip install rasa[spacy]
   pip install websockets==10.4
   pip install protobuf==4.23.3
   ```
10. Download the spacy language model. Refer to the Virtual Analyst Supported Locale to download language models for other languages. (Ignore the step to link the model as linking is deprecated in latest spacy versions).
    ```
    python -m spacy download en_core_web_md
    ```
11. Navigate to casm-bot folder and train the RASA Model, by running the following command:
    ```
    cd casm-bot
    rasa_train.sh
    ```

12. Run the RASA Server.

```
rasa_run.sh
```

Virtual Analyst Supported Locales

NOTE
Japanese is currently not supported on Virtual Analyst.

Table 3: Virtual Analyst Supported Locales

Supported Locales	Supported Commands
English (en)	Run the following command to download English: `python -m spacy download en_core_web_md`
German (de)	Run the following command to download German: `python -m spacy download de_core_news_md`
Spanish (es)	Run the following command to download Spanish: `python -m spacy download es_core_news_md`

French (fr)	Run the following command to download French:
	`python -m spacy download fr_core_news_md`
	`python -m spacy link fr_core_news_md fr`

Italian (it)	Run the following command to download Italian. **""md""** stands for medium. `python -m spacy download it_core_news_md`
Portuguese (pt)	Run the following command to download Portuguese. **""md""** stands for medium. `python -m spacy download pt_core_news_md`

Offline Installation - CA Service Management Virtual Analyst

Offline Installation of Virtual Analyst requires two systems or servers:

1. One system with Internet connectivity.
2. The other, an offline system with no Internet connectivity.

Perform the following steps to download all the required packages and libraries for Installation on a system that has Internet connectivity:

Using RASA Server 3.0.6

1. Create a directory named **VA** under the root directory.
2. Download Python 3.8.10. Make sure you enable the **ADD TO PATH** option during installation.
3. Follow steps 1-4 from Automated Installation of Virtual Analyst for Windows.
4. Zip the content of *casm-bot folder* to casm-bot.zip.

Perform the following steps for offline installation:

1. Transfer Python 3.8.10 installation file which was downloaded in the other machine (system with internet connectivity) and install it.

2. Create a directory named VA under root directory(maintain the same path that you gave for the system with internet connectivity). In this case, C drive is used as root directory and hence the VA home is C:/VA.
3. Navigate to VA home directory from the Command Prompt(Administrator) and copy the casm-bot.zip file and extract the content to casm-bot folder.
4. Install Python 3.8.10 on the offline system to the same path used in online system. By default, this path is *%ProgramFiles%\Python38.*
5. Navigate to the casm-bot folder from the command prompt and run the following command to activate the virtual environment in the offline machine:
   ```
   .\botenv\Scripts\activate
   ```
6. Run the **rasa_train.bat** to train the VA. After training the model, run the **rasa_run.bat** to run the VA.
7. Type *http://<localhost>:5005* in a browser to see a "Hello" message from RASA.

Using RASA Server 3.6.19 for 17.4.3.0

1. Create a directory named **VA** under the root directory.
2. Download Python 3.10.11. Make sure you enable the **ADD TO PATH** option during installation.
3. Follow steps 1-4 from Automated Installation of Virtual Analyst for Windows for 17.4.3.0.
4. Zip the content of *casm-bot folder* to casm-bot.zip.

Perform the following steps for offline installation:

1. Transfer Python 3.10.11 installation file which was downloaded in the other machine (system with internet connectivity) and install it.
2. Create a directory named VA under root directory(maintain the same path that you gave for the system with internet connectivity). In this case, C drive is used as root directory and hence the VA home is C:/VA.
3. Navigate to VA home directory from the Command Prompt(Administrator) and copy the casm-bot.zip file and extract the content to casm-bot folder.
4. Install Python 3.10.11 on the offline system to the same path used in online system. By default, this path is *%ProgramFiles%\Python310.*
5. Navigate to the casm-bot folder from the command prompt and run the following command to activate the virtual environment in the offline machine:
   ```
   .\botenv\Scripts\activate
   ```
6. Run the **rasa_train.bat** to train the VA. After training the model, run the **rasa_run.bat** to run the VA.
7. Type *http://<localhost>:5005* in a browser to see a "Hello" message from RASA.

Train the NLU Server

After successful installation of Virtual Analyst, training the RASA NLU server is mandatory for Virtual Analyst to work in your environment. You must also train the NLU server whenever you make any changes in Rasa (adding utterances, modifying or customizing intents, and so on).

Perform the following steps to train the NLU server:

1. If you have installed a virtual environment for installing Rasa. ensure that you activate the virtual environment before training the NLU server. For more information, see Install Virtual Analyst.
2. Navigate to the directory VA which was created during installation and run the following command to activate the virtual environment:
   (Windows)
   ```
   .\botenv\Scripts\activate
   ```
   (Non-Windows)
   ```
   ./botenv/Scripts/activate
   ```
3. Change the directory to casm-bot. Run the following command:

```
cd casm-bot
```

4. Train the Rasa model.
   a. **(Windows)**
      Run the following command:
      ```
      rasa_train.bat
      ```
   b. **(Non-Windows)**
      Run the following command:
      ```
      rasa_train.sh
      ```

Start/Stop the NLU Services

Execute the following commands from Anaconda Prompt to start and stop the Rasa NLU services:

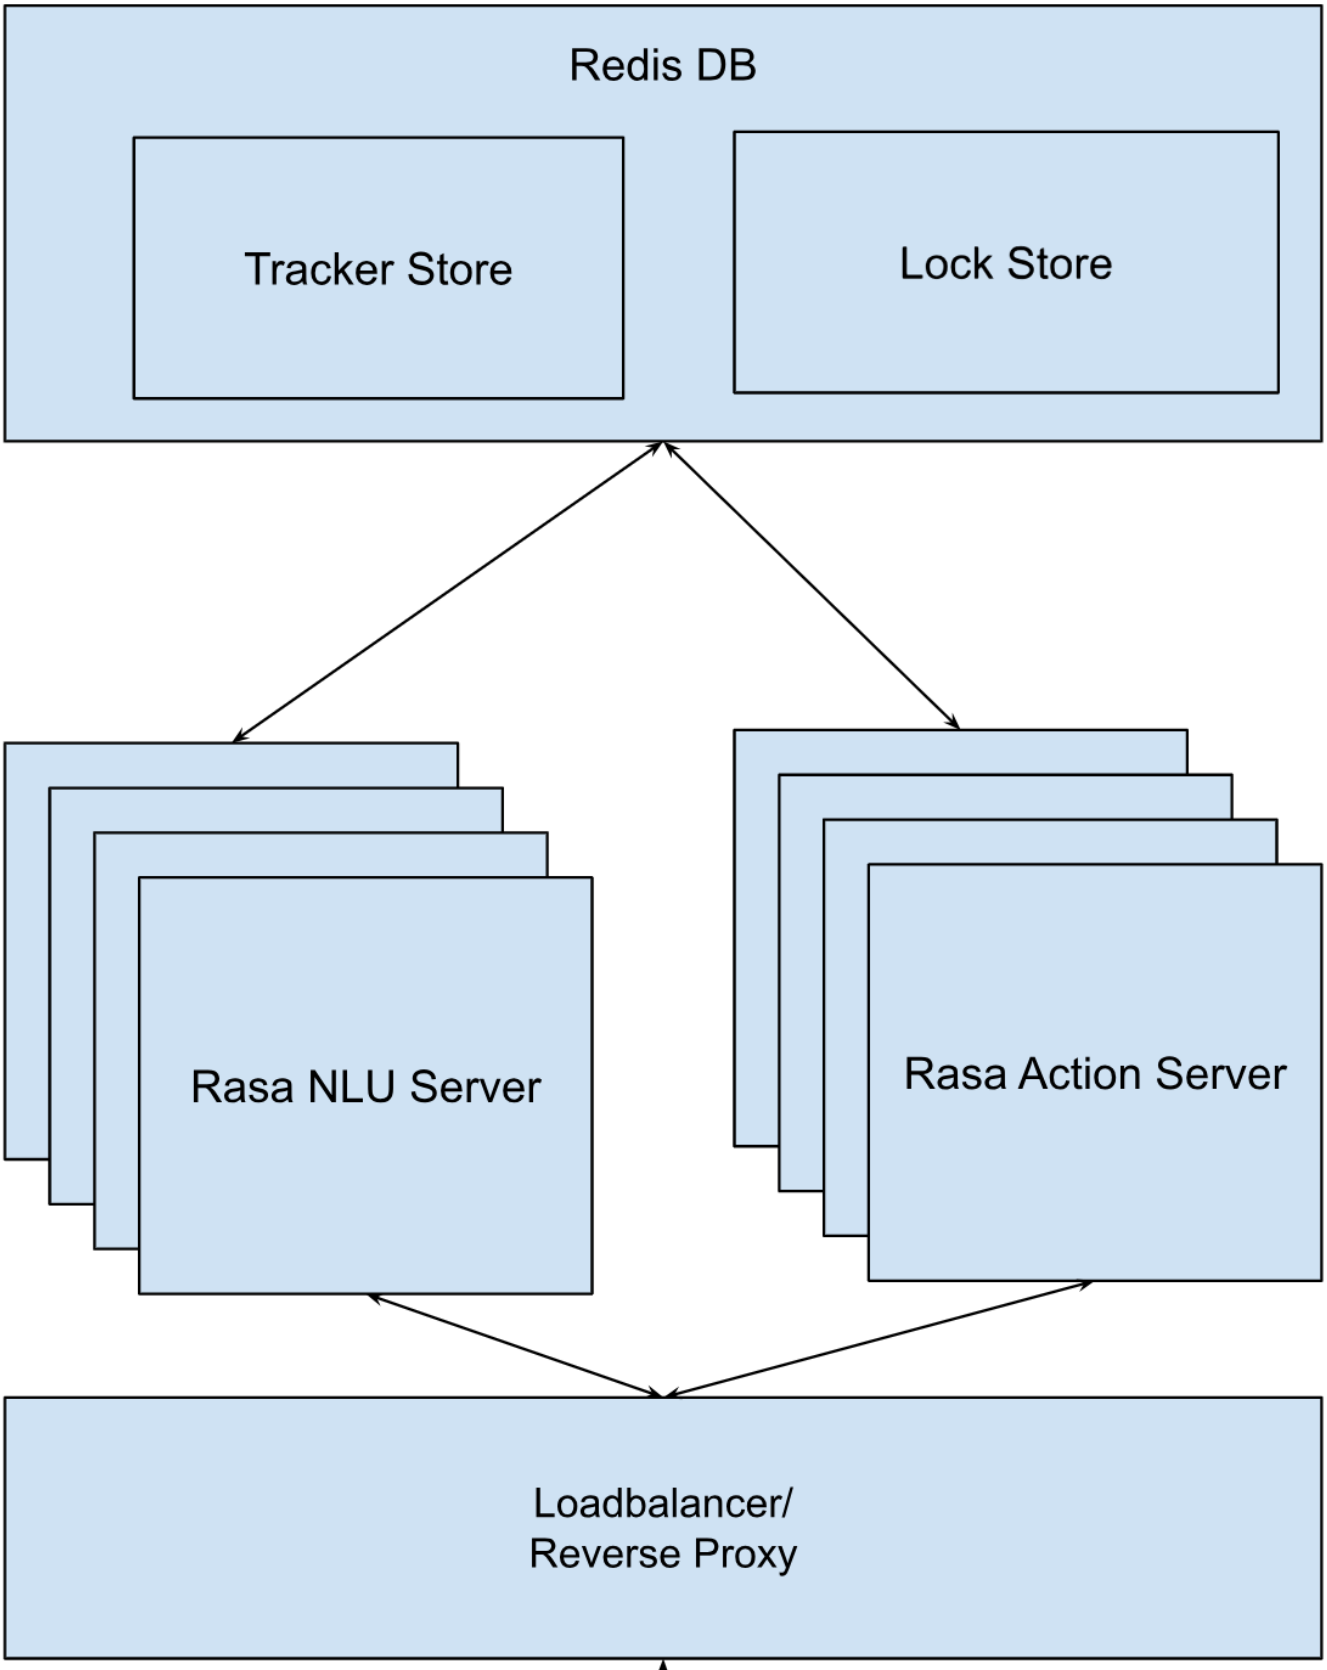
1. **(Windows)**
   Run the following command:
   ```
   rasa_run.bat
   ```
2. **(Non-Windows)**
   Run the following command:
   ```
   rasa_run.sh
   ```
3. Verify if Rasa services are up and running. Open the Rasa URL browser window (*http://<localhost>:5005*) and check for **"Hello from Rasa"**message.
4. To stop Rasa NLU services, run the following commands:
   a. **(Windows)**
      Run the following command to stop the services:
      ```
      rasa_halt.bat
      ```
   b. **(Non-Windows)**
      Run the following command to stop the services:
      ```
      rasa_halt.sh
      ```

RASA Clustering

RASA clustering with and without Dockers

RASA Clustering using Dockers

Rasa server can be scaled as shown:



Redis DB
Tracker Store
Lock Store
Rasa NLU Server
Rasa Action Server
Loadbalancer/
Reverse Proxy

RASA cluster contains the following components:

- **Load Balancer**:
  A load balancer, for eg, Nginx listens to RASA NLU requests and sends them to one of the many available Rasa NLU Servers. This is also used to balance the requests that are sent by Rasa NLU servers to one of the many available RASA Action Servers.
- **RASA NLU Servers**:
  The NLU server interprets the user's inputs, this helps to understand the context of the user's, and MS Teams Bot responds accordingly. The NLU server can handle tasks like tokenization, named entity recognition, and intent classification.
- **RASA Action Servers**:
  The Action server is where the responses to the user's inputs are handled. Actions in RASA can be anything from simple responses to executing complex tasks like calling an API, querying a database, or any other custom action defined in the RASA framework. Actions can also influence the flow of the conversation by determining which question or statement the chatbot should deliver next based on the current state of the conversation.
- **Redis DB:**
  By default RASA keeps the session information and the locking mechanism in memory, which is not a good practice in multi node configuration. In a multi node configuration of RASA the locking and session information must be kept in a shared location. RASA offsets support for Redis DB to keep this information. For more details, check “Trackler Stores” and “Lock Stores” in RASA documentation. It is highly recommended to configure the cluster using Docker Compose technology. See below a few samples of the key configuration files.

It is recommended to configure the cluster using Docker Compose technology.

Refer the following samples of the key configuration files:

docker-compose.yaml

```
version: '3.7'

            return 200 "User-agent: *\nDisallow: /\n";
        }
    }

    server {
        listen       5055;
        server_name  localhost;
        location / {
            root   html;
            index  index.html index.htm;
            proxy_pass http://actions_server;
        }
    }
```

endpoints.yml

```
  action_endpoint:
  url: "http://rasa-nginx:5055/webhook"

tracker_store:
  type: "redis"
  url: "rasa-redis"

lock_store:
  type: "redis"
  url: "rasa-redis"
```

Run this command to scale RASA servers.

```
"docker-compose up -d –scale core=X action=Y"
```

This would start X core containers and Y action containers.

RASA Clustering without Docker

1. Install RASA using the steps from Install Virtual Analyst.
2. Install Redis Database Server from https://redis.io/docs/getting-started/installation/.
3. Refer to comments in rasa_run.bat to spawn multiple RASA instances. Replicate existing endpoint.yml file for each instance that you want to create and update the content of endpoints.yml file as shown:
   action_endpoint

   ```
   url: "http://localhost:5055/webhook"
   ```

tracker_store

```
type: redis
    url: <url of the redis instance, e.g. localhost>
    port: <port of your redis instance, usually 6379>
    db: <number of your database within redis, e.g. 0>
    key_prefix: <alphanumeric value to prepend to tracker store keys>
    password: <password used for authentication>
    use_ssl: <whether or not the communication is encrypted, default `false`
```

lock_store

```
type: redis
    url: <url of the redis instance, e.g. localhost>
    port: <port of your redis instance, usually 6379>
    db: <number of your database within redis, e.g. 0>
    key_prefix: <alphanumeric value to prepend to tracker store keys>
    password: <password used for authentication>
    use_ssl: <whether or not the communication is encrypted, default `false`>
```

Configure Virtual Analyst in Service Desk Manager

This article describes the following topics. Perform the following tasks to configure Virtual Analyst in CA Service Desk Manager:

NOTE
If **va_chat_sessions** table is already populated before enabling multi-tenancy, it's recommended that you run the script after enabling multi tenancy. For more information, see Manage Multi-Tenancy. For example: SREL Type Syntax

```
<Object name="va_chat_sessions">
   <TenantRule type="SREL">last_mod_by</TenantRule>
   <Where>tenant is null</Where>
</Object>
```

NOTE
For a multi-tenanted environment, ensure that **System_Bot_User** (Service Bot User) in SDM is added to the Service Provider tenant.

Enable Virtual Analyst

Perform the following steps to enable the Virtual Analyst Bot Services:

1. Login to CA Service Desk Manager.
2. Navigate to **Administration**, **xFlow Interface**, **General**, Open the **va.bot.nlu.server.url** configuration.
3. Update the value "**configuration value"** to rasa service (*http://<RASASERVER>:5005)*. Default port is **5005**.
4. You can enable Virtual Analyst Chat Engine in Service Point Configuration. For more information about how to add these configurations in Virtual Analyst, see Manage Features.

Configure the Collaboration Microservices

NOTE
For Linux, add absolute path for **local.dir** and **leveldb.dir** in application.conf file (*<XFLOW HOME>/Apps/Services/collabmicroservice-version>/conf*).

For example:

```
local.dir = "/opt/CA/xFlow/APPS/Services/collabmicroservice-17.0.479/chatlog-persistence/snapshots
leveldb.dir="/opt/CA/xFlow/APPS/Services/collabmicroservice-17.0.479/chatlog-persistence/journal
```

Perform the following steps to configure Collaboration Microservices:

1. Navigate to *<XFLOW HOME>/Apps/Services/collabmicroservice-version>/conf*.
2. Take a backup of **application.conf** file.
3. Open the **application.conf** file, verify the property **search.ms.url**, ensure that the value is pointing to **search microservice**. Example: "*search.ms.url="http://<LOCAL HOST>:9006"*
4. Restart the xFlow Interface services.

Data Configuration

If you have configured your ticket numbers with any prefix or suffix in the CA Service Desk, perform the below steps.

Example Use Case: Consider a use case where ticket prefix is **abcd** and suffix is **12**:

1. Navigate to **Administration**, **Service Desk**, and **Sequence Numbers**.
2. Open **Request/Incident/Problem Number**. Verify the prefix and suffix value.
3. Navigate to the installed location of Rasa, open the **data**/**nlu.md** file.
4. Under the **inform** intent, you can find some training examples for getting ticket details. Consider the following statement
   a. Please show ticket **[40](tkt_id)**
      40 is the ticket ID.
      Please show ticket [40](tkt_id) is modified to "**Please show ticket [abcd4012](tkt_id)**"
      abcd = ticket prefix and **12=** ticket suffix.
5. Perform these replacements for at least **5** statements in the inform intent section.
6. Add at least **5** more ticket IDs under the inform intent.
7. Ensure that you use different ticket IDs for proper Rasa training.
8. Navigate to **regex:tkt_id** and add a regex which will describe ticket IDs as per the CA SDM configuration. For this example, regex would be **abcd[0-9]{2}**.
9. Now, start training the NLU server, Run the command in Anaconda Prompt:
   ```
   rasa_train.bat
   ```
   Restart Rasa services.
10. Navigate to Collaboration Microservices location (***<xFLOW HOME>/Apps/Services/collabmicroservice-<version>/conf***).
11. Open the **entity_mapper.cfg** file. Check the '**where**' clause under the entity name **tkt_id**. Ensure that it is inline with the ticket format configured in CA SDM.

Urgency

Urgency for a ticket can be configured in SDM. When some changes are made to urgency configuration, users must update the same configuration in Rasa also in order to work with the virtual analyst.

Out of the box, urgency values are **1,2,3,4,5**. If you want to add a value, say **6**, perform the following steps to configure Urgency for a ticket:

1. Navigate to **cfg/config.json** and under the urgency field, add new urgency values to the list of urgency values.
2. If some training is required for Rasa to pick up this urgency, you may have to add some training samples to the **nlu.md** file under the i**nform_urgency** intent.

Chat Session Details

Administrators can run a query on Oracle or Microsoft SQL database server to get additional details of user-initiated chat session with the Virtual Analyst. The query will provide the following information:

- Details of a user initiated chat session with the service bot for a specific issue.
  For example: User Name, chat text, chat room name, and chat session ID, user provided feedback, chat session rating, and comment details.

```
select A.sender,A.msg_text, B.rating, B.comments from chat_log A INNER JOIN va_feedback B ON A.chat_room_name
 = B.va_chat_session_id
```

User Chat Logs

User chat log provides information about a user chat utterance and confidence of the Service Bot in classifying that utterance to an intent. This log is generated as comma separated values. The log can be opened with any CSV reader for better readability purposes.

Perform the following to view the user chat log file:

1. To locate the log, navigate to **xFlow Home>/APPS/logs** and change the extension of the file from **user_chat.log** to **user_chat.csv**.
2. User chat log provides details for the following values:
   a. **Time**: The time at which the user chat was initiated.
   b. **Session ID**: Each user utterance in the bot is tied to a chat session and the log can be filtered based on this value to identify the user utterances in a particular session.
   c. **Utterance**: Utterance pertains to the user chat text that is send to the Service Bot. Actions are special kind of utterances which are always classified as a particular intent with confidence level **1**. Actions start with character **"/"** followed by the intent name. For example: Action "**/get_tkt_status**" will get the status of a ticket.
   d. **Intent**: Specifies an intent for a given user utterance. This is classified by the Service Bot.
   e. **Main Intent**: There are scenarios where the bot can request information from a user to fulfil a request. One example of this is adding comments to a ticket. In this case, the bot needs both ticket ID and added comment to fulfil a request. When the user provides an information, these utterances are also classified into intents. The Main Intent here is "**adding a comment**" and "**sub-intent**" (known as intent in general) can be "**ticket id**" and "**providing comment**".
   f. **Confidence**: Confidence is a metric which shows how confident the service bot is with intent prediction. The threshold value for confidence metric is **0.7**. If the confidence level is below**0.7**, service bot is unable to comprehend the issue described by a . The user utterance can be a good sample data for training the bot.

Service bot must be trained with sample log data to help with accurate intent prediction. The user log files provide details for utterances that has low confidence threshold values. The utterances with confidence value less than 0.8 can be used to train the bot to improve intent prediction. Administrators must review these utterances before training.

Virtual Analyst Intents

CA Service Management supports the following intents for Virtual Analyst:

Task Name	Supported Bot Intents	Description	Example
My Open Tickets	**my_open_tickets**	Retrieves the list of open tickets.	• Can you show my ticket list? • Ticket Status.
Ticket Status	**get_tkt_status**	Displays the status of a specific ticket.	• Can you tell me the status of ticket 50?

Search Knowledge Base	**search_kd**	This intent helps the virtual analyst to search the CA SDM knowledge Base and get relevant KB articles for a said problem/issue.	• Can you suggest me a solution? • I have a problem with my laptop?
Create a Ticket	create_ticket	This intent helps the bot to create a ticket for a said problem/issue.	• Can you create an incident for me? • Help me create a ticket.
Close Ticket	**close_tkt0**	Ticket is closed	• Can you please close the ticket. • I want to close ticket 23
Update Urgency	**upd_tkt_urgency**	Updates Ticket Urgency.	• Please change the urgency of ticket 23. • Update Urgency
Add comment to a Ticket	**add_tkt_comment**	Adds a comment to a ticket.	• Add comment to ticket 23.
Transfer the chat to an Analyst	**transfer_to_analyst**	This intent connects the business user to a human analyst through a chat queue.	• Please connect me to an Analyst. • I want to talk to a human analyst.
Forgot password Administrators can set the password reset url in forgot password option: <**CollborationMicroservicePath**> **\conf\intent_mapper.cfg** >	**forgot_password**	Shows the Password Reset URL link (set by Administrators)	• Hey I Forgot password. • Reset my password
Reset the chat **NOTE** '**Reset**' is a powerful command and helps in clearing or revoking an existing conversation to start a fresh one. You can use this command when the bot is not responding well to queries or is stuck while performing a task.	**Reset**	This intent lets the virtual analyst or bot stop an ongoing conversation and start a fresh conversation.	• Begin • Reset • Restart • You can't help me

How to train the Service Bot with additional data or when it is unable to understand the given intents?

This scenario may arise when a logged in business user tries to make a statement, and the service bot responds with "**I am unable to understand**".

Verify the **collabMS.log** in ***<XFLOW Home>/logs/collabMS.log*** location. This log file contains chat text entered by a business user along with confidence-level. If confidence level is less than the suggested threshold leve**l (0.6>)**, train the intent with new utterances.

Sample example: When the Training Threshold is not Enough-

Training needed : The confidence is **0.3912886982016276** for **intent:affirm**

For example, "**Delegate the conversation to an analyst"** may not be understood by the service bot as compared to the intent "**transfer to an analyst**"".

- Navigate to where you have installed Rasa Server.
- Open the **nlu.md** file.
- Search the said intent (**transfer_to_analyst**).
- Add the utterance which is failing in the model data format.
- Open the Anaconda prompt window in the Rasa home directory.
- Stop Rasa Services.
- Train the model by using command 'rasa train'.
- Start the service using '**run**'.

> **NOTE**
> Ensure the length of the new utterances are similar to the existing ones for an intent. Do not train with rarely used utterances or statements. Always use frequently used utterances.

Few sample examples below showcase recommended and complex utterances:

Recommended Utterances	Complex Utterances
• Show my open tickets • What are my open tickets?	• Awesome, for displaying the complete list. But, want to see my open tickets.
• Want to see my ticket details • Show my ticket details	• In a jiffy, can you show me my ticket details?
• What is my ticket status? • Tell my ticket status	• Are my open tickets assigned to an analyst or are they still in waiting state?

It is recommended that you use simple utterances to train the bot. Complex sentences complicate the initial training data. Try to use brief and simple utterances or sentences.

Customize the Virtual Analyst Responses

Customizing the Configuration Files

Customize the Virtual Analyst responses by making changes to the **Entity Mapper** and **Intent Mapper** Configuration Files.

Perform the following steps to customize the responses:

1. **Intent Mapper:** This file is used to map an intent coming from NLU with an action executed in Service Management and the response. Location of this file: ***<xFLOW HOME>/APPS/Services/collabmicroservice-<version>/conf/intent_mapper.cfg***
2. **Entity Mapper**: This file is used to map an entity in the NLU server with system parameter. For example, a ticket number will be translated to persistent ID. Location of this file: ***<xFLOW HOME>/APPS/Services/collabmicroservice-<version>/conf/entity_mapper.cfg***

> **NOTE**
> You can update the response string by adding new message code which is defined in the **messages.language** file. Response strings can be edited by users. it is recommended that configuration file must always be edited by Administrators.

It is recommended that the configuration file must be edited by Administrators.

To customize or modify the service bot responses, retrieve the bot responses as shown below. Virtual Analyst response are kept in two locations, RASA server and collaboration microservices.

1. **Rasa Services**:
   - Open the **domain.yml** file.
   - Navigate to the templates section, search for the Utterance that you want to update. Change it and train the NLU server using the “**rasa train**” command. In case, if you want to add a new utterance refer to the existing text format and replicate the format.
   - The response comes from RASA server, when a query is initiated to fulfill an intent or when a query does not require a Service Management action. This response is derived from the **domain.yml**. The response may contain text and buttons. The response is defined under the templates node in the **domain.yml** file. RASA responds or provides different text for the same conversation flow at different points of time.

     Example: "*Provide me the ticket number*." OR "*Did you forgot to provide the ticket number, please give the details*."

     Such responses can be defined in an array node, so that RASA can pick one randomly. The response contains text and buttons. In case you want to remove a button, remove the title and the payload pair together.
   - After making the above changes, ensure to stop the RASA server, train it, and start it again.
     For more information, see RASA documentation.
2. **Collaboration Microservice**s
   - Navigate to the configuration file: ***<xFLOW HOME>/APPS/Services/collabmicroservice-<version>/conf***.
   - To update the response text, open the **messages.en-US** file or a supported language-specific file.
   - Search for the message string that you want to edit, update the message, and restart the xFlow Analyst Interface Services.
   - All bot-related messages start with **BOT, BCF,** and **BWP.** **BCF** messages are used in the intent mapper and entity mapper file. **BWP** are confirmation prompt messages.
   - When the query requires action from CA SDM, the response is built at the microservice layer. To update or change the response of any specific flow, first figure out the intent. Open the **intent_mapper.cfg**, and go to the specific intent.
   - The response node contains array of message code starting with **BOT**, **BCF**, and **BWP**. BCF messages are used in the intent mapper and entity mapper file. BWP are confirmation prompt messages:
     - Add additional responses, in the JSON array with a comma-separated value, so that virtual analyst can pick these responses randomly.

       NOTE
       Ensure that the newly added message code do not start with **BOT**,**BCF**, or **BWP**.
       For example, you can add "TEST0001", and the string can be added in the **messages.en-US** file with the same code.
     - To update the label of a button, pick the message code from the buttons array node in the footer, and search for the code in the **messages.en_US** file. You can edit the text as required.

       NOTE
       CA Service Management supports only a single message code.
     - To remove the buttons from the response, remove the complete JSON node containing label and action.

Customize the Virtual Analyst Help Text

When a user enters "Help"/"help" in the Virtual Analyst chat interface or instructs the Virtual Analyst to perform certain tasks, it shows a help content with few pre-defined user queries. For example: "I want to know the status of my ticket", "Printer is not working" and so on.

You can customize the help content as required. To customize the Help text for Virtual Analyst, perform the following steps:

1. Navigate to where you have installed collaboration micro services.
2. Locate the folder <**CollaborationMicroServiceHome>/conf/vafiles**

3. In the language specific folder, locate the configured language folder.
   For example if you have **English** as the default language, the folder location is <*CollaborationMicroServiceHome*>/*conf/vafiles/en_US.*
4. Open the file **help.txt** and edit as required.
   This file supports HTML formatting. Ensure not to add rich html content and validate the HTML formatting before saving the file.
5. From the Service Point interface, open the Virtual Analyst chat interface, and enter help/Help. Verify your changes.

Custom Attributes for Ticket Creation

If you are using custom attributes for ticket creation and want to add these attributes as part of ticket creation, review the following two options on how you can add custom attributes in Virtual Analyst as part of ticket creation process;

1. **Updating the Virtual Analyst (VA) Template**: After the VA template is updated in Service Point configuration via Service Desk Manager, the custom attributes values are picked from the VA template. Custom attribute values are similar for all the tickets created using the Virtual Analyst. In case of a tenanted environment, the Service Point configurations will differ for each tenant if you have not applied the default configuration.
2. **Service Bot prompts user for custom attribute field inputs** The Virtual analyst Service Bot understands the user string with the help of the NLU engine (Rasa engine). It is recommended that you update the collaboration microservices for actions and Rasa engine for the conversation flow.

The **entity mapper** file in Virtual Analyst takes care of querying the business user when data is not available or confusing.

Example: Let's create a ticket and add two attributes that will be queried to a business user while creating this ticket.

- Take '**impact**' as one of the attributes. **"Impact**" is a relation or SREL attribute (stores data in another table).
- Second attribute will be 'ticket avoided', which is a plain attribute.

Add Custom Attributes to an Intent

Perform the following steps to add custom attributes to an intent:

Step 1

Open the **intent_mapper.cfg**. Add the attributes in entity list under **create_ticket** intent.

Add the following code under '**entities**' node:

Example: Single RELation (SREL) Attribute

```
  {
 "name" : "my_impact",
 "required" : "false",
 "default" : "_SKIP_NLU_"
         },
```

Example: Plain Attribute

```
 {
 "name" : "tkt_avoided",
 "required" : "false",
 "default" : "_SKIP_NLU_"
 }
```

NOTE
_SKIP_NLU_ is required if you want to skip training the NLU engine to manage the conversation. Also "**required**" is kept as false, so that the xFlow Interface does not expect inputs from NLU server.

Step 2

Update the intent **create_ticket** for the action, this is required to map the entity with system attribute (majic layer attributes).

1. Add the following code under the **action' > 'Parameters** node:

Example: Single RELation (SREL) Attribute

```
{
"name" : "impact",
"data_type" : "String",
"from_entity" : "my_impact"
},
```

Example: Plain Attribute

```
{
 "name" : "ticket_avoided",
 "data_type" : "Integer",
 "from_entity" : "tkt_avoided"
}
```

In parameter definition, ensure '**name**' field matches with **cr** object attributes (**impact** and **ticket_avoided**). Data type can be taken from the majic layer or from xFlow Interface java pojo source file. The **'from_entity'** must match the name defined in **Step 1**. After updating **Step 1** and **Step 2**, ensure that JSON format is not corrupted.

Step 3

After defining entities and system parameter in the intent mapper, update the entity mapper file. This file is used to map the user provided data with system data. For example, user **ServiceDesk** must be mapped to the UUID value. This helps to define a set of input expected from user when the data is a plan attribute and user is free to enter anything as input text.

1. Open the **entity_mapper.cfg** and add the following code:

Example: Single RELation (SREL) Attribute

```
{
"name" : "my_impact",
"ui_name" : "Ticket Impact",
"description" : "This entity is ticket impact to be mapped to imp enum",
"system" : "sdm",
"object" : "imp",
"id_attribute" : "enum1",
"display_attribute" : "sym",
"where" : "sym like '%@@my_impact@@%'"
},
```

Example: Plain Attribute

```
    {
  "name" : "tkt_avoided",
  "ui_name" : "Avoid Ticket",
  "description" : "This entity is avoid ticket flag, no mapping needed",
  "system" : "none",
  "object" : "",
  "id_attribute" : "",
  "display_attribute" : "0,1",
  "where" : ""
 }
```

The first entity mapping is done to map user input for impact attribute with SDM impact object:

> **NOTE**
> After a newly added JSON is formatted with customer attributes, it is better to cross-check changes in third-party tools to ensure that JSON format is properly defined. Once **intent_mapper.cfg** and **entity_maper.cfg** are updated, verify whether the JSON formatting is good by using any JSON formatter tool.

- **name**: This value must match with entity name defined in **Step 1**.
- **ui_name**: This string is used to querying the user. For example bot may ask, “**please provide 'Ticket Impact'"**. This can be put into message. LANG (LANG can be **en_US**) file as key value pairs and provide the key like 'USERMSG0001' here.
- **description**: This is purely for reference/remarks purposes. Bot does not use it.
- **system**: The name of the system from where we map the data.
  > **NOTE**
  > Currently, only CA SDM is supported.
- **object**: Provide the majic factory name. For '**impact'** the factory name is **imp**.
- **id_attribute**: Specify the relational attribute(relAttr) of the factory mentioned in object field. In the above example, 'enum' is the relation attribute of 'imp' factory, however enum1 is a special name given in xFlow Interface layer only for enum attribute. Rest all attribute are same as majic layer attribute name.
- **display_attribute**: Attribute used to display user name, in case, if multiple record exists, and user has to choose one, which is common name attribute in case of Service Desk.
- **where**: This is the clause used to filter the data based on users input. You can use the user entered data, which is entity name (**my_impact**) in the form of **@@my_impact@@**. This will get replaced with users input. Note that flexibility can be added by adding **%**, so that the user does not have to submit the exact string. The **where** clause can be made rigid or flexible, depending on the use case.

Define Permissions

As an administrator, control the permissions for all the apps within the xFlow Interface. Set the Service Point as a default app for a particular access type:

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **xFlow Interface**, and **App Configuration**.
3. From the list, select **Service Point**.
4. Select an access type. (For example, Administration)
5. From the Access Type Detail page, navigate to the **APPS** tab.

6. Select **Service Point** as the default app.
7. Click **Save.**Service Point is set as the default app.

Define the User Context

To display the most relevant information to the user in Service Point, you must define the user context. The most important pre-defined aspects of user context are: location, organization, and department of the user.

> **NOTE**
>
> You can create a user context at a group level or at a tenant level for each object type.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **xFlow Interface**, **Service Point**, and **User Context**.
3. In the Name column, select the desired tenant configuration name for which the user context must be defined.
4. Click **Edit**.
   The predefined (User Context) attributes are displayed.
5. From the list of attributes, you can modify only the attribute weight.
6. Click **Edit in List**.
7. To modify the attribute weight, select the attribute from the list.
8. Specify the weight.
9. Click **Save**.

Predefined User Context

For a default tenant, the following are predefined attributes for User Context:

Attribute	Weight
Location	10
Organization	8
Department	9

> **NOTE**
>
> Based on organizational requirements, an administrator can turn-off user context. To turn-off user context, set the attribute weights to 0.

Customizing Service Point appearance

An administrator can alter the look and feel of the Service Point interface by modifying CSS. This is the starting point for branding your Service Point instance and changing basic system defaults, such as the background image.

It is recommended that you do not make extensive CSS customizations that can alter the product's UI.

Follow these steps:

1. On the server where xFlow Interface is installed, navigate to the `xFlow Interface root directory\APPS \Services\incidentmicroservice-17.0.479/public` folder and open the `casm.html` file in a text editor.
2. Ensure that the following line is uncommented.

```
<link rel="stylesheet" href="custom.css">
```

3. In the case of CA Service Management 17.3.0.16 or a below version, add the following line inside the head element.

```
<link rel="stylesheet" href="custom.css">
```

4. Save the file.
5. On the server where xFlow Interface is installed, navigate to the `xFlow Interface root directory\APPS\Services\incidentmicroservice-17.0.479/public` folder and create a new file `custom.css`.
6. Open `custom.css` file in a text editor.
7. Create your own CSS class to override the system's default CSS class.
   a) For example: Copy and paste the following content in `custom.css` file

```
.searchSection{
background-image:url(/assets/images/icons/BG4_SP.jpg);
background-repeat:no-repeat;
background-size:cover
}
```

   b) Replace **BG4_SP.jpg** with your background image.
8. Save the file.
9. Refresh the browser cache.

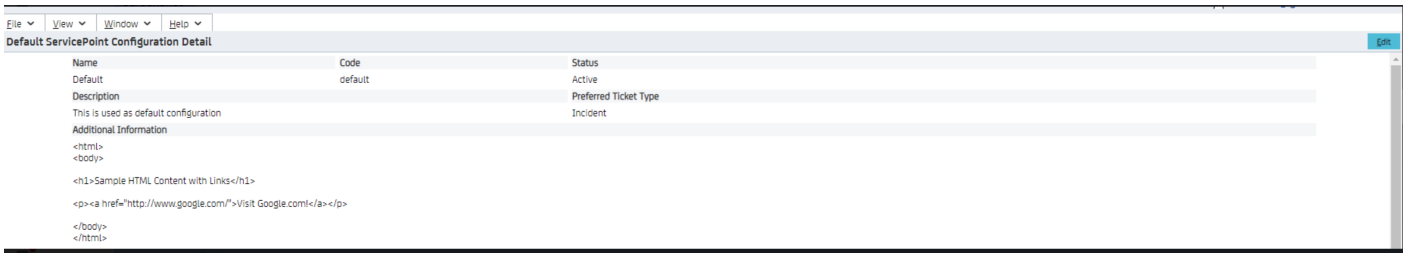
Add Additional Information

This article describes how to add additional information in CA Service Desk Manager (SDM). This information is displayed on the Service Point Home page to provide important information to end users. Additional information is displayed in the Call icon available on the Service Point Home page (top right corner of the interface). Click the Call icon to view additional Information along with contact details.

> **NOTE**
> You must enable the **call_service_desk_mobile_enable** option for the call or contact Help Desk icon to appear on the Service Point Home Page. By default the **@NX_CALL_SERVICE_DESK_MOBILE_ENABLE** option is set to **Yes**. To configure this option, you can edit the CA SDM Options Manager.

Perform the following steps to add additional information:

1. Login to CA Service Desk Interface.
2. Navigate to **Administration**, **xFlow Interface**, **Service Point**, **Configuration**, **Default**.
3. Click **Edit** to open the configuration in edit mode.



4. You can either enter HTML content or plain text in the additional information text area (text size limit is 1500 characters).
5. Save the Configuration in SDM and refresh the Home page in Service Point to reflect the changes.

Define the Default Categories

As an administrator, you can define the default **five** categories, that appear on Service Point. When a category is assigned to a ticket, the properties associated with that category are automatically added to the ticket.

NOTE

Service Point displays categories only when the following fields are selected, **Active**, **Self-Service Include** and **Self-Service Symbol**. When you change the **Incident Dependent Attributes** control (**CA SDM Administration**, **Service Desk**, **Request/Incident/Problem Areas**, **Status**), restart the xFlow Interface services.

Follow these steps to define default categories:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **xFlow Interface**, **Service Point**, and **Default Areas**.
3. In the Name column, select the desired tenant configuration name for which the default categories or areas are to be defined.

   TIP

   In a multi-tenant environment, the global default category is displayed on Service Point if none of the tenants have a category assigned to them.
4. Click **Update Default Areas**.
5. Click **Search**.
6. Select from the list of categories or areas.
7. Click **OK**.
   The selected categories now appear on Service Point.

Manage Ticket Attributes

As an administrator, define the set of attributes to be displayed during ticket creation and manage the attributes that appear when viewing a ticket.

NOTE

To restrict Urgency data in Service Point, it is recommended that CA SDM Administrators create Data Partition restrictions for respective employee roles.

NOTE

The Preferred Ticket Type attribute specifies the default type of a ticket created by Service Point when the logged in user does not select a category/Area or when the selected category is designed for both incidents and requests.

NOTE

Service Point honors all transition types supported by CA Service Desk Manager employee interface. If you are changing the Status Transition type for a ticket in CA SDM, ensure to restart the xFlow Analyst Interface Services.

Create New Ticket Attribute

An administrator can configure the attributes that are displayed during ticket creation in Service Point.

NOTE

We recommend not to add the Local attributes of an object as a ticket attribute, as they are temporal and do not have a database storage.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **xFlow Analyst Interface**, **Service Point**, and **Configurations.**

3. Select a configuration from the configuration list.
   The Service Point Configuration Detail page appears.
4. Click **Create New**.
   Administrators can create a tenant-specific configuration.
5. Complete the fields as appropriate:
   a. **Configuration**: The configuration to which the new ticket attribute belongs to.
   b. **Active**: Only active attributes are displayed while creating a ticket.
   c. **Ticket Attribute**: Identifies the ticket attribute name. To add a custom attribute, see Objects and Attributes.

      NOTE

      We recommend not to add the following system level attributes to be displayed while creating a ticket. This includes and is not limited to the following attributes: **Active**, **Call Back Flag**, **Closed On**, **Customer, Description**, **Heat**, **Id**, **Last Modified**, **Modified By**, **Opened On**, **Resolved On**, **Reported by**, **SLA Violation**, **Ticket Number**, **Type**, **Persistent id**, **Predicted SLA Violation**, and **Priority** (When APC is enabled).
      The following attributes will not be shown in the Service Point new ticket creation page: **Category**, **Problem**, **Status**, and **Team**.
   d. **Default Value**: A pre-filled value in the field that is displayed while creating a ticket. It displays the Majic attributes of the New Ticket attribute that is selected.
      For example, for a request object (cr), the attribute value can be *assignee* or *assignee.organization* or *summary*.
6. Click **Save**.

Manage Ticket Summary Attributes

An administrator can configure the attributes that are displayed while viewing a ticket in Service Point.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **xFlow Analyst Interface**, **Service Point**, and **Configurations.**
3. Select a configuration from the configuration list.
   The Service Point Configuration Detail page appears.
4. Click **Add Ticket Attribute**.
5. Click Ticket Summary Attribute.
6. Complete the fields as appropriate:
   – **Sequence:** Represents the order in which the ticket attributes appear in the ticket summary section of the Ticket Details page.
   – **Attribute Name:** Click the magnifier icon to search for an attribute from the **Object Attribute List**. To add a custom attribute, see Objects and Attributes.
7. Click **Save.**

ServicePoint Request Approval Process

Service Point now provides the ability to approve your Service Catalog requests, provided you have an integrated environment of CA SDM and CA Service Catalog. Any logged in user in Service Point can approve, reject, Transfer, Delegate, and Take/Return CA Service Catalog Requests.

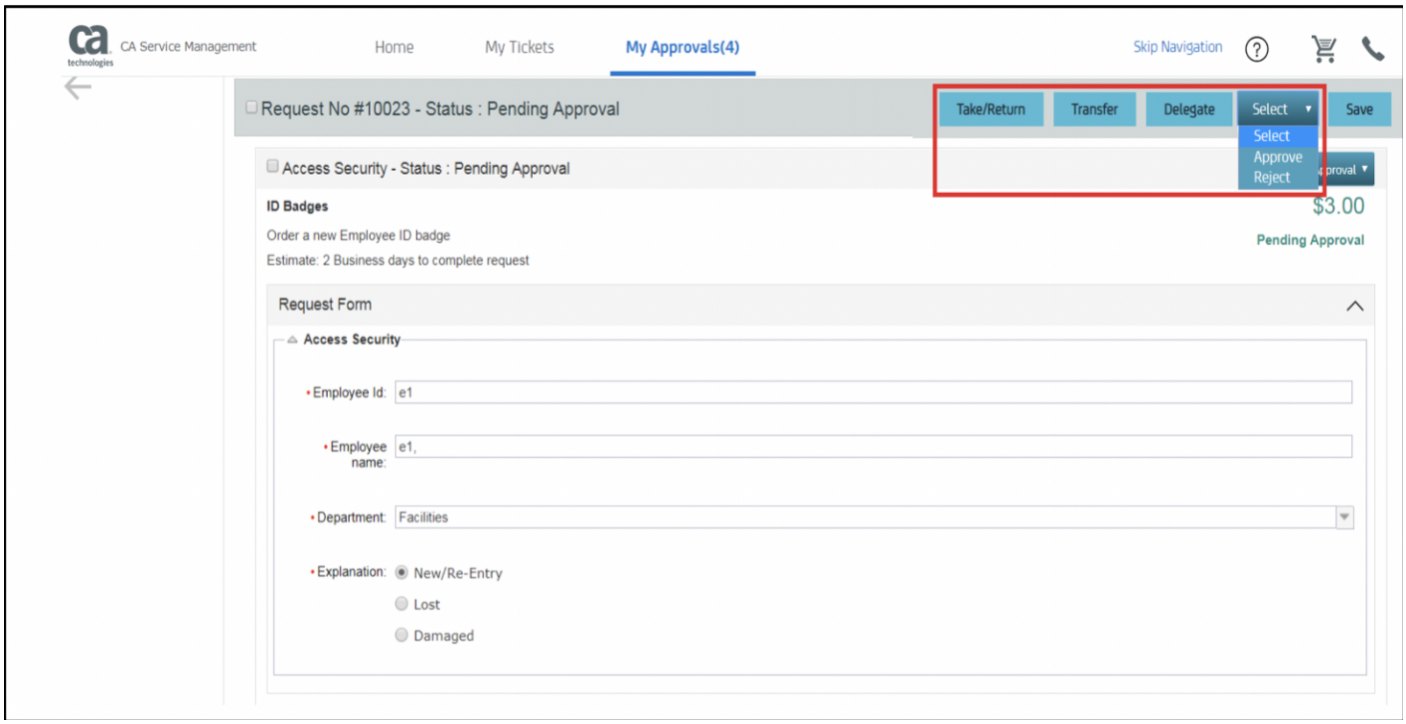
Service Point will fetch pending approval requests from CA Service Catalog and will approve the requests through Catalog Request wizards. Requests that are in Pending Approval state can be viewed by the logged in user or user groups. In case, when there are no requests assigned to a user or group, Service Point will display appropriate message. In Service Point, My Approval Tab displays all pending approval requests.

Perform the following steps:

1. Login to CA Service Point and Click on the My Approvals tab from the Home Page.
2. Select a request that is in Pending Approval state, and from the Request Page take appropriate action(s).
3. **Select**: Provides drop-down options to either approve or reject a request.

   NOTE
   Rejecting a service rejects the entire request. The request is returned to the user who submitted it and the user decides whether to update the request and resubmit it or accept the rejection as final. Once all services in the request are approved, the request wizard moves the request to the next phase of the request life cycle.

Figure 6: Figure - Request Approvals in Service point



4. **Take/Return**: Logged in users have the option to either assign a request to another analyst, user or group, or return the assigned requests in a queue back to the request assignee. Take or return ownership of requests pending action in a queue. Users can take ownership from a group queue or the queue of another user in the same business unit or sub-business unit. Similarly, you can return ownership of requests pending action from your queue to the queue of your group. You can take or return ownership of requests pending action that is assigned to your group.

   NOTE
   Take and Return works only if you are logged in as a user of the group to which the request pending action is assigned. Only CA Service Catalog administrators and other users with the required access control setting can do so.
5. **Transfer**: Request managers can transfer the requests pending actions that are assigned to themselves or other request managers. You can transfer a request pending action that is assigned to you or another user.
   For example, when a user is unavailable to perform or approve an assigned task.
6. **Delegate**: Request managers can delegate the request pending actions. Request managers can auto-delegate requests pending actions that are assigned to themselves or other request managers.
   For example, when users are unavailable to perform or approve an assigned task. Auto-delegation is useful for managers who monitor requests but who do not address requests directly. Thus, auto-delegation helps ensure that requests are addressed in a timely manner. A request pending action can be delegated only once.

NOTE
Only the owner of the request pending action can delegate, if the owner has the required access control setting.

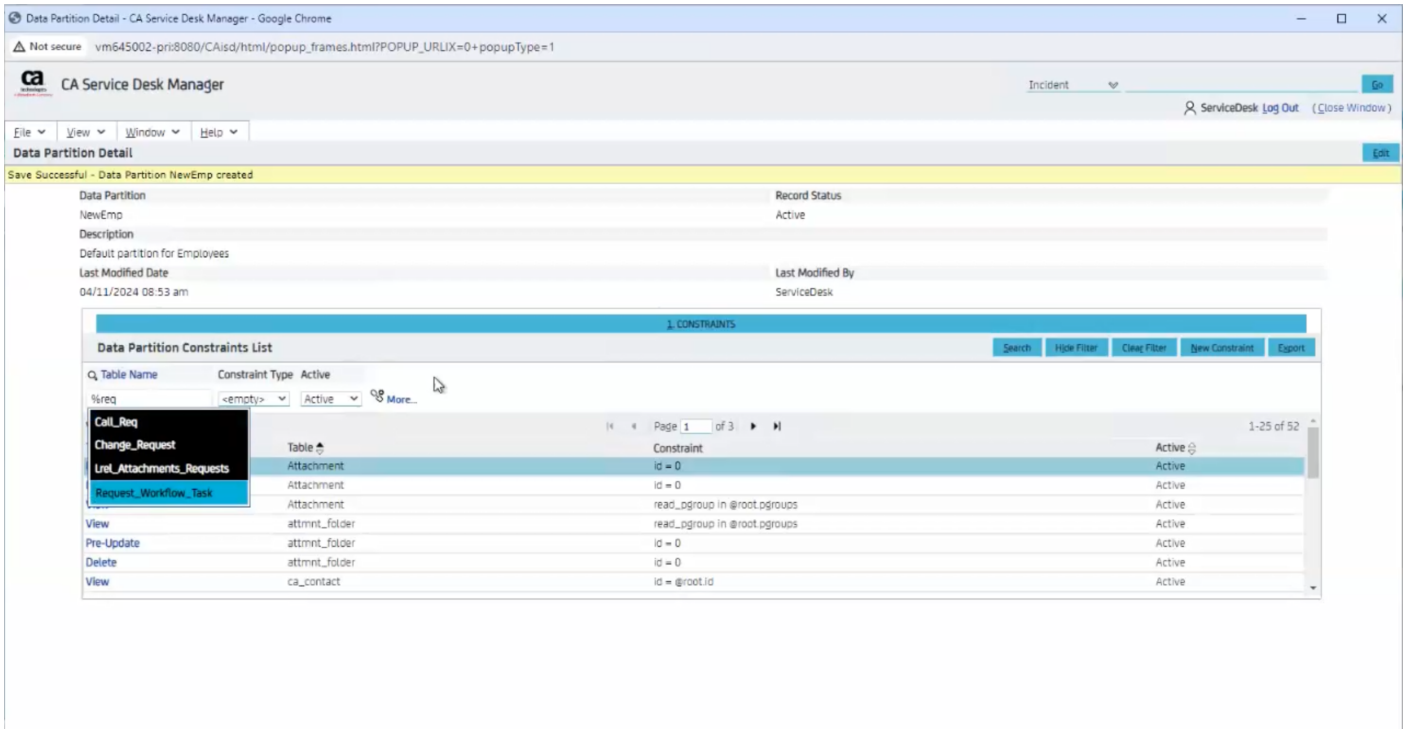
ServicePoint Task Approval Process for Classic workflow

Service Point now provides the ability to approve your customer's pending Classic CA SDM workflow tasks. In Service Point, **My Approval** displays all the pending approval requests. Service Point user can now perform actions like approve, reject or any custom task configured in the CA SDM classic workflow.

Managing Workflow tasks for Service Point

For **Employee** data partition, disable the *create* condition for the Request workflow task. Follow these steps to disable the condition:

1. In CA SDM Classic workflow, go to **Administration**> **Security and Role Management** > **Data Partition constraints** > **Data Partition** > **Data partition List**.
2. In the **Data Partition List** page that's displayed, right click on the **Employee**, and click **Copy**.
3. A page, **Create New Data Partition** is displayed, enter the **Data Partition** name as NewEmp and **Save** it.



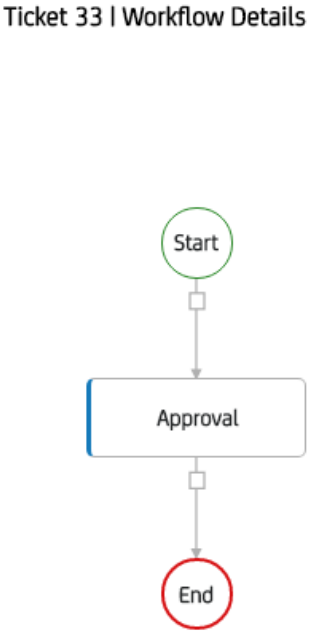
4. In the newly created Data Partition List, search for **Request_Workflow_Task.**
5. In the List displayed, click **Create** > **Edit**.
6. In the screen displayed, set the **Create** data partition constraint to **Inactive**, and click **Save**.
7. Go to Administration > Security and Role Management> Role Management> Employee Role List.
8. In the **Employee Role Detail**, update the **Data Partition Name** created in the earlier steps and set the **Override Contact Data Partition** to **Yes.**

Predefined Workflow Tasks

The following workflow tasks are available by default:

Pending Tasks

- When the end user logs in to Service Point, a new My Approval tab is displayed with a list of pending tasks that need an action by the user.
- Only the the tasks with status set to **Pending,** are assigned to the Employee user are displayed in this list. You can see the number of tasks and the graphical representation of the tasks.
- User can view the graphical representation of the workflows by clicking **View Workflow.**



Legend:
Green color indicates that the task is complete.
Blue color indicates that the task is pending.
Orange color indicates it is a future task

- Click on the required task to view the workflow details.
- Perform the required operations, and click **Save** to save the changes made.

Customize workflow fields in Service Point

- The fields displayed in the the Service Point workflow task detail page have to be configured in CA SDM (Classic interface) .
- In CA SDM, navigate to **Administration** > **XFlow Interface** > **View Configuration** > **Detail View** > **Request/Incident/Problem Workflow Task.**
- In the **Detail View Attribute List** window displayed, choose the fields you want displayed in the **Service Point Workflow Details** screen.

Manage Features

As an administrator, you can enable (show) or disable (hide) the My Resources features in Service Point:

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to **Administration** tab, select **xFlow Interface**, **Service Point**, and **Configurations**.
3. In the Name column, select the desired tenant name to enable or disable the features.

4. Click **Edit**.
5. From the **My Resources** drop-down list, select **YES** to show or **NO** to hide.
6. Click **Save**.

Add Features in Service Point

CA SDM Administrators can now add, view, and modify configurations or features for business users in Service Point. It helps administrators easily manage various capabilities of Service point and Virtual Analyst as described in this article.

To add feature configurations, perform the following steps:

1. Login to the Classic SDM UI.
2. Navigate to **Administrator**, **xFlow Interface**, **Service Point**, **Configurations**, **Default**. Click the **Feature Configurations** tab, and click the **Add Feature** button. Click **Look Up** (Search icon) on the Name Field. Click **Search**. The feature list page is displayed.
3. **Table 4: Add Features in Service Point**

Feature	Description
Chat Engine	An Option to choose between Virtual Analyst and Live Chat Support.
Virtual Analyst Greeting	Option to choose the Greeting format or welcome message in Virtual Analyst bot as L,M or F,M or L,F or L or F or M e.t.c. Last Name(L), Middle Name(M), First Name(F). Regex being used internally for validation: ([LlMmFf])([,]*)([LlMmFf]?)([,]*)([LlMmFf]?) For example: When specified as **L**, welcome message is Hi <**LastName**>. When specified as **L M** welcome message is Hi <**LastName**> <**MiddleName**>. . When specified as **L**, **M** welcome message is Hi <**LastName**>, <**MiddleName**>. In case of an invalid format, the welcome message will be something like: Hi <**Lastname**>, <**Firstname**> <**Middle Name**>
Chat with Analyst	Provides an ability to enable/disable chat with an analyst in Service Point.
Mask Analyst Name	Specify a preferred name to mask the Analyst name in Service Point.
Chat Icon	Upload and save an icon of your choice. This icon will be used to launch the Chat interface. Recommended image dimensions in the range of 126x140 pixels. Prohibited File Type formats defined by SDM Administrators will not be used. To view the Prohibited File types, navigate to SDM **Administration** tab, **Attachments Library**, **Repositories**, **ServiceDesk**, right-click and select **View**.
Virtual Analyst Launch Text	Add a text of your choice for the Chat Interface. This text appears adjacent to the Chat Icon.
Virtual Analyst Name	Name of the Virtual Analyst Service Bot. The default name provided with Service Point Virtual Analyst can be changed as per your requirement.

Feature	Description
Virtual Analyst Incident Template	Template used while creating an incident through Virtual Analyst.
Virtual Analyst Request Template	Request Template used while creating a request using Virtual Analyst.
Virtual Analyst Auto Categorization	Enable/Disable Auto-Categorization while creating an incident or a request. When disabled, template category is used while creating a ticket. If enabled, Virtual Analyst uses smart search to identify ticket category.
Allow Ticket Edit	Controls the end-users' ability to edit the ticket in Service Point. When set to **No**, ticket attributes cannot be modified in Service Point.
Notification Redirect This option is only available with CA Service Catalog and CA SDM integration.	When this option is selected from the Create New Feature page, the notification redirect is enabled for either: • CA Service Catalog Service Request details page. OR • The corresponding CA SDM Ticket details page. After adding Notification Redirect option using the Manage Feature/Create New Feature configuration, the **Service Request** option for Service Point is added. For Notification Redirect feature, select **Service Request** from the Create New Feature page. Default option is CA SDM Ticket. If this value is set to **Service Request**, notifications for Incidents/Requests which are created via CA Service Catalog requests will display notifications with CA Service Catalog request ID Appended to it. Click on the notification from Service Point to redirect to Catalog request. If the value is set to **SDM Ticket**, all the notifications of Incidents/Requests which are created through Catalog requests will be redirected to SDM Incident/Request. If this configuration is not set in the feature configuration list, then the behavior will remain same as before which is similar to '**SDM Ticket**'.

4. Select any feature that you want to add from the displayed Feature List. Select or give a value to a feature. To add Chat Engine, select **Virtual Analyst** as the value. For example, feature **"Chat with Analyst"** can be configured as "**Yes**" "**No**". When set to **Yes**, it provides an ability to enable chat with an Analyst in Service Point.
5. Click **Save** on the Create New Feature page.

Set Up My Resources

The vertical segment, **My Resources**, lists all the assets and Configuration Items (CI) assigned to the user. As an administrator, you must configure My Resources, for it to be displayed in Service Point.

The following predefined attributes are available for every asset and CI: `Asset Tag, Name, DNS Name, Host Name, Mac Address, and Serial Number`. Based on the organizational requirements, an administrator can create custom attributes for an asset and CI.

How to create custom object attribute

In case the predefined object attributes are not sufficient or do not match your environment, you can create custom object attributes.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **xFlow Interface**, and **Object Attributes**.
3. Click **Create New**.
4. Complete the fields as appropriate:
   a. **Object Type**Set the type as **Configuration Item**
   b. **Attribute Name**
   Name of the attribute.
   c. **Status**
   Current state of the attribute, such as active or inactive.
   d. **Attribute Value**The majic level object attribute.
   e. (Optional) **Show in Streams**
   Select the **Show in Streams** check box to display the attribute in work streams rule list.
   f. (Optional) **Show in Attributes**
   Select the **Show in Attributes** check box to display the attribute on the Ticket Details page.
5. Click **Save**.

How to display attributes

Two (2) attributes are displayed under **My Resources** section for every asset and CI assigned to the business user. The following steps explain how you can select those two attributes.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **xFlow Analyst Interface**, **Service Point**, and **Configurations.**
3. Select a configuration from the configuration list.
4. Navigate to the **My Resources Attributes** tab.
5. Click **Create New**.
6. Complete the fields as appropriate:
   a. **Active**
   Set the state of the attribute, such as active or inactive.
   b. **Configuration Item Attribute**
   Click the magnifier icon to search for an attribute from the Object Attribute List.
   c. **First Field?**
   Represents the order in which the attribute appears for the CI in Service Point.
7. Click **Save.**

Manage CA Service Catalog Featured Offerings

You can now manage CA Service Catalog featured offerings and requests in Service Point. CA Service Catalog offerings are tenant specific.

NOTE
It is recommended to avoid using page size attribute for the Select component in CA Service Catalog Form designer, when the same form needs to be rendered in Service Point.

NOTE

Ensure that you have taken into consideration the mapping between Business Unit(s) and Tenants in your environment. Common tenant administration or multi-tenant administration allows administrators to use a

single administration tool to simultaneously create and maintain business units (tenants) for multiple products, including CA Service Catalog and CA Service Desk Manager.

Perform the following steps:

1. Log in to CA SDM as an administrator.
2. Navigate to **Administration**, select **xFlow Interface**, **Service Point**, and **Configurations**.
3. Select a configuration from the configuration list, and click **Edit.**
4. From the **Catalog** drop-down list, select **YES** to show or **NO** to disable/enable the catalog featured offerings and requests in Service Point.
5. Click **Save**.

CA Service Catalog Clustered Environment Considerations

If CA Service Catalog is clustered in your environment, and you want to use the load balancer to communicate to a Catalog instance in Service Point.

NOTE

Service Point depends on CA SDM Options Manager (**Administration, CA Service Catalog, casc_endpoint**) for displaying Catalog Featured Offerings in Service Point. But in case, CA Service Catalog is clustered and you want Service Point to point to any other Catalog server or load balancer, you can override this option using the CA SDM **Administration**, **xFlow Interface**, **General, casc_endpoint** key

Follow these steps:

1. Login to CA SDM as an administrator.
2. Navigate to **Administration**, select **xFlow Interface**, **General.**
3. Search for the Configuration Key **casc_endpoint.** This configuration key is set to Inactive state by default.
4. Select the configuration key, and click **Edit**.
5. Modify the configuration Value and point to the Catalog Cluster URL and set to **Active** state.

After configuring Service Point, if you encounter some issues, for example, if you are not able to search for Catalog Featured Offerings in Service Point and other such issues, see Troubleshooting Service Point.

View Knowledge Base Articles from Service Point

Service Point provides the ability for business users to view and use the Knowledge Base (KB) documents as a solution to their immediate problem, rate and provide feedback for a KB article.

Perform the following self-service options in Service Point for a given knowledge base document:

View Knowledge Base Documents from Search Results

Service Point uses Natural Language Search (NLS) and provides relevant KB solutions based on your problem description. Or Click on any categories displayed on the Service Point Home page to see relevant KB solutions. Suggested Solutions display the list of published knowledge base articles. It provides a short synopsis of a solution for a reported issue. Click the KB article to review. You can also Open the KB solution in a new browser tab Or simply, click the Copy to Clipboard icon to copy the KB article.
When you attach a KB solution to a ticket it is displayed On Service Point Home Page, Timeline view.

View a Knowledge Base Documents from Ticket Timeline

When a KB solution is attached to a ticket, the Knowledge Base document gets linked to that ticket and is logged in the ticket timeline on the Service Point ticket detail page. In Service Point, navigate to the ticket timeline, look for or click the Solutions Used Hyperlink in a said ticket and view the KB article that is linked to the ticket. If a KB document addresses a reported issue, click **Use as a Solution** option. The suggested solution gets appended to the Ticket Timeline as a link.

Provide Comments and Feedback for a KB Solution

After viewing the complete KB article, you can provide your comments or feedback about a KB article/solution provided to you in the comment box. Click Submit. You can view any other existing comments on a selected KB document.

Rate a Knowledge Base Document

You can rate a KB article and give a rating on a scale of 1-5.. If a KB article is not rated, "Be the first to rate this Document" is displayed so that user can rate it. if it is rated, the rating is displayed on a scale of 1-5 star representation. Additionally, if a KB article is accepted as a solution for a ticket, that information is available as Number of times it has been accepted as a solution.
The rating on a scale of 1-5 represents the following:

- 1 Star & 1.5 star - Poor
- 2 star & 2.5 star - Fair
- 3 star & 3.5 star - Average
- 4 star &4.5 star - Good
- 5 Star - Excellent

Manage Smart Search

This article introduces you to Smart Search and related concepts.

> **TIP**
>
> This article is applicable for an CA Service Desk Manager and CA Service Catalog integrated environment. Before you follow this article, follow the instructions on Manage CA Service Catalog Featured Offerings.

Introduction to Smart Search

Business-users can ask a question or describe an issue using the Smart Search bar. The Smart Search displays categories, service offerings, and 20 most relevant Suggested Solutions that match the search query. The Smart Search results are based on the following parameters: `search terms` , user context, minimum weight, and maximum weight.

Based on the organizational requirement and to optimize the search relevance, an administrator can customize smart search.

Customize Smart Search

Based on the organizational requirement and to optimize the search relevance, an administrator can customize smart search.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **xFlow Interface**, **Service Point**, and **Configuration**.
3. In the name column, select the desired tenant configuration name.
4. From the list of components, select **Smart Search**.
   The smart search details for categories and service offerings are displayed.
5. To modify the smart search details, click **Edit** at the top right of the screen.

   > **WARNING**
   >
   > It is recommended you do not modify the minimum and maximum weights. However, you may `swap` the maximum values for Categories and Service Offerings.
6. Edit the following fields for Categories:

- **Minimum Weight**
- **Maximum Weight**
- **Search Term**

7. Edit the following fields for Service Offerings:
   - **Minimum Weight**
   - **Maximum Weight**
   - **Search Term**
8. Click **Save**.
9. If you modify the **Search Term**, verify the Elasticsearch cluster node is working.
10. Manually execute the **pdm_es_initial_load** command:
    `$ES_HOME/search/bin/pdm_es_initial_load.bat index=sp_index.autocat_search`

Smart Search with Fuzziness

Fuzziness is an elasticsearch concept which returns a list of results even though the search strings or spellings may not exactly match. Fuzziness is a way for smart search to handle small typos in search strings and still return the right results. For example, matching the string, `network printer not functional` with `network printre not functional` requires some form of fuzzy matching.

Fuzziness is disabled for Service Point as it may have a negative impact on the search relevance. However, based on an organisation's requirements, an administrator can enable fuzziness.

Follow these steps:

1. Navigate to the default location, <`xFlow_Home>\APPS\Services\searchmicroservice-17.0.479\conf` and open **application.conf** file in a text editor.
2. Update the `searchQueryWithContext` and `searchQueryWithContextAndTenant` as follows:
   Current:

   ```
   "minimum_should_match": "%s",
   "tie_breaker": 0.3
   }
   ```

   Update:

   ```
   "minimum_should_match": "%s",
    "tie_breaker": 0.3,
     "fuzziness": "AUTO",
     "prefix_length": "3"
   }
   ```

3. Restart the xFlow Interface services.

Configuration Keys for Smart Search

The following pre-defined configuration keys are used by Smart Search:

- esearch.default.slcm.context.range.time
- esearch.default.slcm.context.scheduler.interval
- smartsearch.query.minmatch
- smartsearch.tickets.resolved.time

> **NOTE**
>
> **Information:** To lookup for the configuration keys, navigate to the **Administration** tab, select **xFlow Interface**, and **General**.

Recommendations:

- Use the predefined configuration **key:values**.
- Restart the xFlow Services if you modify the pre-defined configuration key values.

Enable the Guest Login

Guest accounts allow temporary login to Service Point without requiring to provide credentials. The guest login option is available on the Service Point login page.

While creating a ticket in Service Point, a guest user must provide an email address or phone number to complete the ticket creation process. Guest users cannot view the ticket they created if they logout and log back in. This article explains how to enable guest login for Service Point.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to **Administration**, **Options Manager**, **Security,** use the **GUEST_USER_NAME** option in SDM to Install/ Uninstall Guest Login.
   a. Value of **GUEST_USER_NAME** is the user ID of contact which is used for guest login.
   b. If **GUEST_USER_NAME** option is uninstalled or the value is empty, it will disable the guest login.
   c. Guest login works only when Authentication type is set to **Basic Authentication** type (Navigate to **Administration**, **xFlow Interface**, **General**, **General Configuration**, and update the authentication type to **BASIC**.

Configure the xFlow Interface

The xFlow Interface provides analysts the ability to understand the IT environment, prioritize work and make decisions. Data-driven intelligence improves the productivity of the analyst and enables them to understand the workload for the day and the list of activities to be completed.

This article contains the following topics:

- Configure Security Plugin to Access the Search Server
- Enable Services for xFlow Interface
- Configure Search Server Cluster
- Configure Search Servers in CA SDM
- Configure Event-Based Load
- Perform Initial Load and Refresh Index and Data on the Search Server
- View Configuration
- Command Bar
- Configure the xFlow Interface Server Services
- Heat
- Ticket Attributes
- Weather
- Work Stream
- Push Notification Service
- Enable the Research Tool Extension
- Configure the xFlow Interface Cache Size
- Enable SAML Authentication for xFlow Interface
- Configuration Changes for xFlow Interface
- App Launcher - Apps Configuration and Role Switching
- Manage Chat

Configure Security Plugin to Access the Search Server

Configure the CA Security Plugin to authorize the hosts that access the search server based on your environment requirements.

NOTE

The search server uses two ports, an HTTP port and a TCP port. The CA security plugin authorizes only the HTTP port.

Elastic Search Server 7.17.6

Perform the following steps if you have Elastic Search Server 7.17.6 in your environment:

1. Navigate to where you have installed Elastic Search Server 7.17.6 and edit the elasticsearch.yml file:
   For example:
   ```
   <install_home>\CASearchServer\elasticsearch-7.17.6\config
   ```
   In case, if you do not have elasticsearch-7.17.6 full license, add the below in the elasticsearch.yml file:
   ```
   xpack.security.enabled: false
   ```
2. Configure the IP address or the host names of the servers that can access the search servers.
   ```
   ca-es-security-plugin:
         enable: true
         enable-x-forwarded-for: true
         allowed-list-of-hosts: [host1, host2, ...]
   ```
   NOTE

   By default, the security is disabled for the search servers.
3. Save and close the file.
4. Restart the *CA Search Server* service.
   The security is enabled and only the hosts that are specified in the *allowed-list-of-hosts* parameter can access the search server.

Enable Services for xFlow Interface

Enable the xFlow Interface services and Search Server services if the xFlow Interface is installed.

The failure to do so, results in the following:

- xFlow Interface will not load to the login screen.
- Interruption of all the daemons of the xFlow Interface and does not allow the latest information to be displayed.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **Options Manager**, and **General**.
3. From the list of options, select **xFlow_installed**.
4. Click **Edit** and set the **Optional Value** to **Yes.**
5. Click **Save**.
6. Restart the *CA Service Desk Manager* service.
7. Restart the *CA xFlow Interface* service.
8. *Restart the CA Service Management Search Server service.*

Configure Search Server Cluster

A CA Service Desk Manager administrator can optionally create a cluster of search servers to provide improved performance and fail over protection.

Elastic Search Server 7.17.6

Perform the following steps if you have Elastic Search Server 7.17.6 in your environment:

- Create a Cluster for Search Server 7.17.6
- Manage Search Server 7.17.6

Create a Cluster for Search Server 7.17.6

Perform the below steps:

1. As an administrator, log in to the search server where you want to add the cluster.
2. Navigate to the location where you have installed Elastic Search Server 7.17.6: <elastic-search-installation>\elasticsearch-7.17.6\config folder and edit the *elasticsearch.yml* file.
3. Navigate to the *Cluster* section and add the following properties after the *cluster.name* property:
   a. ***node.master****: true*
      Define the value as *true* to ensure that the node is eligible as a master node.
   b. ***node.data****: true*
      Define the value as *true* to ensure that the node also services the data requests.
   c. **discovery.seed_hosts**: ["<search server 1>:9300", "<search server 2>:9300","<search server 3>:9300"] and so on for other search servers in your environment.
      Edit the *elasticsearch.yml* file in *search server 1,* and define the *search server 2*, and *search server 3* host names in the file. Similarly, repeat the configuration in other hosts.
   d. **cluster.initial_master_nodes**: Host name of your first search server in a cluster. For example: <search server 1>.
      NOTE
      For all search servers in a cluster, provide the host name that you have provided for the first search server <search server 1>. For example, in case of search server 2, provide the host name in **cluster.initial_master_nodes** as **<search server 1>**.
4. Save and close the file.
5. Restart the *CA Search Server* service.
6. Restart the *CA **xFlow Interface*** service.
   After the services start, the search cluster is created.
7. Repeat steps 1 - 6 on all the search servers.
8. Manage Search Server 7.17.6

Manage Search Server 7.17.6

As an administrator, you can add or edit the details of the servers in the cluster. For example, if you add an eligible master search server to the cluster, you can edit the minimum number of eligible master nodes property.

Follow these steps:

1. Navigate to the <elastic-search-installation>\config*elasticsearch.yml* file and edit these properties, if necessary, complete the following information:
   a. *http.port:* <port-number-for-the-search-server>
      Update the port number when the default port is changed. For example, if the port number is already in use, define another port number for the search server.
2. Update the cluster details in the CA SDM, **Administration**, **xFlow Interface** , **Search Servers** page.
   For more information about configuring search servers, see Configure Search Servers in CA SDM.
3. Restart the CA Search Server service.

4. Restart the *CA Service Management xFlow Server* service.
5. Verify the configuration:
   a. Ensure that the search servers and the **xFlow Interface** services are running.
      To troubleshoot Search Server, refer the search server logs.
   b. Log in to the **xFlow Interface** and perform the search.

NOTE

After you configure and manage the cluster, you can configure the CA Security plugin to secure the search server. For more information, see Configure Security Plugin to Access the Search Server.

Configure Search Servers in CA SDM

The **Search Servers** page allows you to view and update the search server details. The configuration is internally referred to by the search processes. For example: Loading the CA SDM data into Elasticsearch server processes. When you update the server details on the search server and when you configure the search server cluster, update the same configuration on the CA SDM server. Perform the following steps to configure search servers in CA SDM:

1. Log in to CA SDM as an Administrator.
2. Navigate to **Administration**, **xFlow Interface** , **Search Servers**.
   The list of search servers that are configured during installation is displayed.
3. Search for the required server by entering the server name.
4. Click **Edit** to edit the applicable server details, such as the HTTP or TCP port and save.
5. Restart the CA SDM services.
6. Restart the *CA **xFlow Interface*** service.
   The search services reference the updated server details.

Configure Event-Based Load

Event-based load (EBL) is a process that runs in the background and periodically updates the search server with the changes in CA SDM. EBL is a preconfigured process and takes the default values.

Configure EBL on the following servers:

- Primary server in conventional configuration
- Background server in advanced availability configuration

NOTE

We recommend that you configure the EBL variables only in scenarios, such as implementing SSL or when you encounter issues that are related to connectivity or database.

Follow these steps:

1. Log in to the CA SDM server as an administrator.
2. Execute the following command to configure the required EBL variable:

```
pdm_options_mgr -c -a pdm_option.inst -s <parameter_name> -v <parameter_new_value> -t
```

Where,
-c, updates the changes to the secondary servers
-a, updates the NX.env file
-t, updates the parameter in the template file
For example, if you want to increase the wait time of the connection before timeout to 20 seconds, configure the parameter as follows:

```
pdm_options_mgr -c -a pdm_option.inst -s ES_HTTP_CONNECTION_WAIT_TIMEOUT -v 20 -t
```

3. Repeat step 2 to configure more variables.
   For more information about the default EBL parameters that you can configure, see Default EBL Variables.
4. Restart the *CA Service Desk Manager* service.
5. (Optional) In Advanced Availability, perform rolling maintenance to apply the NX options on all application servers.
6. Navigate to the *$NX_ROOT* folder and verify that the variables are set to the updated values in the *NX.env* file.

Default EBL Variables

Variable Name	Description	Default Value
ES_HTTP_CONNECTION_WAIT_TIMEOUT	Max wait time in seconds to get HTTP connection.	10 (in seconds)
ES_HTTP_CONNECTION_TIMEOUT_AFTER	Timeout connection after x seconds.	10 (in seconds)
ES_HTTP_CM_CONNECTION_KEEP_ALIVE_TIME	Time to keep the HTTP connection alive (seconds).	300 (in seconds)
ES_HTTP_IDLE_CONNECTION_CLOSE_TIME	The idle time of connections to be closed (seconds).	300 (in seconds)
ES_HTTP_WAIT_TIME_BEFORE_CLOSE	The idle time of connections to be closed (seconds).	240 (in seconds)
ES_PUSH_THREAD_SLEEP_TIME	Thread sleep time for search Data Push (seconds).	30 (in seconds)
ES_DB_SUPPORT	*If value is set to On, it uses database to store data, before sending to search.*	on
ES_ORA_MIN_LIMIT	Oracle database minimum connection pool.	2
ES_ORA_INITIAL_LIMIT	Oracle database initial connection pool.	2
ES_ORA_MAX_LIMIT	Oracle database maximum connection pool.	5
ES_DB_BATCH_SIZE	Oracle database batch size.	100
ES_HTTPS_CERT_PATH	For the HTTPS protocol, define the certificate path.	<certificate_path>\server.keystore
ES_HTTPS_CERT_PWD	For the HTTPS protocol, define the encrypted password.	<encrypted password>

NOTE

If you configure HTTPS to connect to the search server, the ES_HTTPS_CERT_PATH and ES_HTTPS_CERT_PWD variables are mandatory.

Perform Initial Load and Refresh Index and Data on the Search Server

This article contains the following topics:

Configure the Indexes

Before you perform initial load or refresh index and data on the search server, you can configure the indexes that you want to load or refresh. Search currently supports the following indexes:

- sdm_index_cnt (users)
- sdm_index_kd (knowledge document)
- sdm_index_nr (configuration items)
- sdm_index_cr (incidents and requests)
- sdm_index_kdlinks (suggested solutions)
- sdm_index_pcat (category)
- catalog_index_service_offering (offerings)
- catalog_index_service_request (requests)

NOTE

By default, the **dataload_limit** is set to one year. You can use this parameter to limit the initial load data for number of years.

By default, all these indexes are configured.

WARNING

You cannot add new or custom indexes other than what **Search** server currently supports.

Follow these steps:

1. As an administrator, log in to the search server and navigate to the *<es_install>\config* folder and edit the *config.yml* file.
2. In the config.yml file, remove the index you don't want to configure from the **objects** and **index** section.
   For example:
   ```
   sdm_index_kd (knowledge document)
   catalog_index_service_request (requests)
   ```
3. By default, the **dataload_limit** is set to one year. You can use this parameter to limit the initial load data for number of years.

   ```
   dataload_limit: 1y
   ```
4. Save and close the file and perform initial load.

Data Verification

Execute the query against the MDB database to verify data:

- **Oracle**:

```
select * from usm_offering where (date_available <= to_date('1901-12-13','yyyy-mm-dd')
or date_available >= to_date('2038-01-19','yyyy-mm-dd'))
or (date_unavailable <= to_date('1901-12-13','yyyy-mm-dd')
or date_unavailable >= to_date('2038-01-19','yyyy-mm-dd'))
or (date_cancelled <= to_date('1901-12-13','yyyy-mm-dd')
or date_cancelled >= to_date('2038-01-19','yyyy-mm-dd'))
```

- **SQL**:

```
select * from usm_offering where (date_available <= CONVERT(DATETIME, '1901-12-13', 102)
or date_available >= CONVERT(DATETIME, '2038-01-19', 102))
or (date_unavailable <= CONVERT(DATETIME, '1901-12-13', 102)
or date_unavailable >= CONVERT(DATETIME, '2038-01-19', 102))
or (date_cancelled <= CONVERT(DATETIME, '1901-12-13', 102)
or date_cancelled >= CONVERT(DATETIME, '2038-01-19', 102))
```

WARNING

We recommend you update the data and run the rebuild index, if the query returns any results.

Perform Initial Load on the Search Server

Initial load is an activity that is typically performed when you install search server using the installer. Initial load prepares the search server with the index and data that are imported from the CA SDM and CA Service Catalog database that is used by search in xFlow Interface.

WARNING

We recommend that you perform the initial load task during off peak hours as it affects the CA SDM server performance.

If you perform the initial load action after installation, execute one of the files based on your operating system:

- *$ES_HOME/search/bin/pdm_es_initial_load.bat (Windows)*
- *$ES_HOME/search/bin/pdm_es_initial_load.sh (Linux)*

This file creates an index and loads the data into the search server.

When you execute the file from the command prompt, you can use the following options:

- *$ES_HOME/search/bin/pdm_es_initial_load.bat [v, V] [h, help] (Windows)*
- *$ES_HOME/search/bin/pdm_es_initial_load.sh [v, V] [h, help] (Linux)*

Where,

v, V: This option displays the data load version. You can use any option with the batch file.

h, help: This option displays the help on the batch file. You can use any option with the batch file.

NOTE

To perform initial load on a specific index on Windows, execute the command as *$ES_HOME/search/bin/pdm_es_initial_load.bat index=<index_name>.*

For example, to perform initial load on *sdm_index*, execute the command as *$ES_HOME/search/bin/pdm_es_initial_load.bat index=sdm_index*

Refresh Index and Data on the Search Server

Typical scenarios to refresh the index and data:

- When you execute the *pdm_load* command on the users, assets, knowledge base, or tickets (incidents and requests) data.
- To refresh the changes that are done to the dependent indexes, such as changes to the location or asset class name.
- When you enable or disable tenancy.

If you selected to run initial load while configuring the Search Server details from the common installer, pdm_es_rebuild is run by default. when initial load is not checked while configuring the Search Server Details, you must manually execute the *pdm_es_rebuild* command.

- *$ES_HOME/search/bin/pdm_es_rebuild_index.bat (Windows)*
- *$ES_HOME/search/bin/pdm_es_rebuild_index.sh (Linux)*

When you execute the batch file from the command prompt, you can use the following options:

- *$ES_HOME/search/bin/pdm_es_rebuild_index.bat [v, V] [h, help] (Windows)*
- *$ES_HOME/search/bin/pdm_es_rebuild_index.sh [v, V] [h, help] (Linux)*

Where,

v, V: You can use any option with the file. This option displays the data load version.

h, help: You can use any option with the file. This option displays the help on the file.

NOTE

To refresh a specific index on Windows, execute the command as *$ES_HOME/search/bin/ pdm_es_rebuild_index.bat index =<index_name>.*

For example, to refresh the *catalog_index* index, execute the command as *$ES_HOME/search/bin/ pdm_es_rebuild_index.bat index=catalog_index*

NOTE

To load the local specific service offerings, execute the command as: *$ES_HOME/search/bin/ pdm_es_rebuild_index locale=local_name*

For example, to load the service offering data in Japanese, execute the command as *$ES_HOME/search/bin/ pdm_es_rebuild_index locale=ja_JP*

Refresh the Smart Words for Command Bar in the Search Server

Smart Words that are created in CA SDM are not automatically updated in the Search Server. Therefore, when you type a new smart word in the Command Bar, the associated categories and templates do not display because the Search Server is not updated with the latest Smart Words.

TIP

: We recommend that you schedule a reindex at specific intervals to maintain the latest smart words and associated categories and templates in the Search Server.

Schedule a Refresh on Windows

The example in this procedure schedules the refresh once every week.

Follow these steps:

1. From the **Start** menu on the *CA Search Server*, open the **Windows Task Scheduler**.
2. For example, on Windows Server 2016/ 2019/ 2022, go to **Control Panel**, **System and Security**, **Administrative Tools**, **Task Scheduler**.
3. Click **Create Task**.
4. On the **General** tab, type a name for the task.
   - Select the check box for **Run** whether user is logged in or not.
5. Navigate to the **Actions** tab and click **New**.
   - In the **Action** field, select **Start** a program.
   - In the **Program/script** field, type the execution script name as *pdm_es_rebuild_index.bat index=sdm_autocat_index*.
   - In the **Start in (Optional)** field, set the root path of *pdm_es_rebuild_index.bat index=sdm_autocat_index* script and click **OK**.
     For Example: C:\es\bin\
6. Navigate to the **Triggers** tab and click **New**.
   - In the **Settings** field, select *Weekly*.
   - In the **Start** field, select *12:00:00 AM*.
   - In **Recur every** field, type *1*, and select a day from the list, and click **OK**.
7. On the **Create Task** dialog, click **OK**.
   You have completed scheduling the Windows task to refresh the auto-categorization index.

Schedule a Reindex on Non-Windows

Define a cron job to schedule a reindex on Linux.

Prerequisite

Enable the execute permission for the user executing the reindex script.

Follow these steps:

1. As an administrator, log in to the search server.
2. Navigate to the *<search_server_install>/search/bin* folder.
3. Execute the following command to open the cron job file for editing.

```
crontab –e
```

4. Define the cron job schedule.

Crontab job scheduling pattern:

```
# Minute  Hour         Day of Month       Month                   Day of Week          Command
# (0-59)  (0-23)       (1-31)             (1-12 or Jan-Dec)       (0-6 or Sun-Sat)     path_to_script
```

Cron job command examples:

```
# execute every minute
* * * * *  cd /root/<search_server>/search/bin && ./pdm_es_rebuild_index.sh index=sdm_autocat_index

# execute every 5 minutes
*/5 * * * *  cd /root/<search_server>/search/bin && ./pdm_es_rebuild_index.sh index=sdm_autocat_index

# execute every Friday 1AM
0 1 * * 5  cd /root/<search_server>/search/bin && ./pdm_es_rebuild_index.sh index=sdm_autocat_index

# execute on workdays 1AM
0 1 * * 1-5 cd /root/<search_server>/search/bin && ./pdm_es_rebuild_index.sh index=sdm_autocat_index

# execute 10 past after every hour on the 1st of every month
10 * 1 * * cd /root/<search_server>/search/bin && ./pdm_es_rebuild_index.sh index=sdm_autocat_index
```

You can define a cron job that is based on the scheduling pattern or can enable the cron job from the examples.

5. Save and close the file.

NOTE

To view the cron job, execute the following command: *$ crontab -l*

select * from usm_offering where (date_available <= to_date('1901-12-13','yyyy-mm-dd') or date_available >= to_date('2038-01-19','yyyy-mm-dd')) or (date_unavailable <= to_date('1901-12-13','yyyy-mm-dd') or date_unavailable >= to_date('2038-01-19','yyyy-mm-dd')) or (date_cancelled <= to_date('1901-12-13','yyyy-mm-dd') or date_cancelled >= to_date('2038-01-19','yyyy-mm-dd'))

View Configuration

This article contains the following topics:

Card and List View

An administrator can configure the attributes displayed in the card and list view.

A total of 10 predefined attributes are set to be displayed on the card and list view. The first four attributes are fixed and cannot be customized. Rest of the attributes (6) can be customized.

Follow these steps:

1. Log in to CA SDM as a system administrator.
2. Navigate to the **Administration**, **xFlow Interface** , **View Configuration**, **Card and List View**.
3. Select the **Ticket type**.
   The List and Card View Configuration Detail page appears.
4. Click **Edit**.
5. From the list of customizable attributes, select an attribute that you wish to modify.
6. Click **Edit**.
7. Enter the **Attribute Name** or click the magnifier icon to search for an attribute name.
   Search results display OOTB attributes available in the Object Attribute List (**Administration**, **xFlow Interface**, **Object Attributes**).
   Filter the attributes based on the object type: **Incident**, **Request**, and **Problem**.
8. Select the attribute and click **Save**.

   NOTE

   The analysts cannot sort tickets by description, due to limitation in the database for NTEXT or NCLOB data types.

   The attributes configured here will be used by the analyst to filter and sort tickets on the interface. For more information on sorting, see Enable Sort for New Attributes.

   Notify the analysts to re-login for the change to take effect.

Enable Sort for New Attributes

After configuring a new attribute to be displayed in the card and list views, perform the following steps to make the attribute available for sorting on the interface.

Follow these steps:

1. Log in to the following CA SDM server where WSP is installed, depending on your CA SDM configuration:
   - Conventional: Primary server
   - Advanced availability: Background server
2. Start WSP using any of the following actions, depending on the operating system that is installed on the CA SDM server:
   - (Windows) From the Start menu, select Program Files, CA, CA SDM, Web Screen Painter.
   - (UNIX) Enter the command pdm_wsp with $NX_ROOT/bin in your path.

   The Web Screen Painter login window opens.
3. Enter your login credentials.
4. Select Tools, and Schema Designer.
5. For ticket type as Incident:
   a. Select *in (Incident)* table and click the Domset tab.
   b. Right click on *in_list_l1_web* and click Properties.
   c. Add the new Attribute Value in the **sort columns** field.
   d. Select **Save**.
   e. Right click on *in_list_l1_web_static,* click Properties, and follow steps 5c - 5d.

f. Select File, Save and Publish.

6. For ticket type as Request:
   a. Select *cr (Request)* table and click the Domset tab.
   b. Right click on *cr_list_l1_web and* click Properties.
   c. Add the new Attribute Value in the **sort columns** field.
   d. Select **Save**.
   e. Right click on cr_list_l1_web_static, click Properties, and follow steps 6c - 6d.
   f. Select File, Save and Publish.
7. Stop the *CA Service Desk Manager Server* service.
8. Run the following command:

```
pdm_publish
```

9. Restart the *CA Service Desk Manager Server* service.

Detail View

An administrator can configure the attributes that are displayed in the Workflow Tasks details.

The first three attributes are fixed and cannot be customized. Those attributes are: **Task**, **Sequence**, and **Description**.

Follow these steps:

1. Log in to CA SDM as a system administrator.
2. Navigate to the **Administration** tab, select **System**, **xFlow Interface** , **View Configuration**, and **Detail View**.
3. Select the **Object type**.
   The Detail View Attributes page appears.
4. Click **Detailed View Attribute**.
5. Enter the **Sequence** of the attribute.
6. Enter the **Attribute Name** or click the magnifier icon to search for an attribute name.
   Search results display the attributes available in the Object Attribute List.
7. Set the **Attribute Status** as **Active.**
8. Select the **Read Only** checkbox if the attribute value cannot be modified.
9. Select the **Required** checkbox if the attribute is mandatory and requires an input.
10. Click **Save**.

Command Bar

You can use the Command Bar to manage text commands, add additional ticket attributes for new tickets, and configure smart words.

> **NOTE**
> Copy and Paste operations are not supported for Command Bar in xFlow Interface.

This article contains the following topics:

Commands

All the commands are in the *Active* state by default.

Disable a Command

As an administrator, you can only disable command from the command bar. You cannot create or add a new command.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **xFlow Interface** , **Command Bar,** and **Commands**.
3. Select the command you want to disable.
   The command detail page appears.
4. Click **Edit**.
5. Set the **Status** to **Inactive**, and click **Save**.

Modify the Command Alias

As an administrator, you can modify the command alias. An Alias is optional and can be used in place of the command.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **xFlow Interface** , **Command Bar,** and **Commands**.
3. Select the command for which you want to modify the alias.
   The command detail page appears.
4. Click **Edit**.
5. Modify the **Alias 1**, and click **Save**.
   The command Alias is saved.

Exclude Attributes for the Set command

An administrator must exclude system level attributes for the Set command.

Follow these steps:

1. Access the **casm.conf.do-not-change.js** file located in C:*Program Files\CA\xFlow\APPS\UI\Apache24\htdocs\conf* folder.
2. Locate the key: *customattribExclusions.*
3. To the existing list, add the system level attribute that you want to exclude for the Set command.
4. Click **Save**.
5. Restart the **CA Service Management xFlow Server** Service.

> **NOTE**
>
> We recommend to exclude any system level attributes for the Set command. This includes and is not limited to the following attributes: *Call Back Flag, Closed On, Heat, Id, Last Modified, Modified By, Opened On, Resolved On, Reported by, SLA Violation, Ticket Number, Type, Persistent id, Predicted Sla Violation*, and *Priority* (When APC is enabled)

New Ticket

Default Ticket Type

A ticket in the **xFlow Interface** can be an incident or a request. An administrator can set a default ticket type for the tickets created by the analysts.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **System**, **xFlow Interface** , and **General**.
3. From the General Configuration List, select **TicketType**.
4. Click **Edit** and enter one of the following values in the **Configuration Value** field:
   0: The ticket type is Incident.
   1: The ticket type is Request.

2: The ticket types are Incident and Request. However, the default ticket type is Incident.
3: The ticket types are Incident and Request. However, the default ticket type is Request.

5. Click **Save**
   The default ticket type is saved.

Attributes Displayed While Creating a Ticket

To capture additional information for a ticket, an administrator can mandate attributes to be displayed when a ticket is created.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **xFlow Interface** , **Command Bar**, and **New Ticket**.
3. Click **Create New**.
   The Create a New Ticket Attribute page appears.
4. Complete the fields as appropriate:
   StatusIndicate if the attribute is active or inactive.
   Ticket Attribute
   Click the magnifier icon to search for an attribute to be displayed while creating a ticket.Search results display attributes available in the Ticket Attribute list.

   NOTE

   We recommend not adding any system level attributes to be displayed while creating a ticket. This includes and is not limited to the following attributes: *Active, Call Back Flag, Closed On, Customer, Description, Heat, Id, Last Modified, Modified By, Opened On, Resolved On, Reported by, SLA Violation, Ticket Number, Type, Persistent id, Predicted Sla Violation*, and *Priority* (When APC is enabled)

   Default Value(Optional) Click the magnifier icon to search and assign a default value to the attribute.
5. Click **Save**.

Smart Words

Smart Words are suggestions with which you can auto-categorize and apply template to a ticket.

Command bar identifies the smart words when an analyst enters the description of the reported issue. Each smart word has one or more associated categories and templates.

For example, you can create a mapping for smart words like *outlook*, *express*, *lotusnotes* and *macmail*, and assign a Category (For example, *Email*) and a Template (For example, *ITIL Email* and *ITIL Software*).

When you upgrade to CA Service Management 14.1.03, a list of smart words are generated based on the ticket information stored within the Search Server or CA SDM Server. However, smart words defined by the administrator have higher preference than the server-generated smart words.

Create a Smart Word

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **xFlow Interface** , **Command Bar**, and **Smart Words**.
3. Click **Create New**.
   The Create New Smart Word page appears.
4. Complete the following fields as appropriate:
   a. **Category**: Click the magnifier icon to search for a category.
   b. **Keyword**: Provide the list of keywords (separated by space) to be associated with the selected category.
   c. **Status**: Indicates if the attribute is active or inactive.

5. Click **Save**.
6. After creating a smart word, you can add or attach a template to it. Select a Smart word and from the Smart Word Detail page, select **Add Template**.
   You can add a template based on your ticket type (Incident or Request).

   TIP

   Ensure that you have configured a schedule to refresh the smart words in the search server. The smart words that you define in CA SDM are added to the search server only when you refresh the auto categorization index. For more information about refreshing the auto categorization index, see *Refresh the Smart Words for Command Bar in the Search Server* topic in Perform Initial Load and Refresh Index and Data on the Search Server.

Configure the Smart Words

As an administrator, you can configure the number of categories and templates that you can view in the command bar.

Follow these steps:

1. Log into CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **xFlow Interface** , **General**.
3. Edit the *esearch.default.categoryNtemplate.suggestions* property and define a configuration value.
   For example, set the value as *esearch.default.categoryNtemplate.suggestions=5.*
4. Click **Save**.
5. Restart the *CA Service Management xFlow Server* service.
   The command bar displays the defined number of categories and templates that match the smart word. For example, if your smart word is *Outlook* and the parameter value is 5, the command bar displays the first five categories and templates that match the smart word. In this example, it displays 10 suggestions, five each of the matching category and template.

Attach a Service Type Event or Update a SLA

You can also attach a Service Type Event to a ticket or Update a SLA using the **xFlow Interface** Command Bar Option. For more information see, Manage Service Type Events (SLA) - xFlow Interface.

Configure the xFlow Interface Server Services

CA SDM Administrators can configure xFlow Interface Server services from the CA SDM console **Administration**, **xFlow Interface** , **General** tab. The variables that you define on this page are used by the incident, search, and notification services.

NOTE

After updating the variables in the **General** configuration page, restart the xFlow Interface services. The xFlow Interface services read only the active records or configurations.

If you want to override these variables from any specific service, define the variables in the **application.conf** file of the corresponding service that is located in the conf directory. Always restart the xFlow Interface Server services after defining the variables in the **application.conf** file. Variables that start with cache are related to caching. The format of cache variable is ***cache.<cache-name>.<cache-parameter>*** . The description of each configuration variable can be found in the respective configuration details page.

WARNING

Define the values for the variables in the specified format to avoid erroneous values for the xFlow Interface.

For more information about configuring the servers, see the following topics:

- Configure xFlow Interface Cache Size
- Configure Suggested Experts Search
- Configure Suggested Solution Search
- Configure Multi-faceted Search

Configure Suggested Experts Search

As an administrator, you can configure the search scope for suggested experts. The suggested experts are listed based on the maximum number of resolved tickets that match the defined scope.

NOTE

To make the search more efficient and relevant for the analyst, you can configure the noise words. After you configure the noise words, refresh the index and data on the search server to include the latest noise words in your searches.

Configure Suggested Experts from CA SDM

Follow these steps:

1. As an administrator, log in to CA SDM and navigate to **Administration**, **xFlow Interface** , **General**.
2. Edit the following parameters:
   – suggested.experts.numberOfSuggestedExperts
   Indicates that number of suggested experts to display in the ticket details page. For example, if you configure the number as 15, the ticket details page, displays the first five and upon scrolling you can view the next five results, until the limit is reached.
   – suggested.experts.searchDurationInMonths
   Indicates that the search is performed on records for the defined period (in months). For example, if you define the duration as one year, the search is conducted on records of the past one year.
3. Restart the *CA Service Management xFlow Interface Server* service.

Configure Suggested Solution Search

As an administrator, you can configure the search scope for suggested solutions. The suggested solutions are listed based on the maximum number of matching keywords in the published articles and resolved tickets that match the defined scope.

NOTE

To make the search more efficient and relevant for the analyst, you can configure the noise words. After you configure the noise words, refresh the index and data on the search server to include the latest noise words in your searches.

Configure Suggested Solution from CA SDM

Follow these steps:

1. As an administrator, log in to CA SDM and navigate to **Administration**, **xFlow Interface** , **General**.
2. Edit the following parameter:
   – esearch.default.numberOf.suggestedsolutions
   Indicates that number of suggested solutions to display in the ticket details page. For example, if you configure the number as 15, the ticket details page, displays the first five and upon scrolling you can view the next five results, until the limit is reached.
3. Restart the *CA Service Management xFlow Interface Server* service.

Configure Multi-faceted Search

As an administrator, you can configure the multi-faceted search scope on specific fields that are related to facets; for example, you can set the search scope for users who are based on their email and user ID.

NOTE

To make the search more efficient and relevant for the analyst, you can configure the noise words. After you configure the noise words, refresh the index and data on the search server to include the latest noise words in your searches.

Configure Multi-faceted Search from CA SDM

Follow these steps:

1. As an administrator, log in to CA SDM and navigate to **Administration**, **xFlow Interface** , **General**.
2. Edit the following parameters:
   - esearch.searchable.objects: Enable or disable the facets in the Multi-faceted search.
     Search currently supports four facets: users (cnt); knowledge document (kd); configuration items (nr); incidents and requests (cr). This parameter allows you to enable or disable the facets in the Multi-faceted search drop-down.
   - esearch.cnt.searchable.columns: Define the searchable fields for the User facet.
     You can define from the following fields: cnt: first_name; last_name; middle_name; userid; email_address; tenant.name; location.name; phone_number; alt_phone; mobile_phone
   - esearch.kd.searchable.columns: Define the searchable fields for knowledge base facet.
     You can define from the following fields: persid; title; problem; kd_summary; resolution; tenant.name

     NOTE

     We currently support only 32 KB of characters in *resolution* field. The search scope is limited to the number of characters you define in the *resolution* field.
   - esearch.nr.searchable.columns: Define the searchable fields for the Assets facet.
     You can define from the following fields: resource_name; class.name; family.name; mac_address; dns_name; serial_number; location.name; tenant.name
   - esearch.cr.searchable.columns: Define the searchable fields for the incidents and requests.
     You can define from the following fields: inc_id; summary; description; tenant.name; ref_num
3. Restart the *CA xFlow Interface Server* service.

Heat

Heat is a composite representation of various attributes and conditions that define the criticality of a ticket.

Heat provides the analysts with a multi-dimensional scoring model to prioritize tickets and understand the amount of attention a ticket must receive.

NOTE

You can create a heat configuration at a group level or at a tenant level for each object type (Incident and Request).

This article contains the following topics:

Configure Heat

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **xFlow Interface** , and **Heat**.

3. Click **Create New**.
   The Create New Heat Configuration page appears.
4. Complete the following fields as appropriate:
   - **Heat Configuration Name**Specify the heat configuration name.
   - **Code**Specify the internal code for the heat configuration.
   - **Status**Indicate if the heat configuration is active or inactive.
   - **Group**Select the group to calculate heat for the tickets belonging to that group.
   - **Object Type**Indicate if the heat configuration is incident or request.
   - **Threshold - Minimum**Specify the minimum value to calculate range for the heat configuration.
   - **Threshold - Maximum**Specify the maximum value to calculate range for the heat configuration.
   - **Maximum Weight**Specify the maximum possible heat associated with a ticket.
     This is a non-editable field and the value is calculated automatically based on the sum of the weight for the individual heat attributes and the highest weight for each attribute group (in case an attribute is grouped under a attribute group)
     For example, Maximum Weight for the following heat configuration is 40, which is the sum of the weight for the individual heat attributes (3,3,7,and 10) and the highest weight for each attribute group (Priority (10), and SLA (7)).

   - **Description**Describe the heat configuration in detail.
5. Click **Save**.
   The heat configuration is saved.
6. On the Heat Attribute List, click **Create New**.
   The Create New Heat Attribute page appears.
7. Complete the following fields as appropriate:

- **Label**
  Specify the label assigned to the heat attribute.
- **Code**
  Specify the internal code for the heat attribute.
- **Status**
  Indicate if the heat attribute is active or inactive.
- **Weight**
  Specify the weight for the heat attribute.
- **Description**Describe the heat attribute in detail.
- **Condition**Specify the condition for the heat attribute.
- **(Optional) Attribute Group**
  Group the mutually exclusive heat attributes.
  For example, the following attributes can be grouped under the SLA attribute group, as they are mutually exclusive and a ticket can only have one SLA at any point in time.

Attribute	Weight
SLA violated	30
SLA violation predicted for today	20

8. Click **Save**.
   The heat attribute is saved. Repeat the steps 6-8 to add another heat attribute.

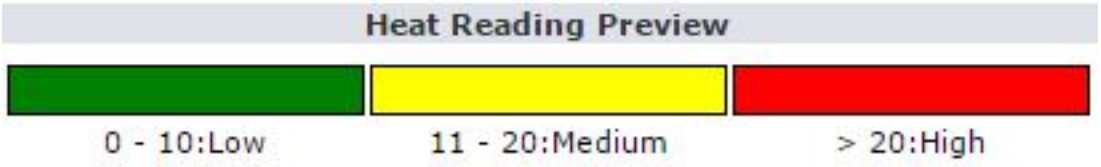
Predefined Heat Configurations

For a default tenant, following are the predefined attributes for the heat configuration:

Heat Attribute	Weight
Untriaged	10
Priority 1	10
Priority 2	5
SLA Critical	7
SLA Warning	4
Age	3
VIP User	7
IT Helper	3
Major Incident	20

Predefined Heat Range

For a default tenant, following is the predefined heat range:



On-Access Heat Calculation

The real time heat of the ticket is displayed when the ticket is accessed from the xFlow Interface

The on-access heat calculation functionality is disabled by default. An administrator can enable this functionality, however this can affect the overall performance of the application.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **Options Manager**, and **Heat-Weather**.
3. From the list of options, select **on_access_heat_calculation**.
4. Click **Edit** and **Install**.
   The on-access heat calculation is enabled.
5. Restart the CA *Service Desk Manager* Server service.

Heat Reindexing

An administrator can define the time interval (in hours) to calculate heat of the ticket.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **Options Manager**, and **Heat-Weather**.
3. From the list of options, select **Heat_Reindexing_Interval**.
4. Click **Edit** and specify the number of hours for each heat reindexing interval in the **Option Value** field.The default time is 6 hours. The minimum value can be 3 hours and the maximum value can be 72 hours.
5. Click **Save**.
6. Restart the CA *Service Desk Manager* Server service.

Enable or Disable Heat

An administrator can enable or disable heat.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **Options Manager**, and **Heat-Weather**.
3. From the list of options, select **Heat_Weather**.
4. Click **Edit** and set the **Optional Value**.
   a. **Off**
      Indicates that heat and weather are disabled**.**
   b. **Heat Only**Indicates that the heat is enabled and the weather is disabled.
   c. **Both Heat and Weather**
      Indicates that heat and weather are enabled.
5. Click **Save**.
6. Restart the CA *Service Desk Manager* Server service.

Ticket Attributes

The Ticket Attribute List page allows administrators to create, edit, export, and search for tickets.

NOTE

We recommend you not to add the LOCAL attributes of an object as a ticket attribute, as they are temporal and do not have a database storage.

Follow these steps:

1. Log in to CA SDM Interface as an administrator.
2. Navigate to the **Administration**, **xFlow Interface**, **Command Bar**, **New Ticket**.
3. Click **Create New** Attribute to add an attribute for tickets.
   Or
   Click an attribute and then click **Edit** to modify the attribute details.
4. Define the fields as appropriate.
   - **Attribute Name**
     Identifies the attribute name.
   - **Status**
     Specifies whether the attribute is active or inactive.
   - **Attribute Value**
     Specifies the majic level object attribute.
     For example, for a request object (cr), the attribute value can be *assignee* or *assignee.organization* or *summary*.
   - (Optional) **Show in Streams**
     Select the **Show in Streams** check box to display the attribute in work streams rule list.
   - (Optional) **Show in Attributes**
     Select the **Show in Attributes** check box to display the attribute on the Ticket Details page.
     By default, the attributes do not display.
5. Click **Save**.

WARNING

When you disable an attribute, the corresponding attribute rule is grayed out for an existing work stream.

Weather

Weather enables an analyst to view the workload forecast for the day, based on the tickets assigned to the analyst, analyst groups, and the planned environmental changes.

NOTE

If Multi-tenancy is enabled, at any point in time only one weather configuration can be active per tenant.

The weather icon is not displayed when a new contact accesses the interface for the first time. It is displayed after the weather is calculated.

This article contains the following topics:

Configure Weather

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **xFlow Interface** , and **Weather**.
3. Click **Create New**.
   The Create New Weather Configuration page opens.
4. Complete the fields as appropriate:

Weather Configuration Name Specify the weather configuration name.**Status**Indicate if the weather configuration is active or inactive.**Description**Describe the weather configuration in detail.**Show Suggestions**Select to enable suggestions for the analyst.**Threshold - Minimum**Specify the minimum value to calculate the range for the weather configuration.**Threshold - Maximum**Specify the maximum value to calculate the range for the weather configuration.

5. Click **Save**.
   The weather configuration is saved and the Weather Criteria List is displayed.
6. The weather criteria list displays the following predefined criterion:

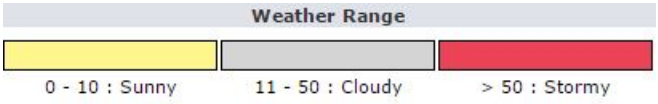
   NOTE

   The administrator cannot add or remove criteria.

   PersonalThese criteria is determined by calculating the weight of the high heat tickets assigned to the logged-in analyst. The default weight per high heat ticket is 10 and this value can be customized by the administrator.**Team**These criteria is determined by calculating the weight of the untriaged tickets and high heat tickets assigned to the logged-in analyst groups. The default weight for an untriaged ticket is 4 and for a high heat ticket is 2. These values can be customized by the administrator.**Environmental**This criteria is used to determine the weather for a scheduled environmental change (Change Order). The default weight per ticket is 6. The administrator can customize all the attributes for this criteria.
7. Click **Save**.

Predefined Weather Range

For a default tenant, following is the predefined weather range:



Weather Reindexing

An administrator can define the time interval (in minutes) to calculate weather.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **Options Manager**, and **Heat-Weather**.
3. From the list of options, select **Weather_Reindexing_Interval**.
4. Click **Edit** and specify the number of minutes for each weather reindexing interval in the **Option Value** field.
   The default time is 60 minutes. The minimum value can be 30 minutes and the maximum value can be 720 minutes.
5. Click **Save**.
6. Restart the CA *Service Desk Manager* Server service.

Enable or Disable Weather

An administrator can enable or disable weather.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **Options Manager**, and **Heat-Weather**.
3. From the list of options, select **Heat_Weather**.
4. Click **Edit** and set the **Optional Value**.
   a. **Off**
      Indicates that heat and weather are disabled**.**
   b. **Heat Only**Indicates that the heat is enabled and the weather is disabled.

c. **Both Heat and Weather**
Indicates that heat and weather are enabled.

5. Click **Save**.
6. Restart the CA *Service Desk Manager* Server service.

Work Stream

Work streams provide logical grouping of tickets based on the specific search criteria.

This article contains the following topics:

Create a Work Stream

An administrator can create default work streams that are available for all the analysts.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **xFlow Interface** , and **Work Streams.**
3. Click **Create New**.
The Create New Stream page opens.
4. Complete the fields as appropriate.
LabelSpecify the label assigned to the work stream.
StatusIndicate if the work stream is active or inactive.**Stored Query**Specify the stored query associated with the work stream.**Description**Describe the work stream in detail.
5. Click **Save** to save the default work stream.
The work stream is displayed on the navigation pane.

Disable a Work Stream

An administrator can disable a default work stream for all the analysts.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **xFlow Interface** , and **Work Streams.**
3. From the list, select the work stream you want to disable.
The work stream detail page appears.
4. Click **Edit**.
5. Set the **Status** to **Inactive**, and click **Save**.

Push Notification Service

The push notification services are configured to enable communication between the CA SDM server and the xFlow Interface.

This service is enabled when you install the CA Service Management 14.1.03 cumulative patch and the xFlow Interface.

Push notifications ensure the logged-in analyst receives real-time change notifications when a ticket is updated or modified by another analyst.

The xFlow Interface receives real-time push notifications only during an active session. This service is configured for the following features:

- Notifications
- Team Messages
- Timeline
- Weather
- Work Streams

NOTE

To improve the overall performance of the application, an administrator can choose to enable the polling mechanism to receive periodical updates on work streams. For more information, see Polling for Work Streams.

Following is a representation of the real-time push notifications:

Feature	Representation of the push notification	Description
Notification		Number of unread notifications are displayed.
Team Messages		A red dot on the icon indicates a new message.
Weather		A red circle on the icon indicates if the weather has changed or is unread. 
Work Streams		A red dot icon on a work stream label indicates a ticket is added or an active ticket is updated in the work stream.

Polling for Work Stream

An administrator can enable the polling mechanism to receive periodical updates on work streams.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **xFlow Interface,** and **General.**
3. From the list of options, select **enableStreamPoll.**
4. Click **Edit**.
5. Set the **Configuration Value** to **True**.
6. Click **Save.**

Set the Polling Interval Value

An administrator can define the time interval (in seconds) to receive periodical updates on the work streams from the polling server.

Follow these steps:

1. Log in to CA SDM as a system administrator.
2. Navigate to the **Administration** tab, select **xFlow Interface,** and **General.**
3. From the list of options select **StreamPollInterval.**
4. Click **Edit** and modify the **Configuration Value**.
   The default time is set as 60 seconds.
5. Click **Save**The polling interval is saved.
6. Restart the *CA Service Management xFlow Interface Server* service.

Enable the Research Tool Extension

Research Tool is available as an extension in the following supported browsers:

- CA Service Management Extension for Chrome
- CA Service Management Extension for Firefox

> **NOTE**
>
> Research Tool extension for Microsoft Internet Explorer and Safari is not supported.

To enable the Research Tool for your browser, follow these steps:

Step 1: Configure the Download Links

As an administrator, configure the extension download URLs.

Follow these steps:

1. Stop the required application server.
2. Based on the application server, edit the following file:
   For Apache, navigate to **<xflow_Install_location>\APPS\Services\incidentmicroservice-17.0.479\public\conf** and edit the **casm.conf.do-not-change.js** file.
3. Locate the *var* ***casm_admin*** section and add the following details:

```
 researchTool:{
             url:"http://www.google.com",
             storeURLs: {
             firefox: 'https://support.broadcom.com/download-center/solution-detail.html?
aparNo=99111302&os=WINDOWS-ALL',
             chrome:  'https://support.broadcom.com/download-center/solution-detail.html?
aparNo=99111301&os=WINDOWS-ALL';
   }
 }
```

4. Save and close the file and restart the application *server*

Step 2: Enable the Extension

Enable Extension for Chrome

Click on the Research Tool icon from the xFlow Interface. This will take you to the Broadcom Support page and download the extension under the **Solution Downloads** section.

> **NOTE**
> To install the extension, perform the following steps:
>
> - Visit chrome://extensions (via omnibox or menu > More tools > Extensions).
> - Enable Developer mode by ticking the checkbox in the upper-right corner.
> - Click on the "Load unpacked extension..." button.
> - Select the directory containing your unpacked extension

After you enable the extension, refresh the **xFlow Interface** .

Enable Extension for Firefox

Follow these steps:

1. Click on the Research Tool icon from the xFlow Interface. This will take you to the Broadcom Support page and download the extension under the **Solutions Download** section.

2. Verify that the Download folder contains the *cart.xpi file.*
3. Launch Firefox and from the download, drag and drop the extension to any Firefox window.
4. Click a Firefox window to initiate the installation. Click **Install**.
5. Confirm the installation.
6. Open a Firefox tab and from the toolbar, click the CA Service Management Extension for Firefox extension.
7. Accept the End User License Agreement and click **Next** to complete the installation.
8. Refresh the **xFlow Interface** .

NOTE
This plugin works for firefox ESR Version lesser than 46.0.

Configure the xFlow Interface Cache Size

Cache Considerations

After installing the xFlow Interface as described in Install CA Service Desk Manager, you can configure the cache size for xFlow Interface server.

Consider the following:

- Ensure to review the cache size of your environment before starting the xFlow Interface and Search Server services, review the cache size with respect to your environment.
- Your environment may already have some CA SDM factory records. It is recommended that you increase the record count for such factories in the CA SDM console (**Administration , xFlow Interface** , **General)**.

NOTE

We recommend that you cache all the active records of CA SDM factories that are mentioned in this article. Set the max record limit to more than the number of active records available in your environment.

The following cache and corresponding CA SDM factory names are given with out-of-the-box (OOTB) CA SDM max record count:

Cache Name	CA SDM Factory	Default value for Max Cache Record	Configuration Key in CA SDM Console xFlow Interface Administration
role_access	func_access_role	10000 records	cache.role_access.maxEntriesLocalHeap
role_auth	role	2000 records	cache.role_auth.maxEntriesLocalHeap
dcon	dcon	50000 records	cache.dcon.maxEntriesLocalHeap
acctyp_role	acctyp_role	2000 records	cache.acctyp_role.maxEntriesLocalHeap
tenant	tenant	2000 records	cache.tenant.maxEntriesLocalHeap
tgm_members	tgm_members	2000 records	cache.tgm_members.maxEntriesLocalHeap

Enable SAML Authentication for xFlow Interface

Prerequisites

1. Ensure that SSL is enabled for CA XFlow. For more information see, Enable SSL Authentication for CA SM 17.4.
2. **For ADFS**: If you want to use ADFS as the identity provider, you must install ADFS on Windows Server 2012 R2 and above. After completing the installation of ADFS and CA Service Desk Manager, you must configure the ADFS with following the CA XFlow related information:
   a. While configuring Add Relying Party Trust on ADFS specify the following on the **"Configure URL"** screen:
      - Select the **"Enable support for the WS-Federation Passive protocol"** check-box.
      - Enter the value in the **"Relying party WS-Federation Passive protocol URL:"** as below: ***https://<xflow_url>:<port_number>/samllogin***
      - Select the **"Enable support for the SAML 2.0 WebSSO protocol"** check-box.
      - Enter the value in the **"Relying party SAML 2.0 SSO service URL:"** as below: ***https://<xflow_url>:<port_number>/samllogin***
   b. While adding claim rules, specify the following in the **"Configure Claim Rule"** step:
      - **Claim rule name**
        Specify a name for the claim rule. For example, XFlow Claim Rule.
      - **Attribute store**
        Select the datasource from the drop-down list. For example, Active Directory.
      - **LDAP Attribute**
        Select "**SAM-Account-Name**" from the drop-down list.
      - **Outgoing Claim Type**
        Select "**Name**" from the drop-down list.
   c. Verify that the certificate you want to use to configure the Identity Provider is SHA 256 signed.
3. **For CA Siteminder**: If you want to use CA Single Sign-On (formerly known as CA Siteminder), as your Identify Provider, do the following:
   a. Launch CA Single Sign-on as Administrator.
   b. Go to the Federation Partnership Partnership Federation and click Partnerships.
      Federation Partnership List appears.
   c. Click the Federation Partnership name which you want to use.
      Partnerships properties page opens.
   d. Expand the IP Restrictions section and verify the Assertion Attributes properties.
   e. The value of the Namespace field must be the URI for the respective Claim. If the value is specified as "Unspecified" the SAML authentication will not work.
   f. Verify that the certificate you want to use to configure the Identity Provider is SHA 256 signed.
4. **For Azure Identity Provider (IdP):** If you want to use Azure Identity Provider (IdP), as your Identify Provider, do the following:
   a. Login to Microsoft Azure Portal.
   b. Click on the "**Azure Active Directory**" link under Azure Services.
   c. Click on the "**Enterprise Applications**" link from left side window.
   d. Click "**New Application**" link and again click "**Create your own application**" link.
   e. Enter name example "**CASM tomcat**" in the "**What's the name of your App**?" text box and Click **Create** on the right-pane.
   f. Click on the "2. Set up single sign on" link and Click on the "SAML" link.
   g. Click on the Edit button on section 1 i.e "Basic SAML Configuration".
   h. Enter SDM SSL tomcat/iis URL like ***https://<xflow_url>:<port_number>/samllogin*** for all below text fields:
      a. "**Identifier (Entity ID)**"

b. "**Reply URL (Assertion Consumer Service URL**"
c. "**Sign on URL**"
d. "**Relay State**"
e. "**Logout Url**"

i. Click **Save**.

SAML authentication for xFlow Interface

Security Assertion Markup Language (SAML) is a standard for logging users into applications based on their sessions in another context. SAML SSO works by transferring the user's identity from one place (the identity provider) to another (the service provider). This is done through an exchange of digitally signed XML documents.

This article explain how to enable SAML authentication for xFlow Interface.

Follow these steps:

1. Launch CA Service Desk Manager and login as Administrator.
2. Go to the Administration tab and navigate to xFlow Interface, General in the left hand navigation.
   The General Configurations List page opens.
3. Find the following from the Configuration Key column and specify the values as specified below:
4. **federation.audienceuris**: Specifies the URI of the application from where to accept the tokens.
   Example: *https://<xflow_url>:<port_number>/samllogin|https://<xflow_url>:<port_number>/samllogin*
5. **federation.enableManualRedirect**: Specifies whether you want to enable manual redirection of the token or not. True indicates that you want to enable the manual redirection and False indicates that you do not want to enable the manual redirection.
   Default: false
6. **federation.realm**: Specifies the location from where the tokens are sent.
   Example: *https://<xflow_url>:<port_number>/samllogin*
7. **federation.reply**: Specifies the URL of the location that receives responses.
   Example: *https://<xflow_url>:<port_number>/samllogin*
8. **federation.trustedissuers.friendlyname**:
   ADFS Idp (Identity Provider)
   Specifies a common name for the Identity Provider.
   Example: *ADFS Signing - <trusted_issuer_URL>.*
   Microsoft Azure Idp:
   Perform the following:
   a. Login to Microsoft Azure portal, navigate to **Enterprise Application**, <**CASM Application Name**>, Single-Sign-On, Block/Section 4, Azure ID Identifier (use the copy option to copy the value).
      For example: *https://sts.windows.net/<tenant_id>/*
   b. Replace **saml2** with **wsfed** in the URL.
      For example: *https://login.microsoftonline.com/<microsoft_tenentid>/wsfed*
9. **federation.trustedissuers.issuer**:
   ADFS Idp (Identity Provider):
   Specifies the URL of the ADFS Identity Provider.
   Example: https://<trusted_issuer_URL>/<identity_provider>/ls/idpinitiatedsignon.aspx.
   For Microsoft Azure Idp (Identity Provider):
   Perform the following:
   a. Login to Microsoft Azure portal, navigate to **Enterprise Application**, <**CASM Application Name**>, Single-Sign-On, Block/Section 4, Login URL. Copy the URL (use the copy option adjacent to the URL).
      For example: *https://login.microsoftonline.com/<tenant_ID>/saml2*
   b. Replace **saml2** with **wsfed** in the URL.

For example: *https://login.microsoftonline.com/<microsoft_tenentid>/wsfed*

10. **federation.trustedissuers.thumbprint**:
    ADFS Identity Provider
    Specifies the value of the certificate thumbprint provided by the Identity Provider.
    Example: *0214c3035d002505b9e5e672a117d9bf5c5d4d02*

    NOTE

    The certificate you want to use to configure the Identity Provider must be **SHA-256** signed.

    The thumbprint you use from the SHA-256 certificate must be the **SHA-1** thumbprint.

    Azure Idp: federation.trustedissuers.thumbprint
    Perform the following:
    a. Login to Microsoft Azure portal, navigate to **Enterprise Application**, <**CASM Application Name**>, Single-Sign-On, Block/Section 3, Thumbprint. Copy the value.
       For example: 7844FB57B8EB854C10F2CBD8BE78B0BF574B729D
11. **authenticationtype**: Specifies the authentication mechanism you want to enable for single sign-on. The available options are SAML, SSO, NTLM and BASIC.
    Enter SAML as the configuration value.
12. Restart the CA xFlow Interface service.
    You have successfully enabled SAML based single sign-on authentication for CA Service Management.

Configuration Changes for xFlow Interface

The main components of the xFlow Interface are a set of services (Incident, search, and notification services). These services share the default domsrvr out-of-the-box. For better performance, dedicate your domsrvrs for these services. From the CA SDM console, navigate to **Administration**, xFlow Interface, **General** tab and update the following domsrvr variables:

- sdm.domsrvr.inms (for Incident services)
- sdm.domsrvr.srms (for search services)
- sdm.domsrvr.psms (for notification services)
- sdm.domsrvr.coms (for collaboration services)

You can provide multiple domsrvrs separated by a comma (,) for these services. After updating these variables, restart the xFlow Interface Server services. For more information, see Configure the xFlow Interface Server Services.

The xFlow Interface requires additional hardware resources and scales better horizontally. xFlow Interface services scaling needs to be implemented based on the performance needs at a particular installation site. Scaling of xFlow Interface services involves essentially three steps. Each step should give a performance benefit over the previous one. Follow the below order of steps to scale the xFlow Interface micro-services better.

1. Attempt to increase the number of domsrvrs that each micro-service connects.
   – For more information about adding new domsrvrs to an installation, see How to Configure Processes for CA SDM Servers.
   – Review the documentation on this page to configure the micro-services to use these new domsrvrs.
2. If the above does not result in satisfactory performance, next step is to scale the micro-service instances. The micro-services (and the UI servers) can be scaled by installing xFlow Interface on different servers and using a load balancer to point to the new instances of the UI servers.

App Launcher - Apps Configuration and Role Switching

This article contains the following topics:

NOTE

If you have upgraded to xFlow Interface 17.4, and have users with custom access types, these users may not be able to access xFlow Interface directly. To be able to access the xFlow Interfacet App, update the custom access type to xFlow Interface app from App Configuration. For more information about how to add multiple access types in an App, see Adding Apps in Bulk To an Access Type.

xFlow Interface expands beyond Analysts in this release. The App driven approach delivers target user experience for different types of users. It provides the capability to switch between Apps and switch between Roles.

In the classic CA SDM UI, functional access and data access is controlled using roles. A contact or user in CA SDM has Access Types assigned to it.The access type in turn is mapped to assigned roles, and one of these is the default role.

The xFlow Interface provides the ability to configure and launch Apps as per user authorization (Access Types and Roles) and is based on the following considerations:

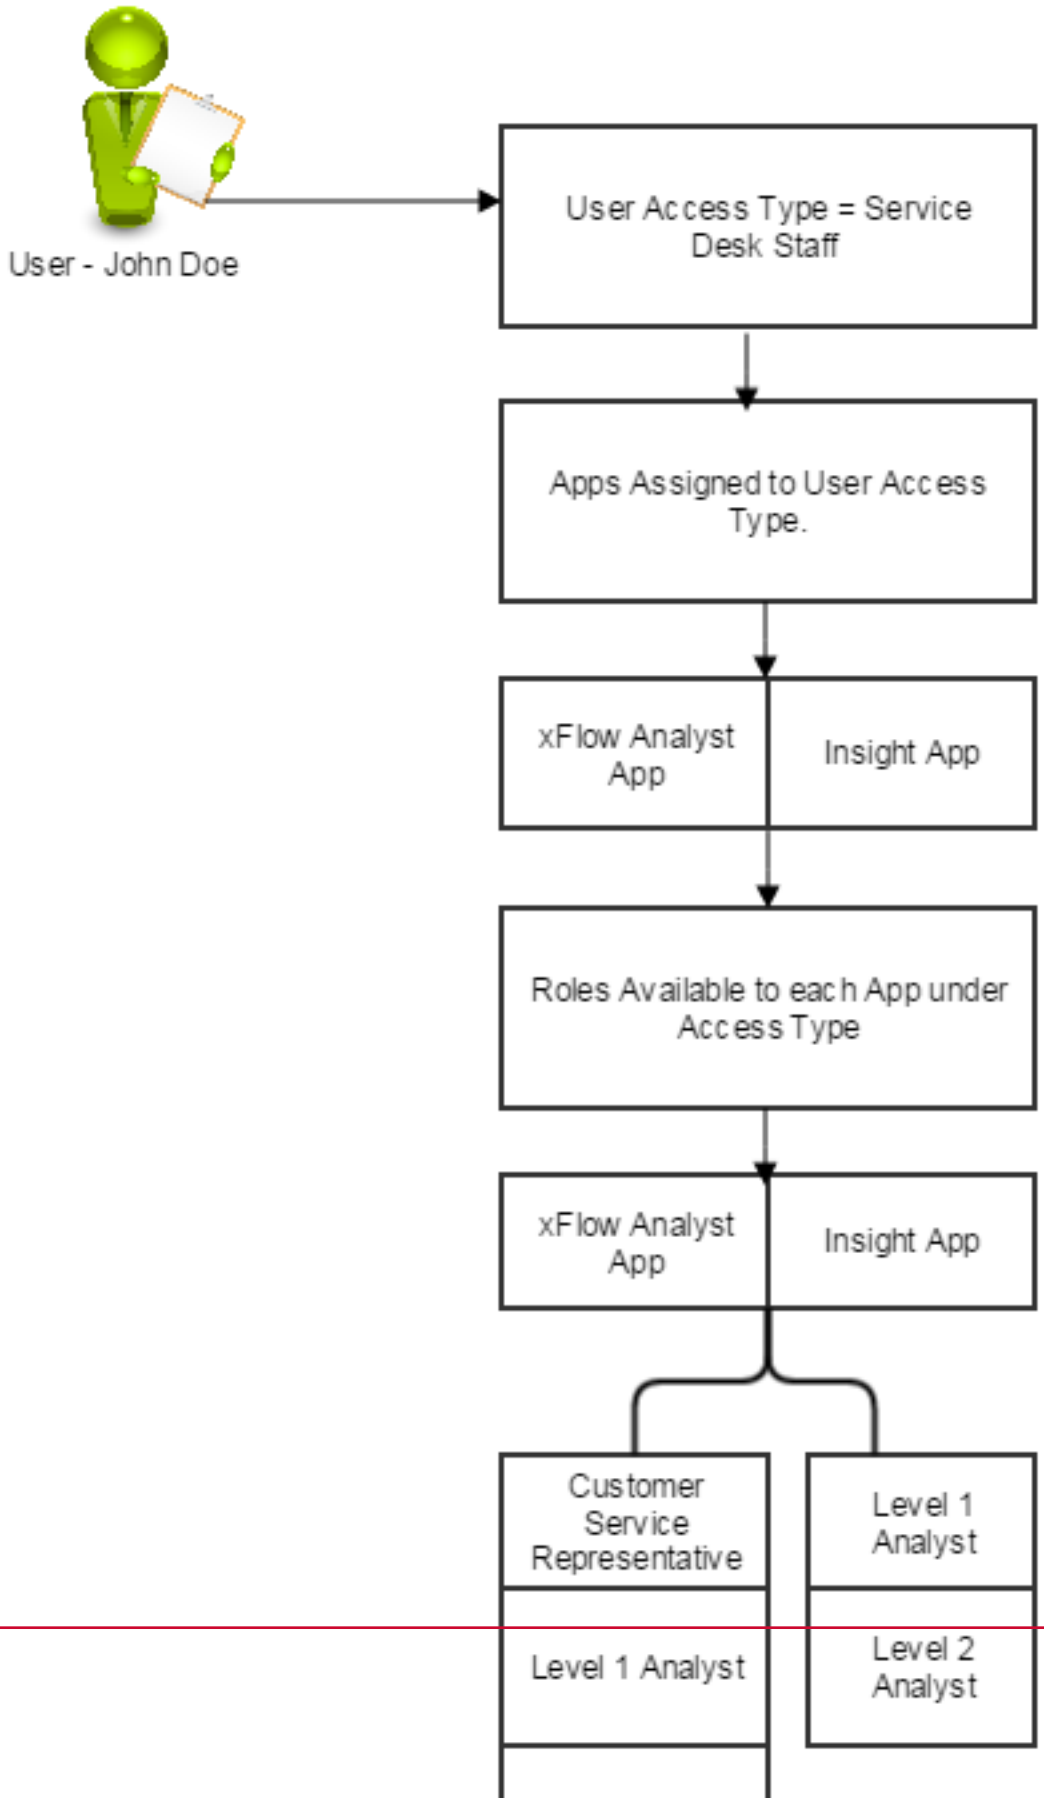
- Access to Apps is given based on the App configured in the Access Type of the user.
- When you login to the xFlow Interface App, you will be logged in with the default App of access type attached to a user.
- The App Launcher will have Out of the box (OOTB) Apps. You can update or change the App assigned to an Access Type.

  NOTE

  You can enable or disable an App but you cannot delete an app. You can enable or disable the app through the Classic CA SDM Interface by making the App Active or Inactive.

  Each App will have a list of roles assigned to it. When you launch the App Launcher for the first time, the current role will be the default role of the App . You can update or change the default role assigned to an app. For more information about APP to Role Mapping, see How to Update Roles for an Access Type.

Figure 7: Manage Appp Authorization in App Launcher



Managing Apps configuration in the xFlow Interface is a two-step process:

- Configure Apps Authorization (Access Types and Roles) - Classic CA SDM Interface
- Accessing the App Launcher - xFlow Interface

Configure Apps Authorization (Access Types and Roles) - Classic CA SDM Interface

To update Access Types and Roles for a user as per the Authorization level, perform the following from the Classic CA SDM UI:

- Update Access Types for an App
- Set the Default App for an access Type
- How to Update Roles for an Access Type
- Adding Multiple Apps in Bulk To an Access Type

Update Apps for an Access Type

To update an app for a given access type, perform the following steps from the Classic CA SDM UI:

1. Click **Administration**, **Security and Role Management**, **Access Types.**
2. From the Access Type List, select the desired Access Type.
   For example, select the access type as **Service Desk Staff.**
   The Access Type Details page is displayed.
   The Apps assigned to an Access Type is displayed on the Access Type Details page.
3. Select the **Apps** tab. Click **Update Apps**, if you want to modify or update the App for an access type.
   For example, **xFlow Interface or Insights.**
4. Click **Search** on the App Configuration List page.
5. Select the desired apps and move it from Available list to the Assigned list.
   Click **OK**.
   The App is updated or modified for the Access Type.

Set the Default App for an Access Type

Log into the Classic CA SDM Interface and perform the following steps:

1. Click **Administration**, **Security and Role Manag.ement**, **Access Types.**
2. Select and Open the required access type**.** For example: **Service Desk Management**
   The Service Desk Management Access Type Detail page is displayed.
   On the **Apps** tab, select the App that you want to set as the default App and click **Set Default App**.
   The selected app is now set as the default app for the user having above access type (Service Desk Management).

Adding Apps in Bulk To an Access Type

> **NOTE**
>
> The topic describes an alternate way of updating apps for an access type other than what has been described in the preceding section. For more information, see Update Apps for an Access Type.

A new node **App Configuration** is added to the classic CA SDM UI. Login to the Classic CA SDM UI and click **Administration**, **xFlow Interface** , **App Configuration** to view, modify or update the Apps assigned to an Access Type and add multiple apps at once.

To add multiple Apps to an Access Type at a go, perform the following steps on the Classic CA SDM UI:

1. Click **Administration**, **xFlow Interface** , **App Configuration**.
2. Select an **App**.
   For example, xFlow Interface App.

The Access Types assigned to an App is displayed on the App Details page.

3. Click **Update Access Types**, if you want to update the access type.
   For example, **Service Desk Management**.
4. Click Search on the Access Type Search page.
5. Select the access type that you want to update from the list.
   Click forward arrow keys to move your selection to the **Access Type Assigned** list.
6. Click **OK**.
   The Access Type is added for an App.

How to Update Roles for an App in Access Type

You can map roles to an Access Type by performing the following:

NOTE

When assigning Roles for an App, ensure that the role is designed for the App's persona.

Perform the following steps to update roles for an App in Access Type:

1. Login to the classic CA Service Desk interface as an Administrator.
2. Navigate to **Administration**, **Security and Role Management**, **Access Types**. For example: **Administration**
   The Administration Access Type Detail Page is displayed.
3. Click on the **Apps** tab.
   The list of Apps assigned to this access type (in this case, Administration) is displayed.
4. Click the App hyperlink for which you want to update the Role.
   This will display the Detail page of the App under a particular Access Type (Example: Administration).
5. Click **Update Roles**,
   The Role Search Page is displayed. Click **Search**.
   Only Roles assigned to an Access Type will be displayed.
6. Select the desired role and move it from Roles Available to Roles Assigned.
   Click **Ok**.
   Now you can also update the Default Role of an App using the **Set Default Role** button.

NOTE

When no roles are assigned to an app, it takes the default role of an access type.

Accessing the App Launcher - xFlow Interface

App launcher is the new UI element in the xFlow Interface on the top right pane. You can view and access the following OOTB Apps.

- xFlow Interface App: Provides the ability to create and manage tickets, manage the service type events/SLA, and view the Knowledge base articles.
- **Insight App**: View the JasperSoft reports and dashboard in your environment. (Insight App is only supported on Microsoft SQL Server Database).

NOTE

If only one app with a single role is assigned to a user, the App Launcher Icon on the xFlow Interface is not displayed.

Perform the following steps to launch the App Launcher:

1. Login to the xFlow Interface.
2. Click the **App Launcher** icon on the top right pane. By default, an App will be selected as per the user Access Type. For example: **xFlow Interface App.**

For more information, see Set the Default App for an Access Type.

3. Click the drop-down list from the selected App to view the role mapped to an app. Select the desired role.For example: In case of the xFlow Interface App, the drop-down list will show the roles available to an analyst user - **Administration**, **Incident Manager**, **Vendor Analyst**, **Level 1 Analyst**, **Level 2 Analyst**.

   NOTE

   This role drop-down list will not appear if the app has a single role assigned to it.

Manage Chat

As an administrator, you can define how chat requests are managed by analysts.

Set Up Access Level Permission

Administrator must ensure users have the required access level permissions.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **Security and Role Management**, and **Support Automation Access List**.
3. The following access levels are available:
   a. **Analyst** Defines the rights for users who provide live chat assistance to end users.
   b. **End User**
   Defines the rights for users that request live chat assistance from analysts, such as employees.

Create a Queue

An administrator can add or define a uniquely named queue.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **Support Automation**, **Queues**, and **Queue List**.
3. Click **Create New**.
4. Complete the following fields:
   - **Tenant**Specifies the tenant for the queue.
   - **Queue Name**Specifies the queue name.
   - **End User Display Name**Specifies the name that displays for the end user.
   - **Default**Specifies if the queue is the default queue.
   - **Status**Specifies the status of the queue.
   - **Default Chat Preset**Specifies the default chat preset for the queue.
   - **Queue Hours**Specifies the queue hours.
   - **Issue Category**Specifies the Issue Category associated with this queue.
   - **Incident/Request Area**Specifies the Inciedent/request Area associated with this queue.
5. Click **Save**.
   The queue is created.

Assign a Default Queue

You can route live chat to a default queue. You can configure only one default queue per tenant.

Follow these steps:

1. Log in to CA SDM as an administrator.

2. Navigate to the **Administration** tab, select **Support Automation**, **Queues**, and **Queue List**.
3. Click a queue.
4. Click **Edit** to modify to the settings.
5. Select the **Default** check box and click **Save**.
   The queue is set as default.

Set Queue Hours of Operation

You can set the hours of operation for each queue. The queues determine multi-tenancy, which are tenant optional.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **Support Automation**, **Queues**, and **Queue List**.
3. Click a queue.
4. Click **Edit** to modify to the settings.
5. Click **Queue Hours**.
   The Workshift Search page appears.
6. Complete the information and click **Save**.
   The hours of operation are saved.

Restrict the Live Chat

You cannot disable the Live Chat. However, you can stop the Live Chat operation by assigning the Workshift which have no work hours set, to the default queue (support). To set a Workshift with no work hours, enter a past date in the schedule. For more information, see Workshift Setup.

> **NOTE**
>
> If you are using Support Automation and using Queues then don't Restrict the Live Chat as it impacts the Support Automation behavior.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **Support Automation**, **Queues**, and **Queue List**.
3. Click a queue.
4. Click **Edit** to modify to the settings.
5. In **Queue Hours**, enter the Workshift and click **Save**.
   The Live Chat is stopped and "*Live Chat not available*" message will be displayed to the user trying to initiate the chat.

Establish an Auto Transfer or Escalate Process

You can establish an auto transfer or escalation process for each queue, when a live chat is not addressed within a specified time interval.

Follow these steps:

1. Log in to CA SDM as an administrator.
2. Navigate to the **Administration** tab, select **Support Automation**, **Queues**, and **Queue List**.
3. Click a queue.
4. Click **Edit** to modify to the settings.
5. Complete the following fields:**Auto Transfer Users**
   Select the check box to automatically transfer or escalate a live chat request to another queue.
   Timeout
   Specifies the timeout value (in seconds)

Target Queue
Specifies the target queue where the live chat request will be transferred or escalated.

6. Click **Save**.
   The auto transfer or escalate process is saved for the queue.

Configuration keys for Live Chat

The following pre-defined configuration keys are used by Live Chat:

- **chat.cleanUpThreadInterval**
  The interval of time (in minutes) to calculate session timeout.
- **chat.escalateThreadInterval**
  The interval of time (in minutes) to calculate escalation timeout for a live chat (when a live chat request is not addressed within a specified time, it is then escalated to a different queue). The **chat.escalateThreadIntervall** value must be less than the **chat.session Timeout** value
- **chat.sessionTimeout**
  Number of minutes to wait without any activity, before ending the live chat session automatically. Making the intervals longer can lead to the unnecessary maintenance of inactive sessions in memory.

> **NOTE**
>
> **Information:** To lookup for the configuration keys, navigate to the **Administration** tab, select **xFlow Interface**, and **General**.

Recommendations:

- Use the predefined configuration **key:values**.
- Higher values can consume significant chunk of memory and may affect performance.
- Restart the xFlow Services if you have modified the pre-defined configuration **key:value**.

Administer the xFlow Interface

The xFlow Interface provides analysts the ability to understand the IT environment, prioritize work and make decisions. Data-driven intelligence improves the productivity of the analyst and enables them to understand the workload for the day and the list of activities to be completed.

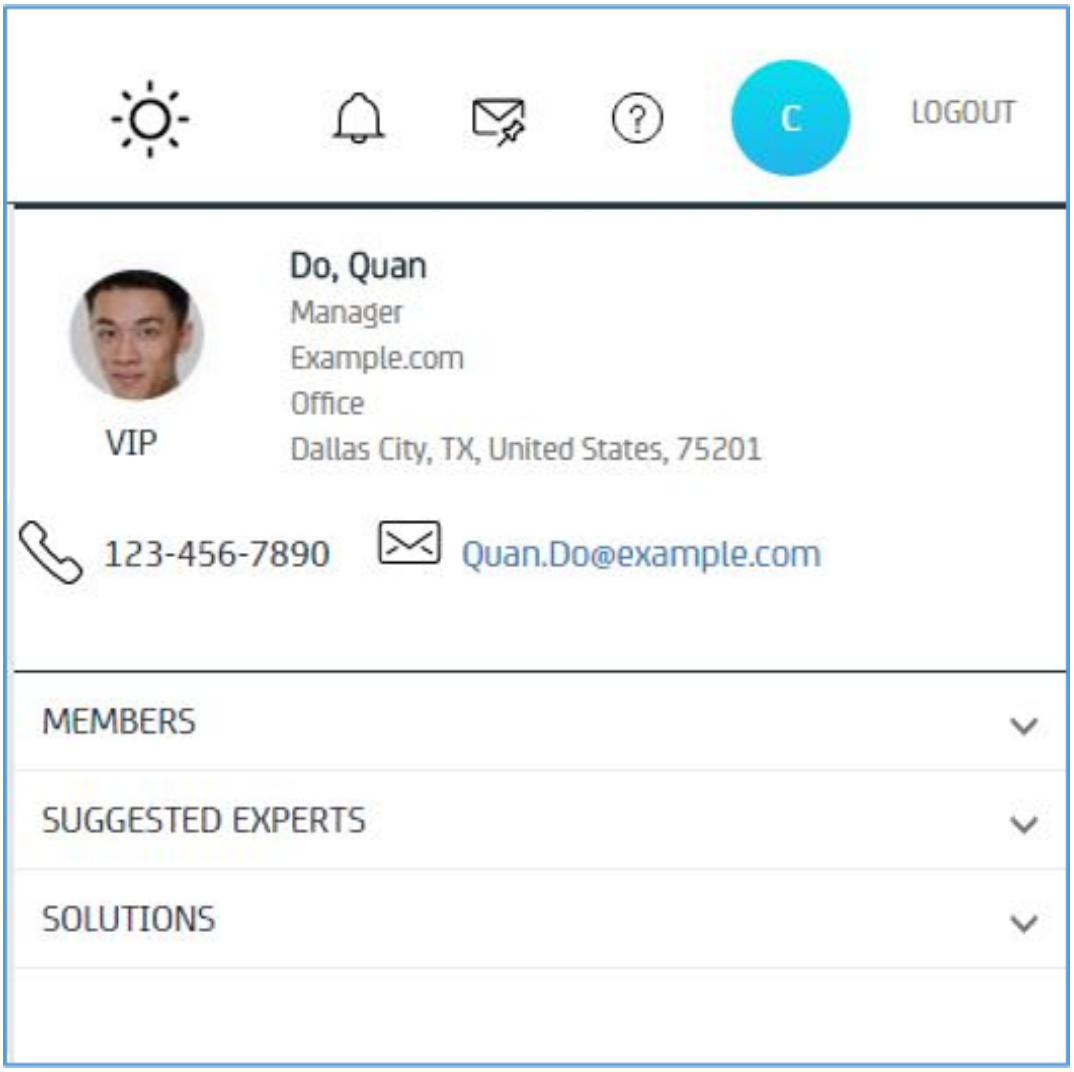
This article contains the following topics:

- Display the User Information
- Customize the Branding
- Modify Date and Time Format
- Manage Attachments
- Team Messages
- Configure External Redirect URL on Logout
- Configure SSO for xFlow Interface/Service Point
- Rate Limiting in xFlow

Display the User Information

The user information (contact widget) is displayed when an analyst creates a new ticket and when a ticket is accessed in either the card or grid view.

The contact widget displays the name, designation, organization name, address, email address, VIP status and profile picture of the user, as shown in the example.



For more information about user accounts, see Configuring User Accounts.

Customize the Branding

As an administrator you can customize the brand logo, branding text, and the favicon.

Brand Logo

The default logo at the global and tenant level for xFlow Interface, Insights, and Service Point is the **CA logo.**

Recommendations for the logo:

- Optimal logo size: 166 x 40 (width x height)
- Supported logo file formats: .png,.jpg, .jpeg, .gif, .bmp, and .tiff;
  Service Point also supports .svg format.

Customize Brand Logo Using pdm_branding Utility

To change the default logo for xFlow Interface, Insights, and Service Point, execute the pdm_branding utility command on the primary server of your CA SDM environment. The default logo path is `C:\Program Files (x86)\CA\Service Desk Manager\bopcfg\www\wwwroot\img`.

NOTE

When multi-tenancy is enabled, you cannot have separate logos for xFlow Interface, Insights, and Service Point.

Follow these steps:

1. Execute the following command: `pdm_branding [-h] | [-m] | [-g] | [-a] | [-d]`
   - **pdm_branding -h**
     Prints the command line help
   - **pdm_branding -m**
     Migrates the default as well as the tenanted logos to database from the filesystem.
   - **pdm_branding -m -g**
     Migrates all the tenant-specific logos and the logo present in the given path as the default/global logo.
   - **pdm_branding -a -t**
     Adds a logo to a particular tenant.
     For example: `pdm_branding -a -t <tenant:persistent ID>` To obtain the tenant persistent ID, execute the following command: `bop_odump domsrvr tenant "name='TenantName'"`
   - **pdm_branding -d -t**
     Deletes a logo for a tenant.
     For example: `pdm_branding -d -t <tenant:persistent ID>` To obtain the tenant persistent ID, execute the following command: `bop_odump domsrvr tenant "name='TenantName'"`
2. Restart the xFlow Interface services.

Customize Brand Logo Without the Utility

When multi-tenancy is not enabled, you can have separate logos for xFlow Interface, Insights, and Service Point.

To replace the CA logo with yours for Service Point, perform the following steps:

1. Navigate to the default location, `C:\Program Files\CA\xFlow\APPS\Services \incidentmicroservice-17.0.479\public\assets\images\logos` and add the new logo file "CA-logo-mod.svg".
   The reference to"CA-logo-mod.svg" will apply for the logo for Service Point.
2. Navigate to the default location, `C:\Program Files\CA\xFlow\APPS\Services \incidentmicroservice-17.0.479\public\conf` and open the **casm.conf.js** file in a text editor.
3. Add the following new key:value, after the **locale** key:

```
bui_branding : {
      builogo : 'assets/images/logos//CA-logo-mod.svg',
  },
```

4. Save and close the **casm.conf.js** file.
5. Restart the xFlow Interface services.

To replace the CA logo with yours for xFlow Interface and Insights, perform the following steps:

1. Navigate to the default location, `C:\Program Files\CA\xFlow\APPS\Services \incidentmicroservice-17.0.479\resources\images\icons` and add the new logo file CA-SM_logo-white-mod.svg".
   The reference to "CA-SM_logo-white-mod.svg" will apply to the logo for the main xFlow login screen and the xFlow logo.
2. Navigate to the default location, `C:\Program Files\CA\xFlow\APPS\Services \incidentmicroservice-17.0.479\public\conf and` open **casm.conf.js** file in a text editor.
3. Add the following new key:value, after the **locale** key:

```
logo : 'resources/images/icons/CA-SM_logo-white-mod.svg'
```

4. Save and close the **casm.conf.js** file.
5. Restart the xFlow Interface services.

Customize the Favicon

The favicon appears in the bookmarks and browser address bar for the platform.

To update the favicon, perform the following steps:

1. Navigate to the default location, `C:\Program Files\Files\CA\xFlow\APPS\Services \incidentmicroservice-17.0.479\public\resources\images\icons`
2. Replace the **favicon.ico** file.
3. Restart the xFlow Interface services.

Customize Brand Name

The brand name is displayed in the top left hand corner next to the logo. The default brand name at the global and tenant level for xFlow Interface, Insights, and Service Point is **CA Service Management** .

Currently, you can replace the CA brand name only for Service Point, and not for xFlow Interface and Insights.

To replace the CA brand name for Service Point, perform the following steps:

1. Navigate to the default location, `C:\Program Files\CA\xFlow\APPS\Services \incidentmicroservice-17.0.479\public\conf` and open **casm.conf.js** file in a text editor.
2. Add the following new key:value, after the **locale** key:

```
logo : 'resources/images/icons/CA-SM_logo-white.svg',
bui_branding : {
            builogo : 'assets/images/logos/CA-SM_logo.svg',
            brandname : 'CA Service Management',
        }
```

3. Override the default CA brand name with your brand name.
4. Save and close the **casm.conf.js** file.
5. Restart the xFlow Interface services.

To replace the CA brand name at a tenant level for Service Point, perform the following steps:

1. Navigate to the default location, `C:\Program Files\CA\xFlow\APPS\Services \incidentmicroservice-17.0.479\public\conf` and open **casm.conf.js** file in a text editor.
2. Add the following new key:value, after the **locale** key:

```
logo : 'resources/images/icons/CA-SM_logo-white.svg',
bui_branding : {
            builogo : 'assets/images/logos/CA-SM_logo.svg',
            brandname : 'CA Service Management',
        }
```

3. Remove **CA Service Management** as the brand name, and let the value be empty.
4. Save and close the **casm.conf.js** file.
5. Restart the xFlow Interface services.
   Tenant name is displayed as the brand name.

Modify Date and Time Format

By default the xFlow Interface displays date and time in dd/MM/YYYY and hh:mm a format.

12 Hour vs. 24 Hour Time

Capital letters denote 24 hour time and lower case 12 hour time.

Example

To use a US date format, perform the following steps:

1. Access the **casm.conf.do-not-change.js** file from \Program Files\CA\xFlow\APPS\Services \incidentmicroservice-17.0.479\public\conf folder.
2. Modify the default date format as shown:
   Current
   ```
   "defaultDate": "dd/MMM/yyyy"
   ```
   New
   ```
   "defaultDate": "MM/dd/yyyy"
   ```
   IMPORTANT
   CA Service Management 17.3.0.8 and above release versions support the **dd/MM/yyyy HH:mm:ss** date format. Modify the date format as shown below:
   Current
   ```
   dateTimeFormat_default": dd/MM/yyyy HH:mm:ss
   ```
   New
   ```
   dateTimeFormat_default":  MM/dd/yyyy HH:mm:ss
   ```
3. Save the file
4. Restart the **CA xFlow Analyst Interface** Service.

Manage Attachments

This article contains the following topics:

Enable Attachments on xFlow Interface

Perform the

1. Log in to CA SDM as an administrator.
2. Navigate to **Administration** tab, **xFlow Interface**, **General**, select **attachments.allowed-content-types**. click **Edit**.

Supported File Formats

The following file formats can be attached to a ticket from xFlow Interface.

File Type	File Format
Word Processing Format	.doc, .docx, .txt
Spreadsheet Formats	.xls, .xlsx
Presentation Formats	.ppt, .pptx
Graphic Formats	.pdf, .jpg, .jpeg, .png

Configurable File Formats

The following file formats are excluded due to security vulnerabilities: **zip**, .**xml**, .**exe**, and .**mht.** However, based on the environment, an administrator can configure these file formats to be attached to a ticket.

For example, to add **.zip** file format, perform the following steps:

1. Log in to CA SDM as an administrator.
2. Navigate to **Administration** tab, **xFlow Interface** , and **General**.
3. From the list of options, select **attachments.allowed-content-types** and click **Edit**.
4. Add the following value toward the end of the existing **Configuration Value**:
   ```
   , .zip:application/zip
   ```
5. Click **Save**.
6. Restart the CA Service Management xFlow Server Service.

Team Messages

This article contains the following topics to manage the Team Messages feature:

Archive and Purge Team Messages

To keep the database at a manageable size for optimum performance, periodically remove historical team messages. A configuration Object Name *team message* has been added to the Archive and Purge Rule. The *team message* object is disabled by default.

> **NOTE**
>
> For more information about creating rules or activating the predefined team message rule, refer, How to Archive and Purge Historical Data.

Disable Team Messages

An administrator can disable the Team Messages feature. The Team Messages feature is enabled by default.

Follow these steps:

1. Log in to CA SDM as a system administrator.
2. Navigate to **Administration** tab, **xFlow Interface** , **General**.
3. From the list of options select **TeamMessagesEnabled**.
4. Click **Edit** and modify the **Configuration Value** to **false**.
5. Click **Save**.

The Team Message feature is disabled. Verify the update by viewing the xFlow Interface, the Team Message icon does not appear on the interface.

Configure External Redirect URL on Logout

After logging out from xFlow Interface or Service Point, you can redirect the browser URL to any configured location by making changes to the casm.conf.js file from the xFlow Interface Installed location:

Perform the following steps:

1. Open the casm.conf.do-not-change.js file where you have installed the xFlow Interface.
   <xFlow Interface Installed Directory>\APPS\Services\incidentmicroservice-17.0.479\public\conf
   The above location has two files: **casm.conf.do-not-change.js** and **casm.conf.js**
2. Open the **casm.conf.do-not-change.js** file and copy the following strings:

```
 onLogout: {
url:'/login', //Custom placeholder for url redirection when clicked on Logout
isExternal : false //Default:false change this to true if you want to keep it o external url like
 www.google.com
},
```

3. Now, paste the above strings in the **casm.conf.js** file.
4. To redirect to an external URL, put your custom URL location in "url:'/login' string and change '*isExternal'* to **True** in the above command (step2).
5. Refresh the browser cache.

Configure SSO for xFlow Interface/Service Point

To configure SSO for xFlow Interface/Service Point, navigate to Administration, xFlow Interface, General, perform the following step

1. **authenticationType**: Specifies the authentication mechanism. The configuration value must be set to SSO. This is mandatory to enable SSO for xFlow or Service Point.
2. **SSOArtifactType**. For SSO authentication, the configuration value must be set to**COOKIE**, **HEADER**, and **PARAMETER.**
3. **SSOArtifactName**: **sm_user** is the fixed value. Users must use this default value.
4. **sso.security.cookies**: By default this value is set to False. If you need to have secured cookies, set this value to True. If set to True, ensure that CA Service Desk Manager (SDM) and xFlow interface is SSL enabled.

Users must be present in CA SDM with access policy set to **Allow external authentication**.
If a user is not present in CA SDM, Error 401 (unauthorized error) is shown.

Rate Limiting in xFlow

> **NOTE**
> This is applicable from CASM 17.4 RU5 and above.

You can now control the number of API requests allowed within a specific time frame using the **Rate Limiter Filter**.
The Rate Limiter Filter is a comprehensive API protection mechanism that safeguards against API abuse by enforcing configurable request limits.

It enforces configurable limits on API calls and supports both token-based and IP-based identification to ensure fair and secure access.

By default, rate limiter filter is disabled (ratelimit.enabled = false). When set to true, the remaining parameters become applicable.

To enable or disable the rate- limiting functionality:

- Locate the file ***application.conf*** at the default location. *(Default location: **C:\Program Files\CA\xFlow\APPS\Services \incidentmicroservice-17.0.479\conf**).*
- Edit the below configurations as per your requirements.

  > **NOTE**
  > This is applicable only for the end-points present in ***incident microservice*** (for both xFlow and ServicePoint)
- Restart xFlow service.

Rate Limitation Configuration

Configuration for application.conf	Description	
ratelimit.enabled = false	Enables or disables rate limiting for API endpoints.	Set
ratelimit.defaultPerUserLimit = 50	Defines the number of requests allowed per API endpoint per X-Access Token within the configured time window.	For ***= 1*** min
ratelimit.timeWindowMinutes = 1	Duration of the rate-limiting time window (in minutes). Users can make the configured number of requests within this window.	Use allo
ratelimit.customIpHeader = ""	Allows specifying a custom header to extract the client IP address for rate limiting. When configured, this header is checked before the standard ones (X-Forwarded-For, X-Real-IP, Remote-Addr).	Exa Cus with

Administer Insights

As a CA Service Management administrator, you can create users and map roles/access types , create domains, add custom attributes, and so on as described in this article for Insights (Aggregate Reports and Transactional Reports for JasperReports):

This article contains the following topics:

Assign Roles and Functional Access

NOTE

CA Service Management no longer supports role switching for Insights App. The default OOTB role for Insights app is available with CA Service Management 17.4, and it is similar to the Out-of-the-Box (OOTB) Reporting role of an Access Type for a contact. In case, if you change the default role of the app to any other role than the Reporting role, ensure that you consider the following:

- Aggregated Reporting reflects data as per the new default role the app
- Transactional Reporting honors only reporting role of the contact

Ensure that the reporting role of an access type and default role of an access type for Insights App is same.

The below table lists out the CA SDM Roles and Functional Access. Ensure that you have assigned the appropriate roles and access for access to reporting domains.

The List of Roles, and Functional Access

Access Type	Roles List	Default Role
Administration	Administrator Level 1 Analyst Level 2 Analyst Service Desk Administrator Service Desk Manager Super Administrator	Default
Process Management	Incident Manager Level 2 Analyst Service Desk Manager Level 1 Analyst	Default

Service Desk Management	Customer Service Manager Level 1 Analyst, Level 2 Analyst Service Desk Manager	Default
Service Desk Staff	Customer Service Representative Level 1 Analyst Level 2 Analyst	Default
Super Admin	AdministratorCustomer Service Manager Customer Service Representative Incident Manager Level 1 Analyst Level 2 Analyst Service Desk Administrator Service Desk Manager	Default

(Optional) Create and Configure Users

Create Roles

You can create roles and can assign roles to the users. The users can access the reports and can view the data in the reports based on the roles assigned to them.

Follow these steps:

1. Log in to JasperReports® Server 8.1.1, as *superuser*, using the following credentials:
   - User name: *superuser*
   - Password: *superuser*
2. Navigate to **Manage**, **Roles**, **casm_insights**.
3. Click **Add Role** in the **Roles** section.
4. Define the role in the following format: *ROLE_<role_name>.*
5. Click **Add Role to servicemanagement** to create and save the role.

Create Users

You can create users and can assign roles to the users.

Follow these steps:

1. Log in to JasperReports® Server 8.1.1, as *superuser*, using the following credentials:
   - User name: *superuser*
   - Password: *superuser*
2. Navigate to **Manage**, **Users**, **casm_insights**.
3. Click **Add User** in the **Users** section.
4. Define the user details for the *servicemanagement* organization.
5. Click **Add User** to **casm_insights** to create and save the user to the *servicemanagement* organization.
6. Associate a role to the user:
   - Click the required user from the list and click **Edit** in the **Properties** pane on the right.
   - From the list in **Available Roles**, move the required role to **Roles Assigned** and then click **Save**.
     The user can now access the reports data based on the assigned role.

(Optional) Configuring Insights with CABI JasperReports Server Load Balancer

If you have configured CABI JasperReports Server with high availability, then you must manually configure Insights with CABI JasperReports Server Load Balancer.

Follow these steps:

1. Verify that Insights is integrated with one of the high availability environment CABI JasperReports Servers.
2. Copy the following content from < *CA Business Intelligence Installed Directory>\apache-tomcat\webapps\jasperserver-pro\WEB-INF* folder:
   a. *applicationContext-externalAuth-template-mt.xml* file
   b. *actionModel-navigation.xml* file
   c. `Config` folder
3. On another high availability environment CABI JasperReports Server, navigate to < *CA Business Intelligence Installed Directory>\apache-tomcat\webapps\jasperserver-pro\WEB-INF* folder.
   a. Replace the existing content with the copied content.
   b. Restart the *CABI JasperReports Tomcat service*.
4. Login to CA SDM as an administrator. Navigate to the **Administration** tab, select **xFlow Interface** , and **General**.
5. Search for the configuration key, **insights.jasper.domain,** and click **Edit.**
   a. Replace the **Configuration Value** with the domain name of the load balancing server. For example, **<hostname:8080>**
   b. Click **Save**.
6. Search for the configuration key, **insights.jasper.hostname,** and click **Edit.**
   a. Replace the **Configuration Value** with the host name of the load balancing server. For example, **<hostname>**
   b. Click **Save**.
7. Restart the *xFlow Interface* service based on your configuration:
   a. **Advanced Availability**: Restart services on the application server.
   b. **Conventional**: Restart services on the primary and secondary servers.

Enable the KPI Option

The KPI option enables the KPI daemon to collect data when a ticket is opened, closed, or modified. The KPI option is enhanced to capture additional information during the ticket creation process. However, for the tickets that were created prior to the implementation of CA Service Management 17.3, this additional information is not captured.

Perform the following steps to enable the KPI options:

1. Login to CA SDM as an Administrator.
2. Navigate to Administration, Options Manager, KPI and select the **kpi_ticket_data_table** and **kpi_ticket_data_enable_workshift** options. Click **Edit** and **Install**.
3. Restart the CA SDM Services.

Insights Architecture Diagram

This article consists of Architecture Diagrams for Transactional and Aggregate Reports for CABI JasperReports Server:

Transactional Reports

The following deployment diagram displays Transactional Reports with offline CA SDM Reporting Components:

Figure 8: Figure: Insights - Transactional Reports 17.3

Aggregate Reports

The following deployment diagram shows various components for Aggregate Reports:

Figure 9: Figure: Insights - Aggregate Components

Transactional Reports

Create a Domain

Pre-requisites to create a new domain

1. Login to CABI as jasperadmin of casm_insights organization or as a superuser.
2. Navigate to **Manage**, **Users**.
3. Click jasperadmin/superuser and click **Edit** on the right panel
4. Navigate to the **Attributes** tab.
5. Click **Add new attribute**. Enter '**contactUUID**' in the Name column. Leave Value column as empty.
6. Click **Ok**. Click **Save**.

How to Create a New Domain?

This video demonstrates how to create a domain in CABI JasperReports. For more information, see the articles that follow the video.

> **TIP**
>
> To play the video in full screen, click the YouTube logo in the right of Settings at the bottom of the video.
>
> To change the video quality, navigate to **Settings**, and set **Quality** to **720p**.

Perform the following steps to create a new Domain:

1. Click Domains, Create from JasperReports Server Home Page.
2. Enter the **Name** and ID of the organization.
   Ensure that the ID is prefixed with letter '**z**' to avoid overwriting of the domain on importing latest releases.
3. For **superuser**:
   a. Select Save Location as: /organizations/casm_insights/SDM/Transactional/domains
   b. Select Data Source as: /organizations/casm_insights/SDM/Transactional/datasources/sdm_d
4. For **jasperadmin**:
   a. Select Save Location as: /organizations/casm_insights/SDM/Transactional/domains
   b. Select Data Source as: /organizations/casm_insights/SDM/Transactional/datasources/sdm_ds
5. Click **Create with Domain Designer**.
6. Select '**casd**' as Database Schema.
   Click **OK**.
7. Under **Tables** tab, pull the required magic objects from **Data Source** column to **Selected Tables** column.
   You can create derived tables from the **Derived Tables** tab.
   Ensure that you write the query in the following syntax:
   ```
   SELECT <columns> from <object_name> Example: select * from chg and NOT LIKE select * from casd_chg
   ```
8. Click **Run** Query.
   If the query is successful, you will see a list of columns. Enter a unique Query ID and select required columns from the list.
   Click **Save Table**.
9. Define joins to this derived table under the **Joins** tab.
   You can create calcuated fields under the **Calculated Fields** tab.
   Syntax to use attributes is as follows:
   ```
   <schema>_<object_name>.<alias_name>
   ```

For example, **casd_chg.assignee**

10. Under the **Joins** tab, create joins between tables based on the primary keys.
    CA Service Management supports **Left outer**, **Right outer** and **Inner joins** only.
    Ensure that all tables are joined under one Join Tree.
11. Under the **Display** tab, pull in the attributes from the **Resources** column to **Set and Items**.
12. (If you donot find the required alias, please create attribute alias in SDM and refresh the CABI browser.)
    Edit their **Properties** as required:
13. Click **OK**. Click **Submit**.
14. The Domain saved dialog appears.
    Now you can use this domain to create your ad-hoc views and reports.

Add Custom Attributes to Reporting Domains

This article is intended for CA Service Management Administrators and describes how to add attributes to a modified MDB schema for a reporting domain. It provides step by step instructions on how you can update the Out-of-the-Box (OOTB) domains provided with CA Service Management to include the additional attributes for reporting. Once SDM and Jaspersoft are integrated and you have imported the default reporting domains, you can start building your own custom reports. If you have modified the MDB schema and need to incorporate the new fields into your report building, you can update the out of the box domains to include them.

The use case used in the example showcases how an attribute is added to the OOTB I**ncident Management** Domain. The newly added attribute will be used to identify incidents that are incorrectly categorized.

CA SDM Web Screen painter was used to add an attribute (**zcatergory_init**) to CA MDB. The attribute that we are going to add is **zcategory_init** and it references the **pcat** object (SREL Table).

Before you Begin

Ensure to consider the following best practices before you start adding a custom attribute to your reporting domains:

1. It is recommended that you take a backup of the domains and save it under a different unique resource ID to perform your customizations.
2. If you are planning to modify the Out-of-the-Box domains, you are only eligible to add custom attributes which exist in tables that you have pulled into your reporting domains.
3. These custom attributes must be added to the empty set that is provided for custom attributes in **Display** Tab. To access the Display tab from JasperReports Server, click **Domains**, **View List**, Select a **Domain** (for example: Incident Management), Click **Edit**, access the **Display** tab.

> **NOTE**
>
> If you plan to modify the Out-of-the-Box domains, do not add new tables or derived tables into an existing domain schema or modify existing joins. Do not modify the existing Out-of-the-Box fields that are provided.

Create an Attribute Alias in CA SDM for the Additional Attributes

This video demonstrates how to add attributes to a modified MDB schema for a reporting domain in CA Service Management 17.3. For more information, see the articles that follow the video. After integrating CA SDM and Insights (CABI JasperReports), and after importing the default reporting domains, you can start building your own custom reports.To use this attribute for reporting, a corresponding attribute alias has to be created, if it is not already present in your reporting domain.

> **TIP**
>
> To play the video in full screen, click the YouTube logo in the right of Settings at the bottom of the video.
>
> To change the video quality, navigate to **Settings**, and set **Quality** to **720p**.

Perform the following steps to create an attribute alias:

1. Login to CA SDM as an Administrator.
2. Click **Administration, Service Desk**, **Application Data**, **Codes**, **Attribute Aliases**. Click **Create New**.

   NOTE

   Attribute Alias codes provide a flattened view of the database and allows you to include columns from related tables. Attribute alias name is same as the majic join name, but underscores are used in place of the dots when defining the alias name.
3. Complete the following fields on the Create New Attribute Alias page:
   a. **Object Name**: Select the Object Name as **IN** for Incident on the Create New Attribute Alias page.
   b. **Alias Name**: Use underscores to create alias name as **zcategory_init_sym**
   c. **Alias Value**: Create Alias Value as **zcategory_init.sym**
   d. **Description**: (Optional) Provide an appropriate description for the new attribute alias.
4. Click **Save**.

   NOTE

   After creating a new attribute alias for the custom attribute, you need to add this to a domain and use this for reporting purposes. Also, in order to Create an Adhoc View for the Custom Attribute using the custom attribute, the attribute alias must be included in the reporting domain first.

Add Attributes to a Non-Tenanted Environment

The Out-of-the-Box domains in JasperReports server are built for tenanted environments. Hence, to add attributes to a domain for a non-tenanted environment, you are required to perform few additional steps as shown below. These steps must be performed before adding any custom attributes to a domain and required only the first time the domain is being modified.

Perform the following steps:

1. Login to JasperReports Server as **Superuser**.
2. Navigate to **Domains**. Click **View list**.
3. Select the domain (in this case, for example, select the **Request Management** Domain) and right-click to **Edit** the domain.
4. Select the '**Edit with Domain Designer**' option under '**Edit Domain**' section.
5. Select the **Display** Tab, **Sets and Items** selection box, and expand the domain (**Request Management** Domain).
6. Expand the selected domain and scroll down to select tenant related fields. In this case, select **Tenant Name** for Request Management Domain and delete it.
7. Select the **Tables** Tab.
   A popup message is displayed.
8. Click **Ok** to delete the tenanted resources and related information from the tenanted schema.
9. Click **Ok** on the Domain Designer. Click **Submit** to update the domain.
   Your domain is now ready to be customized.

Add Custom Attributes to Domains

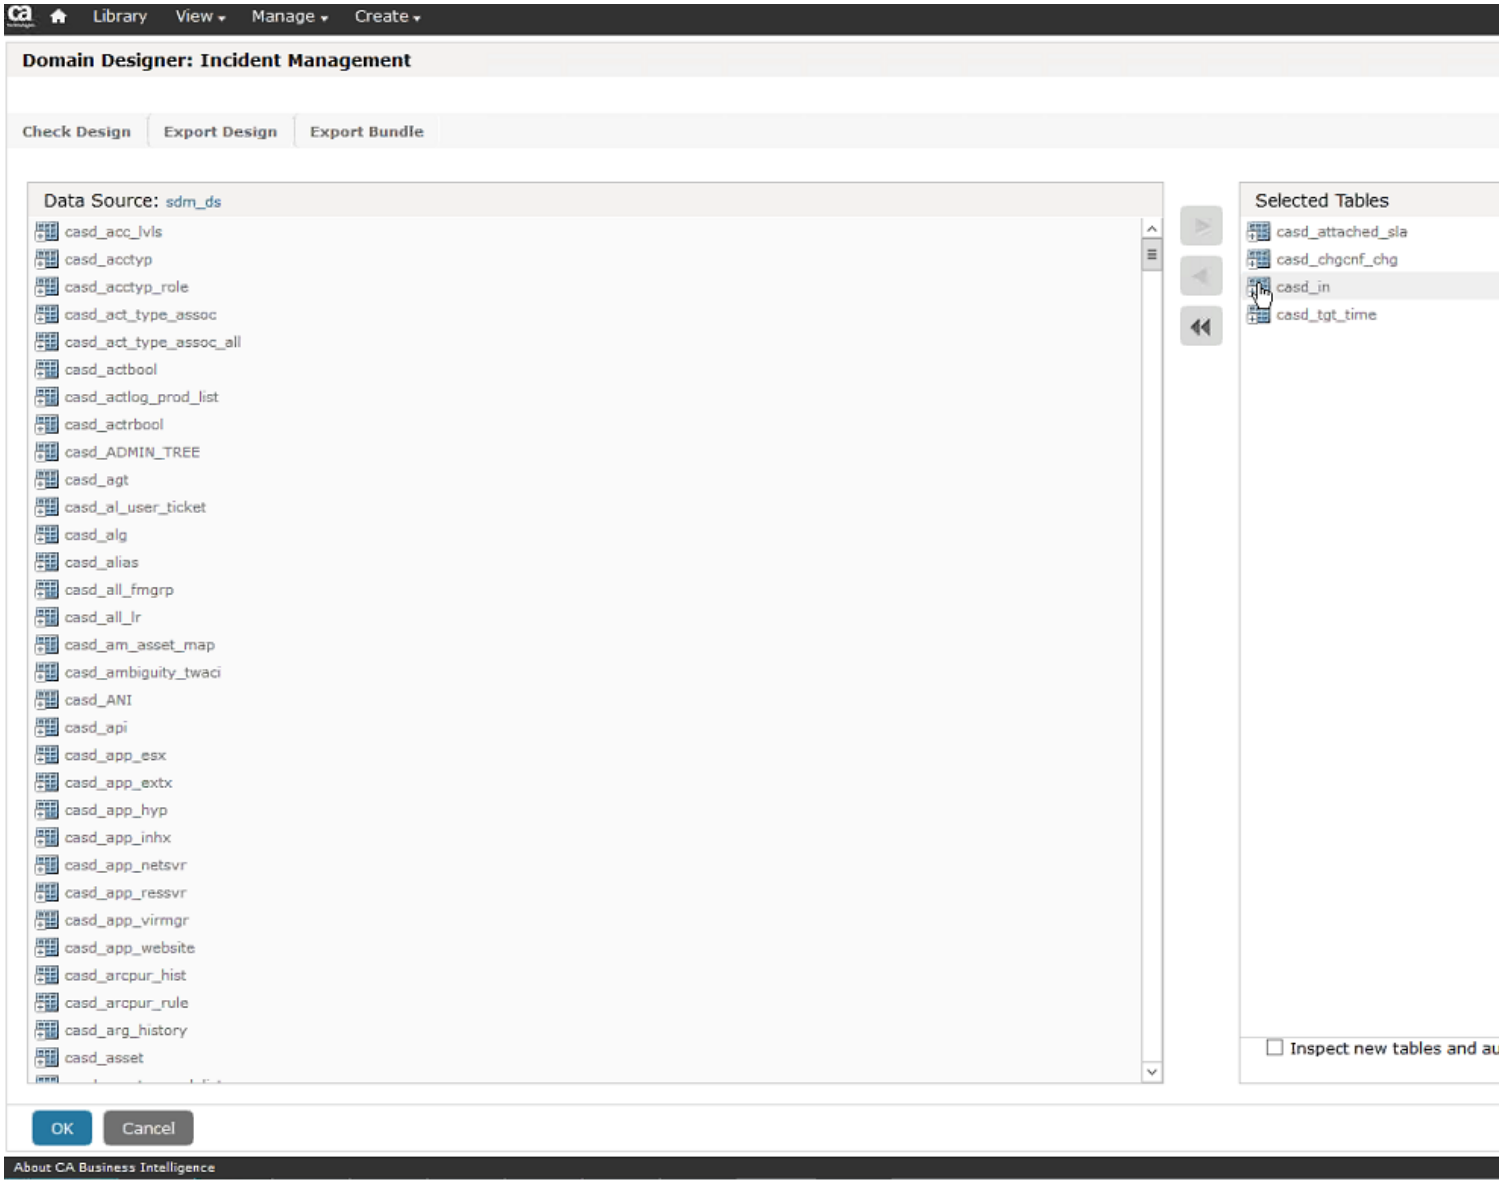
Add the custom attributes (for which attribute aliases were created) to the Out-of-the-Box domain by performing the following steps:

1. Login to CA Business Intelligence JasperReports Server as a **Superuser**.
2. Navigate to **Domains**, click **View List** to see the available domains.
3. Right-click the domain and select **Edit**. In this case, select the **Incident Management** domain.
4. Select the **Edit with Domain Designer** option under the **Edit Domain** section.
   By Default, the **Display Tab** is displayed.

5. Expand the Domain (In this case, **Incident Management**) from the **Sets and Items** section to view all the fields in a domain.
6. Scroll down to verify if the new field (**zcategory_init_symbo**l added in step Create an Attribute Alias) is part of the list or not.

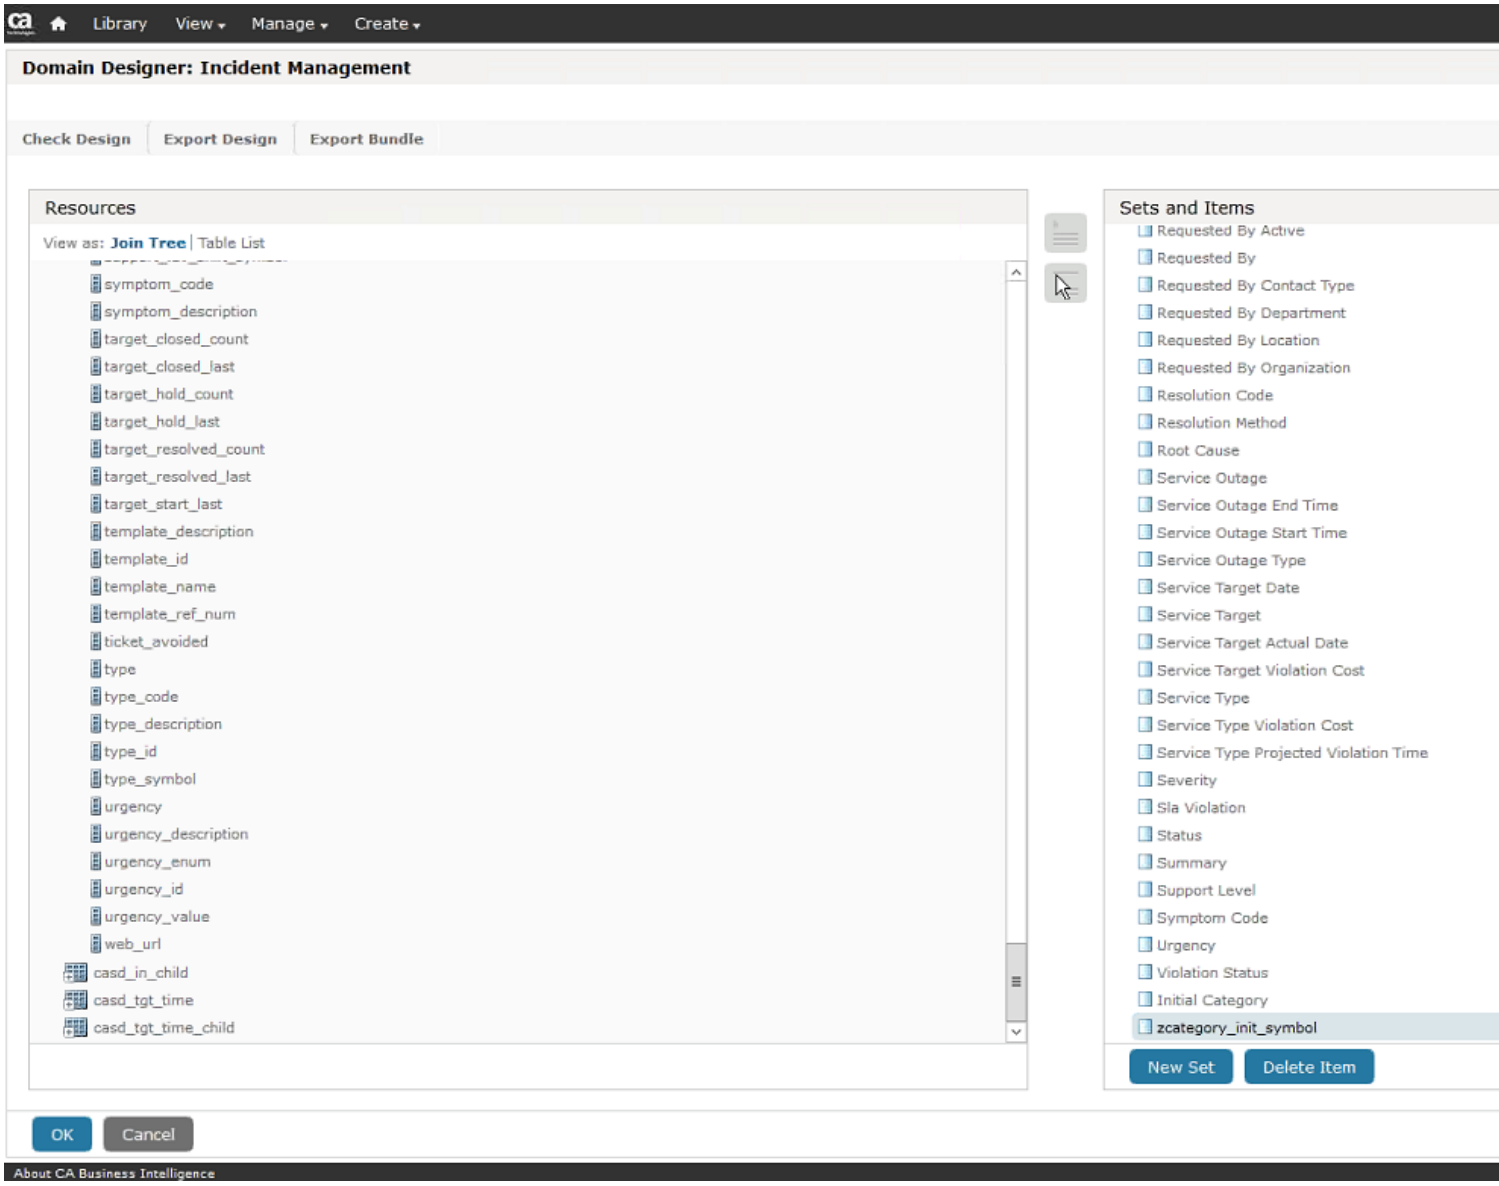
   NOTE

   In this case, the field will be not be listed and must be added manually.
7. Click the Tables Tab. Click **casd_in** table to view where the incident data is located.
   The right-hand side section, that is the, **Selected Tables** contains fields that the schema knows about and this is used to create ad hoc views.



8. Expand **casd_in** and scroll down the list.
9. The attribute alias **zcategory_init_symbol** that was created in step Create an Attribute Alias is visible on the list. This confirms that the newly added attribute alias is present in the schema.
10. Pull this attribute into the domain. Navigate back to the **Display** tab and from the **Resources** section, expand the **casd_in** node under the **Resources** section.

11. Scroll down and select the **zcategory_init_symbol** and click **Add to Selected Set** to add it to the existing domain.
12. Scroll down and verify if **zcategory_init_symbol** is present.
13. Now, modify, if required, the label name of the newly added attribute. Click **Edit** on the extreme right.



14. After editing is complete, click **Save**.
15. Click **Ok** on the Domain Designer.
16. Click **Submit** to update the domain.

(Optional) Create an Adhoc View for the Custom Attribute

Additionally, you can also create a new adhoc view for the custom attribute that is added to the domain.

Perform the following steps:

1. Select **Create** from the menu, select **Ad Hoc Views** to create an Ad Hoc View.
2. Select the **Incident Management** domain from **Select Data**. Click the **Choose Data…** option.
3. From the Source column, expand the **Incident Management** domain and select the fields that you want to generate a report for.

Click **OK**.

4. On the new Ad Hoc View page, click the **Crosstab** drop-down list and select the **Table Type** to Table.
5. Expand the Incident Management fields, drag and drop or double-click the fields that you would like to add to the table Columns and Groups.
   You can group by Category and can even add a Filter.
   Additional Attributes can be added in the same way.

Editing Reporting Domains for Untenanted CA SDM

While customizing JasperReports Server domains, if you have an untenanted CA SDM environment, perform the following steps:

NOTE

These steps must be performed for all domains in your reporting environment before saving a domain:

1. Login to JasperReports Server as an Administrator.
2. Navigate to Domains. Click **View list**.
3. Select the domain of your choice and right-click to **Edit** the domain.
4. On the Edit Domain page, navigate to **Domain Design, Edit with Domain Designer...** option.
5. Select the **Display** Tab, **Sets and Items** selection box, and expand the domain of your choice, for example: **Request Management** domain.
6. Select any tenant related fields, for example Tenant Name and double-click to remove it.
7. Select the **Tables** Tab. A popup message is displayed.
   Click **Ok** to delete the tenanted resources and related information from the tenanted schema.
8. Click **Ok** on the Domain Designer. Click **Submit** to update a domain.
   Your domain is now ready to be customized.

Configure JasperReports Whitelist for Transactional Reporting

For security purposes, perform the following steps to configure JasperReports Hostname whitelist for Transactional Domain reports:

1. Login to Classic CA SDM Interface as an Administrator.
2. Configure the hostname whitelist in CA SDM Options Manager for Transactional Domain Reporting. Navigate to **Administration**, **Options Manager**, **General**, **dal_whitelist**. Click **Edit**.
3. In the Option Value box, enter the host names by comma separated values without quotes. For example:

```
hostname_01<.domain.com>, hostname:02<.domain.com>
```

4. Click **Install** to configure multiple whitelists for transactional domain reports.
5. Restart CA SDM Services.

Configure Multiple Domsrvr for Transactional Domain Reports

Perform the following steps to configure multiple domsrvrs for transactional domain reports for scalability purposes:

1. Login to Classic CA SDM Interface as an Administrator.
2. If you want to add additional object managers or domsrvrs on a CA SDM server for scalability or load balancing, see Add Object Managers.
3. Now, configure the domsrvrs in CA SDM Options Manager for Transactional Domain Reporting. Navigate to **Administration**, **Options Manager**, **General**, **dal_domsrvr**. Click **Edit**.

4. In the Option Value box, enter the domsrvr names by comma separated values without quotes:
   For example, **domsrvr**, **domsrvr:01**, **domsrvr:02**
5. Click **Install** to configure multiple domsrvr for transactional domain reports.

   NOTE

   Ensure that you have provide the **Communication Server Name** for domsrvrs.
6. Restart CA SDM Services.

Aggregate Reports

To get the Aggregate Reports up and running, perform the following as an Administrator:

CA SDM Data Warehouse

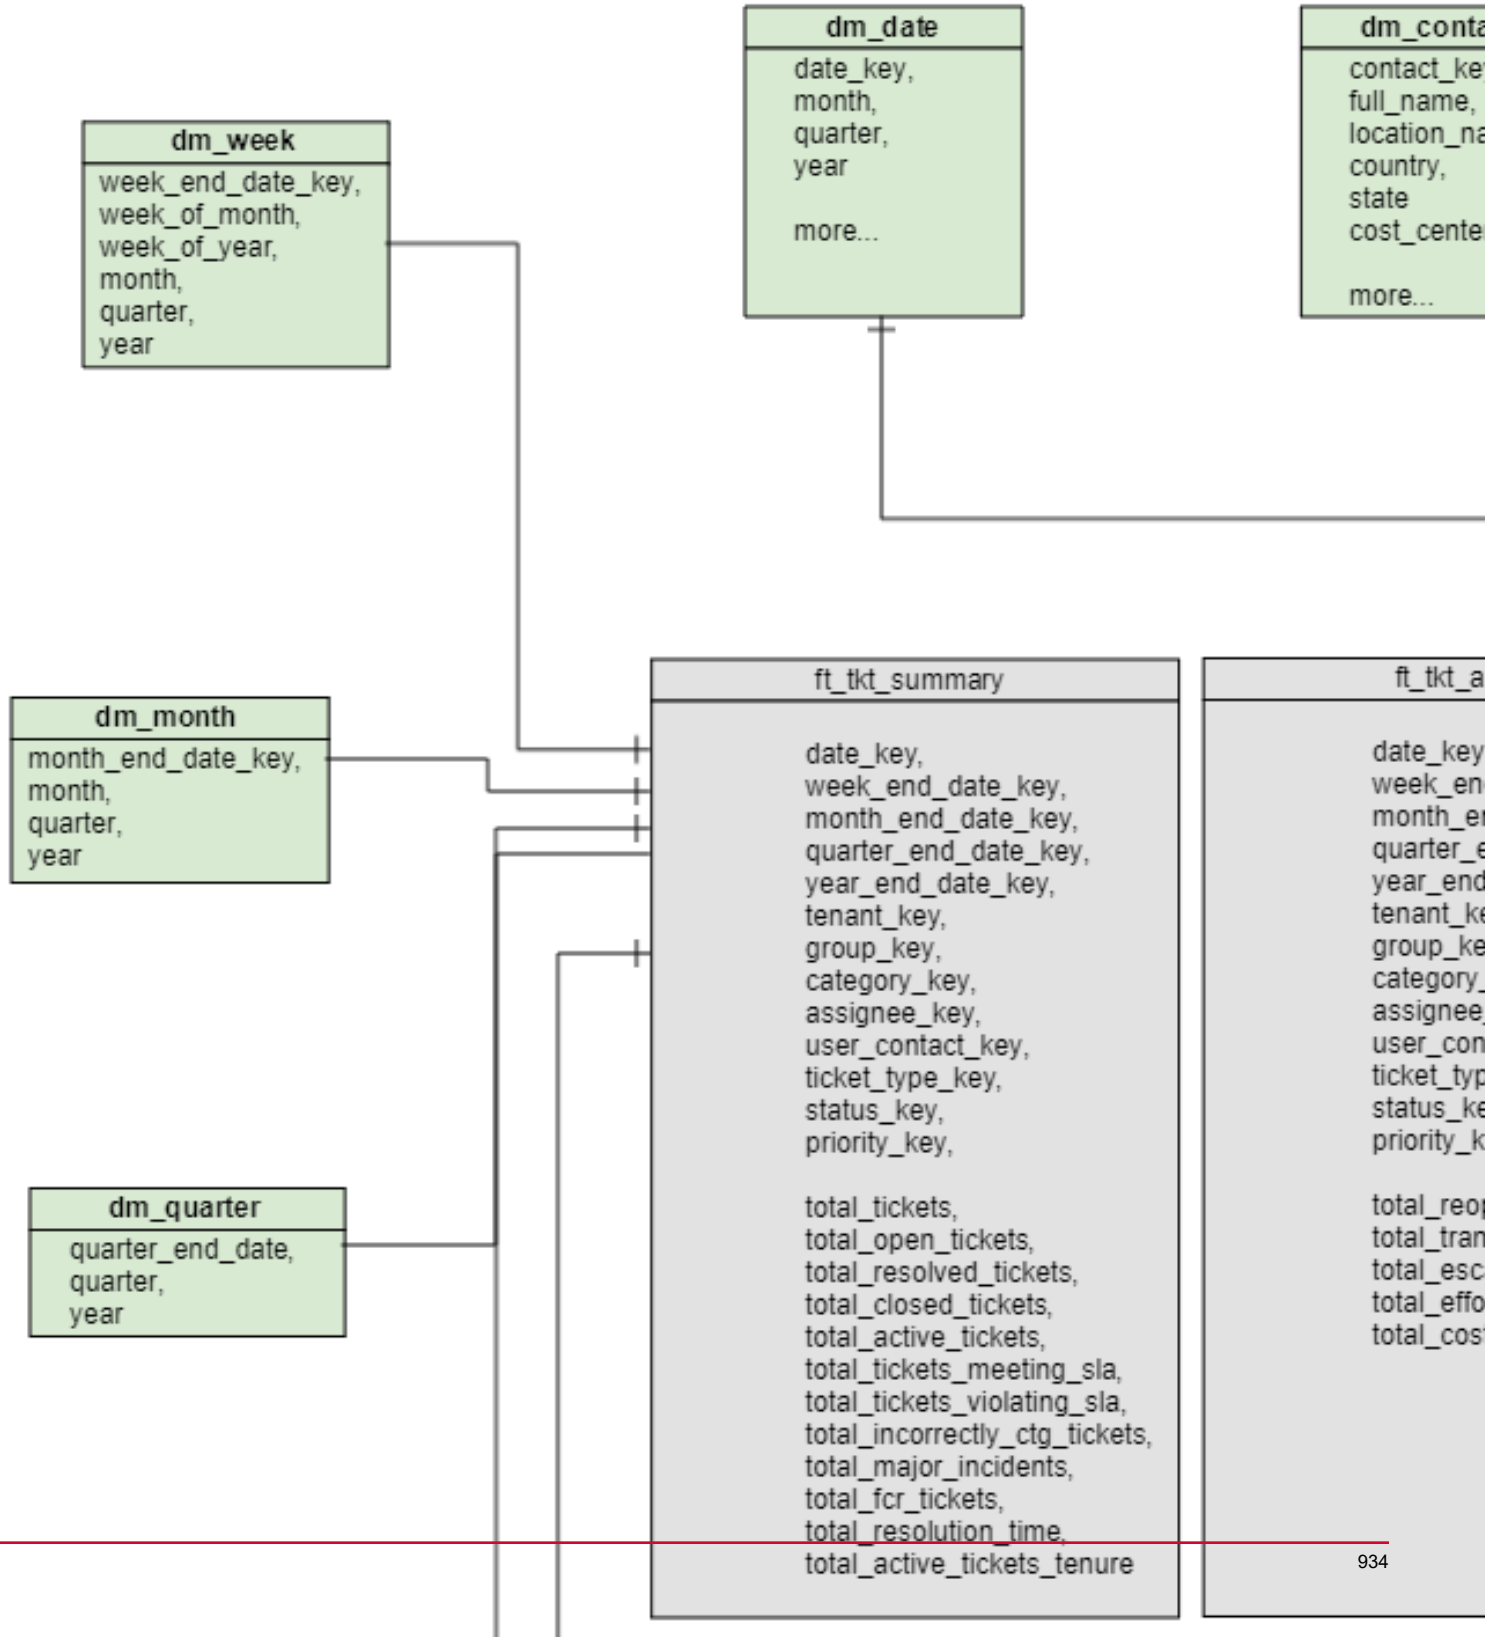
CA SDM data warehouse is the primary data source for Insights and has the following characteristics:

- Optimized for reporting purposes.
- Includes the incident and request management data.
- Can include custom attributes.

Aggregated (Datamart) Schema

The Datamart schema and entity relationship.

Datamart Entity Relationship Diagram (ERD)



Add Custom Attributes to the Dimensions

In the Ad Hoc Designer View, you see dimensions under the fields tab on the left side panel. Expanding each dimension lets you see the exposed attributes associated with that dimension. If you need to add additional attributes, first edit the domain and see the list of attributes associated with that dimension. If the additional attribute that you need is not available in the list, add a new attribute.

Perform the following procedures:

- Add Custom Attributes to the Aggregate (Datamart) Schema
- Expose the Attributes in the Domain and Topic

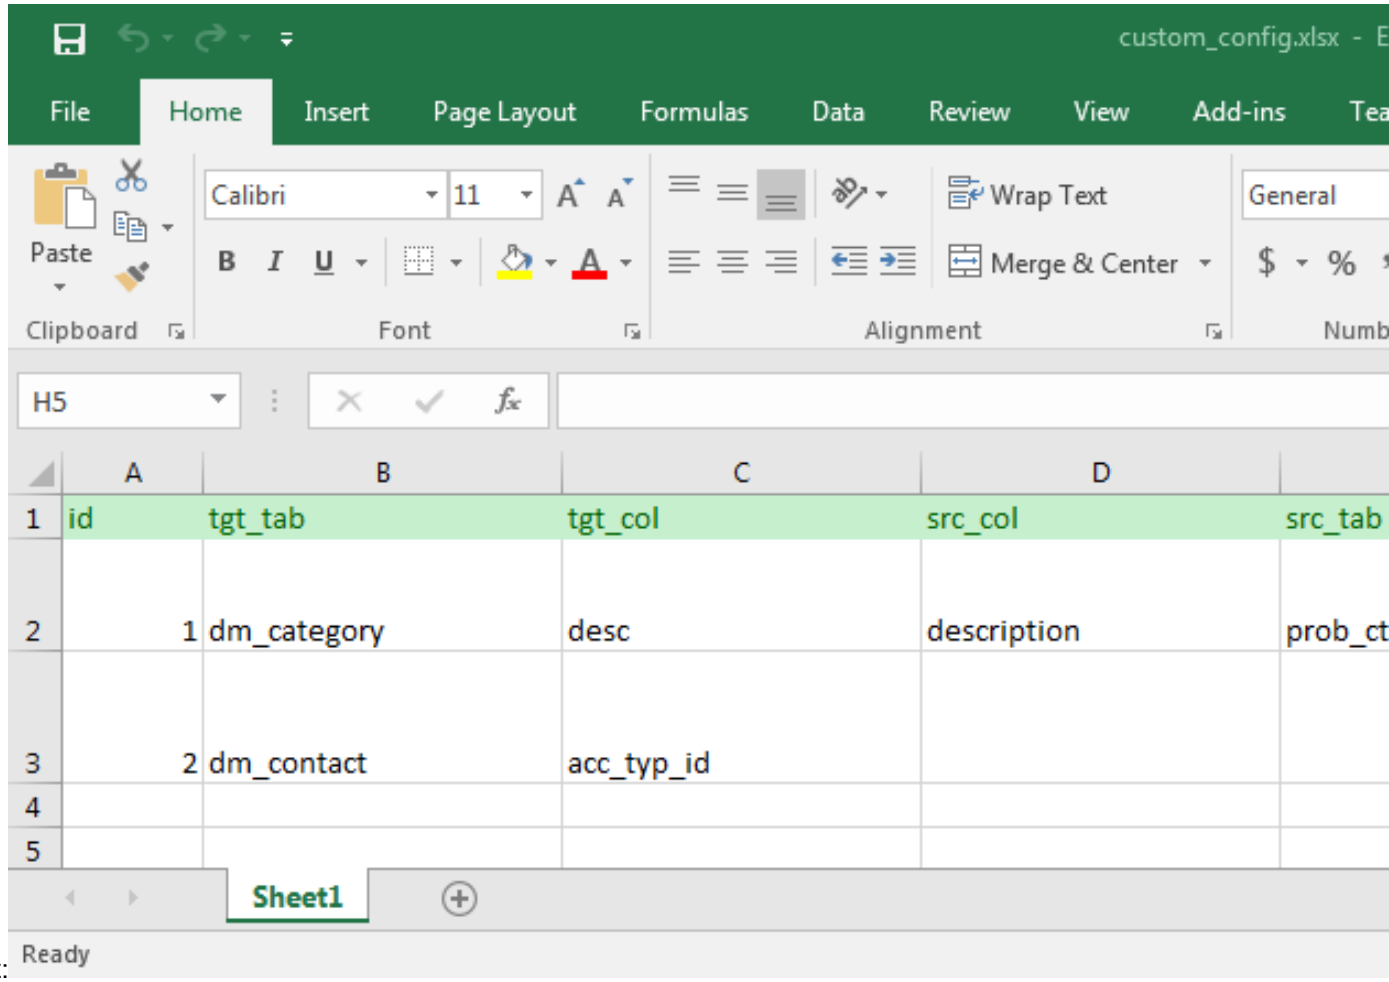
Add Custom Attributes to the Aggregate (Datamart) Schema

1. Navigate to where you have installed Aggregate Reports and open the **custom_config.xlsx** file under the config directory.
2. The file includes the following column. Fill the values under each column as explained below:
   a. **tgt_tab**
   Specifies the target dimension table in which you want to add the new column/attribute.
   b. **tgt_col**
   Specifies the new column that you want to add to the target dimension table which corresponds to the custom attribute.
   c. **src_tab**
   The **base table** in the **MDB** which is the source for the **dimension table** in the **Datamart**. If the new attribute/ column that you want to add is present in the base table, then specify the base table name here. If not, skip this and jump to filling the sql_query field. The below table shows the mapping between dimension tables in the datamart and their corresponding base tables in the MDB:

Dimension	tgt_tab	base table
Analyst	dm_contact	ca_contact
Business User	dm_contact	ca_contact
Group	dm_contact	ca_contact
Category	dm_category	prob_ctg
Priority	dm_priority	pri
Status	dm_status	cr_stat
Tenant	dm_tenant	ca_tenant
Ticket Type	dm_ticket_type	crt

   d. **src_col**
   The column name in the base table of the attribute that you are trying to add. If the attribute that you are trying to add is not present in the base table, then skip filling this field and proceed on to fill the **sql_query** field.
   e. **sql_query**
   SQL query is required to add a column to the target table when the respective column is present in a table other than the base table. This query extracts the required column from the other table along with the **src_lkp** field, which is the primary key of the base table. So, the output of the query must be just two columns, which is, **(src_lkp, src_ col)**.

Example: If you want to add **description** and **c_acctyp_id** attributes/columns to **category** and **analyst** dimensions respectively, this is how you fill the excel sheet:



Adding **c_acctyp_id** to **dm_contact** requires specifying the SQL query. In this case, the base table for **dm_contact** is **ca_contact**. The required column **c_acctyp_id** is not present in **ca_contact** but is present in another table named **usp_contact**. The SQL query joins **ca_contact** with **usp_contact** and extracts the **c_acctyp_id** column.

In this query **ca_contact.contact_uuid** is the **src_lkp** field and **usp_contact.c_acctyp_id** is the **src_col** field.

select ca_contact.contact_uuid,usp_contact.c_acctyp_id from ca_contact left join usp_contact on ca_contact.contact_uuid=usp_contact.contact_uuid

NOTE

You must choose the SQL query option to add attributes to the following two tables even if the attributes are present in the base table. This is because of the data type mismatch between the primary keys of the datamart tables and their corresponding MDB tables.

- – dm_contact
  Spcify the SQL query in the below format:
  select convert(nvarchar(34),contact_uuid,2) as contact_uuid, <src_col> from ca_contact <joins and other conditions if required>
  – dm_tenant
  Spcify the SQL query in the below format:

select convert(nvarchar(34),id,2) as tenant_uuid,<*src_col*> from ca_tenant <*joins and other conditions if required*>

3. Run the ETL job for the changes to take effect in the datamart schema.
   You have successfully added the attributes to the datamart schema.

Expose the Attributes in the Domain and Topic

1. Login into **JasperReports Server** as **Administrator**.
2. Click **View List** under **Domains**.
   Repository page opens with the list of available Domains.
3. Click the **Incident Request Management Domain** under the **Name** column.
   The Edit Domain page opens.
4. Click the **Edit with Domain Designer** option under Domain Design.
   The **Domain Designer** page opens. The **Display** tab shows Resources, Sets and Items, and Properties panels.
5. Expand the JoinTree_1 node and navigate to the dimension to which you have added the new attribute.
6. Select the attribute from the **Resources** panel and select the group from the **Sets and Items** panel under which you want to show the attribute on UI.
7. Click the **Add to Selected Set** button.
   The attribute is added to the selected group under the Sets and Items panel
8. Select the newly added attribute under the Sets and Items panel, and then click **Edit** in the **Properties** panel.
9. Go to **Field or Measure** drop-down list and select **Dimension**.
10. Click **Save** and click **OK.** Click **Submit** on the Edit Domain page.
11. Go to the home page and navigate to **View**, **Repository**.
12. From the left hand panel, expand the **casm_insights**, **capability**, and select **topics**.
13. Select **Incident Request Management Topic** and click **Edit**.
14. Select the attribute under the **Source** panel, select the category under the **Selected Fields** panel, and click the **Add** button.
15. Click **Save**.
    You have successfully added the custom attributes to the existing dimension.

Purging Data from the FACT Tables in Datamart

FACT tables are the tables which contain the aggregated data. The required data for reporting is available in the FACT tables within the datamart. The data is available from the date set as the data aggregation date. Any data that is prior to the data integration date will be automatically purged. Data purging is based on the data aggregation date parameter in the config.properties file. For example, if data was available from 2017-01-01 initially and then the data aggregation date was changed to 2017-06-01, all of the data prior to the date 2017-06-01 will be deleted from the FACT tables.

For more information, see Configure the Data Aggregation Date.

NOTE
For removing the vulnerability of ***Log4j1 Removal and adding the log4j2 jars and related dependencies in Datamart Installed location,*** apply the patch with APAR No : 99112251

Run the Extract Transfer and Load (ETL) Job

Run the ETL job to load the initial data to Aggregate (Datamart) Reports.

Follow these steps:

1. Navigate to `<Datamart Installed Directory>\bin` folder.
2. Run the `std-load` batch file, to load the initial data to Datamart.
   The time taken to complete the ETL job is based on the data size and the server configuration.

NOTE

We recommend to run the ETL job once every day during the non-peak hours.

3. (Optional) Once the ETL job is complete, if the SQL server (MSSQLSERVER) service consumes high memory, then restart the SQL Server service.

The following is an observation when you run an ETL job for different volumes of data on a server with the below configuration:

Test Results Observation for the ETL Job

- **Server:** Physical
- **Operating System:** Windows Server 2016 (64bit)
- **RAM:** 32 GB
- **Processor:** 2.10 GHz (2 processors)
- **Disk Space:** Total available - 1 TB; MDB Consumption - 40 GB
- **Database Server:** MS SQL 2014
- **MDB and Datamart Installation:** On the same server
- **MS SQL Memory Consumption:** Less than 50%

Total Number of Records in MDB	Data Aggregation Period	Initial Load Results	Delta Load Results
Number of Requests = 789,593 Number of Activities = 11,167,780	3 months	Number of Requests Loaded = 26,527 Number of Activities Loaded = 360,063 Time Taken = 20 minutes Disk space consumed = 3 GB	Number of Requests Loaded = 4,810 Number of Activities Loaded = 57,984 Time Taken = 2 minutes
	6 months	Number of Requests Loaded = 78,484 Number of Activities Loaded = 830,574 Time Taken = 3 hours 20 minutes Disk space consumed = 7 GB	Number of Requests Loaded = 4,810 Number of Activities Loaded = 57,984 Time Taken = 30 minutes
	12 months	Number of Requests Loaded = 174,463 Number of Activities Loaded = 1,439,205 Time Taken = 7 hours 40 minutes Disk space consumed = 58 GB	Number of Requests Loaded = 4,810 Number of Activities Loaded = 57,984 Time Taken = 1 hour 2 minutes
	24 months	Number of Requests Loaded = 385,622 Number of Activities Loaded = 5,833,017 Time Taken = 26 hours 19 minutes Disk space consumed = 196 GB	N/A

(Optional) Modify Multi Tenancy

To modify the multi tenancy settings in datamart, and for the changes to reflect instantly in Insights, navigate to the `<Datamart Installed Directory>\bin` folder using the command line interface, and run the `role-tenant-map.bat` file**.**

Schedule the Extract Transfer and Load (ETL) Job

You can use a task scheduling tool to schedule the ETL job at regular intervals or when a certain event occurs. It is recommended to backup the Datamart database before you run an ETL job.

For example, follow these steps to schedule an ETL job using Windows Scheduler:

1. Enter **sched** in the Start search box to open Task Scheduler.
2. In the Actions pane, click **Create Basic Task**.
3. Enter a name and description for the task.
4. Click **Next** to choose a trigger for the task.
5. Choose the task (ETL job) frequency as **Daily**.
6. From the **Start** drop-down, select a date and time when you want the job to begin.
7. Click **OK**.
8. Click **Start a Program** from the **Action** drop-down.
9. Browse the `std-load.bat` file from the `< Datamart Installed Directory>\bin` folder.
10. Click **OK,** and **Finish**.

NOTE

For more information about how to use the Transactional and Aggregate reports, see Using Insights.

For information on how to troubleshoot issues with Insights, see Troubleshooting Insights (CABI JasperReports).

Configure CA Service Desk Manager

Navigate to the required topics for configuring CA SDM.

This section contains the following articles:

- Configuring CA SDM Servers
- How to Configure Surveys
- How to Configure Notifications
- Configure CA SDM and the Components
- Configure the CA SDM Environment
- Managing Servers
- Managing Your Database
- Setting Up Multi-Tenancy
- Handling the Open Redirect Vulnerability Issue in \"LINK WITH BOPSID URL\" Parameter
- Setting Up Security
- Establishing Support Structure
- Auto Assignment
- Manage Roles
- Configuring User Accounts
- Configuration File Modification
- Creating the Business Structure
- CA SDM User Authentication
- Encrypt Session IDs to Address Vulnerability Issues
- Retry Mechanism for CA SDM and CA Process Automation Workflow Options
- Apache HTTP Load Balancer for CA SDM
- How to Configure the F5 Load Balancer for CA Service Desk Manager
- How to Configure the Mailbox to Handle Inbound Emails
- How to Set Up the Data Partition
- How to Perform Proactive Monitoring for CA SDM
- How to Configure Multiple CA SDM Web Engines on Application Servers?

WARNING

Any “modifications” or “adaptions” or “configurations” that are done administratively through the interface (web browser, command-line, Web Screen Painter) are “supported”, meaning CA Support can assist with basic suggestions and trouble-shooting. CA Support does not do the changes for the customer, they are the customer’s responsibility. For example, adding a field to a table and putting the field on a form through Web Screen Painter is a fully supported “modification”. Another example, installing or uninstalling a feature through the Options Manager administration is a fully supported “configuration”.

Anything to do with SPEL code, Java scripting (or any language scripting), or a customer-specific change to the underlying base code-line (done by CA Services or a Partner), is not supported by CA Support. The customer can do these things, but the customer is responsible for the support, maintenance, and trouble-shooting when things go wrong. If such “customizations” affect expected out-of-the-box behavior, CA Support will ask the customer to remove the customizations and see if the behavior persists.

WARNING

Any general configuration that you define for CA Service Desk Manager must be in the valid format to avoid erroneous values for the parameters.

Configuring CA SDM Servers

As a system administrator, configure CA SDM servers. Review the following:

NOTE

You must configure all the CA SDM servers in your environment before you start using the CA SDM application. If the servers are not configured, you will not be able to access the CA SDM application.

- Convert CA SDM Conventional to Advanced Availability Configuration.
- Convert from CA SDM Advanced Availability to Conventional Configuration.

Changing the Server Configuration from Conventional to Advanced Availability

Before proceeding with changing the configuration, ensure that you have upgrade to CA Service Desk Manager 17.4 from earlier an version of CA Service Management or installed CA Service Desk Manager 17.4 on all the servers in your environment.

Follow these procedures:

1. Plan for the Advanced Availability Configuration.
   For more information see, How to Plan for CA SDM Advanced Availability Installation.
2. Stop all services on the secondary servers.
3. Inactivate All the Secondary Servers.
4. Configure the Background Server.
5. Change Secondary Server Type.
6. Configure the Standby and Application Servers.
7. Verify Server Details.

Inactivate All the Secondary Servers

Before you configure the servers for the advanced availability configuration, ensure that you inactivate all the secondary servers. Perform the following steps:

1. Log in to the web interface of the primary server.
2. Select **System**, **Servers** on the **Administration** tab.
   The **Server List** page opens.
3. Click the host name of the secondary server.
   The **Server Detail** page opens.
4. Click **Edit**.
5. Change the **Record** status to **Inactive**.

   WARNING

   If you have inactivated any server, it is recommended not to start CA SDM services on that server. This action may result in unexpected behaviour.
6. Click **Save**.
   The secondary server is set to inactive.
7. Perform steps 3-6 for all the other secondary servers.
   All secondary servers are set to inactive.

Configure the Background Server

Configure the background server before configuring the application or standby servers. Perform the following steps:

1. Log in to the primary server.
2. Use the pdm_configure command to start the configuration.
   The **Select Server Configuration** screen opens.
3. Select **Advanced Availability** as the configuration type and follow the prompts to complete the configuration. For more information, see the Server Configuration Utility.

The background server is configured.

Change Secondary Server Type

After you configure the background server, change the server type for all the secondary servers to application and standby servers and activate them. Perform the following steps:

1. Make sure that the background server is running.
2. Log in to the web interface of the background server.
3. Select **System**, **Servers** on the **Administration** tab.
   The **Server List** page opens.
4. Set the Record Status for all secondary servers as Active.
5. Change the server type of all the secondary servers to application or standby servers, as required.
   The server type of all the secondary servers is changed.

Configure the Standby and Application Servers

You configure each standby and application server after configuring the background server. This configuration is required to establish communication with the background server. Perform the following steps:

> **WARNING**
> (Recommended) Ensure that both background server and all other standby servers have similar configuration. This process ensures that during a failover when a standby server becomes the new background server, it can function exactly like the old background server.

1. Log in to a secondary server.
2. Use the pdm_configure command to start the configuration.
   The **Select Server Configuration** screen opens.
3. Select **Advanced Availability** as the configuration type and follow the prompts to complete the configuration. For more information, see the Server Configuration Utility.
4. Repeat steps 1-3 on each of the servers that you want to configure as the standby and application server.
   You have configured the standby and application servers.
5. If you want to use a load balancer to track the requests to and from the different application servers, configure the load balancer.

   > **NOTE**
   > To use a load balancer URL or an application server URL for the links in the CA SDM notifications, complete the following steps:
   >
   > 1. Log in to the background server.
   > 2. Select **Options Manager**, **Notifications** on the **Administration** tab.
   > 3. Change the value of the web_cgi_url option to point to:
   >   – The load balancer if you have more than one application servers.
   >   – The application server, if you have only one application server.

6. Verify the Server Details.

Verify Server Details

After you have configured all the servers, ensure that each one is properly configured and available. Perform the following steps:

1. Make sure that all background, standby, and application servers are running.
2. Log in to the background server Web UI.
3. Select **System**, **Servers** on the **Administration** tab.
   The **Server List** page opens.
4. Verify that the **Configured** field displays Yes for the standby and application server records.

5. If **Record Status** is set to inactive, edit the server and set to Active. If you change the record status of any server, reconfigure it.
   You have successfully configured servers for the advanced availability configuration.

   NOTE
   You can click any of the Local Host entries on the Server Details page to view the details of the server.

Changing the Server Configuration from Advanced Availability to Conventional Configuration

You can convert the CA SDM conventional configuration to advanced availability. Please see the following:

Convert from Advanced Availability to Conventional

Follow these steps:

1. Verify the Prerequisites
2. Stop all services on the application and standby servers.
3. Inactivate all Application and Standby Servers.
4. Configure the Primary Server.
5. Change the Application and Standby Server Types.
6. Configure the Secondary Servers.
7. Verify Server Details

Verify the Prerequisites

Complete planning for the conventional configuration. For more information, see Plan the CA SDM Installation.

NOTE

Note: You can configure only the background server as the primary server. You can configure only the standby and application servers as the secondary servers.

Inactivate All Application and Standby Servers

Before you configure the servers for the conventional configuration, ensure that you inactivate all the application and standby servers. Perform the following steps:

1. Log in to the web interface of the background server.
2. Select **System**, **Servers** on the **Administration** tab.
   The **Server List** page opens.
3. Click the host name of the application server.
   The **Server Detail** page opens.
4. Click **Edit**.
5. Change the **Record** status to **Inactive**.

   WARNING
   If you have inactivated any server, it is recommended not to start CA SDM services on that server. This action may result in unexpected behaviour.
6. Click **Save**.
   The application server is set to inactive.
7. Perform steps 3-6 for all the other application and standby servers.
   All application and standby servers are set to inactive.

Configure the Primary Server

Primary server must be configured before you configure any secondary servers. Perform the following steps:

1. Log in to the background server web interface and inactivate it.
2. Use the pdm_configure command and start the configuration.
   The **Select Server Configuration** screen opens.
3. Select **Conventional** as the configuration type and follow the prompts to complete the configuration. For more information about the configuration, see the Server Configuration Utility.
   The primary server is now configured.

Change the Application and Standby Server Types

After you configure the primary server, change the server type for all the application and standby servers to secondary servers and then activate them. Perform the following steps:

1. Make sure that the primary server is running.
2. Log in to the primary server web interface.
3. Select **System**, **Servers** on the **Administration** tab.
   The **Server List** page opens.
4. Set the **Record Status** for all application and standby servers as **Active**.
5. Change the server type of all the application and standby servers to secondary servers.
   The server type for all application and standby servers are changed.

Configure the Secondary Servers

You configure each secondary server after configuring the primary server. This configuration is required to establish communication with the primary server. Perform the following steps:

1. Log in in to the application or standby server that you want to configure as the new secondary server.
2. Use the pdm_configure command to start the configuration.
   The **Select Server Configuration** screen opens.
3. Select **Conventional** as the configuration type and follow the prompts to complete the configuration.
   The secondary server is now configured.
4. Repeat steps 1-3 on each of servers that you want to configure as the secondary server.

Verify Server Details

After you have configured all the servers, ensure that each one is properly configured and available. Perform the following steps:

1. Make sure that primary and all secondary servers are running.
2. Log in to the primary server Web UI.
3. Select **System**, **Servers** on the **Administration** tab.
   The **Server List** page opens.
4. If **Record Status** is set to inactive, edit the server and set to **Active**. If you change the record status, ensure that you reconfigure that server again.
   You have successfully configured the servers.

How to Configure Surveys

This article contains the following topics:

Customer surveys let CA SDM administrators systematically collect and analyze customer feedback about service desk performance. You can modify surveys to suit the needs of your site.

Configure Your System for Surveys

Before you can use surveys, you need to configure your system properly, which involves two steps:

1. Install and configure the CA SDM web interface. When a user accesses the URL for a survey, the web interface formats the survey and populates the survey information.
2. Using the Options Manager, configure and install the web_cgi_url option to specify the location of the CA SDM web engine. For more information, see Install/Uninstall Options Manager Options.

Prepare a Survey

You prepare surveys using the Customer Survey List, which is a typical list window. For example, you can use this window to view all surveys or a subset based on search criteria that you enter; you can create new surveys; you can view details on a particular survey; and you can report on the surveys currently listed.

Each survey has the following features that you can define:

- A name that you can use for searching and reporting purposes
- An introduction that you can use to explain the purpose of the survey to customers
- An ordered list of questions for the customer to answer, each of which includes a set of possible answers
- An optional area where the user can enter free-form comments
- A completion message to display after the user submits the survey

Define Survey Notifications

You can use the Survey tab on the Update Activity Notification page to define a survey notification for an activity notification. When the selected activity notification is triggered, the contact who initiated the activity receives the survey notification. An activity log is generated both when a survey notification is sent and when one is received back from a customer.

Follow these steps:

1. On the Administration tab, browse to Notifications, Activity Notifications.
   The Activity Notification List appears.
2. Select the desired activity notification.
   The detail page displays.
3. Click the Edit button.
   The Update Activity Notification page displays.
4. Edit the fields as appropriate.
5. Select the appropriate object type from the drop-down list.
6. Click the Survey tab.
   This tab contains the following fields:
   - **Send Survey**
     This check box allows you to activate or deactivate the survey. If selected, the survey is sent to the contact when the selected activity notification is triggered.
   - **Default Survey**
     Specify a default survey using the search icon or specify your own in the text box.
   - **Notification Method**
     Choose *one* of the following notification methods:
     - Email
     - Notification
     - Pager_Email
   - **Survey Message Title**

Enter the title for the survey.

– **Survey Message Body**
Enter a message for the contact. When a contact receives notification of a survey, the message body automatically includes a URL that they can access from their web browser to find and fill out the survey form.

7. Save the activity notification.
When the selected activity notification is triggered, the contact who initiated the activity receives the survey notification.

Survey Reporting

Within CA SDM you can report on surveys from within the administration tab of the web client in all of the usual ways. For example, from the Customer Survey List window, you can choose Reports from the File menu, and then choose a Summary or Detail report. You can also choose Print Form from the various detail windows to print the form data for your surveys, questions, and answers.

You can also fashion your own reports based on the survey data maintained in the CA SDM database.

Create a Managed Survey

Contents

Create a Managed Survey

The Managed Survey lets the CA SDM administrator select a desired survey sample population and match it to a specific survey. The administrator can then distribute targeted requests for respondents to take the survey at a specific time. This gives the administrator the flexibility of creating open survey periods, while maintaining the ability to have activity-based and category-based surveys related to Requests, Change Orders, and Issues.

The purpose of Managed Surveys is to provide a mechanism for managing surveys. This function can be useful when for survey forms that need to be monitored from time to time (for example, surveys only used during a short period every year or surveys that have been offline too long).

> **WARNING**
> If you want to send the survey to a large number of contacts, set the default value of NX_SURVEY_ILIMIT in NX.env to a higher limit, such as 1073741824.

You can create a managed survey from the Service Desk node on the Administration tab.

Follow these steps:

1. Click the Administration tab.
The Administration page appears.
2. Click Service Desk, Surveys.
Click Managed Surveys, Managed Survey List.
The Managed Survey List appears.
3. Click Create New.
The Create New Managed Survey page appears.
4. Complete the fields as appropriate.
See Managed Survey Fields for field descriptions.
5. Use the controls available on the tabs at the bottom of this page to configure the managed survey as appropriate.
See Managed Survey Tabs for more information.
6. Click Save.
The managed survey definition is saved and the Managed Survey Detail page appears.

The following buttons are available:

- **Event History**

Opens the Event History window, which lists the status, time loaded, fire time, and condition for each event associated with the managed survey.

- **Attach Event**
  Opens the Attach Managed Survey Events window, which allows you to attach events with an object type of Managed Survey.

Managed Survey Fields

The following fields require explanation:

- **Name**
  Identifies the title of the managed survey.
- **Managed Survey Status**
  Select *one* of the following options:
- (Default) Survey Period Open
  - Configuration in Progress
  - Survey Cancelled
  - Survey on Hold
  - Survey Period Closed

  You can create a managed survey status from the Service Desk node on the Administration tab.
- **Active**
  Specifies whether the managed survey is active or inactive.
- **Assignee**
  Specifies the contact that is assigned as the survey owner.
- **Group**
  Specifies the group that is associated with the survey.
- **Survey**
  Allows you to search for existing surveys.

Managed Survey Tabs

The following tabs are available on the Create Managed Survey, Managed Survey Detail and Update Managed Survey pages:

- **Activities**
  Allows you to view the Managed Survey Activity Log List. To display only the log entries of interest, you can filter the list by specifying:
  - Earliest Log Date
  - Latest Log Date
  - Activity Type
  - Created By
- **Objects**
  Allows you to specify assignee (managed survey owner) or associated groups as notification recipients for the managed survey.
- **Contacts**
  Allows you to specify one or more contacts as notification recipients for the managed survey.
- **Types**
  Allows you to specify one or more contact types as notification recipients for the managed survey (for example, Analyst, Customer, Manager, or Vendor).
- **Initial Message**
  Allows you to view or edit the text for the initial message title and body. Also allows you to specify the notification method for the initial message (for example, e-mail, CA SDM notification, FAXserve, or pager e-mail).
- **Reminder Message**

Allows you to view or edit the text for the reminder message title and body. Also allows you to specify the notification method for the reminder message (for example, e-mail, CA SDM notification, FAXserve, or pager e-mail).

View or Edit a Managed Survey Activity

You can view or edit an entry on the managed survey activity log.

Follow these steps:

1. Select Service Desk, Surveys, Managed Surveys, Managed Survey List on the Administration tab.
   The Managed Survey List appears.
2. Click a survey in the Managed Survey Name column.
   The Managed Survey Detail page appears.
3. Select the Activities tab.
   The Managed Survey Activity Log Search fields appear.
4. (Optional) Complete any of the following search filter fields to list only the activity log entries of interest:
   a. **Tenant**Select the appropriate tenant, if you are operating in a multi-tenancy environment.
   b. **Public Data**
      Select whether you want to include, exclude, or list only public data activities.
   c. **Activity Type**
      Search for an activity type if you want to filter the list by activity notification type.
5. Click Search.
   The Managed Survey Activity Log List displays the log entries that match your search criteria.
6. Click Search.
7. The Managed Survey Activity Log List displays the log entries that match your search criteria.
8. Right-click the log entry of interest and select View.
   The Managed Survey Activity Detail page appears.
9. (Optional) Click Edit. The following editable fields require explanation:
   a. **Internal**
      Specifies whether the log entry is public or private.
   b. **User Description**
      By default, this field contains a copy of the System Description field, which specifies the details of the activity (for example, definition of an initial message for the survey. You can edit the User Description to provide an easy way of identifying the activity.
10. Click Save, if you have chosen to edit the log entry.
    Your edits to the log entry are saved.

Managed Survey Status

You can view the default survey status options by navigating to Service Desk, Surveys, Managed Survey Status from the Administration tab.

From this page, you can perform the following tasks:

- Create a new status.
- Edit an existing status.
- Search the Status List.
- Enable or disable a status.

Survey Status symbols, along with their codes, descriptions, and record status appear in the list. The survey symbol is a field that defines the record status of a managed survey.

The following are default Managed Survey Status List symbols:

- Configuration in progress
- Survey Cancelled
- Survey on Hold
- Survey Period Closed
- Survey Period Open

Search Managed Surveys

The Managed Survey List page has the following options:

Show Filter Displays a search filter based on the following criteria: Name Description Active Related Survey Assignee Status Clear Filter Clears the search filter.

> **NOTE**
>
> If multi-tenancy is installed, the list page displays Tenant and Public Data settings in the search filter. Public Data can be Excluded or Included with Tenant data; Only searches for public objects exclusively. On detail pages, select the appropriate tenant from the list. If you select <empty>, the object is public.

Search Managed Survey Status

The Managed Survey Status List page has the following options:

Show Filter

Displays a search filter based on the following criteria:

- Symbol
- Code
- Active
- Description

Clear Filter Clears the search filter.

Create a Survey Template

You can create a survey template from the Service Desk node on the Administration tab.

> **NOTE**
> If multi-tenancy is installed, select the appropriate tenant from the drop-down list. The public (shared) option creates the object for all tenants.

Follow these steps:

1. Click the Administration tab.
2. Click Service Desk, Surveys, Survey Templates.
   The Customer Survey List appears.
3. Click Create New.
   The Create New Survey page appears.
4. Complete the appropriate fields.
   See Survey Template Fields for field definitions.

   > **NOTE**
   > The Survey Name field and the Active? dropdown are required.
5. Click Save.
   The template is saved and questions can be added.
6. Click Add Question to specify the question's sequence, comment label, status and question text. Or click Add Answer to open the Survey Answer Template Detail page.

NOTE

If multi-tenancy is installed, the list page displays a tenant column and a tenant drop-down list in the search filter. Specifying <empty> in the search filter searches for public objects. On detail pages, select the appropriate tenant from the drop-down list. If you select <empty>, the object is public.

Survey Template Fields

The following fields require explanation:

- **Comment Label**
  Indicates the label for the comment text box.

  NOTE
  Use this field when you indicate that you want to include comments in the survey.
- **Active**
  Sets the template to active or inactive.
- **Submit Cycle**
  Indicates to send the survey every 'nth' time.
- **Survey Introduction**
  Shows the introduction text of the selected survey.
- **Survey Completion Message**
  Shows the text when the survey is completed.
- **Include Comments**
  Allows a customer to enter free-form comments by adding a text box to the end of the survey form.
- **Use Stricter Rules?**
  Prevents a user from submitting the same survey more than once.

Search Survey Templates

The Customer Survey List page contains the following options:

Show Filter Displays a search filter based on the following criteria: Active Survey Name Survey Introduction Clear Filter Clears the search filter.

NOTE

If multi-tenancy is installed, the list page displays Tenant and Public Data settings in the search filter. Public Data can be Excluded or Included with Tenant data; Only searches for public objects exclusively. On detail pages, select the appropriate tenant from the list. If you select <empty>, the object is public.

Search Survey Templates

The Customer Survey List page contains the following options:

Show Filter
Displays a search filter based on the following criteria:

- Active
- Survey Name
- Survey Introduction

Clear Filter
Clears the search filter.

NOTE

If multi-tenancy is installed, the list page displays Tenant and Public Data settings in the search filter. Public Data can be Excluded or Included with Tenant data; Only searches for public objects exclusively. On detail pages, select the appropriate tenant from the list. If you select <empty>, the object is public.

Survey Question List

The Survey Question List appears when you create or open a survey template.

NOTE

If multi-tenancy is installed, the list page displays a tenant column and a tenant drop-down list in the search filter. Specifying <empty> in the search filter searches for public objects. On detail pages, select the appropriate tenant from the drop-down list. If you select <empty>, the object is public

The page contains the following fields:

Search
Allows you to search for all questions added to your survey.

Show Filter Displays a search filter.

Clear Filter Clears the search filter.

Add Question Opens the Create New Survey Question window, allowing you to specify the question's sequence, comment label, status and question text.

Sequence
(Required) Indicates a number (greater than zero) for the order in which this question appears on the survey question list. The questions appear in the order in which they are created. Numbers do not have to be sequential.

Question Displays the question text.

Status(Required) Indicates if the question is active or inactive.

Survey Question Detail Page

The Survey Question Template Detail page appears when you create or modify a survey question.

This page displays the following:

Tenant
Specifies the tenant associated with this question. If this field says public (shared), then the question is public.

NOTE

This field only appears in multi-tenancy installations.

Sequence Defines the order in which the question appears in the survey. For example, if the value is 1, then this is the first question in the survey.

Include Comments Allows a customer to enter free-form comments by adding a text box to the end of the survey form.

Comment Label Indicates the label for the comment text box.

NOTE

Use this field when you indicate that you want to include comments in the question.

Active? Specifies if the question is active or inactive.

Response Required?
Indicates that the user is required to answer this question.

Multiple Response Question? Indicates that this question has multiple answers.

Question text
Specifies the question text that appears in the survey.

Last Modified Date Specifies the last date the question was modified.

Last Modified By Specifies the last user who modified the question.

This page also displays the Survey Answer List.

Survey Answer List

The Survey Answer List appears when you create or open a survey question template.

> **NOTE**
>
> If multi-tenancy is installed, the list page displays Tenant and Public Data settings in the search filter. Public Data can be Excluded or Included with Tenant data; Only searches for public objects exclusively. On detail pages, select the appropriate tenant from the list. If you select <empty>, the object is public.

The page contains the following fields:

Search
Allows you to search for all answers added to your question.

Show Filter
Displays a search filter.

Clear Filter
Clears the search filter.

Add Answer Opens the Create New Survey Answer window, allowing you to specify the answer's sequence, comment label, status and answer text.

Sequence (Required)
Indicates a number (greater than zero) for the order in which this answer appears on the survey answer list. The answers appear in the order in which they are created. Numbers do not have to be sequential.

Answer
Displays the answer text. Status Indicates if the answer is active or inactive.

Survey Answer Detail Page

The Survey Answer Template Detail page appears when you create or modify an answer.

This page displays the following:

Tenant
Specifies the tenant associated with this answer. If this field says public (shared), then the answer is public. Note: This field only appears in multi-tenancy installations.

Sequence
Defines the order in which the answer appears in the survey. For example, if the value is 1, then this is the first answer to the question.

Active?
Specifies if the answer is active or inactive.

Answer Text
Specifies the answer text that appears in the question.

How to Configure Notifications

This article contains the following topics:

With CA SDM, you can automatically notify key personnel about ticket activities (researching, escalating) and events (opening a ticket, for example). You can also notify key personnel about Knowledge Report Card (KRC) and Support Automation Assistance Sessions. When a significant activity or event occurs, CA Service Desk Manager creates a notification message that does the following:

- Identifies the ticket activity or the notification event
- References the ticket
- Includes other optional information
- Can identify potential contacts

You can view a notification message for a ticket because of a system action. A system action includes opening, closing, or modifying a ticket through its history information.

Setting up automatic notifications involves the following tasks:

- Defining activity notifications that determine the types of activities that generate notifications.
- Defining object contact notifications that determine the object contacts that can be used to send notifications in an activity notification.
- Identifying the methods used to send messages.

Create Object Contact Notifications

Object contact notifications let you notify the recipients based on the current value of a field on the ticket. Instead of identifying a person to notify, as in a notification method, you identify an object. For example, you can identify the To field to ensure that notification goes to the person currently identified in the To field, even if the value has changed since the ticket was defined.

Follow these steps:

1. Select Notifications, Object Contact Notifications on the Administration tab.
   The Object Contact Notification List page opens.
2. Click Create New.
   The Create New Object Contact Notification page opens.
3. Complete the following fields:
   - **Symbol**
     Defines a unique identifier for the object contact notification.
   - **Status**
     Specifies if the object contact notification is active or inactive.
   - **Object Type**
     Displays the name of the object to which the attribute applies.
   - **Object Attribute Name**
     Provides the name of the object contact notification (in the Symbol field) in Majic, which is internal CA code. The attribute name depends on the Object Type selection:
     - If the Object Type is Issue or Workflow Task, the attribute name is assignee, requester, or group; these are the attribute names in the chg objects and they map to fields in the Change_Request tables.
     - If the Object Type is an Issue Activity log, the attribute name must start with the attribute name in the activity log object that links it to a specific instantiation of the chg object. The attribute name could be change_id.group.
   - **Description**
     Describes the object contact notification.
4. Click Save.
   The new object contact notification is displayed in the Object Contact Notification List.

Previous Assignee Notifications

You can define Previous Assignee or Group values for an activity notification that detects changes to key fields when a ticket is saved. Previous values let you notify a previous assignee when a ticket is transferred, or notify both the current and previous groups when the priority of a ticket is escalated.

The Previous value fields of a ticket are local fields that exist only in memory and not in the database. The fields are populated during the save operation of the ticket only when respective attributes are changed and cleared at the completion of the notification processing. A previous value field is associated with a particular activity type through an activity association.

You can define Previous values that detect changes to the following key fields of a ticket:

Field	Requests, Incidents, Problems	Change Orders	Issues
Status	Yes	Yes	Yes
Active	Yes	Yes	Yes
Assignee	Yes	Yes	Yes
Request Area/Category	Yes	Yes	Yes
Group	Yes	Yes	Yes
Impact	Yes	Yes	Yes
Priority	Yes	Yes	Yes
Urgency	Yes	No	No
Severity	Yes	No	No

There are several contacts that you can specify for each object type (request, incident, problem, change order, or issue), which notify the current and previous contacts when an activity occurs.

- **Assignee**
  Person assigned to handle the ticket.
- **Assignee Previous**
  Person previously assigned to handle the ticket.
- **Group**
  Group assigned to handle the ticket.
- **Group Previous**Group previously assigned to handle the ticket.

After the notification rule is saved, the Assignee Previous and Group Previous fields display on the Object Contact Notifications List page.

Example: Configure Current and Previous Values for Key Fields

The following usage example describes how an administrator configures current and previous values for key fields to help ensure that the previous support representative is notified when a request is transferred away from them.

1. **Situation**A support representative is frustrated because a ticket was transferred away from them and they were never notified.
2. **Task** The administrator adds the Assignee and Assignee Previous object contacts to the notification rule for the Transfer activity notification. They attach a message template and specify the current and previous assignees to notify on the request form.
3. **Action** When the request is saved, the Assignee and Assignee Previous fields of the request are populated. When the activity occurs (ticket is transferred), the condition for the rule is evaluated.

4. **Result** If the condition is met, a notification message that describes the ticket activity is sent to the current assignee and the previous assignee.

Notify Contacts When a Ticket is Transferred Example

You can notify both the current and previous contacts when a CA SDM ticket is transferred.

Example: Notify both the current and previous contacts when a ticket is transferred

1. On the Administration tab, browse to Notifications, Activity Notifications.
   The Activity Notifications List page appears.
2. Select the Transfer activity notification.
   The Transfer Activity Notification Detail page appears.
3. In the Object Type field, select Requests/Incidents/Problems.
4. On the Notification Rules tab, under Symbol, select the Default Transfer Notification Rule.
   The Default Transfer Notification Rule page appears.
5. On the Object Contacts tab, click Update Object Contacts.
6. Click Search.
   The Notification Rule Update Recipients page appears.
7. From the Object Contacts list, select Assignee and Assignee Previous from the list on the left, and click the contact selection button (>>).
   The selected item is added to the list on the right.

   NOTE

   : Use the CTRL or SHIFT keys plus the left mouse button to select multiple object contacts.
8. Click OK.
9. Save the notification rule.
   The Object Contacts list displays the selected object contact.
10. On the Default Transfer Notification Rule page, click Message Template. Select a template and ensure that the Auto Notification option is enabled.
11. Create a request, specify an Assignee, and click Save.
12. On the Request Detail page, select Activities, and Transfer from the File menu.
13. Specify a new Assignee, and click Save.
    The notification is sent to the current and previous assignees when the transfer activity occurs.

Configuration Item Notifications

A configuration item (CI) notification lets you define an activity notification that is associated with a specific CI that is associated with a specific CA SDM ticket. This feature lets you track information about the users, organizations, and vendors of a CI. You can specify the CI object contacts on the Notification Rules Update Recipients page, such as CI Maint Org, CI Primary Contact, and so on.

Notify the Primary Contact of a Configuration Item for an Issue Example

You can define an activity notification for a primary contact that are sent for a specific CI for a specific CA SDM ticket.

Example: Notify the primary contact of a configuration item for an issue

1. On the Administration tab, browse to Notifications, Activity Notifications.
   The Activity Notification List page appears.
2. Select the Initial Activity Notification from the list.
   The Initial Activity Notification Detail page appears.
3. Select the object type you want to use.
4. On the Notification Rules tab, select the Default Notification Rule link.
   The Default Notification Rule page appears.

5. Select the Default Message Template link and ensure that the Auto Notification option is enabled.
6. Select the Object Contacts tab, and click Update Object Contacts.
   The Object Contact Notification Search page appears.
7. Click Search. A list of object contacts appears.
8. Select CI's Primary Contact from the list on the left, and click the contact selection button (>>).
   The selected item is added to the list on the right.
   You can use the CTRL or SHIFT keys plus the left mouse button to select multiple object contacts. You can add one object for a request and multiple objects for a change order or issue.
   The object contact is in the list on the right.
9. Click OK.
10. Save the notification rule.
    The Object Contacts list displays the selected object contact.
11. Complete the following tasks:
    – On the Service Desk tab, create or update an existing CI.
    – Add the primary contact listed on the Object Contacts tab. The selected object contact appears on the Configuration Items Detail page.
    – Add the CI to the Issue.

When an activity event occurs, the rule is implemented and the condition is evaluated. If the criteria for the condition is met, a notification message that describes the ticket activity is sent to all contacts of the CI associated with this notification rule.

Notification Log Reader

The Notification Log Reader displays the notifications received for the logged-in user by date, urgency, and status. With the Notification Log Reader, you can do the following:

- Change the sort order and set menu options to have the Notification Log Reader appear automatically when new messages are received.
- Double-click a notification message to request that CA SDM display the detail page for the ticket associated with the notification.
- Monitor notification messages by entering specific selection criteria to query the database for analysis or for selection of notification messages based on data entered in the fields. For example, you can list only those notification messages that have not been cleared by changing the Message Status field to Not Cleared.
- Clear notification messages to keep your list of notifications to a manageable size. Cleared notifications are not displayed when you first access the Notification Log Reader, although you can display them, if needed.

Set Notification Log Reader Options

You can set options for the Notification Log Reader to define how you are notified when new messages are received for an issue.

Follow these steps:

1. On the ServiceDesk tab, browse to View, Log Reader.
   The Notification Log Reader page appears.
2. Use the check box to the left of each notification to set the following options. You can select items to perform operations such as Clear Selected or Delete Selected.
   – **Header**
     Displays the header of the message, which usually contains the number of the ticket and the activity type.
   – **Start Date**
     Displays the date and time the notification was sent to your Log Reader window.
   – **Status**

Displays the status of the notification.

- **Urgency**
  Defines the level of urgency for the notification (low, normal, high, or emergency), which indicates the relative importance of different activities. Urgency levels are predefined; however, the system administrator is responsible for setting up other aspects of notification, such as notification methods and activity associations. The system administrator also defines the method of notification used for contacts and groups for each urgency level.
- **Message Text**
  The full message text for the notification.

The Log Reader displays any changes.

3. Click Close.
   The Notification Log Reader page closes and the options are set.

Personalized Responses

You can create personalized responses and attach them to requests, issues, and change order records when adding activities to the record. For example, you can append a personalized response on the Status Change or Log Comment windows available from the Activities menu.

Create a Personalized Response

You can create a personalized response to append to requests, issues, and change order records.

Follow these steps:

1. From the Administration tab, navigate to Service Desk, Personal Responses.
   The Personal Response list page displays.
2. Click Create New.
   The Create New Personalized Response page displays.
3. Complete the fields on the page:
   - **Response Owner**
     Specifies the contact who owns the response. If this field is left blank, the response is available to all analysts.
   - **Response**
     Specifies the text delivered to all those who receive this response. This field can be up to 1000 characters long. You can use variables in this field, for example:

     ```
     Ticket ref_num: @{call_req_id.ref_num}
     Assignee: @{call_req_id.assignee.combo_name}
     Customer: @{call_req_id.customer.combo_name}
     Description: @{call_req_id.description}
     ```
4. Select the type of records for which you want this response available. Click Save.
   A personalized response is created.

Personalized Response Variable Substitution

Variables can be embedded in the text of a Personal Response. These variables allow information to be substituted from the corresponding Request, Change Order, Issue, Problem or Incident. The syntax of the variables is the same as is used elsewhere in the CA SDM product, such as in the Activity Notification Message Templates and the Manual Notify Activity Message Text. The information can only be substituted from the corresponding Request, Change Order, Issue, Problem or Incident. Activity Notification Message Templates and the Manual Notify Activity Message Text allow information from the Activity Log Record to be included as well.

Check boxes for each object type (Requests, Change Orders, Issues, Incidents, and Problems) allow Responses to be filtered during selection. If the object type is not checked, the Response is not available for that object. For example, if only the Request box is checked, the Response is only presented in Activities for a Request.

A single Response can be used for all object types (Requests, Change Orders, Issues, Problems or Incidents). Because each object has different attributes, information that does not apply to the object is not substituted (for example, attempting to substitute the Request Number in a Response for an Issue).

A Response text example and the variable substitutions that occur for each object type follows:

```
This is Request # '@{call_req_id.ref_num}'
This is Change Order #' '@{change_id.chg_ref_num}'
This is Issue # '@{issue_id.ref_num}'
```

For a *Request*, the following substitution occurs:

```
This is Request # 'cr_demo:11'
This is Change Order # "
This is Issue # "
```

For a *Change Order*, the following substitution occurs:

```
This is Request # "
This is Change Order # 'chg_demo:3'
This is Issue # "
```

For an *Issue*, the following substitution occurs:

```
This is Request # "
This is Change Order # "
This is Issue # 'iss_demo:6'
```

By using the "Display this Response for" check boxes, you can create different versions of a Response with the appropriate substitution variables for the corresponding object (Requests, Change Orders, Issues, Problems or Incidents).

The format of the substitution variables for the different objects is as follows.

Object	Variable Format
Request / Incident / Problem	@{call_req_id.attr}
Change Order	@{change_id.attr}
Issue	@{issue_id.attr}

The substitution occurs when the Response is copied to the User Description field. The Response is copied after it is selected from the Personalized Response drop-down list and the drop-down list loses focus.

Internal Logs

You can define whether a particular access type is qualified to view internal logs. If allowed to view internal logs, contacts see a check box labeled Internal on each of the Log Activity windows, which they can select to mark the activity as internal. When activities are marked as internal, only contacts with an access type that is qualified to view internal logs sees the activity or is notified of it.

View the Log Reader

The Log Reader lists the notifications that are received for the logged-in user. You can filter the list by clicking Show Filter and specifying search criteria in the search fields. From the menu select View, Log Reader.
